Small intestine is the major site of zinc absorption and possibly serves as a gateway to the exchangeable zinc pool. In this study, an understanding of the global changes in the gene expression in response to zinc deficiency and supplementation is attempted. Therefore, using next generation sequencing (NGS) based deep sequencing was employed to capture the global changes in the transcriptome and its impact on various physiological process was analysed using enrichment of differentially regulated genes (DEGs) under zinc deficient and supplemented conditions in the small intestine of rats.

METHODS

Total RNA sequencing was performed using the IonProton, a semiconductor based Next Generation Sequencing system (ThermoFisher). The Next Generation Sequencing platform is mainly involved with three main steps: a) preparation of RNA libraries b) template preparation and c) sequencing. Finally, the binary alignment map (.bam) files were collected from the machine for each sample and analysed.

RESULTS

The binary alignment map (BAM) reads generated in the NGS machine for the corresponding transcriptomes of the rat small intestine (Control, Zinc deficient and Zinc supplemented). The Gene ontology (GO) analyses of the differentially expressed genes were carried out to understand the impact of zinc deficiency on the biological processes. It was found that under zinc deficient conditions, majority of biological processed related to the immune system functions are modulated, whereas upon supplementation of dietary zinc modulated tweleve biochemical pathways. In addition using PathView, association of enriched DEGs with KEGG pathway was visualized and representative associations of down regulated DEGs with chemokine signaling, osteoclast differentiation and NF-kB signaling pathways were obsereved. Link to data:http://surl.li/jhvwqd

CONCLUSIONS

Transcriptome analysis,revealed a snapshot of several genes that are modulated in the small intestine during zinc deficiency and sufficiency condition. Expression of several genes were found to be significantly modulated under these conditions which covered wide array of functions from immune signaling to amino acid metabolism. Further analysis of other tissues important for zinc homeostasis is likely to give deeper insights into the molecular events responsible for tight regulation of zinc homeostasis and how the tissues respond differentially to different zinc status. The findings may augment the current understanding of PCR-based biomarker for zinc.

AN INDIVIDUAL-SPECIFIC APPROACH TO MULTIDIMENSIONAL NUTRITION POVERTY IN INDIA: EVIDENCE FROM LARGE SAMPLE SURVEYS

Jyothimol Joseph[1]; R Sendhil[1]
[1]Economics, Pondicherry University, Kalapet, India

BACKGROUND AND OBJECTIVES

Globally, India records the highest rate of child wasting (18.7%) and stunting (35.5%) for 2018-2022. Despite efforts, progress in improving nutrition remains limited, and chronic malnutrition continues to pose a severe challenge to policymakers. In accordance with SDGs of health, the study aims to (1) develop a novel individual Multidimensional Nutrition Poverty Index (MNPI) for children under five in India, (2)compare the extent and factors of MNPI in states of India over the years and (3) assess and compare the area-wise share of MNPI.

METHODS

Using two rounds of the National Family Health Survey (NFHS 4 2014–15 and NFHS 5 2019–21), Alkire-Foster's methodology was applied to estimate the MNPI among children aged 0–59 months across the states of India. For the study, eight indicators were selected under four dimensions, viz., (1) stress: stunting and wasting, (2) access: maternal education and living standards, (3) availability: diet diversity and antenatal care, and (4) adequacy: immunization and maternal health. First-order stochastic dominance is used to check on the robustness of poverty cut-off and Spearman Rank correlation for weights of indicators.

RESULTS

The MNPI estimation shows a decline in multidimensional nutrition poverty between NFHS-4 (R1) and NFHS-5 (R2). The Headcount Ratio (H) decreased from 0.76 to 0.68, the Intensity of Poverty (A) from 0.56 to 0.52, and the MNPI from 0.43 to 0.35, reflecting overall nutrition poverty reduction. It is observed that the deprivation rates vary widely across states and indicators. At the national, state and regional levels, in both rounds, poor children are more deprived in the dimensions of minimum diet, standard of living, antenatal care and immunization with varying magnitude and order. However, the standard of living marked a 14% reduction in deprivation as against a 9% reduction in minimum diet over two rounds. By decomposing the country's MNPI for both rounds, Bihar (R1:0.57, R2:0.51) and Jharkhand (R1:0.55, R2:0.46) emerged as the states with the highest MNPI for R1 and R2. Though the overall share of state MNPI has declined over the years, states like Nagaland (R1:0.457, R2:0.461) and Kerala (R1:0.096, R2:0.139) have witnessed an increase in nutrition poverty compared to previous years. A comparison between rural and urban India showed that the MNPI was higher in rural regions (R1: 0.47, R2: 0.38).

CONCLUSIONS

This study provides insightful data for policymakers to prioritize nutrition-poverty states to ensure improvements in the overall MNPI. Another significant intervention is the identification of specific indicators that majorly impact the MNPI.

S-ADENOSYLHOMOCYSTEINE HYDROLASE DEFICIENCY DECREASES STABILITY OF ATHEROSCLEROTIC PLAQUE AND INDUCES VSMCS PHENOTYPE SWITCHING VIA EPIGENETIC UPREGULATION OF KLF4 AND OCT4

Yunjun Xiao[1]; Liu Si[1]; Xin Dai[1]; Wang Yongyi[1]; Xu Ke[1]; Su Wenen[1]; Huang Ting[1]
[1]The Seventh Affiliated Hospital,Research Center, Sun Yat-sen University, Shenzhen, China

BACKGROUND AND OBJECTIVES

S-adenosylhomocysteine (SAH) is a novel risk factor of cardiovascular disease. SAH hydrolase (SAHH) inhibition leads to SAH accumulation and promotes the formation and development of atherosclerosis. However, the role and underlying mechanism of SAHH in stability of advanced atherosclerotic plaque is still unknown.

METHODS

Apolipoprotein E-deficient mice with heterozygous SAHH knockout or vascular smooth muscle cells (VSMCs)-specific or macrophage-specific SAHH knockout were used to investigate the effect of SAHH deficiency on atherosclerotic plaques stability. Murine and human aortic VSMCs were cultured to explore the potential mechanism of SAHH deficiency in phenotype switching of VSMCs. The relationship of SAHH with atherosclerotic plaque stability was evaluated in patients with coronary artery disease or ischemic stroke.

RESULTS

Heterozygote or VSMCs-specific but not macrophage-specific knockout of SAHH induced VSMCs phenotype switching and decreased plaque stability. Mechanistically, on one hand, SAHH deficiency resulted in SAH accumulation and induced KLF4 upregulation by inhibiting DNMT3b and leading to hypomethylation of KLF4 promoter. On the other hand, SAHH deletion led to adenosine deficiency and inhibition of AMPK, which resulted in downregulation of Sirtuin1(Sirt1)-mediated deacetylation and tetmethylcytosine dioxygenase (TET)2-mediated hydroxymethylation of KLF4 promoter in SAHH-deficient VSMCs. Furthermore, SAHH deletion reactivated OCT4-mediated VSMCs migration in KLF4-dependent manner via TET1-mediated hydroxymethylation of OCT4 promoter. Finally, decreased SAHH activity and elevated SAH levels were associated with unstable atherosclerotic plaque in patients with coronary artery disease or ischemic stroke.

CONCLUSIONS

These RESULTS suggest that SAHH deficiency decreased stability of atherosclerotic plaques and induced VSMCs phenotype switching via epigenetic upregulation of KLF4 and OCT4.

ASSESSMENT OF PHYTOCHEMICAL PROFILE AND THERAPEUTIC POTENTIAL OF BAMBOO SHOOT FORTIFIED COOKIES AGAINST DIABETES

Naureen Naeem[1]; Bisma Naeem[2]; Wasey Kareem[3]; Roha Naeem[4]
[1]Criminology and Forensic Sciences, Lahore Garrison University, Lahore, Pakistan; [2]Computer Science, IMT School for Advanced Studies Lucca, Lucca, Italy; [3]Economics, Information Technology University (ITU), Lahore, Pakistan; [4]Mass Communication, Lahore Garrison University., Lahore, Pakistan

BACKGROUND AND OBJECTIVES

It was an endeavor to make use of cheaper sources through high nutritional contour for the production of best quality baked products. The present exploration focused bamboo shoots' powder as an excellent supplemented flour for cookie production. Owing to nutritional composition and readily availability it is established that bamboo shoots can be incorporated in cookies to increase their meticulousness in nutrition conscious consumers.

METHODS

The research included phytochemical composition, therapeutic potential in organ protection, and enhancement in nutritional profile in cookies. This experiment delves into the phytochemical profile of bamboo shoots aiming to identify health- promoting compounds.

RESULTS

Proximate composition revealed that the powder of bamboo shoots contained elevated amount of fiber (24.44%) and protein contents (19.32%) while the lowest amount of fats (1.46%). Similarly means values for T10 was found to contain 14.10% protein and 2.48% fiber followed by mean values for T8 with 13.97% protein and 1.97% fiber, while means for fat percentage were non-significantly different among all treatments. The findings underscored the multifaceted therapeutic potential of bamboo shoots, contributing to the understanding of plant-based interventions in health.

CONCLUSIONS

Organoleptic and physicochemical analysis of fortified wheat flour with bamboo shoot powder revealed that this innovative product can bring a change in the production of functional foods with enhanced accuracy. The current research on this extraordinary material is very fascinating leading to emergence of new avenues of bamboo utilization including baking industry with nutraceutical potential.

EXPLORING THE IMPACT OF SOCIAL MEDIA ON DIETARY HABITS: AN INTEGRATED BEHAVIOR MODEL APPROACH AMONG SAUDI COLLEGE STUDENTS

Nahla Bawazeer,[1]; Sara Almalki,[1]; Ruba Alanazi,[1]; Alamri Remaz[1]; Rana Alanzi,[1]; Raghad Alhanaya,[1]; Anwar Alhashem,[1]; Rehab Aldahash,[1]
[1]Department of Health Sciences, Princess Nourah bint abdulrahman University, Riyadh, Saudi Arabia

BACKGROUND AND OBJECTIVES

Health behaviors play a crucial role in overall well-being, and in the digital era, social media has become a major influence on everyday life (1). While nutrition is a popular subject on social media, it is often accompanied by misinformation due to limited professional oversight (2). College students are among the most active users of social media, but its effects on their dietary habits remain underexplored. This study aims to assess the relationship between social media usage and the dietary habits of college students in Riyadh, Saudi Arabia using the Integrated Behavior Model (IBM). This model helps in understanding and predicting health-related behaviors, with a focus on intention and motivation (3).

METHODS

A cross-sectional study was conducted in Riyadh, Saudi Arabia using an online questionnaire among college students aged between 18-25 years. The questionnaire consists of two sections on demographics, and the influence of social media usage on dietary habits using the IBM constructs (attitude, subjective norms, knowledge, skills, perceived agency, intention, and salience). Its validity and reliability were tested, and structural equation modeling assessed the associations between the constructs.

RESULTS

The 38-item scale, tested for reliability among 401 participants (74.6% female), showed a Cronbach's α of 0.953–0.956. Females scored significantly higher than males on attitude (16.72±5.1 vs. 15.11±5.8), personal agency (15.82±5.4 vs. 14.43±5.5), intention (17.53±5.8 vs. 15.43±5.9), skills (5.04±2.6 vs. 4.41±2.5), knowledge (6.27±2.0 vs. 5.17±2.6), and salience (14.59±4.5 vs 13.01±4.6). Using the IBM model, social media's impact on dietary habits was analyzed across seven domains. Salience, personal agency, perceived norms, and skills significantly predicted intention, which indirectly influenced dietary habits through attitude ($p<0.0001$). Attitude mediated 74% of the total effect of intention on dietary habits, while the direct effect of intention was insignificant.

CONCLUSIONS

Using IBM was beneficial for understanding and predicting social media use in dietary practices. It provides a framework to identify the determinants of the behavior. This study could help create foundational work to establish targets for future public health interventions.

XYLOOLIGOSACCHARIDE AND AKKERMANSIA MUCINIPHILA SYNERGISTICALLY AMELIORATE INSULIN RESISTANCE BY RESHAPING GUT MICROBIOTA, IMPROVING INTESTINAL BARRIER AND REDUCING INFLAMMATION IN GESTATIONAL DIABETES MELLITUS MICE

Jiexian Wang[1]; Yanhua Wu[1, 2]; Junyi Yang[1, 2]; Shihao Ying[1, 2]; Huiyu Luo[1]; Longying Zha[1]; Qing Li[2, 1]
[1]Department of Nutrition & Food Hygiene, School of Public Health, Southern Medical University, Guangzhou, China; [2]Department of Clinical Nutrition, Nanfang Hospital, Southern Medical University, Guangzhou, China

BACKGROUND AND OBJECTIVES

This study aimed to investigate the synergistic effects and mechanism of xylooligosaccharides (XOS) and *Akkermansia muciniphila* (*Akk*) on insulin resistance (IR) in gestational diabetes mellitus (GDM)/pseudo-germ-free (PGF) mice.

METHODS

Female mice were fed with AIN-93 (n=19) and high fat diet (HFD) (n=206). After 4 weeks, HFD-fed mice were further allotted to HFD, GDM, GDM+XOS, GDM+*Akk*, GDM+XOS+*Akk*, GDM+PGF, GDM+PGF+XOS, GDM+PGF+*Akk*, and GDM+PGF+XOS+*Akk* groups (n≥19). GDM was induced by intraperitoneally injecting streptozotocin and PGF was established by intragastrically administrating antibiotic cocktails. XOS (500 mg/kg·BW) or/and *Akk* (4×10⊥8 CFU) were gavaged once a day for 10 days. Fasting blood glucose (FBG), insulin and oral glucose tolerance test (OGTT) were determined. Gut microbiota were detected by 16S rRNA sequencing and absolute quantities of *Akk* by qRT-PCR. Intestinal tissues were stained by Hematoxylin-Eosin and Periodic acid-Schiff-Alcian blue staining. Occludin and Zonula occludens-1 (ZO-1) in intestine, and Akt, IRS-1, NF-κB p65 and TLR4 in liver and muscle were detected by Western blotting. The levels of LPS, TNF-a, IL-6 in serum were determined by ELISA kits.

RESULTS

In GDM mice, XOS, *Akk* and XOS+*Akk* reduced (p<0.05) the area under the curve of OGTT ,insulin and HOMA-IR and increased (p<0.05) Akt phosphorylation in liver and IRS-1 phosphorylation in muscle. Furthermore, XOS+*Akk* reduced (p<0.05) FBG and increased (p<0.05) Akt phosphorylation in muscle and IRS-1 phosphorylation in liver. XOS, *Akk* and XOS+*Akk* reshaped gut microbiota with XOS+*Akk* exhibiting the greatest effectiveness. XOS increased (p<0.05) *Akk* and clearance of gut microbiota abolished such effect. XOS, *Akk* and XOS+*Akk* reduced (p<0.05) the small intestine Chiu's score and the colon Dieleman's scores, increased (p<0.05) ZO-1 and Occludin, and decreased (p<0.05) TNF-α, IL-6 and LPS in serum and NF-κB p65 phosphorylation and TLR4 in liver and muscle.

CONCLUSIONS

XOS and *Akk* synergistically ameliorate IR by reshaping gut microbiota, improving intestinal barrier and reducing inflammation in GDM mice.

ASSESSING DIGESTIBLE INDISPENSABLE AMINO ACID SCORE (DIAAS) AND NUTRITIONAL QUALITY OF NOVEL PLANT CELL CULTURES AND OAT PROTEIN PRODUCED VIA DRY EXTRUSION

Valeria Iannone[1]; Rosa-Sibakov Natalia[2]; Johnson Lok[1]; Eveliina Helenius[1]; Hani El-Nezami[3]; Rischer Heiko[2]; Carlos Gomez-Gallego[1]; Emilia Nordlund[2]; Marjukka Kolehmainen[1]
[1]Institute of Public Health and Clinical Nutrition, University of Eastern Finland, Kuopio, Finland; [2]-, VTT Technical Research Centre of Finland Ltd, Espoo, Finland; [3]School of Biological Sciences, University of Hong Kon, Hong Kong, Hong Kong

BACKGROUND AND OBJECTIVES

Plant cell culture (PCC) technology is gaining attention as a promising and sustainable approach to future food production, driven by the need to reduce environmental impact and enhance productivity. In line with the FAO recommendations (1), assessing protein quality and amino acid digestibility is essential for validating their potential as high-quality food sources. This study evaluated the Digestible Indispensable Amino Acid Score (DIAAS) of two novel plant cell lines: scurvy grass (Cochlearia danica) and rowan (Sorbus aucuparia) in vivo and in vitro. Oat protein (Avena sativa) fractionated via dry extrusion was also evaluated to compare the cell lines with a plant protein. Additionally, the nutritional composition was analysed.

METHODS

Forty-eight 7-week-old Sprague-Dawley male rats were fed for 9 days with a morning meal with 4 grams of either scurvy grass, rowan or oat based-diets for the intervention groups (n=8/group) and with no-protein, soy and casein for the control groups (n=8/group). On day 10, the rats were sacrificed 3.5 hours after received the morning meal, and the ileal lumen content was collected. The nutritional composition, including proteins and amino acids (AA) was determined and the true ileal digestibility values % (TID) and DIAAS score were calculated. The protein digestibility in vitro was assessed with INFOGEST digestion protocol combined with DIAAS calculation.

RESULTS

Rowan contained 27% total fibers, followed by scurvy grass (21%) and oat (14%). Scurvy grass had 132 mg/100g of vitamin C, while rowan had 126 mg/100g. Rowan also contained 16.8 µg/100g of vitamin D3. TID calculated in in vivo study of essential AA lysine in oat (143%) was significantly higher compared to scurvy grass (44%), latter being also significantly lower compared to soy (139%). Additionally, in scurvy grass, TID for methionine was found significantly lower (35%) compared to soy (265%). DIAAS scores for adult population was in oat 74%(for lysine), for scurvy grass 31% (for lysine) and rowan 59% (for threonine).

CONCLUSIONS

DIAAS score of novel PCCs (scurvy grass and rowan) and oat protein was assessed and together with previous unpublished RESULTS the consumption of these PCCs could be considered safe, non-toxic and able to provide essential AA required.

FAS IN ADIPOSE TISSUE MODULATES GUT MICROBIOTA TO EXACERBATED DEXTRAN SODIUM SULFATE-INDUCED INFLAMMATORY BOWEL DISEASE IN OBESITY

Meng Duan[1, 2, 3]; Jialing He[1, 2]; Yating Yang[1, 2]; Ye Jiao[1, 2]; Xinyu Chen[1, 2]; Jinhua Lin[1, 2]; Congcong Wang[1, 2]; Wei He[1, 2, 3]; Shankuan Zhu[1, 2, 3]; Fei Yang[1, 2, 3]
[1]Department of Nutrition and Food Hygiene, Children's Hospital, Zhejiang University School of Medicine, National Clinical Research Center for Child Health, Hangzhou, Zhejiang, China; [2]Chronic Disease Research Institute, School of Public Health, School of Medicine, Zhejiang University, Hangzhou, Zhejiang, China; [3]Binjiang Institute of Zhejiang University, Zhejiang University, Hangzhou, Zhejiang, China

BACKGROUND AND OBJECTIVES

Inflammatory bowel disease (IBD) has emerged as a global health concern owing to rising incidence rates worldwide. Studies have shown that obesity is a risk factor for IBD development, although the underlying molecular mechanisms remain unclear. Fas (CD95), a member of the tumor necrosis factor (TNF) receptor superfamily, is upregulated in the adipose tissue of obese individuals and influences adipocytes through non-apoptotic pathways. However, the role of Fas signaling in adipose tissue during IBD has not been thoroughly investigated. Both obesity and IBD are characterized by gut homeostasis disruption, including alterations in the gut microbiota. This study aimed to determine whether Fas signaling in adipose tissue contributes to the progression of IBD during obesity and to explore the mechanisms involved in gut microbiota.

METHODS

Fas overexpression in male adipocyte (Fas CKI/CKI×Adi-cre) and littermate mice (Fas CKI/CKI) were used to establish a mouse model of IBD induced by dextran sodium sulfate (DSS) after a high-fat diet (HFD) for 7 weeks. Body weight and stool blood were monitored daily, and changes in serum, colon, and fecal samples were analyzed for inflammatory markers, histological alterations, and gut microbiota composition. Fecal microbiota transplantation (FMT) was conducted to investigate the role of gut microbiota in the susceptibility of Fas CKI/CKI×Adi-cre mice to colitis.

RESULTS

Compared with HFD-Fas CKI/CKI mice, HFD-Fas CKI/CKI×Adi-cre mice exhibited a significantly higher disease activity index, exacerbated weight loss, and more severe colonic damage post-DSS treatment, along with elevated serum IL-6 levels. Key microbial differences were identified, with dominant genera including *Roseburia* in FasCKI/CKI mice and *Escherichia-Shigella, Erysipelatoclostridium* in Fas CKI/CKI×Adi-cre mice. Additionally, FMT experiments indicated that mice receiving the gut microbiota from the Fas CKI/CKI×Adi-cre mice exhibited intensified DSS-induced IBD symptoms.

CONCLUSIONS

Our study showed that HFD-induced obesity promoted the progression of IBD by increasing Fas signaling in the adipose tissue, which modulated the alteration of the gut microbiota.

PROTEIN FERMENTATION BIOMARKERS DO NOT VARY BETWEEN DIETARY PROTEIN SOURCES DIFFERING IN DIGESTIBILITY

Roseanne Minderhoud[1]; Edoardo Capuano,[2]; Sonja De Vries[3]; Aniek Even,[4]; Guido Hooiveld,[1]
[1]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [2]Food Quality and Design Group, Wageningen University & Research, Wageningen, Netherlands; [3]Animal Nutrition Group, Wageningen University & Research, Wageningen, Netherlands; [4]OnePlanet Research Center, OnePlanet Research Center, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES

Microbial fermentation of undigested proteins in the large intestine may result in the production of metabolites that are potentially harmful to gut epithelia and host health. Whereas an increase in protein intake is known to increase the flow of proteins into the large intestine, and in turn, protein fermentation, the effect of protein digestibility on this process is unknown. To investigate this, a fully controlled randomized cross-over human dietary intervention study with 2 protein sources that differed in digestibility was performed in 15 participants, after which protein biomarkers were measured.

METHODS

Participants were provided for 7 days with a diet supplemented with 30 grams of protein per day (divided over 3 meals) either from Bovine Plasma Protein, as low digestible protein (LDP), or Whey Protein Isolate, as high digestible protein (HDP) source. The proteins, lipids, carbohydrates, and fiber contents were the same for both diets and corresponded to 12%, 36%, 50%, and 2% (w/w) of total energy intake. Acid-insoluble-ash (AIA) was added to the diet as indigestible marker to quantify fecal biomarkers. There was a 7-day washout period between dietary interventions.

RESULTS

It was found that, fecal ammonia concentrations were not different between diets (mean ± SD: LDP 16 ± 6 vs HDP 17 ± 5 mg/g AIA, $p=0.743$). Also, no statistical differences between diets were observed for fecal SCFA (LDP 1807 ± 1085 vs HDP 1987 ± 1575 µmol/g AIA) and BCFA (LDP 134 ± 52 vs HDP 139 ± 43 µmol/g AIA) concentrations ($p>0.05$), and urea in urine (LDP 19 ± 5 vs HDP 22 ± 3 mmol/mmol creatinine, $p=0.595$).

CONCLUSIONS

In conclusion, protein fermentation biomarkers measured in feces and urine were not increased when participants were supplied a LDP source compared to a HDP source. Individual variation in fecal biomarkers between participants was high, suggesting that individual differences play a large role in metabolite kinetics in the gastrointestinal tract.

PROXIMATE ANALYSIS AND MINERAL CONTENTS OF LOCALLY MADE MULTIGRAIN POWDER (SABAYA) IN NORTHERN NIGERIA

Nasir Sirajo Sadi[1]; Umar, Abdullahi Muhammad[2]
[1]Biochemistry, Bayero University Kano, Kano, Nigeria, Federal Republic of; [2]Integrated Science, Federal University of Education, Kano, Kano, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES

In Northern Nigeria, there is a growing trend among women to prefer a chubby physique over a slim one. To achieve this, women consume locally made multigrain powder (Sabaya) as a supplement for weight gain, particularly during weaning or after experiencing weight loss. Despite its popularity, there is a scarcity of research on the composition and nutritional content of this powder. This study aims to investigate the nutritional contents of locally made multigrain (Sabaya) powder obtained from different vendors.

METHODS

The moisture, crude protein, crude fat, total ash, crude fibre contents of different Sabaya powders were determined using the established procedures of AOAC. The mineral contents of the powders were also determined according to the procedures of AOAC. Data obtained were subjected to one way analysis of variance (ANOVA) using SPSS V24.0.

RESULTS

Significant differences were observed in the proximate composition of various powders. Carbohydrates contents of the powders varied significantly ($P<0.05$) between sample A, B and C. Sample A contains high level of protein (26.05%) when compared with that of B (21.23%) and C (19.60%) with also significant increase in ash content. The order of the mineral elements in the powders was K>Ca>Fe>Na>Mg>Zn>Cu, sample B consist of high amount of K (2138 mg/L) and Mg (2.373 mg/L) when compared with A and C. Sample C contains low Ca (15.65 mg/L), Cu (0.200 mg/L), K (1412 mg/L) and Zn (1.619 mg/L) but with increase in the level of Na (7.295 mg/L).

CONCLUSIONS

The present study has shown that locally made multrgrain (Sabaya) contains high protein, fat and carbohydrate which are nutrients needed by the body. The ash contents suggest that they are good sources of minerals.

SOURCES OF DIETARY MICRONUTRIENT INTAKE AMONG U.S. YOUTHS AGED 2–19 YEARS, NHANES 2021–2023

Huimin Zhong[1]; Bess Caswell[2]; Hanqi Luo[3]; Charles D. Arnold[4]; Reina Engle-Stone[5]
[1]Epidemiology, University of California, Davis, Davis, United States of America; [2]Agricultural Research Service, Human Nutrition Research center USDA, Davis, United States of America; [3]Rollins School of Public Health, Global Health, Emory University, Atlanta, United States of America; [4]Department of Nutrition, University of California, Davis, Davis, United States of America; [5]Institute for Global Nutrition, University of California, Davis, Davis, United States of America

BACKGROUND AND OBJECTIVES

Information on the dietary sources of essential micronutrients (MN) can help guide public health strategies to address deficiencies. This study aimed to identify and quantify the primary dietary sources contributing to the intake of nutrients of concern—iron, potassium, calcium, Vitamin D (VD)—among U.S. youths aged 2–19 years.

METHODS

Descriptive analysis of dietary intakes among US youths aged 2–19 years in the most recent NHANES cycle, 2021-2023 were conducted using the Day 1 dietary recall data (n=3756). Dietary supplements were not included in this analysis as the supplement data from this cycle has not yet been published. Micronutrient contributions were summarized by What We Eat in America (WWEIA) food classification categories and subcategories, overall and stratified by age group (2-5, 6-11, or 12-19 years).

RESULTS

Iron intake was highest from Grains (32%, including 19% from the Ready to Eat (RTE) Cereals subcategory), and Mixed Dishes (30%, including 12% from Sandwiches and 7% from Pizza). Top sources were similar by age group. Potassium intake had significant contributions from Mixed Dishes (20%, including 11% from Sandwiches), and Milk and Dairy (17%), primarily from Milk alone (8%). Other contributors to potassium intake were Protein foods (12%), Grains (11%), and Snacks and Sweets (10%). Fruits contributed 11% of potassium at 2-5y, 8% at 6-11y and 6% at 12-19y. For calcium intake, Milk and Dairy contributed 36% overall, with Milk alone accounting for 19%. Additional contributors to calcium intake were Mixed Dishes (26%, including 12% from Sandwiches and 7% from Pizza), Grains (11%), Snacks and Sweets (8%), and Water (7%). Half (51%) of VD intake was from Milk and Dairy, with Milk contributing 32%. Protein Foods contributed 15% of VD intake, Grains 14% (including 13% from RTE Cereals), and Mixed Dishes 12%. Milk provided relatively more calcium and VD to children 2-5 years (40% and 29%, respectively) compared to older children (~30% and 15-18%).

CONCLUSIONS

This study highlights the primary dietary sources of calcium, potassium, VD, and iron among U.S. youths, suggesting important roles for dairy and fortified foods (e.g. RTE cereal). Mixed dish disaggregation and supplement analysis will provide further insight. Some sources differed by age, especially for children 2-5y. Efforts to address inadequacy of nutrients of concern should prioritize food groups that align with overall diet quality.

APPLICATION OF THE COM-B MODEL TO INFORM DIET BEHAVIOUR CHANGE INTERVENTIONS IN PASTORALISTS SETTING IN KENYA

Esther Omosa[1]; Paula Dominguez-Salas[2]; Inge Brouwer[3]
[1]People Policies and Institutions, International Livestock Research Institute, Nairo, Kenya; [2]Natural Resources Institute, University of Greenwich, London, United Kingdom; [3]Global Nutrition, Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES

There is limited evidence for successful interventions to improve consumption of healthy diets among pastoralists in Africa who are most affected by malnutrition. Designing effective interventions requires characterisation of barriers and enablers underlying healthy diet consumption. We used the Capability-Opportunity-Motivation- Behaviour (COM-B) Model to identify these for diet behavor change intervention planning in pastoralist setting.

METHODS

A cross-sectional study was used to collect data on diet behaviour of pastoralist Women of Reproductive Age (WRA). Survey tools comprised of a questionnaire developed based on COM-B and administered through ODK- and a 24-hour diet recall in CATCH-24 App. Confirmatory Factor Analysis measured models and Structural Equation Modelling tested the models.

RESULTS

A total of 349 WRA were sampled with a mean age of 34 years, household sze of 6 persons, predominantly male headed (85%), severely food insecure (70%), illiterate (50%), and Muslim (99%). The COM-B model explained 38% of the variance in diet quality. Diet quality was positively associated with motivation (Beta=0.69; $p<0.001$) as measured through convenience and food price; opportunity (Beta=0.68; $p<0.001$) measured through availability of healthy foods and media exposure to unhealthy foods; capability (Beta=0.74; $p<0.001$) measured through well-being. However, capability measured through habit and nutrition knowledge was negatively associated with capability.

CONCLUSIONS

The COM-B model identified barriers: habit and nutrition and, enablers: price, convenience, availability of healthy foods, media access to unhealthy food as underlying pastoralists' diet behaviour suggesting combination of of all the 3 COM-B constructs to effectively influence and accelerate behaviour change. Further research is needed to apply COM-B model in non-pastoralist settings, for a different age group.

The future of nutrition recommendations

SOAP 01 - THE FUTURE OF NUTRITION RECOMMENDATIONS

SOAP01_01

MODELING INCREASED DIETARY DIVERSITY IN PLANT AND ANIMAL PRODUCTS AND ITS IMPACT ON DIET QUALITY

Anaëlle Bolo[1, 2]; Sarah Chabert[1]; Juhui Wang[1]; François Mariotti[1]; Jean-François Huneau[1]; Hélène Fouillet[1]
[1]Université Paris-Saclay, AgroParisTech, INRAE, UMR PNCA, 91120, Palaiseau, France; [2]Graduate School BIOSPHERA (Programme thématique SANAH), Université Paris-Saclay, Palaiseau, France

BACKGROUND AND OBJECTIVES

https://doi.org/10.1017/jns.2026.10126 Published online by Cambridge University Press

Dietary diversity is an integral component of dietary guidelines that aim to improve nutritional quality and health. However, the associations between dietary diversity, diet quality and health are not well defined. Unspecific recommendations for dietary diversity may lead to unintended negative health effects, depending on the food groups where diversity operates. In the context of the shift towards more plant-based diet, this study investigates the effect of increasing dietary diversity within animal and plant food groups on diet quality.

METHODS

We developed a model to simulate individual-specific increases in dietary diversity within one or more food groups, based on observed adult diets from the latest French Individual and National Food Consumption (INCA3) Survey. Diet quality of modeled diets for each individual was assessed using scores for nutrient adequacy, nutrient security (risk of overt deficiency), moderation (avoiding excessive intake of sugar, sodium, and saturated fat), using probabilistic assessment, and the risk of chronic diseases, using comparative risk assessment. In this study, dietary diversity was increased within plant products, animal products, fatty/sweet/salty products, or in all food groups.

RESULTS

Increasing dietary diversity in plant products or animal products similarly improved nutrient adequacy (by +12±1% and +15±1%, respectively) and nutrient security (+3±1% and +4±1%, respectively). The score reflecting the risk of chronic diseases also improved for all types of products, indicating a reduced risk, with the greatest benefit observed for increased diversity in plant products. However, moderation was negatively affected when diversity was increased in animal products (-8±1.0%) but remained stable for plant products. By comparison, increasing diversity within fatty/sweet/salty products had only minor effects on diet quality, and increasing diversity in all groups had varied effects on nutrition and health assessment.

CONCLUSIONS

Dietary diversity can improve some aspects of dietary quality, but can compromise moderation when applied to animal products. Improving diversity in plant products is more beneficial to diet quality, especially with respect to long-term health.

SOAP01_02

GENERATING EVIDENCE IN MODERATE WASTING (GEM)

Ranjan Kapali[1]; Ojaswi Acharya[2]; Lila Bikram Thapa[3]
[1]Nutrition and Health, Action Against Hunger | ACTION CONTRE LA FAIM (ACF), Lalitpur, Nepal; [2]Country Director, Action Against Hunger | ACTION CONTRE LA FAIM (ACF), Lalitpur, Nepal; [3]Family Welfare Division, Department of Health Services, Kathmandu, Nepal

BACKGROUND AND OBJECTIVES

In Nepal, 25% of children under five are stunted, 8% are wasted, and 43% of children and 34% of women are anemic with high micronutrient deficiencies. Moderately Acute Malnourished (MAM) children face a 3–4 times higher mortality risk. Despite efforts through programs like IMAM, initiated in 2011, malnutrition rates remain high due to food insecurity, inadequate healthcare, and sociocultural barriers. The Moderate Wasting Initiative (MWI) enhances nutrition stakeholders' capacity to implement scalable solutions, including traditional and WHO-aligned approaches. By assessing regional nutrition determinants, MWI identifies gaps and opportunities to strengthen and adapt programs for children with moderate wasting.

METHODS

The MWI tools, developed by the Nutrition Determinants Working Group (NDWG) of the Global Nutrition Cluster (GNC) and led globally by ACF UK, were contextualized by ACF Nepal. Using the Rapid Nutrition Determinants Assessment methodology, the project was implemented in three municipalities. Data collection included 11 Key Informant Interviews (KIIs) and nine Focus Group Discussions (FGDs) to assess 20 nutrition determinants across five categories. Qualitative research developed Nutrition Determinant Pathways and Action Plans, supported by surveys, stakeholder workshops, and multi-sectoral analysis, culminating in comprehensive MAM intervention methodologies, training, implementation, and regular monitoring.

RESULTS

The analysis conducted in three municipalities of Nepal identified significant factors influencing undernutrition, with gender playing the most critical role. Women's heavy workload, inadequate diet quality, and limited access to income sources were consistently ranked as priority determinants. These findings led to the development of a nutrition determinants pathway aimed at addressing these challenges. A workshop involving municipal stakeholders was organized to present the pathway, discuss key insights, and identify strategies to improve nutrition outcomes within their respective communities.

CONCLUSIONS

The assessment methodology, piloted by Action Against Hunger Nepal, effectively improved assessment preparation, optimized team sizing, and contextualized tools. It enhanced local teams' capacity for qualitative assessments and provided actionable insights on nutrition determinants for program planning. Action Against Hunger intends to share the tools and methodology widely following the pilot's success.

CONFLICTS OF INTERESTS

SOAP01_04

DEVELOPING INTERIM FOOD-BASED DIETARY GUIDELINES FOR THE GENERAL POPULATION IN CAMBODIA – HEALTHY, DIVERSE, SUSTAINABLE

Sanne Sigh[1]; Mara Burkhard[1]; Kroeun Hou[2]; Kim Rattana[3]; Sam Oeurn Un[1]
[1]MUSEFO, GIZ Project Office, Phnom Penh, Cambodia; [2]Nutrition, Helen Keller Intl Cambodia,, Phnom Penh, Cambodia; [3]National Maternal and Child Health Center, Ministry of Health, Cambodia, Phnom Penh, Cambodia

BACKGROUND AND OBJECTIVES

Despite economic growth high prevalence of malnutrition persists in Cambodia. Simultaneously, Cambodia is amid a nutrition transition, moving from a traditional diet rich in starch and fibre-based foods to one dominated by consuming fatty, animal-source foods, refined carbohydrates, and (ultra-) processed foods. The growing consumption of sugar-sweetened beverages and energy-dense snacks, high in sugar, fat, and salt, has become a major concern, particularly among young children. The increasing threats of Climate Change to Cambodia's food systems are further expected to exacerbate the prevalence of undernutrition, micronutrient deficiencies, and overnutrition. The main objective of the food-based dietary guidelines (FBDG) is to increase awareness and behavioural change among the Cambodian population, resulting in improved dietary patterns while promoting sustainable healthy diets concerning climate, cultural acceptance, food availability and affordability.

METHODS

The development of the FBDGs was initiated by the Ministry of Health in Cambodia to complement existing guidelines on dietary patterns. A mixed-METHODSapproach was used to develop the FBDG. First, an in-depth literature review of available scientific evidence was conducted. The pre-developed key recommendation was tested for wording and understanding during two focus group discussions (FGD) with 20 participants. Following the finalization of the key recommendations, social behaviour change materials were developed and tested using FDG (n= 10) within five provinces in Cambodia (Kampot, Kampong Thom, Takeo, Kratie and Phnom Penh) among the target group.

RESULTS

The guidelines target women of reproductive age (15-49 years), pregnant and lactating women, caretakers of infants 0-6 months and 2-6 years old, adults (18-59 years) and elderly (60+ years). Children aged 2-5 years and school-aged children 7-17-years were covered in other guidelines. Based on the literature review, a set of 14 key messages was developed for the general Cambodian population. The key messages cover exclusive breastfeeding, dietary diversity, reduction of rice, reduction of sugary, fatty and salty foods, physical activity, tobacco and alcohol, water intake, and handwash.

CONCLUSIONS

Cambodia has developed their first food-based dietary recommendations for the general public using a sustainable and human-centred approach, including the general public in understanding the recommendations and communication materials.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

BACKGROUND AND OBJECTIVES

Asia is an emerging economic power housing >50% of the global population. The recent rapid economic development has fuelled nutrition transitions, leading to a triple burden of diseases- overnutrition, undernutrition and, micronutrient deficiencies. Asia's diverse food environment and differences in physiology and dietary response indicate that local empirical evidence is imperative to solve its unique and complex nutrition challenges. It is therefore important to evaluate and reflect on the current state of Asian evidence to make intelligent future investments. The ACTIVATOR aims to fulfil this urgent need by addressing four specific objectives: (i) Understand the current state of nutrition research in Asia, (ii) Identify successes and gaps within the region, (iii) Facilitate collective proposition of context-specific solutions to close gaps, and (iv) Build capacity for Asian nutrition research and advocacy.

METHODS

ACTIVATOR will take place in four phases: (i) Consortium building, (ii) Meta-research study for decadal evidence evaluation, and (iii) Dissemination and discussion with a broader group of intergenerational nutrition researchers through the involvement of Asian nutrition societies to identify facilitators and barriers to good research and outline a road map for capacity-building. Finally, (iv) Liaison with stakeholders will collate and publish the outcomes from Phases (i–iii) as a white paper for dissemination through webinars to reach all stakeholders: academia, professional bodies, industry, and policymakers.

RESULTS

The ACTIVATOR Consortium has been established with its Core Team including active and consenting researchers at different career stages from the ten Asian countries (Bangladesh, China, India, Indonesia, Malaysia, Nepal, Pakistan, Singapore, Sri Lanka, and Thailand) that account for >70% of the region's publication output**.** ACTIVATOR is supported by external observers and experts in meta-research, nutrition, and management of science-policy interface in Asian settings (Table 1). Towards addressing the project's first objective (i.e. to understand the current state of nutrition research in Asia), a meta-research protocol was registered and evaluation is ongoing. The RESULTS from this evaluation will be presented at IUNS-ICN.

CONCLUSIONS

NEPAL'S SCHOOL FOOD ENVIRONMENT AND NUTRITION PRACTICES: ASSESSMENT OF FAT AND SODIUM IN SCHOOL CAFETERIAS IN URBAN MUNICIPALITIES

Megan Henry[1, 2]; Archana Shrestha[3]; Namuna Shrestha[3]; Priza Pradhananga[3]; Xiao Hu[1, 2]; Christine Johnson Curtis[4]; Nicole Ide[4]; Ashley Lederer[5, 4]; Sara Benjamin-Neelon[6]
[1]Department of Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [2]Welch Center for Prevention, Epidemiology and Clinical Research, Johns Hopkins University, Baltimore, MD, United States of America; [3]Department of Public Health and Community Programs, Dhulikhel Hospital - Kathmandu University Hospital, Dhulikhel, Nepal; [4]Cardiovascular Health, Resolve to Save Lives, New York, United States of America; [5]Healthy Food Policies and Programs, Thoughtful Food Nutrition, New York, United States of America; [6]Department of Health, Behavior and Society, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America

BACKGROUND AND OBJECTIVES

In Nepal, NCDs account for over half of total mortality, and diet is a key modifiable risk factor. Nepal's multisectoral action plan for 2021-2025 aims to reduce NCD-related mortality by 25%. The World Health Organization (WHO) endorses public food procurement and service policies to reduce NCDs caused by unhealthy diets. A novel tool was used to assess school meal service in Nepal to evaluate changes before and after policy implementation.

METHODS

Trained data collectors visited all schools implementing procurement policy in three municipalities in 2024, and the *Healthy Food Procurement and Service Policy Evaluation Toolkit* was implemented. This novel tool was developed using the *Guide to developing nutrition standards for healthy public food procurement and service policies*. One-day structured observations were made of meals and snacks served, and foods and beverages in the pantry. On-site interviews were held with food procurers or preparers. School food environment data pertaining to fat and sodium were summarized using median and interquartile range (IRQ) for continuous variables and percentages and frequencies for categorical variables.

RESULTS

Among 249 schools, 202 (84%) were private, 30 (12%) were government, and 9 (4%) were community schools. Schools had a median of 305 (IQR 100-500) students enrolled. All schools had an onsite kitchen, and almost all (94%) served meals and snacks to children 6 days per week. Most schools (n=236; 94.8%) composed and served a fixed meal to children; 3 (1.2%) used standard recipes. Salt and condiments were available in the eating area of 1.2% and 4.8% of schools, respectively. Most schools (65%) reported deep frying foods; on the day of observation, 33% were observed doing so. Just under one-third (31%) reported always purchasing lean meats or trimming visible fat from meat. 17% of schools had at least one food that contained industrial trans fat in the pantry.

CONCLUSIONS

Baseline data collecting using the *Healthy Food Procurement and Service Policy Evaluation Toolkit* reveals strengths and areas for improvement in Nepal school food environments. Children currently have limited access to table salt and condiments. However, school procurement policies should mandate the use of standardized recipes with limited added salt, limit fried foods (served in most schools), provide training on purchasing and serving meat with less fat (currently practiced in one-third of schools), and eliminate foods that contain trans fats (currently present in about one out of every 6 schools).

BACKGROUND AND OBJECTIVES

Protein quality assessment by amino acid digestibility scoring has been discussed in various Food and Agriculture Organisation (FAO) expert meetings. In 2014, the need for a robust database on the protein digestibility of foods consumed globally –particularly for low-income and middle-income countries – was first recognized. In 2022, the FAO and the International Atomic Energy Agency (IAEA) embarked on the creation of such a database.

METHODS

The 2022 Joint FAO/IAEA technical meeting outlined the database development framework based on oro-ileal digestibility data for both protein and individual amino acids obtained *in vivo* in humans, pigs and rats, in dissenting order. A systematic review of the literature was carried out from database inception (Scopus, Web of Science, PubMed Central) to end of November 2024. A technical advisory group led by FAO and IAEA was established in March 2024 to guide the database construction and a follow-up expert meeting was held in November 2024 to revisit the inclusion criteria and finalize the database architecture.

RESULTS

A total of 5,313 published articles were identified of which, 1,088 were eligible after title and abstract screening leading to a final ~550 full text articles included for data extraction. The database included food description (name, food group, botanical name, country of origin, seasonality, degree of processing etc.), protein and amino acid content (per 100g food and per g of protein), moisture content, protein and amino acid ileal digestibility followed by calculations of ileal Protein Digestibility Corrected Amino Acid Score (ileal-PDCAAS) and Digestible Indispensable Amino Acid Score (DIAAS) by age groups.A separate database was created to include data on the metabolic availability of amino acids in food, measured by the indicator amino acid oxidation (IAAO) method, considering that while these data are of interest, IAAO is not a direct measure of protein and amino acid ileal digestibility.

CONCLUSIONS

The scientific literature is sufficiently advanced to support the creation of a database on the ileal digestibility of protein and amino acids in foods consumed by humans. Values of oro-ileal digestibility are prioritized over faecal digestibility when discussing the digestibility of foods. Studies in animals should be validated against

https://doi.org/10.1017/jns.2026.10126 Published online by Cambridge University Press

human data and standardised protocols should be used across the research design. Following the database publication, researchers and organizations should contribute to this highly relevant resource and utilize the practical guide as a source of inspiration and an educational tool.

SOAP01_09

WHEN DOES DIETARY DIVERSITY ENHANCE DIET QUALITY? THE IMPORTANCE OF FOOD GROUPS AND DIMENSIONS

Anaëlle Bolo[1, 2]; Sarah Chabert[1]; Jean-François Huneau[1]; Hélène Fouillet[1]; François Mariotti[1]
[1]Université Paris-Saclay, AgroParisTech, INRAE, UMR PNCA, 91120, Palaiseau, France; [2]Graduate School BIOSPHERA (Programme thématique SANAH), Université Paris-Saclay, Palaiseau, France

BACKGROUND AND OBJECTIVES

To some extent, dietary diversity is essential for adequate nutrient intake. However, a higher diversity has also been associated with overconsumption and excessive intake of harmful nutrients. Therefore, the impact of diversity is likely to depend on the food groups in which it operates. It may also depend on the dimension of diversity, which can be of three types (the number of foods consumed, their uniformity, and their nutritional dissimilarity). The aim of this study was to evaluate how dietary diversity within different food groups affects diet quality by analyzing the effects of an increase according to three dimensions.

METHODS

Following a literature review, we defined dietary diversity according to three dimensions: count, evenness, and nutritional dissimilarity of the foods consumed. We developed a model to simulate individual-specific increases in diversity within one or more food groups, either in all dimensions simultaneously or one dimension at a time, and without changing the total amount of the food groups. Our study was based on observed adult diets from the latest French Individual and National Food Consumption (INCA3) Survey. The diet quality of diversified diets was assessed using scores for nutrient adequacy, nutrient security (risk of overt deficiency), and moderation (avoiding excessive intake of some nutrients). In the modeled diets, diversity was increased within 18 food groups according to each dimension.

RESULTS

The Vegetables group was the only group where increased diversity consistently improved or maintained diet quality scores across all dimensions, with changes ranging from 0% to +4.4% compared to the observed diets. Increased diversity was also beneficial within "Bread products" (-1.0% to +4.7%), driven by higher fiber and magnesium intake due to partially replacing refined bread with whole-grain bread, and within "Fish and seafood" (-0.3% to +5.2%), attributed to higher EPA+DHA intake from partially replacing lean fish and seafood with fatty fish. In contrast, increased diversity within "Dairy" had an overall negative effect, resulting in decreases in nutrient adequacy (-1.8% to 0.0%) and moderation (-3.1% to -0.1%) due to partially replacing milk with cheese and dairy desserts. For other food groups, the effects of increased diversity were mixed and depended on the dimension of diversity applied. For example, increasing nutritional dissimilarity within "Grains and potatoes" improved diet quality, whereas increasing evenness did not.

CONCLUSIONS

The effect of dietary diversity on diet quality is dependent on food groups and dimensions. Specifying subgroups to be recommended within food categories could improve diet quality.

SOAP01_12

ADAPTING THE MEDITERRANEAN DIET FOR ASIANS: SENSORY EVALUATION IN NON-ALCOHOLIC FATTY LIVER DISEASE (NAFLD) PARTICIPANTS

G. Chiah[1]; Y.W. Lee[1]; I.Y. Lim[2]; G.B.B. Goh[3, 4]; V.M.H. Tan[1]
[1]Health and Social Sciences, Singapore Institute of Technology, Singapore, Singapore; [2]Biomedical Datahub Division, Bioinformatics Institute, A*STAR Singapore, Singapore, Singapore; [3]Gastroenterology & Hepatology, Singapore General Hospital, Singapore, Singapore; [4]SingHealth Duke-NUS Medicine Academic Clinical Programme, Duke-NUS Medical School, Singapore, Singapore

BACKGROUND AND OBJECTIVES

The Mediterranean Diet (MD) is associated with health benefits and sustainability. However, its acceptance and implementation in Asia face challenges due to local unfamiliarity. The aim of this study is to examine the acceptability of the Asian-adapted MD in NAFLD patients in Singapore.

METHODS

We developed 14 Asian dishes adhering to MD characteristics. Participants with primary NAFLD, aged 21-60 years, attended two sensory evaluation sessions, each featuring 7 dishes. Participants rated four sensory attributes (appearance, aroma, texture, saltiness) and overall taste and acceptability on a 7-point Likert scale, with a rating of 5 and above indicating good acceptability. Linear mixed models (LMM), adjusting for dish and subject identifiers, were used to assess the association between the sensory attributes and overall taste and acceptability.

RESULTS

Thirty subjects (19 males, 11 females; mean age 43.9 ± 12.1 years; mean BMI 29.7 kg/m² ± 5.3) completed both sessions. Of the 14 dishes, 12 (85.7%) achieved good overall mean score in appearance (5.29 ± 1.31), aroma (5.46 ± 1.19), texture (5.29 ± 1.33), overall taste (5.45 ± 1.37), and overall acceptability (5.45 ± 1.38). LMM analysis showed that texture is strongly associated with overall taste (βtaste = 0.83, Padj<0.001) and overall acceptability (βacceptability = 0.83, Padj <0.001). This is followed by saltiness, aroma, and appearance against both overall taste and acceptability (Padj <0.001) (Table 1).

Table 1. Associations between sensory attributes and overall taste and acceptability

Sensory Attribute	Overall Taste			Overall Acceptability		
	β	SE	Padj	β	SE	Padj
Appearance	0.557	0.045	<0.001	0.587	0.044	<0.001
Aroma	0.714	0.045	<0.001	0.742	0.044	<0.001
Texture	0.830	0.029	<0.001	0.833	0.030	<0.001
Saltiness	0.795	0.035	<0.001	0.787	0.036	<0.001

CONCLUSIONS

Our findings demonstrate high overall acceptability across various sensory attributes. Understanding the contribution of different sensory attributes to overall taste and acceptability can guide the future development of Asian-adapted MD recipes for broader adoption in Singapore.

SOAP01_13

SOCIOECONOMIC INEQUALITIES IN DIET AND NUTRITION – A SYSTEMATIC REVIEW OF ASIA

Darel Wee Kiat Toh[1]; Amanda Simin Fu[1]; Rachel Ai Fang Tso[1]; Rina Yu Chin Quek[1]; Shweta Sunil Singh[2]; Tsz Ning Mak[2]; David Cameron-Smith[1]
[1]Nutrition, Singapore Institute of Food and Biotechnology Innovation (SIFBI), A*STAR, Singapore, Singapore; [2]Nestle Institute of Health Sciences Singapore Hub, Nestle Research, Singapore, Singapore

BACKGROUND AND OBJECTIVES

Chronic disease burden is disproportionately shouldered by the lowest socioeconomic strata1,2. Disease risk is predicted by reduced nutrition and diet quality, however, the socioeconomic disparities of Asian countries remain poorly described3. This systematic review aims to investigate the relationship between socioeconomic status (SES) and key parameters of nutritional quality (reported caloric, macronutrients and micronutrients intake, biomarkers of nutritional status) and diet (food groups and types, healthy diet indexes) in adults across Asian countries.

METHODS

Multiple online databases (Pubmed, CINAHL, Embase, Web of Science) were systematically reviewed (n = 4,990) following the PICOS framework. Shortlisted studies (n = 114) were summarised according to the reported correlations between socioeconomic status (defined by income, education level, residential status or relevant SES index) and nutrition/diet measures. Nutrition/diet disparities between the lowest and higher SES strata were also quantitively evaluated. Where relevant, subgroup analyses (e.g. by country's GDP per capita, pregnant women cohorts etc.) were conducted.

RESULTS

Studies were diverse (n = 10 countries such as India, southeast Asia etc., including 65 to 714,421 participants) with a majority that included generally healthy (~ 91 % of studies), cross-sectional cohorts (data reported 1998 to 2021). Collective data evaluation suggested poorer overall nutrition (according to diet quality and diversity indexes) among the lowest SES strata, attributed to challenges in meeting requirements of specific food groups (such as animal-protein foods (median: 30.2 % lower intake in lowest SES), and fruits (median: 33.3 % lower intake in lowest SES)), and the use of excessive table salt over alternative condiments (e.g. herbs and spices). Notably, risks of specific nutrient inadequacies (including dietary fiber, thiamine, riboflavin, folate, vitamin D and potassium) were identified (17.2 % to 91.9 % below WHO recommended daily values), putting the lowest SES strata at heightened risks of malnutrition-related health concerns. This largely aligned with biological nutrients status which highlighted vitamin D, iron and iodine deficiencies as key concerns.

CONCLUSIONS

This systematic review provided evidence-based findings on the most prevalent nutrient and diet constraints that are compromised in the lowest SES of Asia. Our findings will form the basis for key problem statements to address regional food and nutrition insecurities, which will be instrumental in shaping the future of nutrition recommendations.

CONFLICTS OF INTERESTS

SOAP01_14

PESCATARIAN DIET MAY OFFER GREATER BENEFITS FOR PRESERVING DNA INTEGRITY

Goran Gajski[1]; Katarina Matković[1]; Luka Kazensky[1]; Marko Gerić[1]
[1]Division of Toxicology, Institute for Medical Research and Occupational Health, Zagreb, Croatia

BACKGROUND AND OBJECTIVES

A balanced diet provides essential nutrients like carbohydrates, proteins, fats, vitamins, and minerals that are crucial for the body's proper functioning and overall health. Dietary choices have a profound impact on various aspects of physical and mental well-being, disease prevention, and quality of life. Increasing evidence suggests that nutrition can influence DNA stability by enhancing antioxidant defences and modulating the body's DNA repair capacity. In particular, plant-based diets and higher consumption of fish and seafood are linked to improved health, longevity, and well-being.

METHODS

In this study, we aimed to explore the effects of different dietary habits on primary DNA damage in healthy young women living in Zagreb, Croatia using the alkaline comet assay, a sensitive, rapid, and cost-effective technique for assessing DNA damage at the single-cell level. Selected participants were grouped into vegetarians and non-vegetarians, with the non-vegetarians further divided into omnivores and pescatarians.

RESULTS

Our findings revealed significantly ($p < 0.05$) higher DNA damage, expressed as a percentage of tail DNA, in vegetarians (3.6 ± 1.1%) compared to non-vegetarians (2.8 ± 1.0%), with the lowest DNA damage observed in pescatarians (2.4 ± 1.1%). These RESULTS suggest that a pescatarian diet may offer greater benefits for preserving DNA integrity, warranting further research in this area.

CONCLUSIONS

While potential risks like exposure to toxic metals (e.g., mercury) and microplastics from fish exist, a substantial body of evidence, including our findings, indicates that the health benefits of fish consumption may outweigh these risks. Our RESULTS highlight the need for additional studies to better understand how specific dietary choices can influence DNA integrity and, ultimately, human health.

SOAP 22 - THE FUTURE OF NUTRITION RECOMMENDATIONS

SOAP22_01

THE EFFECT OF CALISTHENICS TRAINING ON ESTIMATED VO_2MAX VALUES IN COLLEGE STUDENTS

Rayhan Imran[1]; Triyanti Triyanti[2]
[1]Nutrition, Universitas Indonesia, South Jakarta, Indonesia; [2]Public Health, Universitas Indonesia, South Jakarta, Indonesia

BACKGROUND AND OBJECTIVES

Cardiorespiratory fitness (VO_2max) among college students is worryingly low, with more than 50% of students categorized as unfit (<41,7 mL/kg/min) (Oktaviani, 2019; ACSM, 2014). This study was conducted to determine the effect of calisthenic training and running on estimated VO_2max values.

METHODS

A quasi-experimental study design on 21 male college students was conducted in August to October 2024. Subjects were divided into two groups: the intervention group (n=10) and the control group (n=11). The intervention group received treatment in the form of calisthenics for 40 minutes, and the control group received running treatment for 20 minutes, with both undergoing interventions for 4 weeks with a frequency of twice a week. Body weight, height, nutritional status, estimated VO_2max values, body fat percentage, muscle mass, academic stress levels, sleep quality and macronutirent intake data were measured pre-and post training and were analyzed using independent and dependent t-tests.

RESULTS

The RESULTS showed a significat ($p<0.05$) increase in the average estimated VO_2max values in both the intervention group (by 3.5 mL/kg/min) and the control group (by 11.4 mL/kg/min) and there was a significant decrease in average body fat percentage in both the intervention (by 0.6%) and the control group (by 0.8%). Although, there was an increase in average muscle mass in both the intervention (by 0,5 kg) and the control group (by 0,1 kg), the differences between both groups showed no significant RESULTS. There were no significat RESULTS in the average estimated VO_2max values based on academic stress levels, sleep quality, and macronutirent intake.

CONCLUSIONS

It can be concluded that both the increase in estimated VO_2max values and the decrease in body fat percentage were highly effective in the control group (running) compared to the intervention group (calisthenics), but the increase of muscle mass were higher in the intervention group (calisthenics) compared to the control group (running).

SOAP22_02

NUTRITIONAL QUALITY AND ENVIRONMENTAL IMPACT OF DIETS IN THE DUTCH ADULT POPULATION CHARACTERIZED BY NUTRI-SCORE

Elly Steenbergen[1]; Reina Vellinga[1]; Elisabeth Temme[1]; Joline Beulens[2]
[1]Centre for Prevention, Lifestyle and Health, National Institute for Public Health and Environment (RIVM), Bilthoven, Netherlands; [2]Department of Epidemiology & Data Science, Amsterdam University Medical Centre, Location Vrije Universiteit, Amsterdam, Netherlands

BACKGROUND AND OBJECTIVES

The Front-of-Pack nutritional label Nutri-Score, which aims to guide consumers in making food choices, has been implemented in the Netherlands since 2024. Previous studies have shown the alignment of Nutri-Score with national food-based dietary guidelines (FBDGs) and its ability to discriminate foods based on nutritional quality, while studies based on the environmental impact of foods are limited. As the majority of these studies were carried out on the food level, the present study aims to the investigate the nutritional quality and environmental impact of diets in the Dutch adult population characterized by Nutri-Score.

METHODS

1747 adult participants (aged 18-79) in the Dutch National Food Consumption Survey (2019-2021) were included, from which food consumption data were obtained using two non-consecutive 24-hours dietary recalls. These data were combined with food composition data from the Dutch Food Composition Database (NEVO 2023/v8.0) and environmental impact data from the Dutch Life Cycle Assessment Food Database (LCA 2024). Participants were categorized into quintiles (Q1-Q5) of the Nutri-Score nutrient profiling model dietary index (NS-NPM DI), which was calculated as the mean continuous Nutri-Score of foods consumed weighted for energy intake at individual level per day. Chi-square and Kruskal-Wallis tests were performed to identify significant differences (p <0.05) between quintiles of NS-NPM DI for socio-demographic characteristics and daily food consumption (by food group), nutrient intake (energy, salt, sugar, saturated fatty acids (SFA), protein, and fiber), and environmental impact indicators (greenhouse gas emissions (GHGe) and blue water consumption) of consumed foods.

RESULTS

Preliminary RESULTS show that participants in Q1 have significantly different daily nutrient intakes than Q5, such as for sugar (75.3 vs 95.6 g), salt (4.4 vs 6.1 g), SFA (21.8 vs 36.7 g) and fiber (24.9 vs 16.9 g). Daily food consumption differed significantly between Q1 and Q5 by most food groups, such as fruits, nuts and seeds, olives (231 vs 130 g), vegetables (217 vs 127 g) and cakes and biscuits (42 vs 70 g). GHGe and blue water consumption were both significantly different between Q1 and Q5 (3.5 vs 3.8 g and 0.098 vs 0.070 g respectively).

CONCLUSIONS

The present study showed discrimination in the nutritional quality and environmental impact of diets in the Dutch adult population as characterized by Nutri-Score. Findings suggest that changing food choices based on Nutri-Score can improve diets in the Dutch adult population to align with FBDGs and in terms of health as well as environmental impact.

SOAP22_03

ASSOCIATION IN EATING BEHAVIOR AND NUTRITIONAL STATUS IN CHILEAN PRESCHOOLERS ACCORDING TO THE METHOD OF INITIATION OF COMPLEMENTARY FEEDING

Karina Etchegaray-Armijo[1, 2]; María De Los Angeles Alamos-Ovalle,[2]; Rosario Lecaros-Campbell,[2]; Magdalena Lepori-Lorca,[2]; Martina Padilla-Martínez,[2]
[1]Faculty of Medicine, Nutrition and Dietetics School, Universidad Finis Terrae, Providencia, Chile; [2]Nutrition and Dietetics, Faculty of Medicine, Universidad del Desarrollo - UDD - Las Condes, Chile, Santiago, Chile

BACKGROUND AND OBJECTIVES

Nutrition during the first 1,000 days of life is critical for optimal development. Complementary feeding, which begins at 6 months of age, provides an opportunity to establish healthy eating habits and behaviors that can persist long-term. Complementary feeding can be initiated using the traditional method (caregiver-regulated purees), Baby-Led Weaning (BLW), or a mixed approach.

Objective: To evaluate eating behavior and nutritional status in Chilean preschoolers who began complementary feeding using the traditional method, BLW, or a mixed approach.

METHODS

A cross-sectional study with convenience sampling (n=170 children aged 2 to 5 years) from the Metropolitan Region of Chile. An online questionnaire was administered to assess eating behavior using the Children Eating Behavior Questionnaire. Nutritional status was evaluated through self-reported weight and height. Statistical analysis was performed using the Kruskal-Wallis test or ANOVA ($p<0.05$). Ethical approval: PG_2023-07.

RESULTS

Forty-two point four percent (42.4%) of preschoolers started complementary feeding with the traditional method, while 28.2% began with BLW. Regarding nutritional status, 57.6% of the children were classified as having normal weight, and 26.5% were classified as overweight or obese. In terms of eating behavior, children who started complementary feeding with BLW scored higher on food enjoyment ($p = 0.000$), and lower on eating slowness ($p = 0.005$) and food demandingness ($p = 0.001$) compared to those who started with the traditional method. No significant differences in nutritional status were observed based on the method of feeding initiation.

CONCLUSIONS

These RESULTS suggest that choosing the BLW method or a mixed approach to initiate complementary feeding may positively influence certain aspects of long-term eating behavior, particularly food enjoyment and food selectivity, but does not appear to impact nutritional status. However, recommendations to parents should consider their individual preferences when selecting the method for introducing complementary foods.

MARKERS OF ULTRA-PROCESSED FOODS: EVALUATING THE EFFECTIVENESS OF FOOD ADDITIVES TO IDENTIFY ULTRA-PROCESSED FOODS IN 5 LATIN AMERICAN COUNTRIES

Camila Zancheta[1]; Mariana Fagundes Grilo[2]; Salvador Ayala[3]; Ana Clara Duran[4]; Daniela Canella[5]; Mercedes Mora[6]; Victoria Abril[7]; Lizbeth Tolentino[8]; Marcela Reyes[1]; Camila Corvalán[1]
[1]CIAPEC, Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile; [2]Department of Exercise and Nutrition Sciences, The George Washington University, Washington, United States of America; [3]Centro de Epidemiología y Políticas de Salud, Facultad de Medicina Clínica Alemana, Universidad del Desarrollo - UDD, Las Condes, Chile; [4]Center for Food Studies and Research, UNICAMP Universidade Estadual de Campinas, Campinas, Brazil; [5]Nutrição Aplicada, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil; [6]Departamento de Nutrición Humana, National University of Colombia, Bogotá, Colombia; [7]Medical Science Faculty/ Nutrition and Dietetic career, University of Cuenca , Cuenca, Ecuador; [8]Centro de Investigación en Nutrición y Salud, Instituto Nacional de Salud Pública, Ciudad de México, Mexico

BACKGROUND AND OBJECTIVES
Operational METHODSto identify ultra-processed foods (UPFs) for regulatory purposes remain under active discussion (1). Certain functional classes of additives, such as colors, flavors, emulsifiers, and low-calorie sweeteners, have been proposed as effective markers of ultra-processing (MUPs) (2,3). This study aimed to evaluate the use of different food additives for identifying UPFs.

METHODS

This cross-sectional study analyzed labeling data from food and beverage products sold in supermarkets in Brazil (2017; n=8,806), Chile (2018; n=11,924), Colombia (2018; n=8,366), Ecuador (2019; n=1,980), and Mexico (2017; n=15,651). Products lacking an ingredient list or without added sugar, salt, fat, or additives were excluded from the analysis (n= 5,739). Food items were classified as UPFs based on the presence of at least one MUPs, including cosmetic additives (e.g., functional classes related to colorants, flavorings, emulsifiers, thickeners) and substances used for non-culinary purposes (e.g., maltodextrin, protein isolates, interesterified fats) (4). Then, we evaluated how closely classifications based solely on the presence of specific Codex Alimentarius-listed additives (5), such as colors, flavors (including flavor enhancers), emulsifiers, and low-calorie sweeteners, matched the broader classification. Sensitivity (Se), specificity (Sp), and their combined score (Se+Sp) were calculated for individual and combined functional classes.

RESULTS
Of 44,584 products, 72.3% were classified as UPFs, with country-specific rates ranging from 70.6% in Mexico to 76.9% in Ecuador. Food categories that most accounted for UPF were bakery products (16.1%), confectionery (15.4%), dairy products (13.5%), and beverages (12.6%). Individually, flavors had the highest combined Se+Sp (Sp:95.0%; Se:78.4%) for detecting UPFs. Combinations of low-calorie sweetener & flavors (Sp:94.0%; Se:79.2%), colors & flavors (Sp:87.5%; Se:84.7%), and low-calorie sweeteners & colors & flavors (Sp:86.5%; Se:85.3%) showed the highest Se+Sp. Using all functional classes combined maximized sensitivity (94.2%) but decreased specificity (71.8%). These RESULTS were consistent among countries.

CONCLUSIONS

Flavors, alone or in combination with low-calorie sweeteners and colors, seem to be highly effective markers for identifying UPFs. These findings can support the development of standardized approaches to identify UPFs consistently across different countries.

ARTIFICIAL INTELLIGENCE DRIVEN NUTRITIONAL RISK ASSESSMENT AND DIETARY RECOMMENDATIONS FOR CHRONIC DISEASES

Xiaoya Wang[1]; Qiannan Wang[1]
[1]College of Food Science and Nutritional Engineering, China Agricultural University, Beijing, China

BACKGROUND AND OBJECTIVES
With the increasing incidence rate of chronic diseases, nutrition intervention has become an important means to prevent and manage chronic diseases. However, traditional nutritional assessment METHODSare often time-consuming and lack personalization. In recent years, the development of artificial intelligence (AI) technology has provided new opportunities for chronic disease nutritional risk assessment. Our research aims to use AI technology combined with population nutrition big data to develop an efficient and accurate chronic disease nutrition risk assessment model, providing personalized dietary recommendations for individuals to reduce chronic disease risk.

METHODS

We collected comprehensive data from the U.S. Department of Agriculture's Food and Nutrient Database for Dietary Studies (FNDDS), the National Health and Nutrition Examination Survey (NHANES) cohort, and relevant literature. Using machine learning techniques, we developed an innovative model for predicting chronic disease nutrition risk, which was rigorously evaluated through cross-validation and an independent test set. This model leverages users' dietary habits to digitally represent individual eating patterns and automatically assess their nutrition risk levels. Furthermore, we designed a Diet Optimization Algorithm (DOA) to provide dietary recommendations that minimize chronic disease risk.

RESULTS

Through the comparison of various machine learning algorithms, we found that the Random Forest model, after undergoing parameter optimization, exhibited the most superior performance. Specifically, it achieved an accuracy of 0.9393, a precision of 0.9541, and an AUC value of 0.975 on the test set. Our model can quickly identify the level of chronic disease risk associated with individual dietary patterns, and combined with our independently designed Dietary Optimization Algorithm (DOA), it can quickly screen and recommend recipes with low chronic disease risk.

CONCLUSIONS

Our research reveals the immense potential of AI technology in chronic disease nutrition risk assessment and dietary recommendations. By automating and personalizing nutritional evaluations, AI can significantly aid in the prevention and management of chronic diseases. This study, however, has certain limitations, including a restricted sample size and insufficient data dimensionality. In the future, we will continue to expand the sample size and collect data from more dimensions to further improve the accuracy and applicability of the model.

SOAP22_08

VITAMIN A5 – DEFINITION OF A NEW VITAMIN WITH A FOCUS ON DIETARY INTAKE OF VITAMIN A5

Torsten Bohn[1]; Marta Despotovic[2]; Farhad Vahid[1]; Ralph Rühl[3]
[1]Department of Precision Health, Luxembourg Institute of Health, Strassen, Luxembourg; [2]Department of Nutrition and Metabolism, Institute for Medical Research, Belgrade, Serbia; [3]CISCAREX, UG, Berlin, Germany, Germany

BACKGROUND AND OBJECTIVES

A new vitamin, vitamin A5 has been proclaimed. This vitamin constitutes an umbrella term for compounds that activate the retinoid X nuclear hormone receptor (RXR), and include e.g. 9-*cis*-13,14-dihydroretinol, and further 9-*cis*-beta-carotene (9CBC) as provitamin A5. Here, we present the scientific rationale and the basis for this concept of this new vitamin and evaluate and elucidate still missing knowledge, with a focus on recent estimates of vitamin A5 intake levels in European populations [1].

METHODS

Earlier studies have shown that vitamin A5 acts independently from vitamin A1 (all-*trans*-retinol and related compounds) and cannot be endogenously self-derived. Likewise, vitamin A5 was clearly shown, based on animal trials, to induce activation of RXR, acting as partner with e.g. RARs, LXRs and PPARs, to regulate a large number of cellular mechanisms related to cell proliferation and immune responses, among other [2]. Specifically, low vitamin A5 intake or status has been associated with poor mental health and increased incidence of neurological diseases [1]. A required amount for humans of 1.1 mg/day has been proclaimed [3]. Here we present, for the first time, intake estimations of the European population, combining data available regarding occurrence of dietary provitamin A5 / 9CBC (the main abundant precursor of vitamin A5 in the diet), and intake data from EFSA's food consumption database [4] and the EPIC cohort [5].

RESULTS

More mechanistic studies relating a defined vitamin A5 deficiency or markers of it are partly missing. Regarding dietary intake, main contributors were fruits and vegetables with highest concentrations in leafy vegetables, with a range of 0.1 – 39.4 µg 9CBC/g. Dietary intakes were found to vary from approx. 0.5 (Austria) to 1.3 (Italy) mg 9CBC/day, with an average of 0.9 mg/day. It was further calculated that large parts of European populations, around 2/3, were consuming below the previously recommended 1.1 mg/day of vitamin A5.

CONCLUSIONS

Though more mechanistic studies relating vitamin A5 deficiency to clear endpoints, such as neurological-based biomarkers, are missing, the concept of vitamin A5 has merit and should be further investigated. Dietary intake appears to be low in many European populations, especially in Northern / Central European countries, owing to the general low intake of fruits and vegetables. Further studies into vitamin A5 are warranted.

SOAP22_09

"NO PUBLIC FUNDS FOR UNHEALTHY FOODS!": DEVELOPING COMPREHENSIVE NUTRITION STANDARDS FOR HEALTHY PUBLIC FOOD PROCUREMENT AND SERVICE POLICIES

Nicole Ide[1]; Ashley Lederer[1]; Christine Johnson Curtis[1]
[1]Cardiovascular Health, Resolve to Save Lives, New York, United States of America

BACKGROUND AND OBJECTIVES

In 2021, the World Health Organization (WHO) released the 'Action framework for developing and implementing public food procurement and service policies for a healthy diet'. While countries are now adapting the framework into local policies to promote healthy diets and prevent diet-related non-communicable diseases, global recommendations offering specific nutrition standards to guide these policies were lacking.

METHODS

In 2024, authors developed a comprehensive nutrition standards guide to specify what ingredients, foods, or preparation METHODScan be used in the preparation, service, or sale of food and beverages by public institutions. These multi-pronged standards were based on existing WHO nutrition guidance such as the 'five core principles of a healthy diet' within the WHO Action framework, the WHO Guidelines on sodium intake, saturated fatty acid and trans-fatty acid intake, sugars intake, and use of non-sugar sweeteners (NSS); WHO global sodium benchmarks; and WHO Healthy Diet Fact Sheet.

RESULTS

The 'Guide to developing nutrition standards for healthy public food procurement and service policies' includes five sections: 1) Standards for nutrients: limits to key nutrients of concern including trans fat and saturated fat, sodium, and sugar (and NSS); 2) Standards for food categories: includes bans on sugary beverages, sodium limits for key categories like bread and condiments, bans on processed meats, and minimum standards for whole grains, fruits and vegetables; 3) Standards for meals served and sold: guides nutrient and plate composition; 4) Standards for snacks: limits unhealthy options, e.g., ultra-processed packaged snacks, sweets, and sugary bakery items; and 5) Standards for food preparation: includes banning deep-frying foods and ensuring use of standardized recipes. A set of complementary standards are also outlined to prohibit unhealthy food marketing, promote environmental sustainability, and incorporate food safety standards.

CONCLUSIONS

This guide provides countries a framework to ensure that the criteria used for the government's purchase, service and sale of food are comprehensive, specific, measurable, and ultimately impactful. Multiple governments worldwide are using this guide to shape public food procurement and service policies, to promote healthier diets and combat non-communicable diseases through exemplary procurement and service practices.

SOAP22_13

PERSONALIZED NUTRITIONAL INTERVENTION TO IMPROVE SHORT-TERM PERFORMANCE AND LONG-TERM HEALTH IN SHIFT WORKERS

Suzan Wopereis[1]; Maaike Van Der Rhee[2]; Martijn Dollé,[3]; Inês Chaves[4]; Tim Van Den Broek[1]; Dagmar Smid[1]; Gijsbertus Van Der Horst[4]; Alex Burdorf[2]; Johanneke Oosterman[5]; Heidi Lammers-Van Der Holst[2]; Linda Van Kerkhof[3]

[1]Research group Microbiology and Systems Biology, TNO - Locatie Leiden - Sylviusweg, Leiden, Netherlands; [2]Department of Public Health, Erasmus University Medical Center, Rotterdam, Netherlands; [3]Centre for Health Protection, National Institute for Public Health and Environment, Bilthoven, Netherlands; [4]Department of Molecular Genetics, Erasmus University Medical Center, Rotterdam, Netherlands; [5]Department of Internal Medicine, Erasmus University Medical Center, Rotterdam, Netherlands

BACKGROUND AND OBJECTIVES

Night work is associated with disturbances in sleep and alterations in glucose homeostasis. Interventions focused on nutrition can mitigate the short-term adverse effects of shift work under controlled experimental conditions. However, it is unclear how these RESULTS translate to real life and to long-term health outcomes. The current study aims to implement a personalized nutritional intervention among night shift workers to improve short-term performance and long-term health**.**

METHODS

The study is a non-blinded, controlled intervention study of 3 months, preceded by a run-in period with baseline measurements, and follow-up after 4 and 12 months. Participants are healthy 18-60-year old male night shift workers, working for at least one year in night shifts. In the intervention group (n=25) information from the run-in period including pre- and postprandial measurements of glucose, insulin, triglycerides and cholesterol after a standardized mixed meal tolerance test is used to personalize the nutritional intervention. This consisted of personalized advice on the daily distribution of calories and macronutrients in combination with recommendations on specific food products based on continuous glucose measurements (CGM). The control group (n=10) will continue their normal sleep and nutritional habits. During the intervention, sleep and physical activity will be measured using actigraphy and a sleep diary. Food intake will be monitored with short periods of food logging. Continuous blood glucose will be measured at baseline, 1 and 4 months using a CGM for 10 days each. Performance during the night shifts will be assessed using psychovigilance tests.

RESULTS

Currently, most participants just finished the intervention period in which they followed the personalized advice. The last participants will finish the study in February 2025, and the first RESULTS are expected in March 2025.

CONCLUSIONS

With this real-life nutritional intervention study on short- and long-term effects of shift work we aim to contribute to improving health in night shift workers.

CONFLICTS OF INTERESTS

SOAP22_15

PREDICTING IN VIVO PROTEIN DIGESTIBILITY FROM INGREDIENT COMPOSITION AND IN VITRO DIGESTION

Capucine Picard[1]; Amélie Deglaire[1]; Séverine Olivier[2]; Sophie Vinoy[3]; Sébastien Lê[4]; Françoise Nau[1]; Valérie Lechevalier[1]
[1]STLO, Institut Agro Rennes-Angers, Rennes, France; [2]Nutrition Research, Mondelez France R&D, Saclay, France; [3]Nutrition Research, Mondelez R&D, Paris Saclay Tech Centre, Saclay, France; [4]IRMAR, UMR6625, Institut Agro Rennes-Angers, Rennes, France

BACKGROUND AND OBJECTIVES

The nutritional quality of proteins depends on their indispensable amino acid profile and their digestibility. Accurate measurement of protein digestibility requires in vivo experimentation, which presents several constraints. In vitro digestion models have been developed, but presently, none of them can provide a totally reliable assessment of protein digestibility. An alternative approach, the subject of this study, could be to model protein digestibility on the basis of in vitro digestion data and/or readily available physicochemical characteristics of protein sources.

METHODS

A dataset of 47 individuals, each corresponding to a specific plant protein ingredient in a given form (seed, powder, or isolate, with or without processing), was created. Each individual was characterized by variables measured after in vitro digestion using the Infogest protocol (proteolysis degree, % soluble nitrogen), compositional traits (content of protein, lipid, carbohydrate, starch, fiber, and amino acid profile), and in vivo true N digestibility (ileal or fecal). PCA and hierarchical clustering (HAC) were applied, followed by multiple linear regression to model in vivo digestibility, with missing data handled.

RESULTS

The PCA did not reveal significant correlations between in vivo digestibility and characteristics derived from in vitro digestibility, nor with compositional traits, except for fiber content, which showed an inverse correlation (r^2 =-0.73) with in vivo digestibility. The HAC identified three clusters of individuals: those with low in vivo and in vitro digestibility, those poorly digestible in vivo, and those highly digestible in vivo and in vitro.The latter cluster was characterized by the presence of ingredients that had undergone significant processing, while the former included various forms of chia. Several highly significant (p-value<10-6) regression models were established, with the best performing (r^2=0.777, p-value=4.8e-08) modeling in vivo digestibility from the degree of proteolysis measured in vitro, content of fibers and protein content in Arg, His, Ile, Lys and Pro.

CONCLUSIONS

This preliminary study shows potential for predicting in vivo digestibility of plant protein ingredients using easily accessible measurements, which could reduce the need for in vivo experiments. However, further validation is required, both by expanding the dataset with more diverse, well-characterized ingredients and by using cross-validation. These approaches are currently being explored.

BACKGROUND AND OBJECTIVES
In nutrition research, it is important to validly assess dietary intake. However, dietary assessment METHODSare often burdensome, time-consuming or do not provide habitual food intake. Therefore, we developed the web-based Nutri+ questionnaire to assess a person's habitual dietary intake in a quick and easy way. This study evaluated the validity and reproducibility of the Nutri+ questionnaire compared to the web-based 24-h recall Compl-eat™ in assessing habitual food intake.

METHODS

The online questionnaire assessed dietary intake for 21 food groups, of which 17 are quantitative and 4 are qualitative, depending on dietary guidelines for that food group. A cross-over validation study was conducted in 312 healthy Dutch adults (≥35 years). The Nutri+ questionnaire was completed on a randomly selected day. Compl-eat™ was filled in online on four random non-consecutive days. The questionnaire and the recall were completed on two occasions (wave 1 and 2) in reverse order.

RESULTS

When comparing the mean intake of Compl-eat™ with Nutri+, the correlation coefficient for 14/17 quantitative food groups ranged from 0.43 to 0.90, indicating acceptable (r =0.20-0.49) to good (r ≥0.50) agreement. The three remaining quantitative food groups had correlation coefficients of 0.16 to 0.30, indicating poor to acceptable agreement. The correlation coefficient of the mean intake of wave 1 compared to wave 2 of Nutri+ ranged from 0.56 to 0.93, indicating good agreement for all quantitative food groups. For the four qualitative food groups, the kappa values were low (κ <0.20), showing no to low agreement, indicating a need for improvement.

CONCLUSIONS

The Nutri+ questionnaire is an appropriate tool for assessing habitual food intake. The mean intakes of Nutri+ compared to Compl-eat™ showed an acceptable to good agreement. Furthermore, the Nutri+ questionnaire showed a good reproducibility. Insights in dietary intake assessed with Nutri+ can be used to provide nutritional advice in the future. The next steps are to refine the questionnaire, focussing on the qualitative food groups and to improve its user-friendliness.

ACCEPTABILITY, USABILITY, AND USER PREFERENCES OF SMARTPHONE APPLICATIONS FOR TRACKING AND IMPROVING FOOD CHOICES AMONG ADOLESCENT GIRLS

Nilmini Karunarathna[1]; Fathima Faheema[2]; Hasara Sitisekara[2]; Thushanthi Perera[2]; Thilanka Ranathunga[2]; Renuka Silva[2]

[1]Department of Applied Nutrition, Faculty of Livestock, Fisheries and Nutrition, Wayamba University of Sri Lanka, Makandura, Sri Lanka; [2]Department of Applied Nutrition, Faculty of Livestock, Fisheries and Nutrition, Wayamba University of Sri Lanka, Makandura, Gonawila, 60170, Sri Lanka

BACKGROUND AND OBJECTIVES

Healthy food consumption is sub-optimal for many female adolescents in low and middle-income countries, highlighting the need for improved dietary assessment tools to track their food choices. As smartphone applications (apps) for dietary assessment become increasingly popular, it is crucial to evaluate their effectiveness compared to traditional dietary assessment methods. This study aimed to assess the acceptability, usability and preferences of smartphone applications for dietary tracking among Sri Lankan adolescent girls.

METHODS

Ten FGDs (Focus Group Discussions) were conducted with 81 adolescent girls, aged 13 to 15 years from urban and peri-urban communities in Sri Lanka. The FGD guide was developed to systematically explore views of participants on using smartphone apps for recording and tracking their diets. Smartphone ownership, use of apps for meal planning, and perceptions on setting daily dietary goals based on current eating habits and Food Based Dietary Guidelines (FBDGs) through smartphone applications were investigated through FGDs.

RESULTS

The RESULTS showed a common trend of shared smartphone ownership within families, indicating general acceptance of smartphones usage. However, the primary challenge identified was resistance from family members to using smartphones during mealtime hindered daily meal tracking. The study identified diverse motivations for using smartphone apps for meal planning and setting dietary goals based on dietary habits. Participants emphasized the importance of personalization of apps, specifically setting individualized goals, receiving personalized recommendations, and tracking progress. Personalized approaches were viewed as crucial for making the apps more relevant to users' unique needs and preferences. Usability insights emphasized the key features in smartphone apps, including transformative potential, visual appeal, gamification and privacy protections.

CONCLUSIONS

Smartphone apps for dietary assessment were found to be acceptable, preferred, and usable among Sri Lankan adolescent girls. However shared smartphone ownership within families poses a major challenge to consistent usage. The findings suggest the potential of leveraging technology to address nutritional challenges among adolescent girls particularly through personalized and user-centered app features.

CAN GENE-BASED RECOMMENDATION OUTPERFORM STANDARD WEIGHT LOSS ADVICE? A RANDOMIZED TRIAL

Jacus Nacis[1, 2]; Jason Paolo Labrador,[1]; Diana Glades Domalanta-Ronquillo,[1]; Marietta Rodriguez,[1]; John Chris Rementilla,[1]; Marilou Madrid,[1]; Ruby Frane,[1]; Noelle Lyn Santos,[1]; Franzel J.b. Van Duijnhoven,[2]; Gerard Bryan Gonzales,[3, 1, 2]

[1]Nutrition and Food Research and Development Division, Department of Science and Technology - Food and Nutrition Research Institute, Taguig, Philippines; [2]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [3]Department of Public Health and Primary Care, Faculty of Medicine and Health Science, Ghent University, Ghent, Belgium

BACKGROUND AND OBJECTIVES

Gene-based nutritional interventions may support weight loss, but their effectiveness compared to standard advice remains uncertain. This study compared the effectiveness of a gene-based nutrition recommendation with standard weight loss advice in improving weight loss and related health outcomes in overweight and obese adults.

METHODS

In this 12-month randomized controlled trial, adults with overweight or obesity were randomized to receive either a gene-based nutrition recommendation or standard weight loss advice during the active phase (months 0-6), followed by a free-living simulation (months 6-12, inactive phase). During the active phase, both groups received regular dietary counseling, which was reduced to a single session at month 12 during the inactive phase. The gene-based nutrition recommendation utilized an algorithm developed in-house to provide recommendations tailored to specific genetic markers, including *FTO* rs9939609 (BMI and physical activity), *UCP1* rs1800592 (caloric intake), and *TCF7L2* rs7903146 (fat intake). Primary outcomes included changes in weight, BMI, waist circumference, and body fat percentage. Secondary outcomes included changes in dietary intake, glycated hemoglobin, and lipid profile. Data were analyzed using intention-to-treat analysis, with independent t-tests for between-group differences at months 6 and 12, and paired t-tests for within-group comparisons to assess changes from baseline.

RESULTS

Of 136 screened participants, 52 were enrolled and randomized to either the gene-based nutrition recommendation (n = 29) or standard weight loss advice group (n = 23). By month 12, 27 participants completed the study (gene-based: n = 15; standard weight loss advice: n = 12). In month 6, we found no evidence of differences between the two groups in terms of primary and secondary outcomes. By month 12, the gene-based group reported lower intakes of calories (426 kcal; 95% CI, 0.56 – 0.96, P = 0.023), protein (28.5 g; 95% CI, 0.51 – 0.87, P = 0.003), and carbohydrates (39.9 g; 95% CI, 0.59 – 0.98, P = 0.036) compared to the standard weight loss advice group. No significant differences were observed in other outcomes, including weight loss, BMI, and biochemical markers.

CONCLUSIONS

While the gene-based nutrition recommendation may influence dietary intake, it did not lead to superior weight loss compared to standard weight loss advice. Further research is needed to confirm these findings and to explore the long-term effects of personalized nutrition.

POTENTIAL OF USING A "AGRI-NUTRI-SMART" SCHOOL GARDEN: ADDRESSING NUTRITION CHALLENGES OF SCHOOL CHILDREN IN SRI LANKA

Shiromika Indramali[1]; Madusha Karunanayaka[2]; Thushanthi Perera[2]; Uvasara Dissanayake[3]; Thushara Kudagammana[4]; Janaki Mohotti[5]; Danny Hunter[6]; Renuka Silva[2]
[1]Department of Applied Nutrition, Faculty of Livestock, Fisheries and Nutrition, Wayamba University of Sri Lanka, Makandura, Sri Lanka; [2]Department of Applied Nutrition, Faculty of Livestock, Fisheries and Nutrition, Wayamba University of Sri Lanka, Makandura, Gonawila, 60170, Sri Lanka; [3]Department of Agricultural Extension, Faculty of Agriculture, University of Peradeniya, Peradeniya, Sri Lanka; [4]Department of Paediatrics, Faculty of Medicine, University of Peradeniya, Peradeniya, Sri Lanka; [5]Department of Crop Science, Faculty of Agriculture, University of Peradeniya, Peradeniya, Sri Lanka; [6]Food Environment and Consumer Behaviour, The Alliance for Bioversity and CIAT, Rome, Italy

BACKGROUND AND OBJECTIVES

Adolescents in Sri Lanka face significant nutrition challenges, including micronutrient deficiencies, wasting, and obesity, driven by socio-economic factors and lifestyle changes. School gardens, as part of school-based interventions, can significantly contribute to addressing these challenges by enhancing food literacy. However, existing school gardens are poorly organized, primarily focused on agriculture, and underutilized as platforms for nutrition education. The study aimed to identify challenges in school gardening and propose suggestions for an effective school garden intervention "Agri-Nutri-Smart" to enhance students' knowledge, and attitudes toward agriculture, and nutrition.

METHODS

This qualitative study involved in-depth interviews with 15 agriculture teachers who teach agriculture subject module from 15 schools across Sri Lanka and 10 agriculture experts (Research officers/ Agriculture Instructors/ Additional directors of Agriculture). The data was analyzed by using N-Vivo 14 software.

RESULTS

Key challenges identified included the difficulty of maintaining gardens during school vacations, insufficient financial resources, limited space, limited time for gardening activities, and children's negative attitudes toward gardening and damaged by some wild animals. Experts recommended integrating smart agriculture techniques, such as drip and sprinkler irrigation, permaculture gardening, vertical gardening and hydroponics to enhance students' hands-on experience with agricultural technology. Establishing a student-led gardening club is also crucial for promoting responsibility and ensuring the sustainability of the school gardening program. They also advocated for evaluating practical gardening activities alongside traditional classroom learning and incorporating gardening into core subjects like science. Further, integrating nutrition lessons with the gardening activities, including displaying the nutritional importance of crops, conducting cooking demonstrations using the harvest from garden were suggested.

CONCLUSIONS

In conclusion, key challenges identified were maintenance during school vacations, insufficient funding, limited space and time, negative attitudes among students, and damage caused by wild animals. Implementing "Agri-Nutri-Smart" school garden that address these challenges holds significant potential as an educational tool to enhance agriculture and nutrition literacy among school-aged children in Sri Lanka.

SOAP28_06

METHODOLOGY FOR UPDATING THE DUTCH WHEEL OF FIVE USING DIET OPTIMIZATION: INTEGRATING HEALTH, SUSTAINABILITY AND FOOD SAFETY WHILE TAKING INTO ACCOUNT CURRENT DIETARY INTAKE

Tessa van Elten[1]; Marije Seves-Santman[1]; Annette Stafleu[1]; Sophie Van Der Krieken[1]; Judith Groen[1]; Lisette Brink[1]; Kristel Zaal[1]; Marga Ocké[2]; Reina Vellinga[2]; Polly Boon[2]; Caroline Van Rossum[2]
[1]The Netherlands Nutrition Center, Voedingscentrum, Den Haag, Netherlands; [2]National Institute for Public Health and the Environment, Rijksinstituut voor Volksgezondheid en Milieu (RIVM), Bilthoven, Netherlands

BACKGROUND AND OBJECTIVES

The food-based dietary guidelines (FBDGs) in the Netherlands, communicated as the Wheel of Five, focus on a dietary pattern that prevents chronic diseases and provides the required nutrients, while considering aspects of sustainability and feasibility. With growing scientific consensus and endorsement of organizations such as WHO/FAO, there is a need for more integrated healthy and sustainable food recommendations, where food safety is a prerequisite for health. Also, more data has become available on environmental impact, food safety and food consumption. The aim is to develop a methodology for further development of the Wheel of Five focusing on different target groups and dietary habits in the Netherlands, equally considering health, sustainability and food safety aspects while taking into account current dietary intake.

METHODS

The methodology for updating the Wheel of Five included the following steps: (1) Define the goals that the guidelines should support, based on the scientific consensus on health (Health Counsel of the Netherlands), sustainability and food safety. (2) Define the energy and nutrient requirements, based on the dietary reference values of the Health Counsel of the Netherlands and EFSA. (3) Collect the available data on food consumption (Dutch National Food Composition Survey 2019-2021), food composition (NEVO 2023) and most recent data of the RIVM on 6 environmental impact indicators and 6 food contaminants. (4) Define food groups (83 groups on level 4) and integrate constraints regarding current dietary intake (95th percentile). An optimization model is used to calculate reference diets.

RESULTS

Reference diets will be calculated for men and women of all ages, pregnant and lactating women. Additionally, we will explore various more plant-based diets, diets low in specific foods and a diet within the planetary boundaries. We are currently working on the exact model specifications (e.g. linear or quadratic). Also, different weights can be given to current dietary intake versus environment, and to all environmental indicators individually. We would like to go into detail about these specifications during IUNS-ICN 2025. Finally, the optimization RESULTS will be translated into consistent consumer advice and visualization. Feedback from external experts will be gathered throughout the whole process.

CONCLUSIONS

This process shows our choices for integrating health, sustainability and food safety, taking into account current dietary intake, in diet optimization that can be used for future FBDGs.

EDUCATORS' PERSPECTIVES ON FOOD LITERACY EDUCATION IN SRI LANKAN SCHOOLS: BARRIERS AND PATHWAYS TO IMPROVEMENT

Madusha Karunanayaka[1]; Shiromika Indramali[2]; Uvasara Dissanayeke[3]; Thushara Kudagammana[4]; Danny Hunter[5]; Janaki Mohotti[6]; Thushanthi Perera[2]; Renuka Silva[2]
[1]Department of Applied Nutrition, Faculty of Livestock, Fisheries and Nutrition, Wayamba University of Sri Lanka, Makandura, Sri Lanka; [2]Department of Applied Nutrition, Faculty of Livestock, Fisheries and Nutrition, Wayamba University of Sri Lanka, Makandura, Gonawila, 60170, Sri Lanka; [3]Department of Agricultural Extension, Faculty of Agriculture, University of Peradeniya, Peradeniya, Sri Lanka; [4]Department of Paediatrics, Faculty of Medicine, University of Peradeniya, Peradeniya, Sri Lanka; [5]Food Environment and Consumer Behavior, Alliance of Bioversity International and CIAT, Rome, Italy; [6]Department of Crop Science, Faculty of Agriculture, University of Peradeniya, Peradeniya, Sri Lanka

BACKGROUND AND OBJECTIVES

Malnutrition and micronutrient deficiencies are significant nutrition problems among adolescents in Sri Lanka. Schools have the potential to promote food literacy, encouraging healthy eating habits among children. However, existing research on how food literacy concepts are delivered through the school curricula is limited. This study aimed to explore educators' perceptions on food literacy education, identifying barriers and their recommendations to improve its integration in Sri Lankan secondary schools.

METHODS

In-depth interviews were conducted with 15 school principals and 22 teachers from 18 schools across Sri Lanka. The data were analyzed using thematic analysis to identify key themes emerging from the discussions.

RESULTS

The analysis emerged two key themes: (i) Barriers to delivering food literacy education for secondary school students - Educators highlighted limited inclusion of nutrition topics in core curricula, insufficient time allocation, inadequate teacher training and a lack of teaching resources as significant barriers. Food-related subjects such as agriculture and home economics, often offered as electives, were perceived by students as less important compared to core subjects, leading to low engagement and missed learning opportunities to learn food literacy concepts. (ii) Recommendations for improving food literacy education for secondary school students – Respondents recommended making nutrition education compulsory across all grades levels, incorporating practical components such as school gardening and cooking sessions into main subjects, offering teacher training programmes, providing updated teaching materials and resources for school gardening and cooking sessions and involving parents to reinforce healthy dietary habits at home.

CONCLUSIONS

Systemic changes, including curriculum reforms, teacher training initiatives, resource enhancement, and greater parental involvement is essential to strengthen food literacy education for secondary school students. Implementing these recommendations can address existing barriers and foster healthy dietary habits among adolescents.

SOAP28_09

CREATING DEMAND FOR SUSTAINABLE AND CULTURALLY RELEVANT NUTRITIOUS PRACTICES THROUGH THE APPLICATION OF SOCIAL AND BEHAVIORAL SCIENCE PRINCIPLES

Yana Manyuk[1]; Straton Habumugisha[2]; Innocente Turinimigisha[2]
[1]Behavioral Science, Sight and Life Foundation, Basel, Switzerland; [2]Nutrition in City Ecosystems, Sight and Life Foundation, Kigali, Rwanda

BACKGROUND AND OBJECTIVES

In today's industrialized food systems, more countries face a double burden of malnutrition. Transitioning to resilient food systems requires addressing local dietary practices, barriers and opportunities to behavioral change. This nimble evaluation, part of the Nutrition in City Ecosystems (NICE) project, aimed to test the impact of a social and behavioral change intervention "Smart Food Tips" on household-level adoption of co-designed nutritious recipes. Guided by the COM-B model and EAST behavioral science principles, the intervention emphasizes making the use of local nutritious foods in regular family meals easy, enjoyable, and affordable. It includes interactive sessions targeting mainly female caregivers of children under the age of 5, who are encouraged by a facilitator, trained in behavioral change, to exchange and learn new recipes. The intervention also includes cooking demonstrations, where participants prepare and taste the same recipes.

METHODS

The nimble evaluation, conducted in Rwanda and Bangladesh, employed a qualitative design and descriptive analysis. A total of 137 caregivers in Bangladesh and 34 in Rwanda were surveyed ten days after participating in either an interactive session or a cooking demonstration. Data collected included:

- Recipe and message recall
- Behavioral adoption (frequency of recipes cooked at home)
- Social diffusion (whether recipes were shared with others)

RESULTS

The nimble trial RESULTS showed a high degree of behavioral adoption in both countries. Over 85% of participants reported trying at least one recipe within ten day, all respondents recalled 1–5 recipes out of 10 and over 90% recommended recipes to family or friends.

CONCLUSIONS

The nimble trial highlighted that behaviorally informed nutrition interventions can be effective in driving demand for nutritious foods. One of the most popular recipes have been adopted by two government schools in Rwanda as part of their school meal programs, demonstrating the intervention's potential spill-over effect from household to institutional behavior change. The intervention's participatory approach and cultural alignment grounded in behavioral science and human-centred design demonstrates potential for fostering sustainable behavior change.

SOAP28_10

A DIGITAL-FIRST APPROACH WITH PERSONALIZED NUTRITION ADVICE OR MEAL BOXES LEADS TO DIFFERENT LEVELS OF WEIGHT LOSS

Femke Hoevenaars[1]; Jelle De Jong[1]; Martien Caspers[1]; Remon Dulos[1]; Wilrike J Pasman[2]; Suzan Wopereis[3]
[1]Microbiology & Systems Biology, Netherlands Applied Research Institute TNO, Leiden, Netherlands; [2]Microbiology & Systems Biology, TNO, Leiden, Netherlands; [3]Research group Microbiology and Systems Biology, TNO - Locatie Leiden - Sylviusweg, Leiden, Netherlands

BACKGROUND AND OBJECTIVES

A digital-first approach is gaining popularity in nutrition research to reduce participant burden, accelerate recruitment, and enhance study diversity. However, face-to-face interactions can be crucial for motivation, particularly in delivering personalized nutrition advice, which is often missing in fully digital studies. Therefore, we aim to understand participant experiences, assess their ability to perform self-measured anthropometrics, and evaluate the effectiveness of personalized nutritional interventions through a real-life remote study.

METHODS

The study was a randomized controlled trial with three groups: a control group that received generic advice (n=43), a personalized intervention group that received personalized advice only (n=40), and a personalized intervention plus group that received personalized advice along with personalized food boxes (n=39). The intervention lasted six weeks, during which data on anthropometry, nutritional habits, and study experience was collected. The study was entirely digital, with all data collected by the participants themselves.

RESULTS

Weight Loss: Participants who received personalized nutritional advice lost 1.0 kg on average. Those who also received personalized food boxes lost even more weight, averaging 2.5 kg.

Hip Circumference: The group with personalized food boxes also saw a significant reduction in hip circumference by 2.9 cm.

Ease of Participation: Most participants (84%) found it easy to perform their own measurements, and 92% could easily fill out questionnaires from home.

Implementation: Personalized advice was not easier or more enjoyable to follow than generic advice. However, personalized food boxes made it easier ($p<0.001$) and more enjoyable ($p<0.01$) to follow the personalized nutrition advice

CONCLUSIONS

Personalized nutrition advice, even when given digitally, is more effective for weight loss than generic advice. Personalized food boxes help translate this advice into actual diets, leading to greater weight loss and reduced hip circumference. Most participants could perform their own measurements at home, proving that fully online nutritional studies are feasible and effective.

SMART NUTRITION: DEVELOPMENT OF AN ARTIFICIAL INTELLIGENCE-BASED, GAMIFIED PHONE APP PROTOTYPE TO TRACK AND IMPROVE THE FOOD CHOICES OF ADOLESCENT GIRLS IN SRI LANKA

Nilmini Karunarathna[1]; Thushanthi Perera[2]; Renuka Silva[2]; Aulo Gelli[3]
[1]Department of Applied Nutrition, Faculty of Livestock, Fisheries and Nutrition, Wayamba University of Sri Lanka, Makandura, Sri Lanka; [2]Department of Applied Nutrition, Faculty of Livestock, Fisheries and Nutrition, Wayamba University of Sri Lanka, Makandura, Gonawila, 60170, Sri Lanka; [3]Poverty, Gender and Inclusion, International Food Policy Research Institute, Washington DC, United States of America

BACKGROUND AND OBJECTIVES
There is a gap in dietary intake data of adolescents in low- and middle-income countries. Up-to-date and valid dietary data will contribute to the formulation of effective nutrition policies and programs. Traditional dietary assessment METHODSare resource-intensive and may lack accuracy in estimating portion sizes consumed by adolescents. Hence, this study aimed to develop an AI (Artificial Intelligence)-assisted smartphone app functionality called FRANI (Food Recognition Assistance & Nudging Insights) to track and improve the diets of adolescent girls in Sri Lanka.

METHODS

The development of FRANI involved two major steps. (1) creating an image database to train the FRANI AI model and (2) building a comprehensive food database to feed the FRANI App. Initially, a food inventory was compiled consisting of 278 commonly consumed food items by Sri Lankan adolescent girls. For the image database, over 8000 of these priority food items were captured using a smartphone with varied photo backgrounds, plating methods, portion sizes (small, medium, large & extra large), and angles (45° & 90 °). Then, all the priority food items were cooked and prepared under a controlled laboratory setting. A food database was developed integrating recipes, ingredient lists, and nutrition composition data of raw ingredients. The captured images were linked to the database and annotated to train a semantic segmentation AI model.

RESULTS

The newly developed FRANI app offers several key functionalities including (1) the ability to recognize different dishes, foods, and portion sizes when a phone is held over a meal; (2) assistance in accurately recording meal information and (3) personalized feedback to nudge users towards healthier dietary choices based on established dietary guidelines. In addition, the app tracks food group consumption and generates statistics such as Dietary Diversity Scores (DDSs) and Sustainabale Healthy Diet Score (SHDS). It also provides data on macro and macronutrient intakes.

CONCLUSIONS

FRANI has the potential to significant improve the dietary data collection by providing high-quality, frequent data. Additionally, it could serve as an effective tool for promoting healthy eating habits through personalized dietary nudges.

DIETARY INTAKE BASED ON NOVA CLASSIFICATION ACCORDING TO SELF-REPORTED DIETARY PRACTICES AMONG PARTICIPANTS OF THE NUTRINET-BRASIL COHORT STUDY

Marhya Júlia Silva Leite[1]; Kamila Tiemann Gabe[2]
[1]Departamento de Nutrição da Faculdade de Saúde Pública da USP, Faculdade de Saúde Pública USP, São Paulo, Brazil; [2]Center for Epidemiological Research in Nutrition and Health of the University of São Paulo, Universidade de São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES

Alternative dietary practices based on reducing the consumption of animal-based foods (e.g., veganism and vegetarianism) are becoming more prevalent worldwide. While these practices are often associated with a healthier diet, studies have shown a high consumption of ultra-processed foods among individuals adhering to these practices. This study aimed to describe dietary intake based on the Nova classification according to self-reported dietary practices among participants of the NutriNet-Brasil Cohort Study.

METHODS

A cross-sectional analysis was conducted using data from the NutriNet-Brasil Cohort, a web-based study initiated in 2020. Adults aged 18 years and older voluntarily participated by periodically completing questionnaires about their diet, sociodemographic characteristics, and health status. Those who completed at least three 24-hour dietary recalls (each six months), reported the same dietary practice in all the three surveys and provided complete sociodemographic information were included in this study. The dietary practices analyzed were "No Red Meat," "Vegetarian," "Vegan," and "Omnivorous". Sociodemographic variables included gender, race/skin color, age, macroregion of residence, education level, and income. Dietary intake was described as the caloric percentage of each Nova group, averaged across the three recalls for each dietary practice. The contribution of each Nova group to dietary intake across practices was compared using multivariate linear regression.

RESULTS

The sample (n=27,067) was predominantly female (80.7%), aged 30–39 years (30.1%), of white race/skin color (71.4%). Among participants, 91.8% were omnivorous, 1.7% did not consume red meat, 4.7% were vegetarians, and 1.8% were vegans. Vegans exhibited the highest intake of fresh and minimally processed foods (53.7%), followed by non-red meat consumers (50.6%), omnivores (48.9%), and vegetarians (47.0%). However, vegans also showed the highest consumption of ultra-processed foods (26.3%), followed by omnivores (22.6%), vegetarians (21.7%), and non-red meat consumers (20.4%). The ultra-processed food subgroups contributing most to the high intake among vegans included plain and flavored soy milk, plant-based cheeses and yogurts and industrialized soy-based products.

CONCLUSIONS

Ultra-processed food consumption was higher among vegans, highlighting the need for public policies and health initiatives to promote healthy eating in alignment with the recommendations of the Brazilian Dietary Guidelines.

SOAP28_15

THE NIGERIAN HEALTHY FOOD ENVIRONMENT POLICY INDEX: IDENTIFYING POLICY GAPS AND POLICY ACTIONS THROUGH NATIONAL EXPERT PERSPECTIVES

Semnen Lambert Osakue[1]; Vivian Anoemuah[2]; Smorenburg Herbert[3]; Abass Babatunde Yusuf[4]; Joyce Akpata[5]
[1]Food, Nutrition and Food System, Choices International Foundation, Lagos, Nigeria, Federal Republic of; [2]Nutrition and Dietetics, University of Ibadan, Ibadan, Nigeria, Federal Republic of; [3]Food, Nutrition and Food System, Choices International Foundation, The Hague, Netherlands; [4]Deputy Country Director, Global Alliance for Improved Nutrition, Abuja, Nigeria, Federal Republic of; [5]Head of Policy and Advocacy, Global Alliance for Improved Nutrition, Abuja, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES

Nigeria, like many low- and middle-income countries, faces the dual burden of malnutrition. Effective food environment and nutrition policies are crucial in addressing this issue, yet gaps in implementation persist. This study employed the Healthy Food Environment Policy Index (Food-EPI) tool to assess Nigeria's progress in implementing internationally recommended food environment policies and priorities to promote healthy food environment and nutrition.

METHODS

A panel of 33 government and independent experts rated 37 government actions to improve the healthiness of food environment and nutrition in Nigeria using the food-EPI policy and infrastructure support good practice indicators. These actions were rated according to policy cycle stages and level of implementation against international best practices. The panel also prioritised 34 government actions for improving the Nigerian food environment.

RESULTS

A significant proportion (56.8%) of the rated policy actions were identified as still in the development stage, while 97.3% of the good practice indicators were reported to be at very low or low levels of implementation. Policy priorities included enforcing nutrient declaration regulations on food labels and implementing front-of-pack labelling, which were ranked as the highest priorities. Other highly ranked policy actions focused on restricting marketing to children, establishing limits on sugars and trans fats, and implementing fiscal policies such as taxes on unhealthy foods and subsidies for healthier options. Among infrastructure support actions, the review and update of the national food-based dietary guidelines was ranked as the highest priority. Additional highly ranked infrastructure actions emphasized the need for strengthened funding, governance, and systems for monitoring and intelligence.

CONCLUSIONS

The study revealed significant gaps in the implementation of Nigeria's food environment and nutrition policies, underscoring the urgent need for targeted actions to address these deficiencies. The expert-identified priorities provide a strategic roadmap for advancing policy development and implementation. Key recommendations include updating and enforcing food labelling regulations, enhancing the nutritional quality of foods, and formulating effective strategies for food promotion and pricing policies. Additionally, revising the national dietary guidelines and bolstering governance, funding, and monitoring systems are critical to ensuring sustainable progress. By addressing these priorities, Nigeria can strengthen its food environment, mitigate the dual burden of malnutrition, and achieve better health outcomes.

SOAP 43 - THE FUTURE OF NUTRITION RECOMMENDATIONS

SOAP43_01

EXPLORING APPROACHES TO DERIVE A POPULATION-SPECIFIC CUTOFF POINT FOR RETINOL BINDING PROTEIN TO DEFINE VITAMIN A DEFICIENCY AMONG YOUNG CHILDREN

Aatekah Owais[1]; Lisa M. Rogers[2]; Christine M. Pfeiffer,[3]; Mindy Zhang[3]; Sherry A. Tanumihardjo[4]; Zuguo Mei,[5]; Yaw Addo,[5]; Maria Elena Jefferds[5]
[1]Technical Advisor, Nutrition International, Ottawa, Canada; [2]Technical Officer, World Health Organization (WHO), Genève, Switzerland; [3]Nutritional Biomarkers Branch, CDC, Atlanta, United States of America; [4]Nutritional Sciences, University of Wisconsin, Madison, United States of America; [5]Nutrition Branch, CDC, Atlanta, United States of America

BACKGROUND AND OBJECTIVES

Vitamin A deficiency (VAD) is a leading cause of morbidity and mortality among young children in low- and middle-income countries. Commonly used biomarkers to assess population vitamin A status are serum retinol (SR) and retinol binding protein (RBP), with VAD defined by WHO as SR<0.70 µmol/L, not adjusted for inflammation, but equivalent RBP cutoffs are not yet established. Because SR and RBP are assumed to have an equimolar relationship during adequate vitamin A status, current practice uses a simple linear regression (SLR) to ascertain a population specific RBP cutoff equivalent to SR<0.70 µmol/L in at least a subsample of survey participants. However, Pearson's correlation (Rho) between SR and RBP has varied between 0.4–0.9 in recent surveys, suggesting RBP might not be an appropriate proxy for SR; this may also result in notably different VAD estimates. Hyporetinolemia occurs during inflammation and current practice does not address whether SR and RBP values should be adjusted for inflammation before SLR. We aimed to explore effects of inflammation adjustment on equivalent RBP threshold among young children.

METHODS

This study will assess the potential influence of inflammation adjustment on SR-RBP Rho and RBP cutoffs to define VAD using data from Burkina Faso (paired sample N=645), Rwanda (paired sample N=2385), and Nepal (paired sample N=200) among children aged 6-59 mo.

RESULTS

In Burkina Faso, Rwanda, and Nepal, the inflammation-adjusted SR-based “true” VAD prevalence was 49.2%, 7.0% and 7.5%, respectively. The SR-RBP Rho (not inflammation adjusted) were 0.57, 0.45, and 0.83, respectively, with corresponding SR<0.70 µmol/L equivalent RBP threshold of 0.72, 0.88 and 0.77 µmol/L. The analogous inflammation-adjusted RBP-based VAD prevalence was 44.7%, 27.8% and 9.0%, in each country. Inflammation adjusting SR and RBP before SLR increased RBP thresholds in all three countries (0.03 – 0.04 µmol/L) but had negligible effects on the RBP-SR correlation (Burkina Faso Rho: 0.55; Rwanda Rho: 0.45; Nepal Rho: 0.81).

CONCLUSIONS

RBP-SR correlations differed notably across the three countries, as did the extent to which RBP-based VAD prevalence estimated the “true” burden of disease. Adjusting for inflammation did not improve SR-RBP Rho but increased the equivalent RBP thresholds. These RESULTS suggest that RBP may not be a valid proxy for SR in all settings and highlights the difficulty in developing an appropriate and consistent method to determine equivalent RBP cutoffs in surveys.

SOAP43_02

EAT UP! A MICROANALYSIS OF PARENTAL REQUESTS TO 'FINISH THE PLATE' DURING FAMILY MEALTIMES ACROSS THE NETHERLANDS, ITALY, AND THE UNITED KINGDOM

Amy van der Heijden[1]; Vittoria Colla[2]; Sally Wiggins[3]
[1]Department of Health Sciences, Vrije Universiteit Amsterdam, Amsterdam, Netherlands; [2]Department of Education Studies "Giovanni Maria Bertin", University of Bologna, Bologna, Italy; [3]Department of Behavioural Sciences and Learning, Linköping University, Linköping, Sweden

BACKGROUND AND OBJECTIVES

As sustainable eating practices are urgently needed for both global and population health, eating up all of the food on one's plate is not only a social issue but also one that is morally, economically, and environmentally bound. While research has already documented challenges faced by parents in encouraging children to eat up their food, details about how parental requests to finish the plate unfold and are managed in child-parent interaction during everyday mealtimes are much less known yet highly relevant for food consumption. This study thus focuses on an underexplored phenomenon: how parents and children evoke and negotiate the rule of 'finishing the plate' or 'eating up' during family meals.

METHODS

The data corpus comprises video recordings of 187 family meals across the Netherlands (ten families, 79 meals), Italy (six families, 28 meals), and the United Kingdom (three families, 80 meals). Recordings were analysed using discursive psychology and conversation analysis – qualitative, inductive methodologies for the analysis of real-life talk-in-interaction. Discursive practices of 'finishing the plate' and 'eating up' were analysed in 159 instances, focusing on patterns across the corpus.

RESULTS

Systematic and detailed analyses of all instances resulted in the identification of 12 different discursive practices deployed by parents and children. Examples include directives by parents to eat up, occurring either in response to children displaying or pre-empting not eating up, or in context of progressing the meal; children initiating sequences about having finished their food, making its relevance explicit; and parents' and children's orientations to 'finishing the plate' as consequential to another event.

CONCLUSIONS

This study demonstrates how discursive practices used by parents and children during family mealtimes achieve different social actions in their respective interactional contexts, and that the deployed discursive practices have implications not only for food consumption but also for how children are socialised into eating habits. The analysis points to specific discursive practices that could be adapted to increase children's involvement in deciding how much to eat as well as easing parental burden. The study contributes to the future of nutrition recommendations by providing detailed evidence on how to connect to 'eating up' and 'finishing the plate' conversations in families' everyday life. As such, the study has implications for enhancing adequate nutrition intake and reducing food waste within the contemporary focus on global climate and sustainability.

SOAP43_04

RED MEAT INTAKE AND DIET-RELATED GREENHOUSE GAS EMISSIONS INCREASED WITH AGE AMONG CHILDREN IN CANADA

Vincent Abe-Inge[1]; Ebenezer Kwofie,[1]; Valérie Orsat,[1]; Isabelle Germain,[2]; John Ulimwengu,[3]
[1]Bioresource Engineering, McGill University - Macdonald Campus, Sainte-Anne-de-Bellevue, Canada; [2]Human Nutrition, Agriculture and Agri-Food Canada, Saint-Hyacinthe Research and Development Center, Saint-Hyacinthe Canada; [3]Development Strategies and Governance, International Food Policy Research Institute, Washington D. C., DC, USA, United States of America

BACKGROUND AND OBJECTIVES

There has been a surge of interest in sustainable diets due to the growing climate crisis across the globe. In response, various research works have explored the nutritional and environmental implications of dietary intake among consumers, often focusing mainly on adult consumers while largely excluding children. Understanding the dietary intake patterns and their environmental impacts across the growth of young consumers is essential in developing effective interventions to inculcate sustainable eating habits among consumers as they grow. In this study the dietary intake patterns, environmental impact and diet cost food consumption of children in Canada were investigated.

METHODS

Dietary intake data from the 2015 Canadian Community Health Survey (CCHS 2015) were examined with the SPSS Statistical software as well as Microsoft Excel models. Environmental impact data from dataFIELD and Our World in Data were sourced and matched with various food components for environmental impact calculations. Also, food price data from the Food Price Hub of Statistics Canada were employed to compute the dietary cost.

RESULTS

The RESULTS obtained indicated that dairy is the most consumed animal-sourced food among children aged 1 to 13 years in Canada. Children in the Saskatchewan province consumed the most dairy per day (535 g/person/day), followed by children in Quebec (528 g/person/day) and British Columbia recording the least consumption (406 g/person/day). Children also consumed significant amounts of red meat, which are often associated with higher human and environmental health risks. Dairy accounted for a significant share of the GHGEs (36% - 51%) associated with dietary intake among children in Canada. It was also observed that red meat consumption rates increased as the children get older while dairy consumption rates decreased. Consequently, their associated environmental impacts per day per child changed correspondingly.

CONCLUSIONS

Regardless of their environmental impacts, red meat and dairy remain significant sources of diet-based calcium and iron intake, necessary for healthy ossification and anemia prevention in children. It was noted based on the obtained RESULTS that, although an elimination or reduction in animal-sourced food consumption would favor sustainable dietary shifts, it is necessary to consider age-specific reduction scenarios to ensure equitable and inclusive healthy sustainable dietary patterns in Canada.

SOAP43_06

CRITERIA FOR ENVIRONMENTALLY SUSTAINABLE AND HEALTHY FOOD OFFERING IN PUBLIC RESTAURANTS IN THE NETHERLANDS

Lilou van Lieshout[1]; Judith Groen,[1]; Valérie Klostermann,[2]
[1]Sustainable Food, Netherlands Nutrition Centre, The Hague, Netherlands; [2]Sustainable Food Environments, Netherlands Nutrition Centre, the hague, Netherlands

BACKGROUND AND OBJECTIVES

Global challenges such as climate change, resource depletion, and rising chronic diseases necessitate more environmentally sustainable and healthy food consumption. With a sustainable and healthy catering in public restaurants, the government can set a positive example, promote beneficial food choices, and create a market for sustainable products. The Netherlands Nutrition Centre has developed criteria for healthy and sustainable catering, intended to become procurement requirements for the national government and usable by corporate restaurants to reduce environmental impact and improve health.

METHODS

Initially, a scientific background document was established to identify the most impactful strategies, considering both environmental sustainability and health. Consultations with field experts followed to determine which criteria are feasible, measurable, and effective. These criteria are intended to become procurement requirements for the national government.

RESULTS

The criteria for sustainable and healthy public procurement on catering include the following key strategies:

1. Shifting from mainly animal-based to at least 60% plant-based proteins as well as offering at least one plant-based option per product group.

2. Reducing the offering of unhealthy foods with at least 60% healthier options.

3. Measuring food waste and providing an action plan to prevent it.

4. Increasing the use of environmental sustainability labels (premium labels such as organic) on coffee, tea, animal products and fruits and vegetables.

5. Involving and educating catering staff in on-boarding.

6. Promoting healthier and more sustainable food choices through placement, pricing, and advertisement.

CONCLUSIONS

Implementing these strategies reduces environmental impact and promotes healthier, sustainable food offering in public restaurants. This contributes to healthier and more sustainable food consumption and has the potential to increase sustainable food production. It sets a norm in the public catering sector and serves as a baseline for any procurement aiming to lower environmental impact and enhance public health in restaurant setting.

SOAP43_07

DESIGNING AND DEVELOPING A POPULATION/LITERATURE-BASED WESTERNIZED DIET INDEX (WDI) AND ITS RELEVANCE FOR CARDIOMETABOLIC HEALTH

Zahra Hejazi[1]; Miguel Cifuentes Acebal[1]; Farhad Vahid[1]; Torsten Bohn[1]
[1]Nutrition and Health Research Group, Department of Precision Health, Luxembourg Institute of Health, Strassen, Luxembourg

BACKGROUND AND OBJECTIVES

Recent research indicates a global transition in eating patterns from healthy diets to Westernized diets (WD). Furthermore, noncommunicable diseases (NCDs) have become a significant worldwide health issue in recent decades. It is evident that dietary habits have a major impact on the incidence of NCDs, including metabolic syndrome (MetS). Therefore, the objective of this study was to develop a Westernized Diet Index (WDI) to assess adherence to WD and its association with main cardiometabolic health issues, for which MetS and its components was chosen.

METHODS

The development of the WDI was driven by a thorough examination of the literature that evaluated the influence of WD components on various health outcomes. The scoring system in this index included several steps, giving scores to study design, sample size, and the effect direction of the foods on the health outcomes.

RESULTS

The final developed index encompassed a total of 30 food groups/items, following the evaluation of 504 articles, and indicated that soft drinks, processed foods, red meat, sodium, and hydrogenated fats had the most detrimental influence on cardiometabolic health, while dietary fibre, plant-based metabolites, vitamins, minerals, nuts and seeds, and fish had the most significant beneficial impacts. In this regard, the WDI aligns not only with the existing literature on the importance of certain food items, but also with other verified diet quality indices.

CONCLUSIONS

This index provides a reliable tool for evaluating the quality of one's diet and their adherence to the WD, as well as determining its association with health outcomes. As a result, this index can assist clinicians and researchers in formulating evidence-based dietary suggestions, as well as strategies for the prevention and treatment of diet-related health issues, both on an individual and community scale. However, to verify the index's capability across different contexts, further investigation and validation are required to refine the WDI and validate it with existing data.

SOAP43_08

DECOLONISING NUTRITION RECOMMENDATIONS

Federico Perez-Cueto[1]; Anna-Lena Klapp[2]
[1]Research Group Sustainable Food Transitions, Department of Food, Nutrition & Culinary Science, University of Umea, Umea, Sweden; [2]Department of Agricultural Economics and Rural Development, University of Göttingen, Göttingen, Germany

BACKGROUND AND OBJECTIVES

Colonialism has impacted the world in many different ways [1,2]. Food transitions have been the result of complex environmental, societal and political changes, often related to the exchanges resulting from colonisation [1]. The consequences for people, culture, policy and the economy were extensive and continue to this day. Addressing the legacy of colonialism can contribute to overcoming inequalities and has become an important field of research. However, the impact of colonialism on today's dietary recommendations and food-based dietary guidelines is not well understood and needs to be adressed [3,4].

METHODS

Building upon the literature on decolonising global health [5] and food systems [6], this communication proposes a decolonised framework for future dietary guidelines.

RESULTS

Parallels exist between settler colonialism and the food system. Although guidelines should be ideally adapted to local culture and food production, many still represent the ideology of superior vs inferior foods, and the messages are mixed between nutrients, food and environmental sustainability. Colonisers imposed their dietary habits and culture on conquered indigenous societies, creating a hierarchy of foods that stigmatized local foods.

Further, nutrition recommendations have been instrumental of what we can call *dietary colonialism*, as they reflected the economic priorities of the industrialised West. Food groups were created and guidelines issued containing globalized items. But also, food aid, intended to fight against malnutrition, affected local food security and undermined traditional diets, and played a detrimental role.

CONCLUSIONS

Future dietary guidelines must be evidence-based, and adapted to climate and food security challenges. At the same time, guidelines need to take into account individual preferences and cultural traditions while adhering to healthy eating principles.

A decolonized approach embraces diverse food traditions, while co-creation ensures multiple stakeholder involvement. Respecting indigenous knowledge integrates traditional food systems for sustainability. Together, these principles promote nutritious, just, gender and culturally inclusive diets.

APPLICATIONS OF LARGE LANGUAGE MODELS IN NUTRITION AND DIETETICS: A SCOPING REVIEW

Cathal O'Hara[1]; Gráinne Kent,[1]; Dimitrios Skoutas[2]; Angela C. Flynn[1]; Eileen Gibney[3, 4]; Claire M. Timon[1]
[1]School of Population Health, Royal College of Surgeons in Ireland (RCSI), Dublin, Ireland; [2]Information Management Systems Institute, Athena Research Centre, Athens, Greece; [3]Institute of Food and Health, University College Dublin, Belfield, Dublin 4, Ireland, Dublin, Ireland; [4]School of Agriculture and Food Science, University College Dublin, Belfield, Dublin 4, Ireland, Dublin, Ireland

BACKGROUND AND OBJECTIVES

Large Language Models (LLMs) are generative AI models that excel at natural language understanding and generation (1), with possible applications in nutrition, such as dietary assessment (2) and meal planning (3). It is unclear, however, what quantity or type of research has been conducted into the use of LLMs in any area of nutrition and dietetics. This scoping review aims to identify the ways in which LLMs are being applied to any domain of nutrition and dietetics and the associated opportunities and challenges.

METHODS

The review was conducted in accordance with a pre-defined protocol (4), and included original studies from peer-reviewed journals on the use of LLMs in human nutrition or dietetics in the English language. The databases Medline, EMBASE, PsycINFO, CINAHL, PubMed, Global Health, Web of Science, Scopus, DBLP, and IEEE Xplore were searched in August 2024 using pre-defined search terms. Studies were screened for inclusion in a stepwise process involving three authors with assistance from artificial intelligence tool, ASReview. Forward and backward citation chasing was conducted for included studies. A data extraction template developed by the authors was used to record information from the studies.

RESULTS

There were 1383 unique studies identified, and after screening 41 remained for data extraction. All studies were published between 2022 and 2024. The LLMs used included GPT3.5, GPT4, Bard/Gemini, Llama 2, Bing Chat/Copilot, and UMDFood-VL. The nutrition topics studied included healthy eating, obesity, cardiovascular disease, type 2 diabetes, plant-based diets, kidney disease, inflammatory bowel disease, and malnutrition. When the tasks assigned to the LLMs in the studies were mapped to the four steps of the nutrition care process framework (5), most studies focused on nutrition assessment and intervention, with limited research on nutrition diagnosis and monitoring/evaluation. The text prompts used to instruct the LLMs varied widely with limited research on fine-tuning or training LLMs for use specifically in nutrition and dietetics. The studies focused on determining the accuracy of LLMs in hypothetical situations such as researcher-designed case studies or questions.

CONCLUSIONS

LLMs have been studied for use in various nutrition-related conditions; however, few LLMs have been designed specifically for nutrition and dietetics, and the impact of LLMs on real-world health or sustainability outcomes, nutrition and dietetic workflows, and the views of nutritionists, dietitians, patients, or the general public remains under-explored.

THE EFFECT OF LOW DOSAGE YEAST BETA-GLUCAN 1,3/1,6 ON RESPIRATORY HEALTH, FATIGUE, MOOD, AND QUALITY OF LIFE AMONG MODERATE-STRESS ADULTS: A RANDOMIZED, DOUBLE-BLIND, PLACEBO-CONTROLLED STUDY

Nur Nadia Mohamad Habibullah[1]; Suzana Shahar[2]; Ismail Munirah[3]; Ibrahim Norhayati[4]; Gee Hoon Tang Shirley[5]; Hanif Farhan Mohd Rasdi[6]; Mohamed Faisal Abdul Hamid[7]; Ramasamy Kalavathy[8]
[1]Dietetics Programme, Centre for Healthy Aging and Wellness, Faculty of Health Sciences, Universiti Kebangsaan Malaysia, Kuala Lumpur, Malaysia; [2]Dietetic Programme, Centre for Healthy Ageing and Wellness (H-Care), Faculty of Health Sciences, Universiti Kebangsaan Malaysia, Kuala Lumpur, Malaysia; [3]Dietetics Programme, Centre for Healthy Aging and Wellness, Faculty of Health Sciences, Universiti Kebangsaan Malaysia, Kuala Lumpur Malaysia; [4]Clinical Psychology Programme, Centre for Healthy Ageing and Wellness (H-CARE), Faculty of Healt, Universiti Kebangsaan Malaysia, Kuala Lumpur, Malaysia; [5]Biomedical Science Programme, Centre for Toxicology and Health Risk Studies (CORE), Universiti Kebangsaan Malaysia, Kuala Lumpur, Malaysia; [6]Occupational Therapy Programme, Center for Rehabilitation and Special Needs Studies (ICaRehab),, Universiti Kebangsaan Malaysia, Kuala Malaysia; [7]Respiratory Unit, Faculty of Medicine, Universiti Kebangsaan Malaysia (UKM), Kuala Lumpur, Malaysia; [8]Collaborative Drug Discovery Research (CDDR) Group, Faculty of Pharmacy, Universiti Teknologi MARA (UiTM) Cawangan Puncak Alam, Bandar Puncak Alam, Selangor, Malaysia

BACKGROUND AND OBJECTIVES

As the future of nutrition shifts towards personalised and functional approaches, natural bioactive compounds like yeast beta-glucan 1,3/1,6 (YBG) are emerging as promising dietary interventions for enhancing immune resilience and overall well-being. YBG, a polysaccharide derived from *Saccharomyces cerevisiae*, has demonstrated immune-modulating properties, making it relevant for populations experiencing stress-induced health challenges. This study aimed to evaluate the efficacy of YBG 1,3/1,6 supplementation on respiratory health, fatigue, mood, and quality of life among moderate-stress adults, emphasizing its potential role in shaping the future of preventive nutrition strategies.

METHODS

A 12-week, randomised, double-blinded, placebo-controlled, parallel-group clinical trial was conducted among 198 moderate-stress adults aged 18–59 years, identified using the Perceived Stress Scale (PSS-10; scores 14–26) and Patient Health Questionnaire (PHQ-9; scores ≥9). Participants were randomised to receive either YBG 1,3/1,6 at 120 mg or 204 mg or a placebo once daily. Key outcomes included upper respiratory tract infection (URTI) frequency and severity (WURSS-21), fatigue (MFI-21), mood (POMS), and quality of life (SF-36). Blood samples are collected at days 0 and 90 for measurements of safety parameters.

RESULTS

A total of 190 participants completed the trial (Table 2 https://icnab-03890.tiiny.site/), and the supplementation was well-tolerated. An analysis of URTI episodes throughout the 12-week period indicated a total of 96 confirmed episodes, i.e. 36 in the placebo group and 30 in each of the YBG supplementation groups (120 mg and 204 mg). Significantly, a higher percentage of no episode of URTI was observed among participants received 204mg group, which is 53% as compared to 51% among those received 120mg group and 45% in the placebo group ($p<0.05$ for all parameters). Furthermore, fatigue scores showed significant improvements, particularly in the physical and emotional domains.

CONCLUSIONS

https://doi.org/10.1017/jns.2026.10126 Published online by Cambridge University Press

A three-month supplementation of 204 mg of yeast beta-glucan 1,3/1,6 may enhance respiratory health, alleviate fatigue, and improve mood and quality of life in adults experiencing moderate stress. Its immune-modulating effects and safety profile make it an ideal candidate for future preventive nutrition strategies aimed at improving population health outcomes.

SOAP43_11

NUTRITIONAL SCORING FOR TARGETED INTERVENTION: INSIGHTS FROM THE PTFI DATA CHALLENGE, A CASE STUDY ON MEDITERRANEAN AND JUNK FOOD DIETS

Amos Otopah Anim[1]; Jeison Suescum[2]
[1]Food Science and Technology, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana;
[2]Pontificia Universidad Javeriana, IÓMICAS Research Institute, Cali, Colombia

BACKGROUND AND OBJECTIVES

Understanding the molecular composition of food is crucial to effectively integrate diets into disease management and prevention. However, the lack of standardization in food composition databases, coupled with significant variations in food composition, limits their utility. This study, conducted as part of the Periodic Table of Food Initiative (PTFI) Data Challenge, addresses these challenges by developing a scoring system using the PTFI's standardized database. The system ranks foods based on their potential health impacts, paving the way for the adaptation of healthier diets and the implementation of targeted nutritional interventions.

METHODS

The following nutrients, common to most foods in the database, – monounsaturated fats, omega 3, omega 6, saturated fats, trans fats, protein, potassium calcium, magnesium, zinc, selenium, sodium and phosphorus were the basis for scoring. Sodium and trans-fat are considered unhealthy compounds and the rest considered beneficial. The ranking function evaluates the 500 foods by nutrient concentration, assigning scores (0 to 1) based on their rank for each nutrient class. Healthy compounds receive higher scores for greater concentrations, while unhealthy compounds are inversely scored. This system is validated by applying to the Mediterranean diets and the American junk food.

RESULTS

The Mediterranean diet achieved a total score of 350, outperforming the junk diet, which scored 281. This scoring system effectively highlighted the nutritional disparities between the two diets, particularly in terms of saturated fats, omega 3 fatty acids, omega-6 fatty acids, sodium, and phosphorus contents. The junk diets showed greater amounts of sodium and omega 6, while Mediterranean diets were richer in omega-3 fatty acids and zinc. These differences demonstrate the contrasting nutritional profiles, with the Mediterranean diet aligning more closely with health-promoting dietary patterns, while the junk diet reflects a composition more associated with health risks.

CONCLUSIONS

The scoring system effectively distinguished between the Mediterranean and junk food diets, demonstrating its ability to classify diets based on nutritional quality. Notably, the study showed that the Mediterranean diet can be successfully replicated in the USA, where most of the first 500 foods were sampled. This adaptability demonstrates its potential for integration into diverse cultures for dietary interventions without compromising nutritional quality.

SOAP43_12

CULTURE, TRADITION, AND TERRITORY: CONSIDERATIONS FOR A SUCCESSFUL FUTURE OF THE CHILEAN DIETARY GUIDELINES

Paula Acuna-Salazar[1]; Maria Contesse; Cecilia Baginsky[2]; Daniel Egaña[3]; Patricia Gálvez Espinoza[1]; Gabriela Lankin[4]; Meredith Fort[5]; Rebecca Kanter[1]
[1]Department of Nutrition, University of Chile, Santiago, Chile; [2]Department of Agricultural Production, University of Chile, Santiago, Chile; [3]Department of Primary Care and Family Health, University of Chile, Santiago, Chile; [4]Department of Plant Protection, University of Chile, Santiago, Chile; [5]Department of Health Systems, Management & Policy, Colorado School of Public Health, Aurora, United States of America

BACKGROUND AND OBJECTIVES

In December 2022, the Chilean Ministry of Health released the fourth version of the Food-Based Dietary Guidelines (FBDGs), newly incorporating environmental and sociocultural factors (Ministerio de Salud, 2022). The Chilean FBDGs consist of 10 recommendations that stress sustainable food systems and diets. Chile's vast length, with diverse climates and food cultures, poses challenges for implementing these recommendations within local food systems. The study aimed to identify the structure and characteristics of local food systems across Chile to better implement the new FBDGs.

METHODS

We utilized a transdisciplinary and participatory food systems-based approach to assess the linkages and contextual factors within local Chilean food systems to implement the new Chilean FBDGs by region. The study covered five regions in Chile (two in the north, one in the center, and two in the south), each with distinct climates and agricultural production. In each region, we collaborated with 45 food system actors (producers, vendors, and consumers) and Indigenous communities to co-develop and conduct mapping and surveys identifying key elements of the local food system. The survey data was analyzed to inform regional group model building workshops to identify barriers and strengths within food system actors in relation to the FBDGs. The RESULTS from each group model building workshop were subsequently analyzed to construct region-specific causal loop diagrams.

RESULTS

Local food systems that support territorial and traditional diets rich in local animal- and plant-based ingredients were identified throughout Chile. In all regions, barriers to implementing recommendations in the Chilean FBDGs were associated with fast-paced lifestyles, such as purchasing fried foods from street vendors; and national economic interests, such as intensive agriculture for agro-export. Throughout Chile, territorial diets are re-emerging with the strength of diverse food system actors, such as foundations offering children's cooking workshops, and Indigenous peoples with catering businesses as well as local restaurants that source from local producers to promote traditional diets.

CONCLUSIONS

We conclude that understanding culture is vital for the future of nutritional recommendations like the Chilean FBDGs. Implementation plans should be regionally tailored, highlighting local ingredients and culinary traditions within modern lifestyles. A universal approach risks overlooking the richness of local systems essential for households to engage with FBDGs over the long-term, with the resilience necessary to confront future food system shocks.

SOAP43_13

A NOVEL TOOLKIT TO EVALUATE FOOD ENVIRONMENTS SUBJECT TO HEALTHY PUBLIC FOOD PROCUREMENT AND SERVICE POLICIES

Megan Henry[1, 2]; Ashley Lederer[3, 4]; Christine Johnson Curtis[4]; Nicole Ide[4]; Sara Benjamin-Neelon[5]
[1]Department of Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [2]Welch Center for Prevention, Epidemiology and Clinical Research, Johns Hopkins University, Baltimore, MD, United States of America; [3]Healthy Food Policies and Programs, Thoughtful Food Nutrition, New York, United States of America; [4]Cardiovascular Health, Resolve to Save Lives, New York, United States of America; [5]Department of Health, Behavior and Society, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America

BACKGROUND AND OBJECTIVES

The World Health Organization (WHO) published *Action framework for developing and implementing public food procurement and service policies for a healthy diet* in 2021. A critical early step recommended by WHO was to "establish nutrition and other criteria" to develop policy and evaluate food environments such as schools, hospitals, and social service programs. The *Guide to developing nutrition standards for healthy public food procurement and service policies* was created to provide standards for nutrients, food categories, meals and snacks, and food preparation. We aimed to create a novel evaluation tool using these two guides.

METHODS

In 2023-24, two separate research and policy teams worked to create the toolkit in an iterative and collaborative process. First, two environments were identified: 1) where meals, snacks, and beverages are served (i.e., canteens) and 2) where packaged food and beverages are available for purchase (i.e., kiosks). Next, indicators (markers that could be written in to policy and evaluated in a food environment) were created for each standard established in the WHO and RTSL guides. Finally, the optimal method to collect indicators was determined (observation in the field, photographs, and interviews). An international team, currently engaged in a school food policy project, was consulted to review a draft of the toolkit and assess feasibility before field testing.

RESULTS

The Toolkit includes two components: 1) Tool to Assess Foods and Beverages Procured and Served for Meals and Snacks; and 2) Tool to Assess Foods and Beverages Available for Purchase in Retail Settings. The Meals and Snacks Tool includes questions related to foods and beverages served, available in the panty (e.g., dry ingredients), and available for purchase alongside any food served. The Retail Settings Tool includes questions related to foods and beverages available for purchase, and product placement. Both include questions about the environment, including advertising and marketing.

CONCLUSIONS

Governments have a responsibility to support healthy diets where they serve and sell foods. This toolkit was created to assist in the evaluation of healthy public food procurement and service policies based on WHO principles and established nutrition standards. This toolkit will be made widely available after pilot-testing. A straightforward design, low burden of data collection, and flexibility to allow for adaptation to the local context will allow for robust and standardized data collection a variety of settings in any region.

SOAP43_14

ABSORPTION OF DE NOVO SYNTHESIZED VITAMINS IN THE HUMAN COLON

Shalini Hegde[1]; Roshni M Pasanna[2]; Rajshekar Reddy[2]; Augnes Joseph,[3]; Sarita Devi[2]; Pratibha Dwarkanath[2]; Harshpal Singh Sachdev[4]; Ambily Sivadas[5]; Anura Kurpad[3]
[1]Pediatric Surgery, St John's Medical College Hospital chapel, Bengaluru, India; [2]Division of Nutrition, St.John's Research Institute, Bengaluru, India; [3]Department of Physiology, St. John's Medical College, Bengaluru, India; [4]Pediatrics, Sitaram Bhartia Institute of Science and Research, New Delhi, India; [5]Division of Molecular Biology and Genetics, St. John's Medical College Hospital, Bengaluru, India

BACKGROUND AND OBJECTIVES

Recent evidence suggests that there is significant vitamin B12 (B12) absorption from the colon.1 This raises the possibility that microbially synthesized B12 could be available for absorption, possibly explaining the surprisingly low prevalence of biochemical and clinical deficiency in predominantly vegetarian Indian populations.2,3 This hypothesis can be evaluated by tracing the synthetic pathway using stable isotopically labelled precursors for microbial B12 synthesis.

METHODS

Methods:

13C cellulose was used as a precursor for microbial B12 synthesis in humans. A single 1 g oral dose was administered to 8 adult human subjects, followed by venous blood sampling at 12, 24, 36, 42, 48 and 72 hours, after obtaining a baseline sample. A faecal sample was also taken a baseline, 24 and 48 hours. Plasma and faecal 13C-B12 were measured (as excess over baseline) at the designated timepoints, by the use of an UHPLC coupled to a mass spectrometer Q Exactive LC-HRAM-MS (Orbitrap, Thermo Scientific). Baseline faecal samples were subjected to whole metagenome sequencing to assess the relative abundance of key microbial taxa and genetic pathways for the biosynthesis of B12.

RESULTS

Subjects were aged 19-34 years (7 males, 1 female),with an average BMI of 21.8 ± 4.2 kg/m2. The average plasma active B12 concentrations were 53.8 ± 26.2 pmol/L, with 4 showing mild B12 deficiency. After 13C-cellulose administration, plasma 13C-B12 concentrations increased, with an average increase of 0.011 ± 0.007 nM/L over 3 days. This increase was similar in deficient subjects (active B12 = 31.1 ± 2.6 pmol/L), with the same value of 0.011 ± 0.010 nM/L. Based on the extracellular fluid volume, this approximates to the absorption 0.3 µg of *de novo* synthesized B12, compared to an adult daily requirement of 1-2 µg. Further RESULTS, including population pharmacokinetics and microbiome analyses, will be presented.

CONCLUSIONS

Colonic bacteria can synthesize and contribute bioavailable B12 for human absorption. These findings highlight the potential for microbiota-directed food interventions as a promising strategy to enhance bioavailability of essential nutrients like vitamin B12, paving the way for innovative approaches in nutrition and public health

SOAP43_15

POLICY AND FOOD SYSTEM INSIGHTS FOR DEVELOPMENT OF FOOD SYSTEMS-BASED DIETARY GUIDELINES FOR SERBIA

Milesevic Jelena[1]; Mirjana Gurinovic[2]; Molina Herrera Veronika[3]; Nemeth Aniko[4]; Kenny Mary[4]
[1]Institute for Medical Research, University of Belgrade, Beograd, Serbia; [2]Capnutra, Capacity Development in Nutrition, Belgrade, Serbia; [3]FAO, The Food and Agriculture Organization, Guatemala City, Guatemala; [4]Food safety, FAO Regional Office for Europe and Central Asia, Budapest, Hungary

BACKGROUND AND OBJECTIVES

Serbia is dealing with significant challenges such as rising non-communicable diseases (NCDs), food insecurity, and environmental sustainability issues, particularly in rural and low-income communities. The Food and Agriculture Organization (FAO) has introduced a new methodology for Food Systems-Based Dietary Guidelines (FSBDGs), aligning nutrition, health, and sustainability goals. This study aims to develop an evidence base to support FSBDGs to inform food system transformation for sustainable and health-promoting outcomes in Serbia.

METHODS

A comprehensive policy review analyzed 13 strategic national documents related to health, nutrition, agriculture, and environmental protection using the Public Policy Map and stakeholder input. Food system analysis, guided by the High-Level Panel of Experts (HLPE) framework, assessed supply chains, food environments, and consumer behavior. Data from global organizations (FAO, WHO) and national sources were synthesized to explore systemic gaps and dietary challenges. Vulnerable groups were identified and analyzed using socio-economic and demographic indicators.

RESULTS

The policy review revealed fragmentation and insufficient integration of health, nutrition, and environmental objectives. While strategies like the National Program for Obesity Prevention and agricultural development policies mention health promotion, none explicitly address FSBDGs or provide dedicated funding for nutrition actions. Environmental policies lack a focus on sustainable food systems, while social welfare strategies insufficiently address nutritional inequalities in vulnerable groups. The food system analysis highlighted over-reliance on processed foods, declining availability of fresh produce, and unsustainable agricultural practices. High greenhouse gas emissions and inefficient resource use further exacerbate systemic challenges. Socio-economic barriers, especially in rural areas, limit access to nutritious and affordable foods, worsening food insecurity and health disparities.

CONCLUSIONS

FSBDGs can inform and guide the development and implementation of integrated policies addressing health, nutrition, and sustainability challenges. By embedding FSBDG principles into national strategies, Serbia can promote sustainable agricultural practices, reduce reliance on processed foods, and enhance equitable access to nutritious foods. FSBDGs serve as a critical framework for fostering cross-sectoral collaboration and aligning policy actions with health-promoting and environmentally sustainable food systems.

EVALUATING THE DIETARY AND HEALTHCARE IMPLICATIONS OF NON-COMPLIANCE WITH HEALTH CANADA'S FRONT-OF-PACK NUTRITION LABELLING POLICY

Alisha Buttar[1]; Nicole Hu,[2]; Boris Sobolev,[3, 2]; Lisa Kuramoto,[2]; Richard Perez,[4]; Mahsa Jessri[5, 1]
[1]Department of Human Nutrition, The University of British Columbia, Vancouver, Canada; [2]Vancouver Coastal Health Research Institute, Centre for Clinical Epidemiology and Evaluation, The University of British Columbia, Vancouver, Canada; [3]School of Population and Public Health, The University of British Columbia, Vancouver, Canada; [4]Department of Health Research Methods, Evidence and Impact, McMaster University, Hamilton, Canada; [5]Centre for Health Services and Policy Research, Faculty of Medicine, The University of British Columbia, Vancouver, BC, Canada, Vancouver, Canada

BACKGROUND AND OBJECTIVES

Globally, unhealthy diets are major preventable risk factors for non-communicable diseases, costing billions to the healthcare system. Despite initiatives, diet quality remains poor in Canada. The World Health Organization recognizes Front-of-Package Nutrition Labelling (FOP) as effective policies to promote healthy diets, reformulate foods and reduce disease risk. Health Canada FOP policy mandates "High-In" symbols when foods exceeding thresholds for saturated fat, sugar and sodium (SFSS). However, the benefits of such policies remain unclear. This study evaluates the impact of non-compliance with Health Canada's FOP policy on diet quality and 5-year all-cause hospital occupancy risk at the national level.

METHODS

Data from the Canadian Community Health Survey-Nutrition 2004 linked with individual-level health administrative databases (2004-2014) were analyzed. Dietary intake data from repeated 24-hr recalls were used to measure compliance, defined as the usual proportion of energy consumed from 'High-In' labelled foods with (FOP-ECI) and without (FOP-ECISENS) policy-exempt foods. The number of high-in labels (mCAN-FOP DI) and a reference dietary pattern (DASH) were also used in sensitivity testing. Weighted multivariable zero-inflated negative binomial models estimated relative risk hospitalization across compliance group quintiles.

RESULTS

Of 2839 unique foods reported by Canadian adults (>20yrs), 33% required ≥ 1 FOP symbol. FOP-ECI showed high, moderate and low agreements with mCAN-FOP DI(k=0.83), FOP-ECISENS(k=0.48), and DASH(k=0.13), respectively. Individuals in the low compliance group (Q5) compared to those compliant (Q5) for FOP-ECI, had lower fruit, vegetable intake, and higher energy consumed from SFSS and fast food. Those in the low compliance group, compared to high, for FOP-ECI had 52% higher risk of hospital bed-days (RR:1.52; 90%CI: 1.50-2.19); sex-stratified analyses and FOP-ECISENS models did not reach statistical significance.

CONCLUSIONS

Non-compliance with FOP policy was associated with lower diet quality and was positively associated with hospital risk; sensitivity analyses call for larger studies to confirm RESULTS. This evidence provides a new line of inquiry to support future implementation and refinement of FOP policies globally to improve diet quality and healthcare outcomes.

BACKGROUND AND OBJECTIVES

Sustainable diets, as defined by the FAO, must include more fruits and vegetables (FV) than current diets. This study assesses the nutritional quality and environmental impacts of adults' diets in France based on their FV consumption levels.

METHODS

Estimates of dietary and nutritional intakes are derived from the French INCA3 dietary survey (2014-2015). The population (n=2,121 adults) was divided into quintiles of FV intake (g/day), with Q1 representing the lowest intake. The nutritional quality of diets was assessed using four indicators : average adequacy to recommendations for favored nutrients (MAR), solid energy density, average excess intake of nutrients to limit (MER), and adherence score to the National Nutrition Health Program (PNNS-GS2). The environmental impacts of diets were estimated using the environmental footprint score (weighted average of 16 indicators) and 4 indicators considered individually (climate change, ozone depletion, fine particulate matter, and blue water, referred to here as water use). The analysis was conducted on individual diets adjusted to 2000 kcal.

RESULTS

FV consumption ranged from 119 g/day (Q1) to 694 g/day (Q5) on average. Q5 was characterized by a higher energy density. Adjusted to 2000 kcal, the solid energy density, MAR and PNNS-GS2 indicators were better in Q5 than in Q1. The densities of vitamin C, B9, potassium, and fiber were especially higher, and those of free sugars were lower. Increased FV consumption was associated with a lower impact on climate change, fine particulate matter, and ozone depletion, but a higher impact on water use. No significant differences were observed between quintiles for the environmental footprint score.

CONCLUSIONS

Higher FV consumption is associated with better nutritional quality of diets and lower environmental impacts, except for water use. Thus, it appears essential to increase the proportion of FV in diets to increase the nutritional quality and to reduce the environmental impacts of food. The impact on water use could be mitigated by optimizing upstream agricultural practices rather than reducing FV consumption.

SOAP04_04

FROM PLATE TO POLICY: UNDERSTANDING FOOD CHOICES AND BEHAVIOURS FOR HEALTHY AND SUSTAINABLE DIETS IN OLDER ADULTS

Barbara Bray[1]; Miriam Clegg,[2]; Jayne Woodside[3]; Julie Lovegrove[4]; Claire Mcevoy,[1]; Zoe Donkin,[5]
[1]Centre for Public Health, Queen's University Belfast, Belfast, United Kingdom; [2]School of Food and Nutritional Sciences, University C, Cork, Ireland; [3]School of Medicine, Dentistry and Biomedical Sciences, Queen's University Belfast, Belfast, United Kingdom; [4]Hugh Sinclair Unit of Human Nutrition, University of Reading, Reading, United Kingdom; [5]Food Chain Analysis, Department for Environment Food & Rural Affairs, London, United Kingdom

BACKGROUND AND OBJECTIVES

There is a need to understand consumers' food practices and how to encourage a shift towards healthier, sustainable diets(1). This qualitative study aimed to develop the Department for Environment, Food and Rural Affairs'(Defra) understanding of older people's food choices, attitudes, and behaviours, in relation to dietary trends, sustainability, health, and accessing food, under a programme to understand the sociodemographic differences in food practices and to support evidence-informed policymaking.

METHODS

Semi-structured interviews were carried out with two sets of stakeholders: (i) older people and (ii) organisations providing food and/or dietary advice to older people. Approval for the study and data storage approach was granted by the Defra Data Protection team. Purposive sampling was used to select 12 adults aged 65+ to participate, (n=3 men; n=9 women; white n=9, black n=2, other n=1), and mean age: female 73 years (range 65-83); men 78 years (range 76-79). Those selected were rural (n=3), urban dwelling (n=9), living independently in England, and included single (n=8) and married people (n=4). Organisation interviews (n=12) involved staff from a national food pantry program, two social housing providers, a regional food access charity, and a national ageing support and advisory group.

RESULTS

Barriers to healthy, sustainable diets dominated the five themes that emerged from the analysis of interviews with organisations and older people; physiological changes (lower appetite, declining physical function, chronic illness); social changes (impact of eating alone); access and availability (transport limitations, the shopping environment and selection of foods); skills and capabilities (use of convenience food, ability to prepare and cook food); healthy diet and sustainability (openness to changing diets, opportunities and barriers to dietary change). Adapting to physiological changes impacted food choice, since people were less able to consume habitual foods. The social change of eating alone showed frequent loss of interest in meals and diet quality, and capabilities and skills highlighted the challenges faced by those whose former partner had prepared their meals. Beliefs on healthy and sustainable diets and sources of advice varied, as did the ways in which the participants' eating habits changed. There was a general preference for natural and less processed foods.

CONCLUSIONS

Physiological and social factors are more prevalent in later life and impact food choices, behaviours and ability to access healthy and sustainable diets amongst older people.

SOAP04_05

GENDER-JUST TRANSITION TO REDUCED COMMERCIAL MILK FORMULA USE AND GREENHOUSE GAS EMISSIONS IN FACILITIES PROVIDING MATERNITY AND NEWBORN CARE SERVICES: A SCOPING REVIEW

Julie Smith[1]; Andini Pramono[1]; Tuan Thanh Nguyen[2]; Amy Weissman[3]; Ina Landau Aasen[4]; Arun Gupta[5]; Roger Mathisen[2]
[1]National Centre for Epidemiology and Population Health, The Australian National University, Canberra, Australia; [2]Alive & Thrive East Asia Pacific, Alive & Thrive East Asia Pacific, Hanoi, Vietnam; [3]FHI 360, Family Health International (FHI 360) Asia Pacific Regional Office, Bangkok, Thailand; [4]Health Services Research, Folkehelseinstituttet, Oslo, Norway; [5]Breastfeeding Promotion Network of India, Breastfeeding Promotion Network Of India, Mumbai, India

BACKGROUND AND OBJECTIVES

The use of commercial milk formula (CMF) in maternity services disrupts successful establishment of breastfeeding and adds to greenhouse gas (GHG) emissions. We identified evidence on GHG emissions in maternity services and explored implications for a gender-just transition to lower carbon footprints by a scale-up of the WHO/UNICEF Baby-Friendly Hospital Initiative (BFHI) to reduce CMF use.

METHODS

We performed a scoping review and narrative synthesis on three interrelated topics: 1) the GHG emissions impact of CMF use in maternity and newborn care services, 2) gender-just transitions in food and agriculture systems away from dairy, and 3) the influence of implementing BFHI on CMF use at hospital discharge

RESULTS

Searches retrieved 280 articles across three topics, with 51 meeting inclusion criteria. For topic 1, there was limited focus on the GHG impacts of paediatric and obstetric practices or CMF use, with just one study assessing the impacts of CMF use for hospital food waste. Topic 2 included 14 studies showing that gender disparities and structural inequalities hinder effective gender mainstreaming and climate change adaptation in agriculture such as dairying, while none cited any gendered effects on producers of reducing dairy use from transition to more sustainable health services. For topic 3, 36 studies indicated that hospital practices and policies supporting breastfeeding, like BFHI, significantly lowered use of CMF or increased exclusive breastfeeding, while enhancing the likelihood of investment in adequate education and training of maternity and newborn care staff in breastfeeding support. Conversely, practices like delayed initiation of breastfeeding, CMF supplementation, pacifier use and insufficient staff training and education on breastfeeding management are associated with more CMF use.

CONCLUSIONS

This study highlights a significant gap in the literature about the carbon footprint of facilities providing maternity and newborn services. Given the substantial GHG emissions associated with CMF, absence of evidence of harmful impacts on female dairy farmers, and under-investment in women's skills as maternity care professionals, health systems seeking to reduce their carbon footprint should implement gender-just strategies such as BFHI which minimize unnecessary CMF use in maternity services and increase investments in training and education of mostly female maternal and newborn care services staff.

SOAP04_06

THE SUITABILITY OF VEGETARIANISM FOR ELDERLY POPULATIONS: EVALUATION OF THE IMPACT OF A VEGETARIAN MEAL ON PLANT PROTEIN ASSIMILATION IN RATS OF ALL AGES

Madeline Muziot[1]; Mireille Andriamihaja[1]; Dalila Azzout-Marniche[1]; Morgane Dufay[1]; Cilia Ouahrani[1]; Abira Nanthieswaran[1]; Moulay Sakaha[1]; Soukeyna Agne[1]; Claire Gaudichon[1]; Juliane Calvez[1]
[1]UMR914 PNCA, AgroParisTech - INRAE - Campus Agro Paris-Saclay, place de l'Agronomie, Palaiseau, France, Palaiseau, France, France

BACKGROUND AND OBJECTIVES

The rise of plant-based diets raises questions about their suitability for populations with specific needs, such as the elderly. As plant proteins are known to be less digestible than animal proteins, there is a risk that the protein requirements of this population will not be met. This study then aimed to assess the impact of a vegetarian meal on protein synthesis, digestibility and postprandial distribution of a plant protein in rats of all ages.

METHODS

48 male Wistar rats of 1, 10 and 18 months (n=16/age group) ingested either an omnivorous meal (OMNI, n=8/group) or a vegetarian meal (VEGE, n= 8/group) to which intrinsically 15N-labeled cooked and dehulled peas were added in order to specifically follow their digestive and metabolic fate. Both meals had similar macronutrient contents (22%P/E, 70%G/E, 8%L/E) and the vegetarian meal was higher in fiber and antinutritional factors. These meals represented about 20% of the daily energy intake, with the remaining 80% provided by a standard diet. Body weight and food intake were measured daily. Digestive contents were collected 6h after meal intake to measure protein digestibility. Urine, plasma, organ and tissue samples were also collected to analyze deamination and postprandial distribution of dietary nitrogen. 30 minutes before euthanasia, 13C-valine was injected intravenously to enable analysis of protein synthesis in liver and muscle.

RESULTS

With age, a decrease in body weight gain ($P<0.0001$), food intake ($P<0.05$), liver ($P<0.0001$) and gastrocnemius muscle ($P<0.0001$) weight relatively to the body weight was observed, without any meal type effect. The VEGE group showed a lower indispensable amino acids (IAAs, $P<0.01$) and branched chain amino acids (BCAAs, $P<0.0001$) digestibility compared to the OMNI group, without any age effect. Deamination ($P<0.0001$) was increased with age, as well as the postprandial nitrogen distribution in the liver ($P<0.05$), plasma proteins ($P<0.0001$) and gastrocnemius muscle ($P<0.01$), without any meal type effect.

CONCLUSIONS

Our RESULTS show a decrease in gastrocnemius muscle weight as well as an increase in dietary nitrogen distribution and deamination with age, as described in the literature. However, the vegetarian meal reduced the digestibility of IAAs, notably BCAAs, the latter being essential for stimulating muscle protein synthesis. A prolonged consumption of this diet could therefore increase the risk of sarcopenia in the elderly. Additional long-term studies are needed to evaluate this hypothesis.

SOAP04_07

ASSESSING BIODIVERSITY IMPACTS OF DIETS AND FOOD SYSTEMS

Eva Augustiny[1]; Anita Frehner[1]; Alexander Mathys[2]; Adrian Muller[1]
[1]Department of Food System Sciences, FiBL - Research Institute of Organic Agriculture, Frick, Switzerland;
[2]Sustainable Food Processing Laboratory, ETH Zurich, Zürich, Switzerland

BACKGROUND AND OBJECTIVES
Currently prevalent Western diets are central drivers of biodiversity loss through their contribution to land use change, ecotoxicity, climate change and water consumption caused by unsustainable, intensive and livestock-heavy agricultural production (1, 2). However, assessing the impacts of diets and food systems on biodiversity remains challenging due to the heterogeneity and the intrinsic complexity of biodiversity, which encompasses different scales, time dynamics and diverse dimensions such as species, genetic, and functional diversity. Studies including various impact categories are relatively rare, highlighting the need for robust assessment METHODSat the food system level.
METHODS

An established mass- and nutrient-flow food system model (3, 4) is used to evaluate environmental impacts of diets and associated agri-food systems (e.g. land use, water use, GHG emissions, nitrogen surplus, etc.). To integrate the impacts of diets on biodiversity, this model is combined with life cycle impact assessment (LCIA) indicators developed by the UNEP life cycle initiative (5). These indicators translate the environmental impacts coming from the model into potential biodiversity outcomes, such as eutrophication effects from fertilizer use. Using Switzerland as a case study, more sustainable production scenarios (organic, grass-based, circular) are evaluated regarding their ability to feed the population and performance in various biodiversity related impact categories compared to the current consumption (6) and Swiss dietary recommendations (7).

RESULTS

Combining a food system model with LCIA indicators enables the evaluation of diets and production systems in terms of their impacts on biodiversity and other environmental categories. The application of this method on Switzerland as a case study reveals synergies and trade-offs between impact categories. Importantly, this analysis shows, how far LCIA-biodiversity indicators can be used to assess biodiversity on the rather aggregate level of food system and dietary scenarios. It allows to address related challenges, that e.g. arise from the neglect of aspects like habitat structure or genetic and functional biodiversity.

CONCLUSIONS
The integration of LCIA indicators with a food system model facilitates the assessment of agricultural production and dietary impacts across multiple categories relevant to biodiversity. Nonetheless, careful interpretation of the RESULTS is essential, given the limitations in scope, and transparent communication regarding the method's capabilities and constraints is crucial.

SOAP04_08

DOES DEFORESTATION INFLUENCE BEEF RETAIL PRICES IN BRAZIL?

Jacqueline Tereza da Silva[1]; Aline Carvalho[2]; Valentin Guye[3]; Andrea Garcia[3]; Dominic Moran[1]; Rafael De Oliveira Silva[1]; Erasmus Zu Ermgassen[3]
[1]Global Academy of Agriculture and Food Systems, The University of Edinburgh, Edinburgh, United Kingdom; [2]Nutrição, Faculdade de Saúde Pública USP, São Paulo, Brazil; [3]Earth and Life Institute, UCLouvain, Ottignies-Louvain-la-Neuve, Belgium

BACKGROUND AND OBJECTIVES

Conversion of forests to pasture accounts for 40% of forest loss worldwide (1), notably in Brazil, where the expansion of livestock grazing is the major driver of deforestation (2). Deforestation control efforts confront a purported trade-off between forest conservation and agricultural production. The supposition is that limiting agricultural expansion implies the need for systems intensification, leading to increased production costs, higher consumer prices, and potential food insecurity. We use supply chain data for 2,980 beef products sold in Brazilian retail stores and deforestation data at the municipal level to evaluate the causality between deforestation control and consumer prices.

METHODS

A directed acyclical graph was used to inform the model specification and interpretation of the findings. The influence of deforestation on retail prices was estimated using a fixed-effects model, with retail store neighbourhoods as fixed effects. The deforestation exposure (ha/kt) of beef products was calculated from supply chain data on the deforestation rates in municipalities of product origin (3). The model included the following co-variables: sanitary inspection level (federal or state); product type (premium, non-premium, offal, processed); distance between meatpacker and retail store (km); supply chain monitoring (yes/no); retail store size (top 10, top 900, smaller stores). Standard errors clustered at the retail store neighbourhood were applied to derive 95% confidence intervals. The analysis plan has been detailed in a pre-registration platform (4).

RESULTS

Data was collected from retailers in five states: Acre (35%), Mato Grosso do Sul (4%), Pernambuco (28%), Santa Catarina (9%), and São Paulo (24%). The median price per kg was USD 5.63 (IQR 3.98; 7.96), with median deforestation exposure at 577 ha/kt (IQR 57; 1,613). Although products from the Legal Amazon were USD 1.66 cheaper, deforestation exposure where beef products originated did not affect prices. The main determinant of price was inspection level, with products inspected at the state level being 1.45 USD/kg cheaper (95% CI 3.18; 14.38) than federally inspected ones.

CONCLUSIONS

Our findings indicate that (i) deforestation in the sourcing area does not influence beef retail prices; (ii) more rigorous sanitary inspection is associated with higher prices. This work contributes to the debate about the potential unintended consequences of deforestation control policies. Furthermore, it offers evidence to support Brazil's mitigation and adaptation plans set out as part of its Nationally Determined Contributions.

SOAP04_10

CRITICAL REVIEW OF THE RELATIONSHIPS BETWEEN BIODIVERSITY AND DIETS: CURRENT STATUS AND POTENTIAL OPPORTUNITIES FOR ITS ASSESSMENT

Patrizia Fracassi[1]; Hugo Bourhis[1]; Erica Galanti[1]
[1]Food and Nutrition, Food and Agriculture Organization of the United Nations, Roma, Italy

BACKGROUND AND OBJECTIVES

As biodiversity loss dramatically affects food systems and their ability to deliver healthy diets for all, there is an increasingly urgent need to understand the multifaceted links between biodiversity and the core principles of healthy diets: adequate, balanced, moderate and diverse. While it is clear that healthy diets cannot be achieved without biodiversity, this relation is informal and rarely quantified. The aim of this study is to assess the current evidence on the contribution of biodiversity to healthy diets, by considering all four principles and not only diversity. Ultimately, the study will explore how measures of these relationships can be better harmonized to inform policies and programmes.

METHODS

We conducted an exploratory literature in accordance with the PRISMA guidelines, aiming to analyse studies that measured relationships between biodiversity and diets at household or individual levels. Studies for inclusion were identified through English-language keyword searches in the Web of Science, focusing on studies published after 2010 to capture recent advancements in this area. Particular attention was given to studies that not only looked at dietary diversity but also explored the role of biodiversity in promoting nutrient adequacy, moderate consumption of certain food groups, and achieving balanced diets.

RESULTS

Although widely discussed and acknowledged, the evidence reveals a significant knowledge gap regarding the links between biodiversity and diets. Most studies fail to quantify or comprehensively assess how changes in biodiversity—whether increases or declines—impact household and individual diets and vice versa. While some positive associations have been observed, others have not, underscoring the urgent need to explore these linkages more thoroughly. Notably, increasing biodiversity does not universally lead to improvements across all principles of healthy diets. In high income countries, a growing body of literature has focused on how dietary patterns affect biodiversity. The variety of parameters used to define biodiversity and diets hinders meaningful comparisons and insights in better understanding the relationships.

CONCLUSIONS

Overall, for a subject that seems straightforward, studies do not agree on the relationships between biodiversity and diets. Articulating these links and highlighting existing gaps in the literature is essential to better understand and analyse the multifaceted role of biodiversity in supporting healthy diets and vice versa. This understanding is critical to advancing evidence-based strategies for the conservation of biodiversity for better nutrition.

SYNERGIES IN DIETARY CONSTRUCTS - OPTIMIZING FOOD BIODIVERSITY, NUTRIENT ADEQUACY, AND ENVIRONMENTAL SUSTAINABILITY

Jeroen Berden[1]; Giles Hanley-Cook[2, 3]; Bernadette Chimera[1]; Mathilde Touvier[4]; Julia Baudry[4]; Pietro Ferrari[1]; Carl Lachat[2]; Inge Huybrechts[1]
[1]Nutrition and metabolism branch, IARC - International Agency for Research on Cancer, Lyon, France;
[2]Department of Food Technology, Safety and Health, Universiteit Gent - Campus Coupure, Gent, Belgium;

[4]Nutritional Epidemiology Research Team (EREN), Université Sorbonne Paris Nord and Université Paris Cité, Inserm, INRAE, CNAM, CRESS, Bobigny, France

BACKGROUND AND OBJECTIVES

Diets low in dietary species richness (DSR), high in animal source and ultra-processed foods (UPFs), are characterized by poor nutritional quality and increased environmental impacts (1). Improving diets often requires balancing health and environmental goals, which can be challenging (1,2). This study examined whether diets, incorporating food biodiversity, food processing, and adherence to the EAT-Lancet reference diet, could be optimized to enhance nutrient adequacy while reducing environmental impacts.

METHODS

Greenhouse gas emissions (GHGe; kg CO2-eq/kg food/day), land use (m^2/kg food/day), and nutrient adequacy (Probability of Adequate Nutrient Intake Diet, PANDiet score) were, in turn, related to dietary indices expressing, DSR, disaggregated into DSRPlant and DSRAnimal, food processing (using the Nova classification), and adherence to sustainable diets (using the EAT-Lancet Healthy Reference Diet, HRD, range: 0-140). Multivariable linear models, including interaction terms between dietary indices were applied to data from 368,733 adults in the European Prospective Investigation into Cancer and Nutrition.

In addition, multi-objective optimization (MOO) was used to evaluate trade-offs between environmental outcomes and nutrient adequacy. Optimal combinations of dietary indices were identified to minimize GHGe and land use while maximizing PANDiet and DSR, and participants were aligned with these optimal solutions to assess potential improvements.

RESULTS

The three dietary indices were weakly to moderately correlated (Spearman's ρ: -0.22 to 0.42). MOO identified optimal solutions characterized by a mean (SD) increase of 13.9 points (13.5) in the HRD score, a 1.4 species (4.9) increase in DSRPlant, a small reduction of 0.1 species (1.9) in DSRAnimal, and a 12.4 % (12.5) substitution of UPFs with unprocessed or minimally processed foods. These solutions led to a mean (SD) increase of 4.12 percentage points (6.70) in PANDiet score, a 5.6% (19.3) increment in DSR, a 14.2% (28.0) decrease in GHGe, and a 12.8% (31.4) reduction in land use.

CONCLUSIONS

Diets that promote food biodiversity, prioritize unprocessed and minimally processed foods over UPFs, and adhere to the HRD have the potential to enhance nutrient adequacy while minimizing their impact on the environment.

SOAP04_13

UNDERSTANDING THE INTERPLAY BETWEEN GREENHOUSE GAS EMISSIONS, HEALTH, AND COST OF FOOD AND DRINK: A PRELIMINARY ANALYSIS OF LOYALTY CARD DATA FROM A LARGE UK FOOD RETAILER

Emma Wilkins[1]; Mark Green[2]; Mariana Dineva[1]; Mark Gilthorpe[3]; Alexandra Johnstone[4]; Maddie Thomas,[5]; Nilani Sritharan[5]; Michelle Morris[1]
[1]School of Food Science and Nutrition, University of Leeds, Leeds, United Kingdom; [2]Department of Geography & Planning, University of Liverpool, Liverpool, United Kingdom; [3]Obesity Institute, Leeds Beckett University, Leeds, United Kingdom; [4]The Rowett Institute, University of Aberdeen, Aberdeen, United Kingdom; [5]Healthy and Sustainable Diets, Sainsbury's PLC, London, United Kingdom

BACKGROUND AND OBJECTIVES

The food system is the second biggest contributor to greenhouse gasses globally after the energy industry [1]. Diet-related ill-health costs the UK £268 billion/year [2]. There is a lack of evidence that links these issues, including how sustainable and healthy food purchases vary across the population, due to limited data availability. Transaction data from food retailers is a relatively untapped resource that could evaluate this.

METHODS

We used loyalty card data from a major UK supermarket on >160 million purchases made in 2022 in Yorkshire and the Humber (Y&H). Data included product description, retailer product categorisations, and High in Fat Salt and Sugar (HFSS) status [3] alongside de-identified customer profiles, allowing household purchase estimates. Products were mapped to one of 77 categories based on the Living Costs and Food Survey (LCFS) categories [4]. Published data on global average mean greenhouse gas emissions (GHGE) for 43 food commodities [5] were used to estimate GHGE for each product, based on the LCFS category, retailer categorisations, and product descriptions. Multilevel regression with post-stratification was used to adjust estimates for selection bias in the sample across card-holder age, neighbourhood deprivation, area of residence and household size. For funding see ref [6].

RESULTS

Ten food categories contributed 75.8% of total estimated GHGE by sales volume. The top three contributors were beef, milk and cheese (19.6%, 9.8% and 8.6% respectively). Foods categorised as HFSS had higher median GHGE and higher cost than non-HFSS foods (GHGE: 0.32 vs 0.21 kg CO2 equivalent per 100g; cost: 83p vs 48p per 100g). In the multilevel model, we found an inverted-U-shaped relationship between loyalty card holder's age, and estimated emissions, with those in the 45-54 age category having the highest estimated GHGE. The opposite relationship was found between age and HFSS purchases, with those in the middle age groups being least likely to purchase HFSS foods. There was no correlation between area-level deprivation and GHGE, but a trend of association for those in areas of higher deprivation to purchase proportionally more HFSS foods.

CONCLUSIONS

We found that foods that are more sustainable tend to be non-HFSS and cheaper to purchase. Populations living in areas of high deprivation tend to buy more HFSS foods vs non-HFSS foods. There is a subset of foods that are healthy, sustainable and low-cost, which could be promoted to address health and the environment, but any such intervention may need to be targeted at a local level and/or to specific populations to be most effective.

HARMONISING STORAGE COMMUNICATIONS AND DATE LABELLING CONVENTIONS USED ON SOUTH AUSTRALIAN DAIRY PRODUCTS

Jia En Sit[1]; Bryan R. Coad[1, 2, 3]; Hayriye Bozkurt[1]; Olena Kravchuk[1, 4]; Helen Morris[1]
[1]School of Agriculture, Food and Wine, The University of Adelaide, Waite Campus, Urrbrae, South Australia, Australia; [2]End Food Waste Cooperative Research Centre, Wine Innovation Central Building Level 1, Waite Campus, Urrbrae, South Australia, Australia; [3]UniSA Clinical & Health Sciences, University of South Australia, Adelaide, South Australia, Australia; [4]The Biometry Hub, School of Agriculture, Food and Wine, The University of Adelaide, Waite Campus, Urrbrae, South Australia, Australia

BACKGROUND AND OBJECTIVES

Better harmonisation of labelling information has been suggested as one way to reduce food waste. Fifty-eight percent of Australia's food waste comes from the retail, households and food service sectors. Dairy products such as milk, yoghurt and cheese wasted from these sectors contributes greatly to greenhouse gas emissions and landfill. Research suggests that confusion over statement of storage conditions (SSC), directions for use (DFU) and date marking (DM) on labels may be contributing to consumers discarding these products prematurely and generating food waste. To address this, a comprehensive understanding of current SSC, DFU and DM labelling conventions used on dairy products is needed. This study investigated SSC, DFU and DM labelling practices on selected milk and dairy products, identifying commonalities and inconsistencies, and compared with regulatory standards and industry advice.

METHODS

SSC, DFU and DM information were collected from real-labels of six dairy product categories: fresh milk (plain and flavoured), ultra-high temperature (UHT or long-life) milk (plain and flavoured), yoghurt and a sample of dairy desserts sold online (and a small sample of in-store products) across four leading supermarkets in South Australia. Label information was extracted and analysed to identify conventions, common practices and inconsistencies and compliance to regulatory standards.

RESULTS

Most labels were compliant with Australian labelling requirements. Strong conventions were identified in only a few labelling elements, for example, placing DFU after SSC, providing a usage timeframe suggestion for the product once opened, and DM choices for each dairy product category. Many variations exist in the location, formatting and provision of SSC, DFU and DM across the dairy product categories. Discordance was identified in many labelling elements.

CONCLUSIONS

While harmonisation was identified in some labelling elements, discordances exist in many more elements. Better harmonisation of labelling practices in these areas, combined with other strategies such as education programs may help the industry create labels with clearer, more consistent and easy-to-identify instructions regarding SSC, DFU and DM. This may reduce label-reading confusion, and support consumers in handling, storing and using the product, thereby reducing risk of food waste.

RICE-BASED PRODUCTS FOR CLIMATE-FRIENDLY AND HEALTHIER FILIPINOS: FOOD-BASED SOLUTION TO ADDRESS MALNUTRITION IN CHILDREN AND ADULTS

Riza Abilgos-Ramos[1]; Liafail Davalos[1]
[1]Rice Chemistry and Food Science Division, Philippine Rice Research Institute (DA-PhilRice), Science City of Muñoz, Philippines

BACKGROUND AND OBJECTIVES

Malnutrition remains a significant challenge in the Philippines, with undernutrition disproportionately affecting vulnerable populations. Alarmingly, one in three Filipino children under five experiences stunting, ranking the country among the top five in East Asia and the Pacific for stunting prevalence. This condition impairs childhood development and perpetuates a cycle of poor health, limited economic productivity, and poverty. Thus, the need for complementary and food-based intervention. This work developed nutritious and healthy rice-based products for vulnerable population.

METHODS

Three rice-based products were developed to complement existing nutrition interventions while promoting climate-friendly practices. First, complementary food premixes for older infants were formulated. Second, yogurt drinks, enhanced with fermented rice bran (FRB) from pigmented Philippine rice cultivars. Lastly, choco-flavored rice malt-soy milk beverages for pre-school and school children. All products were subjected to sensory evaluation using target consumers, chemical and nutritional analyses, and shelf life testing.

RESULTS

Optimized blend of rice, soybean, and yellow sweet potato flours for infant food premix composed of 50 to 52.50 per cent rice, 32.50 to 35 per cent soybean, and 15 per cent yellow sweet potato flour, met the standard requirements for complementary foods. The blend provides a practical and healthier food choice, particularly for infants in poor households with inadequate access to food supplies. Yogurt drink was developed with fermented rice bran using pigmented Philippine rice cultivars (Red Dinorado and Black Ominio). The black yogurt drink has higher phytochemical and antioxidant properties, while the red yogurt drink is a rich source of dietary fiber. Both variants are nutrient-dense, containing probiotics and other health-promoting properties, with a shelf life of 17 days under refrigerated conditions. Choco-flavored rice malt-soy milk beverages formulated from suitable Philippine rice varieties most accepted ratio of 7:3 rice-to-soy provides sensory quality comparable to commercially available products. The beverage is highly appealing to children aged 3 to 12 and, when unopened and stored in High Density PolyEthelene bottle containers, remains stable for 20 days under refrigerated conditions.

CONCLUSIONS

These products not only deliver enhanced nutrition but were also produced using locally-grown crops and by-products that will complement existing interventions for climate-resilient population and sustainable food system.

ASSOCIATIONS BETWEEN DIET-RELATED GREENHOUSE GAS EMISSIONS AND NUTRIENT INTAKE ADEQUACY AMONG JAPANESE SCHOOL-AGED CHILDREN: CROSS-SECTIONAL ANALYSIS

Minami Sugimoto[1, 2]; Keiko Asakura[3]; Yasunori Kikuchi[2, 4]; Shizuko Masayasu[5]; Satoshi Sasaki[6]
[1]Department of Environmental and Occupational Health, School of Medicine, Toho University, Tokyo, Japan; [2]Institute for Future Initiatives, The University of Tokyo, Tokyo, Japan; [3]Department of Preventive Medicine, School of Medicine, Toho University, Tokyo, Japan; [4]Department of Chemical System Engineering, The University of Tokyo, Tokyo, Japan; [5]Ikurien-Naka, Ikurien, Ibaraki, Japan; [6]Department of Social and Preventive Epidemiology, School of Public Health, The University of Tokyo, Tokyo, Japan

BACKGROUND AND OBJECTIVES

A growing number of studies investigated sustainable and healthy dietary patterns. However, a few studies targeted children, who have different nutritional needs from adults. This study aimed to examine associations between diet-related greenhouse gas emissions (GHGE) and the prevalence of inadequate nutrition intake among Japanese school-aged children.

METHODS

Diet records were analysed on three non-consecutive days among 915 healthy Japanese school-aged children (8-14 years). Diet-related GHGE was estimated using the Inventory Database for Environmental Analysis and adjusted for energy intake using the density method. Prevalence of inadequacy was defined as a percentage of participants with nutrient intake outside or below the reference value defined by the Dietary Reference Intakes (DRIs) 2025 for Japanese. The association between diet-related GHGE and intake amount of food and nutrients were examined by regression analysis. Further, logistic regression was used to examine the prevalence of inadequate nutrient intake according to quartiles of diet-related GHGE.

RESULTS

Intake amounts were positively associated with diet-related GHGE for total vegetables, fish and seafood, meat, dairy products, protein, total fat, saturated fat, thiamin, riboflavin, niacin, vitamin B6, magnesium, iron, sodium, and potassium. With an increasing quartile of diet-related GHGE, the prevalence of inadequacy decreased for protein, riboflavin, niacin, vitamin B6, iron, and potassium, while that increased for macronutrient balance regarding carbohydrate, total fat, and saturated fat.

CONCLUSIONS

Japanese children with higher diet-related GHGE had worse adherence to the DRIs for macronutrient balance but better adherence to some vitamins and minerals, probably due to higher intake of animal-based foods. Switching to low-fat and environmentally friendly animal-based foods would be required to reduce diet-related GHGE and improve nutrient intake adequacy among children.

UMAMI PROGRAM DEVELOPMENT AND RESEARCH PROTOCOL: A TRANSDISCIPLINARY APPROACH TO PRIMARY SCHOOL FOOD EDUCATION

Joyce Haddad[1]; Franziska Scheidegger-Balmer[1]; Charlotte Bourcet[2]; Sarah Morier[3]; Eugenia Harms[2]; Klazine Van Der Horst[1]
[1]Nutrition and Dietetics, Berner Fachhochschule BFH, Departement Gesundheit, Bern, Switzerland;
[2]Agricultural, Forest and Food Sciences, Berner Fachhochschule BFH, HAFL, Zollikofen, Switzerland;
[3]Research and Development, Teacher Training College of Valais - HEPVS, Saint-Maurice, Switzerland

BACKGROUND AND OBJECTIVES

Healthy and sustainable eating behaviors are crucial for population and planetary health. Primary schools offer a key setting for educating children about food, nutrition, and sustainability, yet the Swiss primary school curriculum lacks evidence-based nutrition education. This study aims to evaluate the impact of the Umami project, a sensory food and nutrition education program developed through co-design and participatory approaches, on improving knowledge, intention, attitude, and neophobia toward healthy and sustainable eating among teachers, school children, and parents.

METHODS

The Umami project employed a trans-disciplinary approach involving experts to identify 80 food system concepts, grouped into 8 themes: food origin, informed consumerism, food waste, food culture, dietary guidelines, intuitive eating, culinary practices, and planetary health. Teachers, specialists, and 22 school children (aged 9–10) co-designed educational materials. For the pilot study, a pre-post evaluation design will be implemented, recruiting 32 primary school classes from German- and French-speaking Swiss cantons using convenience sampling. Teachers will receive training, Umami teaching materials, a digital platform, and extracurricular activity guides for parents. The program will be delivered over 9 months (school year 2026–27). Baseline and post-intervention measurements will assess knowledge, intention, attitude, and neophobia. Paired t-tests will compare pre- and post-program outcomes, while independent t-tests will evaluate differences across cantons and socio-demographic areas. Program satisfaction will be explored through qualitative analysis.

RESULTS

This pilot study will identify areas for refining program delivery and content, including pedagogical sequences, materials, and the online platform. Assessing outcomes by canton and socio-demographic factors will enable program tailoring to diverse needs. Findings will inform program improvements for possible national implementation.

CONCLUSIONS

This study will enhance understanding of how trans-disciplinary, practical education can improve knowledge and attitudes toward sustainable, healthy eating. Refinements will ensure the program's relevance, scalability, and success in diverse educational contexts.

RECONCILING SUSTAINABILITY AND SOVEREIGNTY? THERE IS NO RELATIONSHIP BETWEEN NUTRITIONAL QUALITY, ENVIRONMENTAL IMPACT AND FOOD SOVEREIGNTY IN FRENCH DIETARY PATTERN

Marianne Cerf[1, 2]; Hélène Fouillet[1]; Dorra Ben Aissa[1]; Christian Couturier[3]; Philippe Lescoat[4]; Carine Barbier[5]; Jean-François Huneau[1]; Julia Baudry[6]; Anaëlle Bolo[1]; Elie Perraud[1]; Emmanuelle Kesse-Guyot[6]; François Mariotti[1]
[1]Université Paris-Saclay, AgroParisTech, INRAE, UMR PNCA, 91120, Palaiseau, France; [2]Université Paris-Saclay, Graduate School BIOSPHERA (Programme thématique SANAH), Palaiseau, France; [3]Solagro, Solagro, Toulouse, France; [4]Université Paris-Saclay, AgroParisTech, INRAE, UMR SADAPT, 91120, Palaiseau, France; [5]CIRED, Centre International de Recherche sur l'Environnement et le Développement, Paris, France; [6]Nutritional Epidemiology Research Team (EREN), Université Sorbonne Paris Nord and Université Paris Cité, Inserm, INRAE, CNAM, CRESS, Bobigny, France

BACKGROUND AND OBJECTIVES

The capacity to provide sustainable diets, covering nutrient requirements, reducing risk of chronic diseases and having a low impact on the environment, depends on domestic agricultural production and agricultural commodity trade flows. The transition to more sustainable food systems is therefore closely linked to food sovereignty issues. This study aimed to analyze the nature of the relationships among the nutritional, environmental and food sovereignty dimensions from food groups consumed in France.

METHODS

Three indicators related to the three dimensions were calculated for each food (n=1772) from the French representative survey of adults' food consumption INCA3 (n=2121). First, we developed a nutrient-based food scoring system (PANFood, inspired by the PANDiet system) to assess nutritional quality based on the potential to provide sufficient indispensable nutrients without excessive nutrients to limit (n=32), using the CIQUAL database. Second, environmental impact was estimated using the single Environmental Footprint (EF) score from the Agribalyse database. Third, food sovereignty was estimated as the food self-sufficiency (FSS) capacity, calculated as the ratio of domestic production to food availability using international (FAOSTAT) and national databases. Finally, these indicators were calculated for each food group as the consumption-weighted average of the food indicators to analyze their distribution across the dimensions. The long-term health value of food categories, as outlined in the Global Burden of Disease study, was also considered.

RESULTS

Overall, self-sufficiency showed no correlation with the nutritional and environmental dimensions (all $R^2<0.01$), and the indicators exhibited substantial heterogeneity within food groups. Nevertheless, certain patterns were observed. The cereals and tubers achieved high scores across all indicators. Fruits, vegetables, and legumes showed good nutritional quality, low cardiovascular disease risk, and low environmental impact, but self-sufficiency varied widely, especially within the fruits (e.g., low for citrus and high for apples). France was nearly self-sufficient in red and processed meats (with varying FSS capacity, from low for lamb to adequate for chicken), which were nutrient-dense but also associated with higher cardiovascular disease risk and high environmental impact.

CONCLUSIONS

In France, based on the current dietary pattern, food sovereignty does not align with these sustainability dimensions. However, certain food groups can serve as lever to enhance sovereignty. These data could be used to model more sustainable and self-sufficient diets.

SOAP10_06

FEMALE-HEADED-HOUSEHOLDS COPING STRATEGIES TO CLIMATE INDUCED FOOD SHORTAGES

Claire Ekron[1]; Thembekile Dhlamini[2]; Zoe Nomakhushe Nxusani[1]; Xikombiso Mbheneyane[1]
[1]Division of Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa; [2]Public Health, Sefako Makgatho Health Sciences University, Pretoria, South Africa

BACKGROUND AND OBJECTIVES

Globally, climate change impacts are gradually changing the availability, quality, affordability, and accessibility of food. South Africa's mitigation of food insecurity will depend on the understanding of the nation's risks and vulnerabilities. In 2023, 42.3% of households in South Africa were female-headed and known to suffer multiple burdens of earning less, being heavily depended upon by others and inhabiting both breadwinner and domestic roles (1). Climate change impacts are known to aggravate gender inequality. Through understanding the choice of coping strategy to food insecurity, prediction of the sustainability and feasibility of the female-headed-household to secure food should environmental shocks occur, is critical. The objective of the study was to explore coping strategies to lessen the burden of food inaccessibility, unavailability, and instability; and how sociodemographic factors impact choice of coping strategies towards lessening the burden of food shortages.

METHODS

A descriptive phenomenological qualitative design with 25 participants, face-to-face in-depth-interviews was employed. Each interview was transcribed, and data analysed using *ATLAS.ti.* Through inductive thematic analysis the data was categorised into themes and sub-themes.

RESULTS

Twenty-four participants adopted coping strategies to food shortages which were categorised as:action-oriented, self-sacrificing, emotional or passive. The sociodemographic profile influenced choice of coping strategies. The RESULTS concur with previous work suggesting that food access is an important factor in addressing food insecurity. Sen's-theory of entitlement, asserts that food access is directly related to a resource pool, be it money or other trade commodities, which improve purchasing power. The RESULTS exhibited a pervasiveness of food shortages within female-headed homes and further, that coping strategies to deal with these shortages were commonly adopted.Implementation of coping strategies was contingent upon the participants' age, education, employment, marital status and household income and size.

CONCLUSIONS

Without the voices of female-household-heads, implementation, monitoring and evaluation of policies would be ineffective as they are not sovereign. To proactively deal with imminent climate change threats and consistent food insecurity worries, the study reveals the necessity to include the voices of urban female-household-heads when implementing strategies and policies to improve their access and protection of resources.

SOAP10_07

SUSTAINABLE NUTRITION FOR OLDER ADULTS WITH OBESITY: DEVELOPMENT OF RECIPE BOOKS IN THE 2EAT PROJECT

Amely Verreijen[1]; Susanne Wildemast[2]; Sjors Verlaan[2]; Annet JC Roodenburg[1]; Peter Weijs[2]
[1]Nutrition & Health, HAS university of applied sciences, 's-Hertogenbosch, Netherlands; [2]Department of Nutrition and Dietetics, Faculty of Health, Sport and Physical Activity, Amsterdam University of Applied Sciences, Amsterdam, Netherlands

BACKGROUND AND OBJECTIVES

The number of older adults with obesity increases and the protein transition requires more plant-based diets. Dieticians doubt whether a more plant-based diet meets the nutritional needs of this target group. Do they consume adequate amounts of high quality proteins to maintain muscle mass during a weight-loss diet with more plant-based protein? The objective of the first phase of this 2EAT project is to develop a more plant-based recipe book (60% plant proteins instead of 40%) for older adults with obesity which is: energy restricted, protein optimized, meets nutritional needs, and is appealing for the target group.

METHODS

Based on a first version of a more plant-based recipe book with 5 breakfast options, 10 lunch options and 20 diner options, we conducted three iterations of qualitative research. In each iteration, the daily nutritional value and ecological footprint of the recipe book were calculated by accumulating the average values for breakfast, lunch, and dinner. Iteration 1: Six focus groups were conducted to optimize the first version of the recipe book. Iteration 2: a cooking-at-home study was conducted in which 18 older participants bought, prepared and tasted at least 7 meals from the concept recipe book, a second optimization was performed based on insights from this iteration. Iteration 3: The concept recipe book was tested in a pilot study in which 11 participants received the recipe book at home for 8 weeks. Short interviews were held to make final adjustments.

RESULTS

In the first 2 iterations, it was challenging to meet nutritional criteria for protein (≥ 1.2 g/kg body weight), vitamin B2, B6, and calcium according to Dutch dietary guidelines, especially for females. Subjects were unfamiliar with ingredients like tempeh or tofu, reducing their willingness to try the recipes. Some recipes were too large or needed improved taste. After adjustments, subjects in iteration 3 were satisfied with the recipe book, with only minor adaptations needed.

CONCLUSIONS

The recipe book that is developed is more plant-based (>60% protein), with a higher protein content and higher protein quality, lower in energy, meets other nutrient needs, and is appealing to the target group. Planetary boundaries for greenhouse gas emission however are still not met. In the next phase of the 2EAT project the recipe book, together with a dietetic treatment plan, is tested in an RCT to study the effects on muscle health and overall health in a population of 55+ years old with obesity.

CURRENT HOUSEHOLD PRACTICES FOR PRESERVING INDIGENOUS VEGETABLES: A CROSS-SECTIONAL STUDY TO ADDRESS CLIMATE CHANGE AND ENHANCE GLOBAL HEALTH

Joelaine Chetty[1]; Shonisani Ramashia[2]; Averalda Van Graan[3]; Mthokozisi Kwazi Zuma[4]; Xikombiso Mbhenyane[5]

[1]Biostatistics Research Unit. South African Food Data Systems (SAFOODS), South African Medical Research Council, Pretoria, South Africa; [2]Food Science and Technology, University of Venda, Thohoyandou, South Africa; [3]Biostatistics Research Unit, South African Food Data Systems (SAFOODS), South African Medical Research, Francie van Zijl drive, Cape Town, Cape Town, South Africa; [4]Research, Agricultural Research Council , Pretoria, South Africa; [5]Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch university,, Cape Town, South Africa, South Africa

BACKGROUND AND OBJECTIVES

Indigenous vegetables are nutrient-dense foods, essential for local diets, providing a range of nutrients vital for improving global health outcomes. Limited knowledge about their preservation and food composition under changing climatic conditions poses a barrier to their widespread use. The primary objective of this research is to assess and document the preservation METHODSemployed by households, whilst identifying factors influencing preservation choices and the impact of these METHODSon the nutritional quality and sustainability of indigenous vegetables, in the context of climate change.

METHODS

A cross-sectional survey was conducted with 308 households. Data were collected through structured interviews, focusing on types of indigenous vegetables consumed, preservation METHODSused, and factors influencing these practices. The study assessed the impact preservation METHODShave on nutrient retention and composition of the vegetables. Descriptive statistics and thematic analysis were applied to evaluate patterns and determine key influences on food preservation choices.

RESULTS

Sixty two percent reported that consumption of indigenous vegetables is common practice in their area and that preservation was important to ensure availability of the indigenous vegetables during the dry season. Frequently reported preservation METHODSwere sun-drying (86%). Drying was particularly valued for its low cost, minimal environmental impact, and ability to retain key nutrients like vitamins A and C. Socio-economic factors influenced preservation practices.

CONCLUSIONS

This research highlights the importance of promoting sustainable preservation METHODSfor indigenous vegetables. These METHODScontribute to climate resilient food systems, as well as ensuring year-round availability but also enhance food composition, contributing to improved nutrition and food security in the face of climate change.

SOAP10_09

DIETARY PATTERNS OF CHILDREN IN RURAL BURKINA FASO SHOW DIVERGENCE BETWEEN HEALTHINESS, AFFORDABILITY AND SUSTAINABILITY OF THE DIET

Loty Diop[1]; Elodie Becquey[1]; Aulo Gelli[2]; Lieven Huybregts[3]
[1]Nutrition, Diets and Health, International Food Policy Research Institute, Dakar, Senegal; [2]Poverty, Gender and Inclusion, International Food Policy Research Institute, Washington, United States of America; [3]Nutrition, Diets and Health, International Food Policy Research Institute, Washington, United States of America

BACKGROUND AND OBJECTIVES

Diet-related risk factors are major contributors to the global burden of death and disease. In Burkina Faso, children typically consume low-quality diets, a situation exacerbated by poverty, growing pressure on land and water resources, and the global climate crisis. Our objective was to assess the relationship between dietary patterns, nutritional adequacy, cost, seasonality, and environmental sustainability in rural Burkinabe children.

METHODS

We conducted a secondary data analysis of four rounds of 24-hour dietary recall data of 1,080 children 2 to 8 years of age, and market surveys, collected during pre- and post-harvest seasons between 2017 and 2020. Reported food items were classified using the FAO/WHO Global Individual Food Consumption Tool (FAO/WHO GIFT) which can be matched to the Minimum Dietary Diversity for Women (MDD-W) classification. Data on the environmental footprint of foods (greenhouse gas (GHG) emissions, water use and land use) were extracted from the FAO/WHO GIFT open-access platform. Dietary patterns were generated through hierarchical clustering of principal components. Multivariate logistic regressions were used to assess how dietary patterns varied over time.

RESULTS

Four dietary patterns emerged differentiated by the main staple food consumed, including maize, rice, millet-sorghum, or a combo of beans and several cereals. Dietary diversity was low for all patterns (< 4 out of 10 MDD-W food groups). Staple foods were generally consumed with dark green leafy vegetables and other vegetables. The most frequently consumed maize-based pattern was the least nutritionally adequate (mean probability of adequacy across 11 micronutrients (MPA): 0.38). In contrast, the healthiest (MPA: 0.51) millet-sorghum-based pattern was consumed by poorer households. MPA was significantly positively correlated with GHG emissions (0.37) land use (0.27) and water use (0.45, all p-values <0.05). All diets had a similar cost ranging from $1.2 to $1.5 US dollar/child/day. Consuming any of the dietary patterns at a given round increased the probability of maintaining that pattern in the following rounds (odd ratios: 1.5 – 5.4, p-values <0.05), except for the combo diet which was more frequently consumed during the pre-harvest season, likely due to the low accessibilty of other cereals during this period.

CONCLUSIONS

Dietary patterns in rural Burkina Faso were all nutritionally suboptimal. The healthiest pattern was associated with a higher environmental footprint. Further research is needed to optimize diets in terms of healthiness, affordability, and sustainability.

SHIFTING PROTEIN RATIOS IN FOUR EUROPEAN COUNTRIES: DIETARY SUBSTITUTION MODELLING WITH PLANT AND ALTERNATIVE PROTEINS

Merel C. Daas[1]; Pieter Van 'T Veer[1]; Jelena Milešević[2, 3]; Cécile M. Singh-Povel[4]; Jenni Lappi[5]; Matilde Milana[6]; Sander Biesbroek[1]
[1]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [2]-, Capacity Development in Nutrition (CAPNUTRA), Belgrade, Serbia; [3]Centre of Research Excellence in Nutrition and Metabolism, Institute for Medical Research, National Institute of Republic of Serbia, University of Belgrade, Belgrade, Serbia; [4]-, FrieslandCampina, Amersfoort, Netherlands; [5]-, VTT Technical Research Centre of Finland Ltd, Espoo, Finland; [6]Wageningen Food Safety Research (WFSR), Wageningen University & Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES

Transitioning diets towards more plant and alternative protein is essential for achieving environmental goals but may pose challenges for maintaining protein adequacy and improving overall nutritional quality in the population. This study aimed to evaluate the nutritional and environmental impacts of shifting dietary protein ratios by substituting meat and dairy products with analogues based on alternative protein sources – such as plants, insects, algae and microbial mass – in four European countries.

METHODS

Dietary intake data were obtained from nationally representative dietary surveys, based on two 24-h dietary recalls, of the adult population (18-64 years) in Finland (n = 1142), Germany (n = 10,071), Italy (n = 700) and Serbia (n = 1119). Starting from the observed diets, linear programming with a 1:1 substitution principle (on weight basis) was used to generate realistic dietary replacements that maintained existing meal structures. The model objective was to shift the average dietary protein ratios of animal to plant/alternative protein to 50:50 and 30:70 in each country, while minimizing the number of product substitutions. Diets were evaluated for protein adequacy (quantity and quality), overall nutritional adequacy, greenhouse gas emissions (GHGE) and land use (LU).

RESULTS

The number of substitutions varied slightly by country, with a median of 0.0-0.5 and 0.5-3.0 substitutions/day needed to achieve a 50:50 and 30:70 protein ratio, respectively. Meat products were more frequently substituted than dairy products. Despite the shift in protein ratios, median utilizable protein intake increased and remained well above the average requirement in all countries (> 122%). Fiber, vitamin E, folate, iron, magnesium and sodium intake increased and sugar, saturated fatty acids, EPA/DHA, vitamin B12, calcium and potassium intake decreased and were below requirements for some countries. The adverse impacts on vitamin B12 and calcium intake could be mitigated by fortification of analogues. GHGE and LU decreased with an average of 2-27% for the 50:50 ratio and 16-41% for the 30:70 ratio, with the smallest gains observed in Germany and the largest in Italy.

CONCLUSIONS

This study demonstrates that shifts in dietary protein ratios (up to 30:70) can be achieved through minimal and realistic dietary substitutions with plant and alternative protein analogues, and result in significant environmental gains. However, potential inadequacies of micronutrients primarily provided by animal products should be addressed by establishing fortification or reformulation targets for analogues.

SOAP10_12

THE RESPECTIVE ROLES OF ANIMAL- AND PLANT-SOURCED FOODS FOR SUSTAINABLE LOWEST-COST NUTRIENT SECURITY IN DEVELOPING LOW- AND MIDDLE-INCOME COUNTRIES

Sylvia Chungchunlam[1]; Paul Moughan[1]
[1]Riddet Institute, Massey University, Palmerston North 4442, New Zealand

BACKGROUND AND OBJECTIVES

While the environmental dimension of sustainable healthy diets is well studied amidst climate change, the relationship between nutrition and diet affordability is often overlooked (1,2). With the rise in hunger, nutrient deficiencies, and food insecurity in developing low- and middle-income countries (2,3), the purchasing power to access nutrient dense foods is a key strategy to ease the burden of malnutrition (4,5). The study aimed to highlight animal- and plant-sourced foods that can supply essential nutrients at the lowest dietary cost in developing countries.

METHODS

Diet optimization models were developed to generate least-cost nutritionally adequate dietary patterns in Indonesia, the Philippines, United Republic of Tanzania, and Kenya. The Linear Programming approach used locally available retail food prices to identify the role of key food types in assisting to meet daily energy and nutrient needs of the adult population at the lowest dietary cost possible.

RESULTS

Modelled least-cost diets included a nutritionally balanced mixture of plant-based foods and animal-sourced foods, such as dairy milk, organ meats, eggs, fish, and seafood. The key essential nutrients that were provided at exactly their required intake levels, were mostly the vitamins, such as vitamin B-12, and minerals, particularly calcium, iron, and potassium. The daily cost of least-cost nutrient adequate dietary patterns varied below US $ 2.00, such as US $ 1.57 per day for Indonesia and US $ 0.75 per day for United Republic of Tanzania.

CONCLUSIONS

The respective economic roles of animal- and plant-sourced foods to deliver a baseline level of adequate nutrition at the lowest retail cost, need to be considered. This study offers valuable insights to improve diet quality, food security, and sustainable nutrition, in developing low- and middle-income countries.

SOAP10_13

EDIBLE INSECTS IMPROVE LIPID METABOLISM: POSSIBLE COMPOUNDS AND MECHANISMS FROM A RAT STUDY

Masaru Ochiai[1]
[1]School of Veterinary Medicine, Kitasato University, Towada, Japan

BACKGROUND AND OBJECTIVES

To secure food resources in the face of a rapidly growing world population, there is a need to develop alternative and sustainable food and feed materials, and edible insects are recommended as one of the solutions. However, few insect species are officially recognized as edible in the EU and scientific information on the nutritional and functional properties of edible insects is limited. Considering the global use of recognized edible insects as functional food materials, the functionality, chemical compounds, and possible mechanisms should be clarified. We have reported that migratory locust (ML), a representative edible insect in the EU, contains omega-3 α-linolenic acid-bound phospholipids as well as triacylglycerols. Omega-3 lipids are expected to improve lipid metabolism, leading to the prevention and amelioration of lipid metabolic disorders. Therefore, we have investigated the effect of ML in diet on lipid metabolism, possible compounds, and possible mechanisms in rats.

METHODS

To clarify the lipid-soluble nutritional compounds in the ML, a comprehensive analysis was performed. In an animal study, plasma and liver of the male rats fed with a 10% ML containing normal diet for 5 weeks were used for the evaluation of the lipid metabolism.

RESULTS

The ML in the diet improved plasma and liver lipid metabolism via lipoprotein mechanisms. Plasma levels of low-density lipoprotein (LDL), particularly small-dense LDL, were suppressed and plasma and liver fatty acid profiles were shifted to be dominated by omega-3 fatty acids. Although eicosapentanoic acid (EPA) itself was not present in the ML, EPA would be synthesized and the levels in the plasma and liver were increased by the ML diet. Therefore, atherosclerosis indices and plasma mega-6/omega-3 ratio were improved by the ML. The presentative lipogenic indices, such as lipogenic mRNA expressions and enzymatic activities, in the liver were suppressed, and LDL lipid clearance indices were also improved by the ML. A comprehensive analysis of lipid-soluble compounds has revealed the binding modes of α-linolenic acid-bound phospholipids and neutral lipids. These functional lipids and the dietary fiber chitin in the ML may contribute to the improved effect on lipid metabolism.

CONCLUSIONS

The ML contains some functional compounds to improve lipid metabolism. As a possible mechanism for the lowering of plasma LDL lipids by the ML, it is expected that the uptake of LDL lipids into the liver was enhanced, and the lipogenesis and secretion of very-low-density lipoprotein lipids in the liver were additionally suppressed. ML can be a future food and feed resource with safety and functionality.

SOAP10_14

MINIMUM WASTE, MAXIMUM NUTRITION – EXPLORING FOOD WASTE ATTITUDES AND THE ACCEPTABILITY OF 'ROOT-TO-TIP' DINING AMONGST CONSUMERS IN A HIGHER EDUCATION INSTITUTION

Georgia Browne[1]; Fiona Lavelle[1]; Gillian Brooks[2]; Fatima Wang[2]; Balazs Bajka[1]; Peter Ellis[1, 3]; Graeme Collie[4]; Eric Wu[1]; Sam Jackson[1]; Rachel Gibson[1]
[1]Department of Nutritional Sciences, King's College London, Franklin Wilkins Building, 150 Stamford Street, SE1 9NH, London, United Kingdom; [2]King's Business School, King's College London, Bush House, 30 Aldwych, WC2B 4BG, London, United Kingdom; [3]Department of Biochemistry, King's College London, Franklin Wilkins Building, 150 Stamford Street, SE1 9NH, London, United Kingdom; [4]King's Food, King's College London, East Wing Strand Campus, Strand, WC2R 2LS, London, United Kingdom

BACKGROUND AND OBJECTIVES

The development of 'root-to-tip' recipes in foodservice that incorporate more of the plant (i.e. peels and stalks) is being explored to improve suboptimal population intakes of fruit, vegetables and fibre [1], and reduce the climate impact of food waste [2]. However, given low peels and stalks consumption in the UK [3], the extent to which 'root-to-tip' meals may just shift food waste along the supply chain by increasing plate waste is unknown. The aim of this study is to understand the acceptability of 'root-to-tip' dining by exploring attitudes towards food waste and perceived barriers and enablers to eating peels and stalks.

METHODS

In person focus groups were conducted at a UK university with current employees. Convenience sampling was used to recruit between six to eight participants across three focus groups. A semi-structured topic guide with open-ended questions was developed to facilitate discussion. Discussions were audio recorded, transcribed verbatim and an inductive thematic analysis using NVivo software undertaken. The research protocol was approved by the King's College London Research Ethics Committee (Ref: MRA-24/25-46016).

RESULTS

Three focus group discussions were conducted with twenty participants (November to December 2024), primarily aged 26-45 years (80%) and female (80%). Six preliminary themes were identified: 1) perceived food waste causes and solutions; 2) growing food waste awareness and the intention behaviour gap; 3) the role of social modelling in 'root-to-tip' behaviours; 4) safety and edibility concerns around peels and stalks; 5) knowledge as a key facilitator for 'root-to-tip' adoption; and 6) the importance of sensory appeal. These themes illustrate a perceived growing consciousness of food waste and desire to reduce its associated negative consequences. However, RESULTS highlight structural, social and personal barriers which may contribute to an intention behaviour gap. Improving awareness of the safety and edibility of peels and stalks and practical knowledge related to their use may facilitate adoption of 'root-to-tip' behaviours. Ensuring the sensory appeal of 'root-to-tip' dishes is important to increase acceptability and prevent plate waste.

CONCLUSIONS

Our findings contribute to the understanding of attitudes towards food waste reduction practices at the preparation stage, in particular the use of peels and stalks, and highlight a need for increased knowledge to facilitate behaviour adoption. The next stage of this research will collect data from university students to inform the design of a behavioural intervention to introduce 'root-to-tip' dining within higher education foodservice.

SOAP10_15

HOW THE OVER-EATING AFFECTS HUMAN AND PLANET HEALTH: THE ECOLOGICAL IMPACT AND THE METABOLIC FOOD WASTE OF OVERWEIGHT AND OBESE INDIVIDUALS

Donato Angelino[1]; Elisabetta Toti[2]; Marina Ramal-Sanchez[1]; Veronica D'Antonio[1]; Chiara Bravo-Trippetta[1]; Mauro Serafini[1]
[1]Department of Bioscience and Technology for Food, Agriculture and Environment, University of Teramo, Teramo, Italy; [2]CREA - Centro di ricerca Alimenti e nutrizione, CREA - Centro di ricerca Alimenti e nutrizione, Rome, Italy

BACKGROUND AND OBJECTIVES

Over-eating is one of the main drivers of obesity because of an Excess of Body Fat (EBF). This condition leads not only to human health issues, but also impacts the planet by wasting environmental resources used to produce the excess of food. Thus, the Metabolic Food Waste (MFW) index has been developed, calculated as the amount of food wasted for EBF accumulation and greenhouse gas (GHG) emissions, water and land used for its production. The present study aims at evaluating and comparing the MFW and ecological footprints of some Mediterranean (MEC) and North European (NEC) countries.

METHODS

The MFW from six Mediterranean and North European countries has been calculated as follows: i) EBF, considered as the fat resulted from the difference between ideal and real body weight of overweight and obese individuals, based on FAOSTAT and WHO databases [1]; ii) food wasted for EBF accumulation and energy from the main food categories by retrieving the FAO Food Balance Sheets 2010-2019 [2]; iii) GHG emissions and water and land impact to EBF by foods, according to WWF Virtual Shopping Cart [3] and Barilla Centre for Food and Nutrition [4]. Data were standardized as for the total population, and for 100,000 citizens.

RESULTS

NEC had the highest rates of obese individuals (UK and Sweden on the top) while MEC had slightly higher overweight people rates (Italy and France on the top). An overall higher EBF value for 100,000 citizens, both obese subjects and overweight, was found in NEC compared to MEC, in both cases led by low population countries. Data on MFW and ecological footprints showed that, regardless of the country, obese individuals had an impact two-to-three folds higher than overweight subjects. Highest values of MFW and ecological footprints were found for MEC compared to NEC as for the whole and overweight/obese populations.

CONCLUSIONS

This study highlights the harmful role of over-eating and – consequently – overweighting not only on human health but also on food waste rates and the associated resource exploitations of the Earth. In particular, the consideration of MEC as holders of the Mediterranean Diet, one of the healthiest and most sustainable dietary patterns, should be carefully reconsidered. Informational campaigns should be developed to improve awareness of conscious dietary choices for the health of both humans and the planet.

SOAP16_01

HEMOGLOBIN MEDIATES ASSOCIATION BETWEEN AIR POLLUTION AND GROWTH: MODERATING EFFECTS OF NUTRITION

Wang Shaokang[1, 2]; Xingyi Jin[3]; Chuanyan Yuan[4]
[1]Public health, Southeast university, najing, China; [2]Clinical Medical Research Center for Plateau Gastroenterological Disease of Xizang Autonomous Re, Xizang Minzu University, Xizang, China; [3]Public health, Southeast university, Nanjing, China; [4]Gynaecology and Obstetrics, Zhongda hospital, southeast university, nanjing, China

BACKGROUND AND OBJECTIVES
There have been inconsistent findings in previous studies regarding the relationship between air pollutants and hemoglobin of offspring as well as that between air pollutants and development in offspring. There have been a few studies that have examined the postnatal effects of air pollution on offspring. A unified nutrition package (YingYangBao, YYB) intervention study has been conducted in China in order to improve the growth and development of children in anemia areas, but the RESULTS have also been inconsistent. The purpose of this study was to examine the relationship between air pollution (PM2.5, PM10, SO2, and CO), the hemoglobin of offspring, stunting, and underweight. This study also explores whether hemoglobin levels play an intermediary role, as well as evaluates the regulation effect of nutrition on hemoglobin levels.
METHODS

A unified nutrition package intervention study was conducted in western, China between 2016 and 2023. In accordance with WHO guidelines, stunting, underweight, height-for-age z score (HFA), weight-for-age z score (WFA), and anemia status were all defined. A daily average of PM2.5, PM10, SO2, and CO levels was collected from the National Urban Air Quality Real-Time Dissemination Platform (http://www.cnemc.cn/sssj/) of the China Environmental Monitoring General Station. Linear regression and logistic regression models were used to assess the correlation between air pollution and the above indicators. The role of nutrition in this was also assessed.

RESULTS

A total of 10766 children under 5 years of age participated in this study. According to our study, all four categories of air pollutants reduce hemoglobin levels, but their associations with growth and development were not uniform. Additionally, air pollution had a greater impact on growth in individuals who were anemic than in those who were not anemic. The levels of hemoglobin were responsible for 13% of the HFA caused by air pollution. Furthermore, the length of time a nutrition package is in use may be able to regulate the effects of air pollution on hemoglobin and HFA. Nutrition packs(YYB) are beneficial when used for longer than 10 months by children under 60 months of age, as they reduce the adverse effects of air pollution.

CONCLUSIONS

This study contributes to the research regarding the association between exposure to air pollution and hemoglobin and growth in offspring. As a result of our study, we have discovered that air pollution levels affect the hemoglobin and development of offspring. Nutritional interventions may be able to mitigate the negative effects of air pollution.

SOAP16_02

THE ENVIRONMENTAL IMPACT OF DIET IN LATIN AMERICAN POPULATIONS: A SYSTEMATIC REVIEW AND META-ANALYSIS

Carolina Araya-Bastias[1]; Josefa Garzillo,[2]; Jana Anderson,[3]; Jill Pell,[3]; Duncan Lee,[4]; Carlos Celis-Morales,[1]
[1]School of Cardiovascular and Metabolic Health, University of Glasgow, Glasgow, United Kingdom; [2]Center for Epidemiological Research in Nutrition and Health, Faculdade de Saúde Pública USP, São Paulo, Brazil; [3]School of Health & Wellbeing, University of Glasgow, Glasgow, United Kingdom; [4]Mathematics and Statistics Building, University of Glasgow, Glasgow, United Kingdom

BACKGROUND AND OBJECTIVES

Several studies have estimated the environmental impact of dietary patterns based on food consumption data from developed countries (1-5). Their findings have been collated in several systematic reviews examining the impact of dietary choices on both environmental sustainability and health (6-10). However, equivalent analyses in developing regions, particularly Latin America, are limited. This systematic review and meta-analysis aimed to examine and synthesize available data on the environmental impacts of dietary patterns in Latin American populations.

METHODS

Searches were conducted using Medline, Embase, Web of Science and Scopus databases. Inclusion criteria were studies measuring different environmental impact indicators (EIIs) such as carbon, water or ecological footprint related to food consumption in Latin American countries. We synthesized the evidence on the most reported EIIs, considering socio-demographic factors and food contribution where available. Pooled estimates for average carbon and water footprints were derived for individual countries, considering crude and energy-adjusted (to 2000 Kcal) values, dietary assessment method, and sociodemographic variables.

RESULTS

Of the 3980 studies screened, 29 met the eligibility criteria. Data on the environmental impact of diet were reported for eight Latin American countries with most studies conducted in Brazil. Carbon and water footprints were the most commonly reported EIIs. Dietary carbon footprint (CF) ranged from 2.5 to 6.4 Kg CO2-equivalents/person/day/2000 Kcal, with Argentina and Brazil showing the highest emissions. The water footprint was between 2078 and 4614 L/person/day/2000 Kcal for Chile and Brazil, respectively. Beef contributed the largest share (around 70%) of environmental impact, while pulses, vegetables, and seafood had the lowest (approximately 5%). Higher CFs were observed for individuals with higher education levels and in urban locations (p-value<0.05).

CONCLUSIONS

Our review reveals a significant lack of research on the environmental impact of diet in Latin American populations, beyond Brazil. Establishment of a regional database, documenting the environmental footprint of commonly consumed foods, would support development of evidence-based public policies to achieve more sustainable diets in Latin America.

SOAP16_03

PERCEPTIONS OF A MORE PLANT-BASED DIET IN A WESTERN EUROPEAN COUNTRY: PERSONAL DIETARY HABITS, EDUCATION AND CURRICULUM IN SCHOOLS, AND SUBSIDIES TO FARMERS PRODUCING PLANT-BASED FOODS

Inga Thorsdottir[1]; Birna Thorisdottir[2]; Thorhallur Halldorsson[1]; Bryndís Eva Birgisdóttir[1]
[1]Faculty of Food Science and Nutrition, School of Health Sciences and Unit for Nutrition Research, The Icelandic Health Science Institute, Reykjavík, Iceland; [2]Faculty of Food Science and Nutrition, Unit for Nutrition Research, University of Iceland, Reykjavík, Iceland

BACKGROUND AND OBJECTIVES

Health and environmentally sustainable food based dietary recommendations are aiming for a decreased intake of food from animal sources, especially red meat, and more nutritious and variable plant-based dietary options. This is a challenge that includes raising knowledge, changes in food policy, production and consumption habits. The objectives of this study was to gather knowledge on adults‘ perseptions of plant-rich diets, i.e., as their personal dietary habits, as the diet of the future to include in education and schools‘ curricula, and as subsidies to farmers to locally produce plant-based foods.

METHODS

Online opinion questions to a population representative group of adults were used to collect perspectives to 1. transitioning towards a more plant-based personal diet for health and the environment, 2. inclusion of education on plant-based diet for health and environment in preschool and elementary school curricula, and 3. Subsidies to farmers for production of more plant-based food products. Differences between demographics were tested by chi squared test.

RESULTS

1. 37% of respondents were positive towards personal diet transition, 33% were negative; 2. 51% were positive towards education about plant-based diets for health and environment in preschools and elementary schools, 14% negative; 3. 73% were positive towards supporting farmers to increase production of plant-based foods, 5% negative. Women, people living in a city and university-educated were more positive to all changes than men ($p<0.001$), people living outside bigger cities ($p<0.001$, $p<0.01$, $p<0.01$), and people with lower educational degree ($p<0.001$), respectively.

CONCLUSIONS

There was less willingness to alter personal diets than to support societal-level changes, incorporating plant-based topics into school curricula and providing subsidies to farmers. Strongest agreement was found for the support to farmers to produce more varied plant-based type of food.

ENHANCING DIVERSITY AND ENVIRONMENTAL SUSTAINABILITY OF SUPPLEMENTARY NUTRITION PROGRAM UNDER INTEGRATED CHILD DEVELOPMENT SERVICES SCHEME: STAKEHOLDERS' PERCEPTIONS FROM RURAL CHHATTISGARH, INDIA

Ayushi Dhasmana[1]; Sahiba Kohli[1]; Vidisha Sharma[1]; Praveen Devarsetty[2]; Vivekanand Jha[3]; Christopher Millet[4]; Suparna Ghosh-Jerath[1]
[1]Nutrition and Food Systems, The George Institute for Global Health India, New Delhi, India; [2]Primary Health Care, The George Institute for Global Health, Hyderabad, India; [3]Renal and Metabolic, The George Institute for Global Health, Delhi, India, India; [4]School of Public Health - Faculty of Medicine, Imperial College London, London, United Kingdom

BACKGROUND AND OBJECTIVES

The Supplementary Nutrition Program (SNP) under Integrated Child Development Services (ICDS) Scheme in India aims to bridge the nutrition gap among young children, pregnant and lactating women [1]. With its extensive outreach the program presents an ideal platform for promoting diverse, nutritious and sustainable diets [2]. This study explores stakeholders' perceptions on diversifying food/meals and promoting environmental sustainability within SNP-ICDS in rural Chhattisgarh.

METHODS

An exploratory qualitative study was conducted in Sarguja district, Chhattisgarh engaging with program implementers and facilitators at grassroots, block and district level. Participants included Anganwadi workers, self-help groups (SHGs), Panchayati Raj Institution members (rural local self-government), Child Development Project Officer (block level), district program officer (district level) along with program recipients. Data was collected using semi-structured interviews and focus group discussions, and analysed through inductive thematic approach to identify themes on key aspects influencing meal diversity, environmental sustainability and potential strategies to improve the same.

RESULTS

Provisions under the SNP-ICDS include hot cooked meals (rice served with pulse preparation) for children aged 3-6 years and take-home rations (ready-to-eat premix packets) for children aged 6 months to 3 years, pregnant and lactating women. Meals were perceived as monotonous by the stakeholders. SHGs, who play a key role in procuring food ingredients for meals, reported budgetary constraints that hinder procurement of diverse food items. Stakeholders proposed local food procurement from small-scale farmers and establishing nutrition gardens managed by SHGs as key intervention strategies. Community mobilization for inculcating a sense of shared ownership and convergence with other government departments including Panchayati Raj, rural development, water, and horticulture were suggested. Capacity building of grassroots stakeholders on dietary diversity, preparation of low-cost nutritious meals, along with advocacy for local food procurement, improved budget allocation were considered crucial strategies.

CONCLUSIONS

The study highlights opportunities to enhance dietary diversity and sustainability within the SNP-ICDS through local food procurement. Fostering collaboration with various government departments, community mobilization, addressing logistical and financial challenges could significantly strengthen program's effectiveness and sustainability.

SOAP16_06

SUSTAINABILITY NUTRITION BALANCE: A METRIC INTEGRATING NUTRITION AND ENVIRONMENTAL IMPACT OF FOODS IN THE CONTEXT OF WHOLE DIETS

Alessandra Grasso[1]; Marcelo Tyszler[2]; Hans Blonk[2]; Judith Groen[2, 3]; Roline Broekema[4]; Thom Huppertz[5, 6]; Stephan Peters[7]

[1]Sustainable nutrition, Mérieux NutriSciences | Blonk, Washington, United States of America; [2]Center of Excellence for Environmental Footprinting, Mérieux NutriSciences | Blonk, Gouda, Netherlands; [3]Sustainablility, The Netherlands Nutrition Center, Den Haag, Netherlands; [4]Wageningen Social and Economic Research, Wageningen University & Research, Wageningen, Netherlands; [5]School of Food and Nutritional Sciences, University College Cork, Cork, Ireland; [6]Science & Technology, FrieslandCampina R&D, Amersfoort, Netherlands; [7]Sustainability, Nederlandse Zuivel Organisatie, Den Haag, Netherlands

BACKGROUND AND OBJECTIVES

Food consumption significantly impacts both human and planetary health, demanding integrative approaches to assessing the nutrition and environmental sustainability of food products. Because food products are not consumed in isolation but within the context of entire diets, the nutritional value and environmental burden of a food product is dependent on the dietary context. This study evaluates the Sustainability Nutrition Balance (SNB) score, an integrated metric indicating the environmental burden of food products in relation to the nutritional value they bring to a nutritionally adequate diet for a specific population. These scores may be valuable to guide product development and communication in the direction of more nutrient-dense, environmentally sustainable diets.

METHODS

We present a methodological approach for calculating the SNB score using an optimization-based framework incorporating Dutch nutrition recommendations and food consumption, composition and cradle-to-plate environmental impact data. The dependency on the dietary context was tested by calculating the SNB score for different age- and sex-groups. Various methodological choices, including optimization strategies and regression approach, were systematically tested for their influence on the SNB score. Sensitivity analyses using Monte Carlo simulations were conducted to evaluate the robustness of the RESULTS.

RESULTS

As anticipated and intended, the SNB score demonstrated high dependency on the dietary context. Although mean SNB scores of food groups differed across the different age- and sex-groups, they generally followed the same direction expect for legumes: the mean SNB score of legumes was negative for women and positive for men. The RESULTS of the Monte Carlo analysis indicate that poor data quality compromised the robustness of the SNB score. Methodological choices such as optimization method and constraints influenced the SNB score, but to a lesser degree as compared to dietary context.

CONCLUSIONS

The SNB score provides a context-sensitive metric integrating nutrition and environmental impact at a diet level. While the approach offers valuable insights, its applicability is limited by data intensity, methodological complexity, and understandability. Future work should focus on simplifying the framework, enhancing data quality, and addressing challenges in global scalability and stakeholder communication.

SOAP16_07

Do plant-based foods facilitate a sustainable dietary transition in Europe? RESULTS of a survey in 9 EU Countries

Federico Perez-Cueto[1]; Jean-Paul Garin[1]; Helene Reinbach[2]; Maxime Michaud[3]
[1]Research Group Sustainable Food Transitions, Department of Food, Nutrition & Culinary Science, University of Umea, Umea, Sweden; [2]Department of Food Science, University of Copenhagen, Copenhagen, Denmark; [3]Research Center, Lyfe Institut, Écully, France

BACKGROUND AND OBJECTIVES

Most dietary guidelines promote eating predominantly plants for maintaining good health and preventing chronic disease [1]. The more plant-rich the diet is, the lower its environmental footprint [2]. Although, a dietary shift towards more plant-based diets is desirable from human and environmental health, changing food behaviours at population level is challenging [3–5]. Therefore, the objective of this study is to describe the sociodemographic characteristics of EU citizens who consider that plant-based foods facilitate the dietary transition.

METHODS

Data Collection: A cross-sectional survey was conducted online by Enkätfabriken AB before and after the holiday season (40% December, 2023; 60% February, 2024) in BE, CH, DE, DK FI, FR, IT, RO, SE [6]. The questionnaire covered sociodemographic characteristics (e.g. age, sex, locality of residence, education, diet lifestyle), and several attitudinal statements measured with a 7-point Likert scale.

Data Analysis: A dummy variable was created for the statement "PBF contribute to a sustainable healthy diet transition," with 5–7 (agreement) coded as 1 and 1–4 (disagreement/neutral) as 0. This variable was used as dependent in a logistic regression controlling for the effect of sociodemographic characteristics. A p-value below 0.05 was considered significant.

RESULTS

The likelihood of agreement was positively associated with higher educational achievement, self-reported financial status, and a more plant-based diet. Conversely, agreement was less likely among older individuals, men, and those living in rural areas. A green persona profile was associated with young, urban, university-educated women who were financially better off, not living alone, and followed a plant-based diet.

CONCLUSIONS

CONCLUSIONS: Interventions aimed at promoting a sustainable dietary shift should be inclusive and specifically target middle-aged men, rural residents, individuals without a university education, those experiencing financial struggles, living alone, and following an omnivorous diet.Funding: HealthFerm Project, WP4 Consumer studies, Horizon Europe GA 101060247 and from the Swiss State Secretariat for Education, Research and Innovation (SERI) contract No. 22.00210.

SOAP16_08

OPTIMIZATION OF CHILDREN'S DIETS IN BURKINA FASO TOWARDS HEALTHIER, MORE AFFORDABLE, AND SUSTAINABLE DIETS

Loty Diop[1]; Elodie Becquey[1]; Aulo Gelli[2]; Lieven Huybregts[3]
[1]Nutrition, Diets and Health, International Food Policy Research Institute, Dakar, Senegal; [2]Poverty, Gender and Inclusion, International Food Policy Research Institute, Washington, United States of America; [3]Nutrition, Diets and Health, International Food Policy Research Institute, Washington, United States of America

BACKGROUND AND OBJECTIVES

Dietary guidelines have not yet been established for Burkinabe children, who continue to face health risks linked to poor diet quality amidst economic and natural resource constraints. The aim of this study was to formulate context-specific, healthy, affordable and sustainable diet recommendations that take into account the habitual consumption patterns for children in Burkina Faso.

METHODS

We optimized the diet of 3,932 children 2 to 8 years of age, living in rural Burkina Faso. We used 24h recall data collected at lean and post-harvest seasons between 2017 and 2020. We implemented three rounds of multi-start hierarchical optimizations using constraints on deviations from habitual diet, healthiness, affordability, and sustainability by altering criterion priority. Firstly, we prioritized deviations from habitual diet and healthiness by optimizing diets to meet a set of nutritional constraints while minimizing the deviation from the habitual diet (Step 1). Second, we minimized the cost of the diet under nutritional constraints, ensuring that the deviation from the habitual diet did not exceed the deviation found in Step 1 (Step 2). Finally, we minimized water use as a proxy for the environmental footprint, while still meeting constraints established in previous steps as well as an additional constraint on land use (Step 3).

RESULTS

All optimized diets maintained the most consumed staple food but slightly reduced the number of weekly portions in favor of additional portions of beans, fruits, vegetables, and animal source foods. Fish was favored among flesh foods due to its lower cost in our study area, and optimized diets generally included three additional portions of fish and one portion of red meat or poultry per week compared to habitual diets where flesh foods are barely consumed. Eggs (up to two more eggs per week) and dairy (three additional portions per week) were also introduced in optimized diets. Though minimized, the cost of the optimized diets was higher than that of the habitual diets ($3 vs. $2 US dollar/child/day). Water use necessary to meet all our constraints was two times higher than that for the habitual diet.

CONCLUSIONS

Healthier diets in Burkina Faso require more diversity with the inclusion of more fruits, vegetables, and animal source foods. The economic cost and environmental footprint of these optimized diets are higher than that of current diets. In the context of poverty and climate change crisis, identifying effective policy actions to make these diets more accessible is therefore crucial.

MICROBIAL COMMUNITY ASSEMBLY AND METABOLIC DIVERSITY IN A LEGUME-BASED MATRIX (SYMPOSIUM BIOSPHERA)

Ayité Adama Hondegla[1, 2]; Vincent Hervé[1]; Eric Dugat-Bony[1]; Lucia Brisset-Espinosa[1]; Anne Sainteve[1]; Pascal Bonnarme[1]
[1]UMR SayFood, Université Paris-Saclay, INRAE, AgroParisTech,91120, Palaiseau, France; [2]Graduate school BIOSPHERA, Université Paris-Saclay, Palaiseau, France

BACKGROUND AND OBJECTIVES

The current food system significantly contributes to the ongoing environmental crisis. In recent decades, efforts have been made to mitigate this impact, particularly by promoting increased consumption of plant-based proteins in place of animal-based proteins. Legumes, which are high in protein, fiber, and minerals, represent a sustainable and healthy alternative to animal-derived proteins. However, legumes can contain anti-nutritional factors that represent an obstacle to their consumption.

The main objective of this study is to establish a synthetic ecology approach, combined with consumer science METHODSthrough living labs, to design microbial communities capable of fermenting legume-based matrices while enhancing product nutritional and sensory qualities to meet consumers' expectations.
METHODS

For this study, three legume flours (chickpea, green lentil, and coral lentil) have been selected for fermentation based on their nutritional values and sourcing. Several microbial communities with varying functionalities have been chosen using genome-based modelling and empirical knowledge from a preselected subset of lactic acid bacteria, cheese-ripening bacteria, yeasts, and other bacteria from plant and dairy products.

To achieve healthy and sustainable legume-based products in line with consumers' expectations, living labs have been organized with different stakeholders to assess their expectations.

RESULTS

Using insights from the living labs, we have proposed a minimalist process for formulating a cheese-like product. the ability of selected microbial communities to ferment legume-based matrices while enhancing organoleptic and nutritional properties is being tested.

CONCLUSIONS
The RESULTS of this research will provide insights into the potential of different microbial consortia to colonize legume-based food matrices and deliver desirable nutritional and sensory properties. Additionally, we aim to propose guidelines for developing new legume-enriched products that meet sensory and functional requirements, as well as consumer needs and expectations. Furthermore, the study will provide manufacturers with models for fermented legume-based products suitable for pilot testing.

SOAP16_11

PHYSICOCHEMICAL CHARACTERISTICS OF THE PULP, SEEDS, AND POMACE OF UNDERUTILIZED BAEL (AEGLE MARMELOS) FRUIT

Anjana Kumari[1]; Eram S Rao[2]; Shruti Sethi[3]; Komal Chauhan[4]
[1]Food and Nutrition and Food Technology, Lady Irwin College, New Delhi, India; [2]Food Technology, Bhaskaracharya College of Applies Sciences, New Delhi, India; [3]Division of Food Science and Postharvest Tehnology, ICAR - Indian Agricultural Research Institute, New Delhi, India; [4]Food Science and Technology, NIFTEM, Sonipat, India

BACKGROUND AND OBJECTIVES

Aegle marmelos family Rutaceae commonly known as bael is a highly nutritious and well known for its wide range of medicinal attributes, is one of the fruit crops that earns the limited attention and utilization. It has been utilised for treating pain in conventional medical systems from antiquity like dysentery, diarrhoea, constipation, peptic ulcer and respiratory infections. Actions that have antimicrobial, anti-inflammatory, antidiabetic, antipyretic, analgesic, cardioprotective, anticancer, and radioprotective and antispermatogenic properties are also unveiled by bael. The bael processed products having nutritional and healing properties. The present research was conducted to evaluate physicochemical properties of seeds, pomace and pulp (without seeds) of bael fruit.

METHODS

Proximate composition, Dietary fibre (soluble and insoluble), amino acid profile, fatty acid profile, mineral content and antioxidant activity by DPPH were analysed using standard protocols

RESULTS

It was found that bael pulp, seeds and pomace are good source of protein, crude fibre, fat, ash, and dietary fibre. Dietary fibre was the major components in pulp, seeds and pomace among all the components. Seeds contained higher dietary fibre followed by pomace and fruit pulp (20.33, 20.5 and 13.19 g/100g). The seeds of bael fruit contained higher insoluble dietary fibre (17.14 g/100g) whereas pomace contained higher soluble dietary fibre (11.11g/100g) than other parts of bael under investigation. The seeds of bael fruit also contained higher protein content (19.61g/100g) than other parts of bael. Calcium, potassium and iron were observed in major quantities in seed powder. Amino acids and fatty acids occurred in good quantities in seed powder. Arginine and glutamic acid were prominent amino acids in seed powder. Palmitic acid and Oleic Acid were the predominant fatty acids in seed powder. Pomace powder showed good antioxidant activity.

CONCLUSIONS

Bael fruit has a therapeutic, medicinal, and nutritional value. It is urgently required to develop the technology for transforming this underutilised but magnificent fruit into new, viable value-added resources.

SOAP16_12

DIET QUALITY AND SUSTAINABLE LIFESTYLES, IBERO-AMERICAN MULTICENTER STUDY

Duran Aguero Samuel[1]; Solange Parra-Soto[2]; Georgina Georgina[3]; Gabriela Murillo[3]; Cavagnari Brian[4]; Nava Edna[5]; Jhon Jairo Bejarano[6]

[1]Faculty of Health Sciences, San Sebastián University, Providencia, Chile; [2]Departament Nutrition and Public Health, Biobio University Campus Fernando May, Chillán, Chile; [3]Department of Biochemistry, University Of Costa Rica, San Pedro, Costa Rica; [4]Escuela de Nutrición, Pontifical Catholic University of Argentina, Santo Tomás Moro Building, C1107AFB, Argentina; [5]Facultad de Salud Pública y Nutrición, Universidad Autónoma de Nuevo León, San Nicolás de los Garza, Mexico; [6]Departamento de Nutrición Humana, Universidad Nacional, Bogotá, Colombia

BACKGROUND AND OBJECTIVES

Low diet quality is associated with increased morbidity and mortality, however, it has not been explored whether diet quality is associated with sustainable lifestyles. The aim of this study is to associate diet quality with sustainable activities in Ibero-America.

METHODS

An observational, analytical, multicenter study was conducted with 6,067 participants from 14 Ibero-American countries via an online survey. Diet quality Healthy eating habits were assessed by measuring the frequency of consumption of the recommended food groups (fruits, vegetables, dairy, eggs, meat, legumes, breakfast and bread). Based on the frequency of consumption, each of the questions was scored as follows: “no consumption” (1 point), ‘less than recommended consumption’ (3 points), ‘suggested daily/weekly servings’ (5 points). The survey on sustainable lifestyles was validated and subdivided into 3 items: 15 questions that evaluate food and shopping; 12 questions that evaluate transportation, recreation and self-care; and 11 questions that evaluate the environment. This gives a range between 50 and 185 points, the higher the score, the better the adherence to sustainable lifestyles. Linear regression models were applied, adjusted for sex, nutritional status, schooling and age.

RESULTS

The mean age of the participants was 35.2 years (SD 12.7). When performing the associations between diet quality and sustainable lifestyles, it is observed that in reference to the first quartile, as diet quality increases, better sustainable lifestyles are presented, quartile 2 (β: 4.394; CI95% 3.99.445- 5.588), quartile 3 (β: 6.762; CI95% 5.556- 7.968) and quartile 4 (β: 10.525; Ci95% 9.234-11.816).

CONCLUSIONS

The higher quality diet is positively associated with presenting better sustainable lifestyles.

SOAP16_13

PSYCHOMETRIC EVALUATION OF THE GERMAN VERSION OF THE SUSTAINABLE FOOD CHOICE QUESTIONNAIRE (SUS-FCQ) IN A REPRESENTATIVE GERMAN SAMPLE

Ulrike Gisch[1]; Claus Rothenbuecher[1]
[1]Nutritional Psychology, Justus-Liebig-Universität Giessen, Institute of Nutritional Science, Giessen, Germany

BACKGROUND AND OBJECTIVES

To promote sustainable diets with a low environmental impact, it is crucial to understand the determinants that shape sustainable food choices. One important determinant is food choice motives, which refer to the motives, reasons or motivations behind choosing certain foods. Compared to broader determinants such as personality or values, these motives are more closely related to specific food choice decisions. Verain and colleagues (2021) developed the Sustainable Food Choice Questionnaire (SUS-FCQ), which assesses sustainable food choice motives. Since no German version of the SUS-FCQ has been available to date, we have translated the SUS-FCQ into German and will investigate its psychometric properties.

METHODS

In February 2025, we will conduct this pre-registered study. We will collect a representative sample (N = 660 participants) through a market research institute. The sample will be representative of the German adult population in terms of gender, age, and place of residence (federal state). In addition to the SUS-FCQ, the following questionnaires will be administered: Intuitive Eating Scale-3 (IES-3), Subscale Restrained Eating of the Dutch Eating Behavior Questionnaire (RE-DEBQ), Subscales Health, Social Image and Price of The Eating Motivation Survey (TEMS), Subscales Environmental, Social and Economic Sustainable Attitudes of the Sustainable Consciousness Questionnaire (SCQ) and Subscale Impression Management of the Balanced Inventory of Desirable Responding (BIDR-IM-SF).

RESULTS

We will present the RESULTS of the psychometric evaluation of the SUS-FCQ. We will assess the factor structure using a confirmatory factor analysis (CFA) and internal consistency using McDonald's Omega. We will test the convergent validity by examining the relationships of the SUS-FCQ with the IES-3, RE-DEBQ, the subscales of the TEMS, the subscales of the SCQ and BIDR-IM-SF through correlation coefficients. Furthermore, we will explore group differences in the SUS-FCQ based on gender, age, socioeconomic status (SES) and weight status.

CONCLUSIONS

We expect the German version of the SUS-FCQ to be a reliable and valid instrument for measuring sustainable food choice motives. By providing a German version of the SUS-FCQ, we aim to facilitate cross-country comparisons and investigate cultural differences in sustainable food choice motives.

CONFLICTS OF INTERESTS

SOAP16_14

RELATIVE ENVIRONMENTAL IMPACTS AND MONETARY COST OF FOOD CATEGORIES: FUNCTIONAL UNIT MATTERS

Florent Vieux[1]; Matthieu Maillot[1]; Corinne Marmonier[2]; Anthony Rouault[3]; Marlène Perignon[4]; Nicole Darmon[4]
[1]Research, MS-Nutrition, Marseille, France; [2]Research, CNIEL, Paris, France; [3]Research, ACTALIA, Saint-Lô, France; [4]MoISA, Univ Montpellier, CIHEAM-IAMM, CIRAD, INRAE, Institut Agro, IRD, Montpellier, France

BACKGROUND AND OBJECTIVES

The functional unit (FU) usually used to express the environmental impact or cost of a food is the mass (1 kg). The aim of this study was to explore how the choice of a functional unit (FU) influences the environmental and economic rankings of food categories.

METHODS

Dietary data from the latest French national food survey (INCA3) as well as data on the nutritional composition (CIQUAL), environmental impacts (Agribalyse V3.1) and average price (Kantar) of each food consumed in INCA3 were merged together. For each INCA3 adult (n=2121), we estimated nutrient intakes, environmental impacts (14 metrics) and monetary costs associated with her/his consumption of 20 food categories. Still at the individual level, we expressed the environmental impacts and monetary costs of each food category per weight consumed (1 kg) and also according to 3 others general FUs (100 kcal, 1 portion, 1 overall nutritional quality unit) and to 9 nutrient-specific FUs (e.g. 50 g of protein, 30 g of fiber, etc.). Finally, for each FU, the food categories were ranked according to their median impact calculated among individuals. To express the RESULTS, food categories were classified in 3 classes according to the food source: animal (ruminant meat, seafoods, …), plant (fruits, vegetables, legumes, …) and animal co-products (dairy products, animal fats, eggs).

RESULTS

When FU was mass (1 kg), the animal source food categories were more impactful and more expensive than the plant source food categories. However, for other FUs, the rankings of food categories differed, particularly with the overall nutritional quality FU. For example, while seafoods was the most expensive and the third highest global warming potential (GWP) food category for the 1kg FU, it was among the least expensive (ranked 12th for cost) and least impactful (ranked 13th for GWP) with the overall nutritional quality FU. Despite such differential rankings, some food categories rankings were persistent whatever the FUs: compared to other food categories, legumes, potatoes and whole grains were less expensive and less impactful, meats (especially ruminant ones) were more expensive and more impactful. Dairy and eggs were ranked mostly in the middle of the range of plant-based foods, both in terms of price and environmental impact.

CONCLUSIONS

By providing a broad overview of different “metric × UF” situations, this study illustrates the major influence of FU choice on the hierarchy of food costs and environmental impacts. It highlights the complexity of assessing sustainability at the food level and the need for caution when developing recommendations.

CONFLICTS OF INTERESTS

SOAP16_15

KEY TRANSITIONS TOWARDS A HEALTHIER AND MORE SUSTAINABLE FOOD ENVIRONMENT IN DUTCH HOSPITALS

Gerda Pot[1]; Iris De Koning[1]; Lies Cuppers[1]; Renate Winkels[2]; Menrike Menkveld-Beukers[1]
[1]-, Nutrition & Healthcare Alliance , Ede, Netherlands; [2]Division of Human Nutrition, Wageningen, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES
Healthcare settings provide a vital platform to promote healthy and sustainable food choices among patients, staff and visitors through their food environments. We designed the Dutch national intervention program 'A-Taste-of-Excellent-Healthcare' (TEH) to support hospitals to achieve a better food environment for patients, staff and visitors by 2030 (1) via a comprehensive learning network and toolkit featuring a step-by-step implementation plan (2) and hereby present the RESULTS between 2020-24.
METHODS

20 frontrunning hospitals self-monitored their progression using a traffic light system based on Dutch, evidence-based nutrition guidelines and additional open questions. We use descriptive analyses to present data on implementation progress of actions for a better food environment.

RESULTS

All 20 hospitals entered TEH with a vision for healthy foods for patients and developed a vision for healthy foods for staff and visitors within 2 years (Figure in 3). Hospitals reported an increase in the availability of healthy foods, especially for patients and staff, e.g. more whole-grain options and fewer sugar-sweetened beverages. In line with increasing attention for sustainable nutrition, hospitals increasingly have more attention for sustainable foods, e.g. more plant-based proteins and meals. 19 hospitals (95%) developed a vision for sustainable nutrition for patients and 1 hospital was working towards this; for staff and visitors this was 85%. In 2024, 65% hospitals monitored food waste; for staff and visitors this was 75% and 85%. 10 of these frontrunner hospitals are working towards the aim to offer a minimum of 50% of protein as plant-based for visitors and for staff. For patients this is not monitored (yet) as it remains to be investigated what is medically responsible.

CONCLUSIONS
These RESULTS show that hospitals can shift towards better food environments within 2-4 years, with most substantial improvements in patients and staff's food environments. However, achieving more sustainable food offerings requires additional focus, particularly to address the needs of patients at risk of malnutrition. This national program serves as a model and knowledge resource to enhance health outcomes by leveraging nutrition in disease management and rehabilitation. In addition, it supports the aims of the national Greendeal sustainable healthcare (4) as hospitals are responsible for 7% of Dutch CO2 emissions. Fostering healthier and more sustainable food environments also benefits staff and visitors, promoting greater vitality and well-being, and ultimately also planet.

SOAP19_01

MORE FOOD BIODIVERSITY IN DUTCH DIET DOES NOT LEAD TO LESS ENVIRONMENTAL IMPACT

Rosalie Bakker[1]; Rosa Leek[2]; Reina Vellinga[3]; Corné van Dooren[4]; Mary Nicolaou[5]; Margreet Olthof[2]; Ingeborg Brouwer[2]
[1]Health Sciences , Vrije Universiteit Amsterdam, Amsterdam, Netherlands; [2]Health Sciences, Vrije Universiteit Amsterdam, Amsterdam, Netherlands; [3]National Institute for Public Health and the Environment, Rijksinstituut voor Volksgezondheid en Milieu (RIVM), Bilthoven, Netherlands; [4]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [5]Health Behaviour and Chronic Disease, Amsterdam Public Health Research Institute, Amsterdam, Netherlands

BACKGROUND AND OBJECTIVES

Poor diets significantly impact human and planetary health. Western diets are becoming more monotonous and, consequently, lack biodiversity. This dietary trend influences the dynamics of the Western diet and global food supply chains, further impacting agricultural and environmental factors. Understanding the role of food biodiversity in diet is essential for addressing human and planetary health.

METHODS

We assessed the associations between food biodiversity, measured as Dietary Species Richness (DSR), and six diet-related environmental impact factors: global warming, terrestrial acidification, freshwater eutrophication, marine eutrophication, land use and water consumption. Dietary intake data were retrieved from a nationally representative sample the Dutch National Food Consumption Survey 2012–2016, comprising of 2078 Dutch adults aged 19 to 79 years, collected via two non-consecutive 24-hour dietary recalls. DSR scores were calculated based on the count of unique biological species consumed over the two measurement days. Included food groups were fruits, vegetables, nuts and seeds, legumes, tubers, grains, meat, fish, and dairy. Excluded from the DSR calculation were alcoholic and nonalcoholic beverages, savory snacks, sugars, confectionery, oils, fats, condiments, spices, sauces, processed meat substitutes, and other highly processed foods. Diet-related environmental impact data were obtained from the Lifecycle Assessment database of the National Institute for Public Health and the Environment of the Netherlands(v2019). Associations between DSR scores and environmental impact factors were examined using separate linear regression analyses, with models adjusted for age, sex, educational level, energy intake and seasonality.

RESULTS

The mean DSR was 13.0 species (SD 4.55) ranging from 2-33 species over two days. Higher DSR was associated with slightly higher greenhouse gas emissions (β0.053 [95%CI 0.028-0.077]), freshwater eutrophication (β8.429E-6 [95%CI 6.63E-6 – 1.02E-5]), land use (β0.015 [95%CI 0.002-0.028]) and water consumption (β0.013 [95%CI 0.011-0.014]). DSR was not associated with terrestrial acidification and marine eutrophication (p-values >0.05).

CONCLUSIONS

The RESULTS of this study suggests that for every additional species consumed the environmental impact of the diet increases. Our findings underscore the complex relationship between DSR and environmental impact factors and the need for nuanced approaches to mitigate environmental impacts while promoting dietary diversity.

DIETARY ENVIRONMENTAL IMPACT, FOOD INTAKE, AND MICRONUTRIENT STATUS IN ELDERLY: THE LIFELINES-MINUTHE STUDY

Elise de Boer[1]; Yinjie Zhu[2]; Junyang Zou[1]; Reina Vellinga[3]; Pieter Van 'T Veer[4]; Jenny Kootstra-Ros[5]; Ido Kema[5]; Gerjan Navis[6]; Ineke Riphagen[7]; Stephan Bakker[6]; Eva Corpeleijn
[1]Epidemiology, University Medical Center Groningen, Groningen, Netherlands; [2]Consumption and Healthy Lifestyles, Wageningen University & Research, Wageningen, Netherlands; [3]National Institute for Public Health and the Environment, Rijksinstituut voor Volksgezondheid en Milieu (RIVM), Bilthoven, Netherlands; [4]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [5]Laboratory Medicine, University Medical Center Groningen, Groningen, Netherlands; [6]Internal medicine, University Medical Center Groningen, Groningen, Netherlands; [7]Certe Medical Diagnostics and Advice, Medical Center Leeuwarden, Leeuwarden, Netherlands

BACKGROUND AND OBJECTIVES

The growing global population demands a shift towards sustainable diets that are healthy, environmentally friendly, acceptable, and affordable. A shift towards different food sources (e.g., more plant-based) has consequences for micronutrient intake and bioavailability. This study examines whether micronutrient status in elderly, a population at risk of deficiency, is different between diets with high or low environmental impact.

METHODS

For 689 participants of the Lifelines-MINUTHE (Micronutrients and Health inequalities in Elderly) study, dietary intake was assessed using the Lifelines Food Frequency Questionnaire (207 food items). Diet-induced GHGE and BWC were calculated using Lifecycle Assessment data by the Dutch Institute for Public Health and the Environment and adjusted for food weight to examine the dietary patterns. Micronutrient status was assessed by serum levels and 24-hour urinary excretion. Nutrient status is presented as median (Q1-Q3) and differences between high and low impact diets were tested using the Mann-Whitney U test.

RESULTS

Mean ± sd age was 64 ± 4 years and 51% was male. Meat (beef and pork), ready-to-eat meals, cheese, and vegetables mostly contributed to GHGE. Fruit, fats and oils, cooked grains, nuts, and vegetables mostly contributed to BWC. The lowest GHGE tertile, compared to the highest, had lower 24-hour urinary excretion (mmol/day) of sodium (138 (108-186) vs. 156 (123-192), $p = 0.009$) and protein biomarker urea (366 (310-454) vs. 404 (339-490), $p < 0.001$). Low dietary GHGE was also related to lower serum levels of vitamin E (γ-tocopherol) (1.5 (1.2-2.0) vs. 1.7 (1.4-2.3) µmol/L, $p < 0.001$). Evaluating sustainability from water consumption perspective, the lowest BWC tertile, compared to the highest, had lower serum levels of folic acid (14.6 (10.5-22.1) vs. 18.6 (12.7-27.3) nmol/L, $p < 0.001$), vitamin B6 (53 (35-79) vs. 60 (42-92) nmol/L, $p = 0.004$), vitamin B12 (265 (209-338) vs. 300 (230-337) pmol/L, $p = 0.017$), vitamin D3 (62 (43-75) vs. 65 (49-80) nmol/L, $p = 0.040$), and vitamin E (α-tocopherol) (33 (28-38) vs. 34 (30-39) µmol/L, $p = 0.012$), and higher excretion of sodium (155 (124-193) vs. 143 (109-184) mmol/day). Data analyses on nutrient (in)adequacy and additional biomarkers are ongoing.

CONCLUSIONS

Dietary patterns with lower environmental impact in diverse domains are associated with altered (sub)clinical nutrient status. Dietary recommendations promoting lower environmental impact should carefully consider nutrient adequacy, particularly in populations at risk for deficiency.

SOAP19_03

AGE AND SEX RELATED DIFFERENCES IN DIETARY PROTEIN INTAKE IN THE PROTEIN-I STUDY

Aoife Courtney[1]; Martina Wallace[1]; Breige Mcnulty[2]; Lorraine Brennan[1]
[1]School of Agriculture and Food Science, Institute of Food and Health, Conway Institute, University College Dublin, Dublin, Ireland; [2]School of Agriculture and Food Science, Institute of Food and Health, University College Dublin, Dublin, Ireland

BACKGROUND AND OBJECTIVES

Plant-based dietary patterns have gained popularity for both human and planetary health reasons. Protein diversification offers a practical way to transition to a more sustainable and healthy diet, while also protecting the environment. The aim of this analysis was to examine age and sex related differences in protein intake from baseline data of the Protein-I study.

METHODS

A 16-week randomised controlled intervention is underway with healthy adults aged 18-65 years old to examine evidence-based approaches for diversification of protein intake. Baseline data was used for this analysis.

RESULTS

The n=179 sample (60% female, mean age 42.8 years old, mean BMI 25.7kg/m2) had an average protein intake of 1.3±0.46 grams per kilogram body weight per day (g/kg/ BW/d), with 48% meeting or exceeding 1.2g/kg BW/d. Participants under 50 years old had significantly higher average protein intakes (1.3±0.48g/kg BW/d (n=126)) than those over 50 years old (1.1±0.37g/kg BW/d (n=53), $p<0.05$). Males over 50 had the highest prevalence of not meeting an average protein intake of at least 0.83g/kg BW/d (25%, n=5). This contrasts with males under 50, where 98% achieved an intake of at least 0.83g/kg BW/d (n=50). Among females, 18% of those over 50 did not meet an average protein intake of 0.83g/kg BW/d compared to 15% of females under 50. This age-related difference in protein intake was less pronounced in females (3%) than in males (23%). Food groups predominantly contributing to protein intake varied across age groups, where key food groups contributing to protein intake in participants under 50 were unprocessed white meat (12%), vegetables and vegetable dishes (9%) and unprocessed red meat (7%). The food groups predominantly contributing to protein intake in participants over 50 were vegetables and vegetable dishes (11%), unprocessed white meat (9%) and fish and fish dishes (7%).

CONCLUSIONS

Age and sex related differences in protein intake were identified, where protein intake was significantly higher in participants under 50 years old. The difference in meeting an average protein intake of 0.83 g/kg BW/d across age groups was less pronounced in females compared to males. Animal protein sources emerged as key contributors to protein intake in both age groups, but featured more prominently in the under 50 year old age group. These RESULTS highlight the potential to broaden protein intake across a wider range of foods and emphasises the importance of personalised dietary advice rather than a ‘one-size fits all’ approach.

ENVIRONMENTAL CHANGE AND THE DOUBLE BURDEN OF MALNUTRITION IN LMICS: AN EVIDENCE- AND SYSTEMS-BASED CONCEPTUAL FRAMEWORK

Paraskevi Seferidi[1]; Karen Bonilla-Aguilar,[2]; Aline Carvalho[3]; Lita Palomares-Estrada[4]; J. Jaime Miranda,[5]; Birgit Kopainsky,[6]; Christopher Millett,[1]; Leandro Garcia,[7]
[1]School of Public Health - Faculty of Medicine, Imperial College London, London, United Kingdom; [2]CRONICAS Centre of Excellence in Chronic Diseases, UPCH, Lima, Peru; [3]School of Public Health, Universidade de São Paulo, São Paulo, Brazil; [4]Swiss Centre for International Health, Swiss Tropical And Public Health Institute, Allschwil, Switzerland; [5]Sydney School of Public Health, University of Sydney, Sydney, Australia; [6]Department of Geography, University of Bergen, Bergen, Norway; [7]Centre for Public Health, Queen's University Belfast, Belfast, United Kingdom

BACKGROUND AND OBJECTIVES

Increasingly globalised food systems of many low- and middle-income countries (LMICs) have led to a 'double-burden of malnutrition' (DBM), where overnutrition and undernutrition co-exist within the same population, household or individual. Climate-driven environmental change is intrinsically linked to food systems, which need to both adapt to and mitigate further environmental degradation. This study aimed to describe the food system drivers that interconnect climate and climate-driven environmental change and the DBM in LMICs, using an evidence- and systems-based approach.

METHODS

We conducted a realist-informed review of evidence synthesis studies to construct the evidence base that informed the development of the conceptual framework. The framework was then synthesised as a systems map to emphasize the co-evolution between factors and dynamics involved.

RESULTS

Interconnections between environmental change and the DBM were described across several planetary boundaries, such as climate change, biodiversity loss, land system change, freshwater use, and nitrogen and phosphorus flows, including fertiliser use. Feedback loops, accumulations, and delays characterise these interconnections, highlighting sources of potential policy resistance related to climate mitigation and adaptation actions and side effects against the DBM.

CONCLUSIONS

Addressing the DBM in a constantly changing climate requires triple duty actions that target food systems without causing unintended harm to the environment, while opportunities for nutritional health and environmental co-benefits are also evident. Using a system-based approach highlights key points of policy resistance and leverage points for effective action within the complex system of overnutrition, undernutrition, and environmental change.

BARRIERS TO ADOPTING A MORE PLANT-BASED DIET IN OLDER ADULTS

Annelies Rotteveel[1]; Sofie Van Rongen[1]; Amely Verreijen[2]; Peter Weijs[3, 4]; Jacqueline Langius[1]
[1]Department of Nutrition and Dietetics, Faculty of Health, Nutrition and Sport, The Hague University of Applied Sciences, The Hague, Netherlands; [2]Department of Nutrition and Health, HAS University of Applied Sciences, 's-Hertogenbosch, Netherlands; [3]Department of Nutrition and Dietetics, Faculty of Health, Sport and Physical Activity, Amsterdam University of Applied Sciences, Amsterdam, Netherlands; [4]Department of Nutrition and Dietetics, Amsterdam University Medical Centers, Vrije Universiteit, Amsterdam, Netherlands

BACKGROUND AND OBJECTIVES

A shift towards diets with more plant-based proteins and less animal-based proteins will provide important benefits for both health as well as the environment (1). However, changing dietary behaviour is challenging. To date, limited research has been conducted on the barriers to adopting a more plant-based diet among older adults (2,3). Therefore, the aim of this study was to identify and understand these barriers in older adults.

METHODS

Nine semi-structured focus group discussions were conducted, involving 41 participants (aged 55-90 years; independently living). Each group discussion consisted of several rounds, starting with a group conversation on the role and importance of animal products in a person’s diet, followed by a discussion on barriers towards more plant-based diets and possible factors to facilitate a change in diet. Finally people were asked whether they agreed or disagreed with a number of statements. Sessions were audio-recorded and transcribed. Thematic analysis was applied on the data to understand the barriers.

RESULTS

The focus group RESULTS show various barriers. Common barriers are that plant-based diets are difficult to prepare and ask for special preparation skills, while meat substitutes are less appreciated. Social environment appears to have a strong influence on people's diet. For some of the older adults plant-based food is negatively associated with veganism. A part of the group has the prevailing belief that animal products like meat and milk are essential for health. These ideas are strongly anchored through information they have received in the past. Some of the participants also indicated that animal proteins should always be part of a meal, otherwise 'it is not a real meal'.

CONCLUSIONS

Our findings show that older adults experience practical objections and obstacles as well as deeper beliefs that might hinder behavioural change. Challenging existing beliefs and overcoming the barriers offers opportunities for adopting more sustainable plant-based diets.

ADHERENCE TO THE TRADITIONAL CHINESE DIET AND ITS ASSOCIATION WITH ENVIRONMENTAL IMPACTS

Jizhao Niu[1]; Bai Li[1]; Angeliki Papadaki[1]
[1]Center for Exercise, Nutrition and Health Sciences, University of Bristol, Bristol, United Kingdom

BACKGROUND AND OBJECTIVES

Traditional diets may be sustainable as they might produce low environmental impact. However, little is known about how traditional Chinese diet (TCD) affects environment This study aimed to assess the environmental impacts of adherence to the traditional Chinese diet (TCD).

METHODS

This study utilized data from the China Health and Nutrition Survey, a prospective cohort study conducted across multiple waves, with data collected between 1997 and 2011 selected for analysis. Eligible participants were aged 18 to 74 years, and had participated in at least two survey waves with complete nutrition data available. TCD adherence was measured using a recently developed TCD index, based on three 24-hour recalls data. Environmental impacts were measured by calculating greenhouse gas emissions (GHG) (kgCO2 equivalents), total water footprint (TWF) (m^3) and total land use (m^2). Linear regression models were used to estimate the associations between TCD adherence and environmental impacts.

RESULTS

A total of 11,219 adults were included. The median (IQR) values for GHG emissions, TWF and total land use were 1.7kg (0.48-2.44), 1.38m^3 (0.65-2.35) and 2.66m^2 (1.10-5.26), respectively. Among food groups, rice accounted for the highest proportion of GHG emissions (40.5%) and TWF (26.7%), while beef and beef products contributed the most to total land use (40.1%). Compared to low TCD adherence, high adherence was associated with lower GHG emissions ($\beta = -0.03$ kg CO2e; 95% CI, -0.036, -0.029), lower TWF (β = -0.02 m3; 95% CI, -0.026, -0.014 m3) and lower land use (β = -0.05 m2; 95% CI, -0.07, -0.03 m2).

CONCLUSIONS

High adherence to the TCD may benefit the environment through reduced GHG emissions, TWF, and total land use.

SUSTAINABLE AND HEALTHY DIETARY BEHAVIOURS OF UNIVERSITY STUDENTS IN IRELAND: INSIGHTS FROM THE PLAN'EAT PROJECT

Lauren Devine[1]; Patrick Elliott[1]; Michael O'neill[1]; Abbie Horgan[1]; Eileen Gibney[1]; Aifric O'sullivan[1]
[1]UCD Institute of Food and Health, School of Agriculture and Food Science, University College Dublin, Dublin, Ireland

BACKGROUND AND OBJECTIVES

The complexity of modifying dietary behaviours is well established (1). When considering how best to achieve positive dietary change towards more sustainable and healthy dietary behaviours (SHDBs), the university setting has shown promise, providing substantial access to a wide range of young adults who are gaining increasing independence and autonomy with respect to their dietary choices during this life stage (2). As part of the University College Dublin (UCD) PLAN'EAT Living Lab (LL) (3), this study aimed to explore Irish university students' health and lifestyle practices, dietary behaviours, and dietary intakes.

METHODS

The UCD PLAN'EAT LL is a two-year study (February 2024-September 2026), with the aim to co-create, implement, and evaluate a series of interventions to support UCD students' transition towards more SHDBs. Young, healthy UCD students (aged 18-30 years) are currently being recruited to the UCD PLAN'EAT LL, with the aim to recruit 500 students. At LL baseline, participants are invited to complete a demographic, health, lifestyle, and dietary behaviour questionnaire, and up to three 24-hour dietary recalls via an online dietary recall tool, Foodbook24. Statistical analysis was conducted using SPSS (v.29) and R (v.4.3.1).

RESULTS

On average, participants currently enrolled in the LL (n=150) were aged 22 years (range 18 to 30 years), with 78% female (n=117) and 22% male (n=33). Participants were recruited across undergraduate (61%), postgraduate/ master (29%), and PhD (9%) levels, with a minority of participants undertaking alternative courses (1%). Preliminary analysis identified barriers to the consumption of a sustainable and healthy diet. For example, barriers existed for increased fruit and vegetable intake (e.g., price, storage restrictions), increased legume intake (e.g., lack of knowledge, required preparation/ cooking time), reduced meat intake (e.g., perceived nutrient shortfalls, social influences), and reduced high fat, sugar, and salt (HFSS) food intake (e.g., convenience, taste, ease of accessibility).

CONCLUSIONS

This study will provide an insight into university students current health and lifestyle status, dietary behaviours, and dietary intakes. These findings will aid in informing the design of tailored dietary interventions that will be delivered within the UCD PLAN'EAT LL to help support university students' transition towards more SHDBs.

ASSOCIATION OF FOOD ENVIRONMENT WITH FOOD SECURITY AND DIET QUALITY IN RURAL COMMUNITIES OF ANDHRA PRADESH, INDIA: A CROSS-SECTIONAL STUDY

Vidisha Sharma[1]; Sahiba Kohli[2]; Ayushi Dhasmana[1]; Praveen Devarsetty[3]; Vivekanand Jha[4]; Christopher Millet[5]; Suparna Ghosh-Jerath[1]
[1]Nutrition and Food Systems, The George Institute for Global Health India, New Delhi, India; [2]Nutrition and Food Systems, The George Institute for Global Health, New Delhi, India; [3]Primary Health Care, The George Institute for Global Health, Hyderabad, India; [4]Renal and Metabolic, The George Institute for Global Health, Delhi, India, India; [5]School of Public Health - Faculty of Medicine, Imperial College London, London, United Kingdom

BACKGROUND AND OBJECTIVES

A good quality diet reduces mortality from major chronic diseases.[1] Food environment influences food choices, preferences, and diet quality of a community, directly impacting nutritional status.[2] Driven by urbanization, and lifestyle changes[3], rural communities are undergoing food environment and nutrition transitions while still struggling with food security challenges.[4],[5] This is leading to a rise in non-communicable diseases as well as malnutrition in low- and middle-income countries.[6] This study assessed association of food environment with food security and dietary diversity among rural communities in Andhra Pradesh, India.

METHODS

A cross-sectional household (HH) survey was carried out in 16 randomly selected villages from four blocks in Srikakulam district, Andhra Pradesh, India. Data were collected from an adult woman in 328 HHs on socio-economic profile, HH food environment profile, HH food security status (n=320), and dietary diversity (n=323) of adult women of reproductive age (18-49 years). A questionnaire was used to assess an adult HH member's lived experience and perception of their HH's food environment. Food Insecurity Experience Scale[7] was used to assess HH food security. A digital tool developed based on Minimum Dietary Diversity for Women[8] was used to assess dietary diversity (24-hour recall). Multivariable linear regression and ordinal logistic regression were used to analyze relationships between food environment, food security, and dietary diversity.

RESULTS

The community majorly accessed food from local markets (99%), government food programs (98%) especially Public Distribution System, farmland (69%), and domesticated animals (36%). The mean Food Access Diversity Index that highlights HH's access to natural food sources was low (0.21±0.29). More than half HHs experienced mild to moderate (48%) or severe food insecurity (12%) while only 40% were food secure. The mean Dietary Diversity Score (DDS) for women was lower than the recommended cut-off of five (4.39±1.27). Analysis revealed that women with DDS ≥5 were 55% less likely to be food insecure ($p<0.01$). Further, those accessing food from kitchen garden were 5.04 times more likely to have DDS ≥ 5 than those who did not ($p<0.05$).

CONCLUSIONS

The findings highlight presence of diverse food environment yet poor dietary diversity. These can inform policies that intend to improve food security and dietary diversity in rural communities. Strengthening local food systems and their integration into government food supplementation programs can be vital in addressing these challenges.

SOAP19_09

EVALUATING ‘CLIMATE FRIENDLY’ CLAIMS ON CONSUMER PERCEPTIONS AND PURCHASE INTENTIONS OF UNSUSTAINABLE FOOD AND BEVERAGE PRODUCTS

Sydney Pryor[1]; Allison C. Sylvetsky,[1]; James W. Krieger,[2]; Mariana Fagundes Grilo[1]; Ana Clara Duran[3]; Lindsey Smith Taillie[4]
[1]Department of Exercise and Nutrition Sciences, The George Washington University, Washington, United States of America; [2]School of Public Health, University of Washington, Seattle, United States of America; [3]Center for Food Studies and Research, UNICAMP Universidade Estadual de Campinas, Campinas, Brazil; [4]Department of Nutrition, University of North Carolina in Chapel Hill, Chapel Hill, United States of America

BACKGROUND AND OBJECTIVES

Shifting to healthy and sustainable diets globally is essential for human and planetary health. Misleading environmental claims on unsustainable (i.e., high climate impact) food and beverage products may confuse consumers about their impact and influence purchasing intentions, undermining sustainability and nutrition goals. While it is known that nutrition claims lead to a 'health halo' effect (consumers perceive unhealthy products as healthier), it is unclear if environmental claims on unsustainable products have a similar 'sustainability halo' effect. The objective of this study was to evaluate the impact of environmental claims on consumer perceptions of product sustainability, healthfulness, and purchase intentions.

METHODS

In an online survey, US participants (n=2882) were randomized to view 4 food and beverage products carrying either a ‘climate friendly’ claim (treatment, n=1445) or no claim (control, n=1437). Animal-based foods, such as red meat and dairy, are associated with high greenhouse gas emissions, thus, we selected products in these categories to reflect unsustainable (high climate impact) products. After each product, participants responded to questions such as ‘How good or bad for the environment/health do you think this product is?’ and ‘How likely would you be to purchase this product at the store next week?’, assessed on a 5-point Likert scale from ‘Very Bad’ to ‘Very Good’ and ‘Very Unlikely’ to ‘Very Likely’, respectively. Logistic regression was used to examine the effect of the ‘climate friendly’ claim on perceptions of product sustainability, healthfulness, and purchase intentions.

RESULTS

Across all products, 48% (95%CI:45.6-50.8%) of participants randomized to view the 'climate friendly' claim perceived the products to be environmentally sustainable, compared to 29% (CI:26.6-31.4%) in the control. 38% (CI:35.6-40.6%) of participants who viewed the 'climate friendly' claim perceived the products to be healthy, compared to 31% (CI:29.0-33.9%) in the control. Compared to the control, participants who viewed the 'climate friendly' claim were 2.28 times as likely to perceive the products as sustainable (p<.001), and 1.34 times as likely to perceive the products as healthy (p<.001). However, intentions to purchase unsustainable products did not differ between the treatment and control groups.

CONCLUSIONS

‘Climate friendly’ claims were associated with more positive perceptions of unsustainable food and beverage products’ sustainability and healthfulness, indicating a sustainability and health 'halo' effect. These findings support the need for regulation of environmental claims on products to prevent greenwashing and ensure consumers have reliable information.

SOAP19_10

SHORT-CHAIN CARBOHYDRATE PROFILES AND MICROBIAL COMMUNITY DYNAMICS OF FINNISH FABA BEAN AND PEA TEMPEH INOCULATED WITH RHIZOPUS OLIGOSPORUS, RHIZOPUS ORYZAE AND ASPERGILLUS ORYZAE

Finlay Sim[1]; Antti Karkman[2]; Susanna Kariluoto[1]; Rossana Coda[1]; Ndegwa Maina[1]; Anne-Maria Pajari[1]
[1]Department of Food & Nutrition, University of Helsinki, Helsinki, Finland; [2]Department of Microbiology, University of Helsinki, Helsinki, Finland

BACKGROUND AND OBJECTIVES

Plant-based foods are a solution for a sustainable future, yet concerns around their digestibility abound. Fermentable short-chain carbohydrates—known as FODMAPs and include raffinose-family oligosaccharies (RFOs)—are nutrients in legumes that are poorly absorbed in the human digestive tract, causing gut symptoms especially for sensitive individuals. Utilisation of fermentation in food processing, such as tempeh, can lower FODMAPs and enhance nutritional profiles. However, production of tempeh is historically with soybean. The aim of this study was to explore the FODMAP-reducing effects of selected fungi on faba bean and pea and their microbial community dynamics during tempeh production.

METHODS

Faba bean (*Vicia faba*) and pea (*Pisum sativum*) were dehulled and soaked for 18 hours in 0.5% lactic acid and steam-cooked at 100°C for 25 (faba) and 60 minutes (pea). Once cooled, legumes were inoculated with 1ml spore solution (1x10^4 spores/ml/g) of either *R. oligosporus* (NRRL 5905), *R. oligosporus* (NRRL 2710) and/or *R. oryzae* (CCUG 61147), and *A. oryzae* (NRRL 2217). Tempeh was incubated at 28°C and harvested at 30 and 48 hours. Samples were stored at -20°C and freeze-dried. Selected FODMAPs were quantified using HPAEC-PAD and microbial communities were characterised using 16S rRNA gene and ITS amplicon sequencing. Data were statistically analysed using R software.

RESULTS

Faba and pea tempeh were produced with all strain inoculations. Both *R. oligosporus* (NRRL 5905; NRRL 2710) strains combined produced the most aesthetic pea and faba tempeh at 30 hours, whilst *R. oryzae* (CCUG 61147) produced tempeh mostly at 48 hours, albeit inconsistently in pea and with dense sporulation in faba. *R. oligosporus* (NRRL 2710) co-inoculated with *A. oryzae* (NRRL 2217) had the greatest degradation effect on total selected FODMAPs at 30 hours in both faba (-58.8%) and pea (-73.8%) compared to pre-inoculation levels. At 48 hours, *R. oligosporus* (NRRL 2710) with *A. oryzae* (NRRL 2217) decreased RFOs by -100% in faba and -96.7% in pea.

CONCLUSIONS

Finnish-grown faba bean and pea are suitable substrates for tempeh production. Co-inoculating tempeh with *A. oryzae* enhances the degradation effect of FODMAPs proving a possible solution for individuals sensitive to gut symptoms by plant foods.

SOAP19_11

CONSUMPTION OF DIETARY FIBRE, FRUITS AND VEGETABLES, AND FISH, IS ASSOCIATED WITH GREATER FOOD BIODIVERSITY IN UK DIETS

Magaly Aceves-Martins[1]; Anneli Löfstedt[1]; Carlos Francisco Moreno-García[2]; Mariska Dötsch-Klerk[3]; Elizabeth Zandstra[4]; Anne Wanders[4]; Baukje De Roos[1]
[1]The Rowett Institute, University of Aberdeen, Aberdeen, United Kingdom; [2]School of Computing, Robert Gordon University, Aberdeen, United Kingdom; [3]Nutrition and Health, Unilever Foods Innovation Centre - Hive, Wageningen, Netherlands; [4]Diet and Health, Unilever Foods Innovation Centre - Hive, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES

Dietary species richness (DSR), a metric of food diversity, has been inversely associated with total and cause-specific mortality in European populations. We determined whether i) DSR can be robustly measured based on four-day food intake data, ii) DSR is associated with diet quality, and iii) DSR is dependent on socio-demographic characteristics.

METHODS

The NDNS nutrient databank 2018–2019, with data on nutrient composition, was expanded to include data on FoodEx2 food classification, ingredients, the number and identity of unique species, and greenhouse gas emissions. Four-day food intake data and data on age, sex, BMI, ethnicity, Index of Multiple Deprivation (IMD), and household income were obtained from the UK National Diet and Nutrition Survey (NDNS) waves 9–11 (years 2018 to 2019), to calculate dietary quality indicators and DSR on the food and diet level.

RESULTS

We identified 216 unique species across UK diets. On the food level, composite dishes had the highest DSR (median 8 [Q1=4, Q3=12]), followed by seasoning, sauces, and condiments (median 7, [Q1=4, Q3 =10]) and grains and grain-based products (median 5, [Q1=2, Q3=7]). On the dietary level, the median DSR over four days was 49 [Q1=43, Q3=56; range 14 - 92], with the first two days covering 80% of the total DSR measured over four days. DSR was significantly higher in younger age categories and those with a higher household income or higher IMD (all $p<0.001$). A higher DSR was significantly associated with a higher intake of dietary fibre, fruits and vegetables, and fish (all $p<0.001$).

CONCLUSIONS

We successfully established DSR in UK diets based on four-day food intake data. We also identified opportunities to increase DSR, for example, by increasing the consumption of fruits and vegetables, fibre, and fish, potentially through composite dishes. More research will be required to further validate the DSR, and to establish the relationships between DSR, individual health outcomes, personalised approaches to increase food biodiversity, and ecological biodiversity impact.

SOAP19_12

RECONFIGURING OF MEALS WITHOUT MEAT: IMPLICATIONS FOR THE NET REDUCTION IN GHG EMISSIONS AND HEALTHINESS

Benjamin Mccormick,[1]; David Mcbey[2]; Graham Horgan[3]; Jennie Macdairmid[2]
[1]The Rowett Institute, The Rowett Institute, Aberdeen, United Kingdom; [2]The Rowett Institute, University of Aberdeen, Aberdeen, United Kingdom; [3]Human Health and Nutrition, BioSS, Aberdeen, United Kingdom

BACKGROUND AND OBJECTIVES

High income populations are recommended to reduce their meat consumption for a more environmentally sustainable diet, especially ruminant meat. However, in isolation this recommendation is no guarantee that the environmental impact of diets will be smaller or healthier because foods are eaten within the context of meals and a wider diet. The objective was to examined the structure of meals with or without meat in them to understand the knock-on consequences of reducing meat for overall meal structures.

METHODS

The UK National Diet and Nutrition Surveys (2008-2019) were used to compare the composition of 51,890 meals from 9,189 adults (aged ≥16 years old). The composition of meat and non-meat meals were compared for the foods included in a meal. Logistic and gamma mixed models were constructed to quantify the likelihood and quantity of different foods in the meal respectively.

RESULTS

Meat was observed in 62.5% of evening and 48.7% of lunch meals. Vegetables were less likely to be included in non-meat evening meals (70.8%) compared to meals that did include meat (26.5%). The meat type was differentially associated with starch components ($p < 0.001$): compared to other meats, poultry was more likely consumed with rice, beef with pasta, bacon/ham and non-meat meals with bread. These starchy elements had significant impacts on the greenhouse gas emissions of meat meals, for example, switching from a beef to poultry evening meal, both with pasta would result in an average of a 35% reduction in emissions, whereas switching between the more popular combinations of beef with pasta to poultry with rice would only result in a 14% reduction in emissions on average.

CONCLUSIONS

Recommendations to reduce meat consumption and the estimated effect size of the environmental impacts must consider the wider consequences on the whole diet as meals will be restructured such that the net reduction in emissions or consumption of other healthy meal components may not be beneficial. Policies to encourage a reduction in meat consumption must avoid the unintended consequences of reducing vegetable consumption and need to account for the likely meal structures that are culturally appealing in the absence of meat to avoid meals that are worse for health or the environment.

SOAP19_14

SUSTAINABLE NUTRITION FOR FARMED SALMON IN SUB-OPTIMUM ENVIRONMENTS DUE TO CLIMATE CHANGE

Chris G. Carter[1, 2]; Maxi Canepa,[1, 2]; Gianluca Amoroso,[1, 2]; Richard Wilson[3, 2]; Atshaya Sundararajan[1, 2]; Peter Osaigbovo[1, 2]
[1]Institute for Marine and Antarctic Studies, University of Tasmania, Hobart, Australia; [2]Seafood and Marine Products, Blue Economy Cooperative Research Centre, Launceston, Australia; [3]Central Science Laboratories, University of Tasmania, Hobart, Australia

BACKGROUND AND OBJECTIVES

Aquaculture of salmon species is one of the most valuable aquaculture industries and makes important contributions to the supply of nutritious food. However, salmon aquaculture faces significant challenges, including global climate change, decarbonization and being mainly located in heavily contested coastal regions. Moving salmon aquaculture offshore is being investigated around the world. The objective of the current research is to understand the impact of sub-optimum environmental conditions due to climate change on salmon nutrition.

METHODS

The first Australian offshore aquaculture research trial will contribute new knowledge about Atlantic salmon nutrition. In preparation, we have established a translational research program that has validated nutrition data gained from on-shore tanks by combining a selective breeding program with OMICS based nutrition research. For example, approximately 1200 seawater Atlantic salmon with known genetics and belonging to over 160 families were used. Salmon were exposed to a climate change scenario: a sub-optimum 10 week summer (elevated temperature and reduced dissolved oxygen) followed by an autumn recovery period. Standard nutrition analyses combined with proteomics and transcriptomics were used to identify and explain differences in salmon nutrition.

RESULTS

Using the same families and breeding cohort we showed sub-optimum climate change environments, genotype and salmon size impact salmon nutrition. Although the smaller salmon performed better, salmon at two sizes were resilient under sub-optimum conditions and recovered well (survival was high). Transcriptomic analysis uncovered significant differences in lipid metabolism. Proteomic analysis identified key differences in energy metabolism and protein turnover of larger salmon which, more than small salmon, showed significant energy reallocation to meet their increased energy demands.

CONCLUSIONS

Atlantic salmon families in Tasmania demonstrated a suitable range of performance in important traits that will underpin sustainable production under immediate climate change. Although smaller salmon were more robust than larger ones, the majority of larger individuals continued to feed, grow and recover. Thus, the current salmon stock has resilience across the seawater salmon production cycle. The translational approach adopted in the present research and new knowledge about mechanisms underpinning relative performance of different families provides further options to explore via selective breeding.

SOAP19_15

DIETARY PROFILES IN THE FRENCH WEST INDIES: WHAT DO WE KNOW ABOUT THE EXPOSURE TO CHLORDECONE AND THEIR DIET MONETARY COSTS ?

Uyen Thao Vu[1]; Julien Jean[2]; Ngoc-Du Martin Luong[2]; Ariane Dufour[2]; Sophie Drogué[1]; Zoé Colombet[3]; Joaquin Ameller Pavez[4]; Caroline Méjean[1]
[1]UMR MoISA, Inrae Centre Occitanie-Montpellier, Montpellier, France; [2]Department of Risk Assessment, Agence nationale de sécurité sanitaire (Anses), Maisons-Alfort, France; [3]Department of Public Health, University of Liverpool, Liverpool, United Kingdom; [4]UMR MoISA, Cirad, Montferrier-sur-Lez, France

BACKGROUND AND OBJECTIVES

The French West Indies (FWI, Guadeloupe and Martinique) are facing a triple challenge: 90% of the population is exposed to chlordecone (CLD), an organochlorine pesticide that pollutes durably soils, water, and food products; increasing nutrition-related chronic diseases' rates related to unbalanced diet; and food choices constrained due to high food prices and low incomes for a large part of populations. Informal distribution channels (e.g.: self-production) may reduce the economic constraints for populations but may increase the risk of CLD exposure. In this context, our study assesses the diet monetary costs and CLD exposure of four current co-existing dietary patterns previously identified in the FWI: the "prudent" and "traditional" patterns, both with high global diet quality, the "convenient" pattern with the lowest diet quality and the "transitioning" one, with an intermediate diet quality (1, 2).

METHODS

Our study used data from the cross-sectional Kannari survey (2013–2014) conducted on 1,105 adults in FWI. Dietary intake was assessed using two 24-hour recalls and a food frequency questionnaire (FFQ). To estimate CLD exposure and the highly contributed foods (≥10% of the total exposure), we combined the frequency from FFQ with food contamination data from formal and informal distribution channels. Diet monetary costs were estimated based on food prices, distribution channels, and daily consumption. Kruskal-Wallis and Dunn-Bonferroni tests were used to compare CLD exposure and costs across patterns.

RESULTS

The "transitioning" pattern had the highest CLD exposure ($p<0.05$), with marine fish from roadside purchases and crustaceans from gifts as the highly contributed foods, while in other patterns, only crustaceans by gifts were identified as the main contributors. The "transitioning" pattern also had the highest diet monetary cost (4.80 €/day, $p<0.01$). Interestingly, there is no difference in cost between the "convenient" and "prudent" patterns (3.71 vs 4.34 €/day, $p=0.59$).

CONCLUSIONS

In the FWI, the "convenient" and "prudent" patterns were comparable in cost while opposite in diet quality (1), showing that food prices do not limit access to healthy diets. In addition, the "transitioning" pattern had the highest cost as well as the highest CLD exposure but a moderate diet quality suggesting that one public health action could be to help the transitioning population group (20% of the total population) shift towards a diet with lower risk in terms of CLD exposure and nutrition by promoting safer, nutritious, and affordable food options.

WISEFOOD PROJECT: A PROTOCOL FOR UTILISING ARTIFICIAL INTELLIGENCE TO ENHANCE HEALTHY AND SUSTAINABLE HOUSEHOLD FOOD CHOICES

Claire M. Timon[1]; Angela Flynn[1]; Cathal O'Hara[1]; Sasa Straus[2]; Tamara Kozic[2]; Gyula Kasza[3, 4]; David Szakos[3, 4]; Vanda Pozner[5]; Emese Antal[5]; Stylianos Kolidakis[6]; Dimitris Skoutas[6]
[1]School of Population Health, RCSI, Dublin, Ireland; [2]Living Lab, Green Point, Pomurje, Slovenia; [3]Living Lab, Wasteless Foundation, Budapest, Hungary; [4]Institute of Food Chain Science, University of Veterinary Medicine, Budapest, Hungary; [5]Living Lab, ESSRG, Budapest, Hungary; [6]Information Management Systems Institute, Athena Research Centre, Athens, Greece

BACKGROUND AND OBJECTIVES

The Horizon Europe WiseFood project addresses the pressing need for healthier and more sustainable dietary habits, aligned with global public health and environmental goals. By leveraging artificial intelligence (AI), WiseFood aims to empower households to make informed food choices. The project's primary objectives are to develop three applications—FoodScholar, RecipeWrangler, and FoodChat—and utilise Living Labs (LLs) to co-design and evaluate their impact on nutrition and sustainability at a household level.

METHODS

A scoping landscape analysis will synthesise existing AI solutions supporting healthy eating to inform the development of the three applications. Technical development will leverage Large Language Models (LLMs), data pre-processing, integration, and Retrieval-Augmented Generation (RAG) techniques to ensure access to domain-specific and up-to-date information. Mechanisms to enhance AI robustness and align outputs with national guidelines will be integral to the approach.

The WiseFood applications will be developed through stakeholder engagement, involving households, nutritionists, dietitians, and policymakers to ensure relevance and usability. Iterative co-design workshops will be conducted to gather diverse perspectives and refine the applications. An 8-week cohort study with 300 households across Ireland, Hungary, and Slovenia will evaluate the feasibility, acceptability, and usage of the applications. Key outcomes will be assessed using validated tools, including household level dietary assessments, the General Nutrition Knowledge Questionnaire (1) and the Food Environmental Impact Knowledge Questionnaire (2).

RESULTS

The scoping review of existing state-of-the-art solutions will inform the development and technical approaches used for WiseFood applications. Anticipated outcomes from the cohort study include feasibility metrics such as acceptability, retention, and user engagement, alongside improvements in nutrition and food environmental knowledge and dietary choices among participating households.

CONCLUSIONS

WiseFood integrates cutting-edge AI tools with participatory co-design METHODSto address barriers to healthy and sustainable eating. Its household-level approach aims to contribute significantly to global health and sustainability targets.

SOAP 31 - CLIMATE CHANGE, SUSTAINABILITY AND NUTRITION

SOAP31_01

FOODWAYS THROUGH THE FOREST: WILD EDIBLE PLANTS IN MALAYSIA

Rachel Tharmabalan[1]
[1]Human Biology, University of Wisconsin-Green Bay, Green Bay, United States of America

BACKGROUND AND OBJECTIVES

Micronutrient fortification and macronutrient supplementation have been vital in improving global health, saving millions of lives. In Malaysia, malnutrition, especially among indigenous populations, remains a pressing issue, highlighting the need for locally sourced nutritional solutions to combat malnutrition and reduce non-communicable disease (NCD) risks. Current food movements emphasize wild edible plants (WEPs) to revive traditional culinary practices and enhance nutrition. These WEPs are rich in essential micronutrients, fats, and amino acids, offering a promising way to address food shortages and promote dietary diversity among indigenous communities.

METHODS

This research seeks to document the nutritional and medicinal properties of WEPs utilized by marginalized ethnic minorities in Malaysia. An ethnobotanical survey was conducted among ethnic minority communities in Malaysia to gather data on commonly used wild edible plants (WEPs). Nutritional analyses were performed on five selected plants. These analyses aimed to evaluate the content of essential micronutrients and macronutrients in these plants.

RESULTS

The findings show several species showing high concentrations of both carbohydrate and protein that ranged from 1.5 to 6.2 g/100 g (carbohydrate) and 4.9 to 9.2 g/100 g (protein) respectively. The mineral analysis showed that these plants contain considerable calcium, iron, potassium, and magnesium content compared to commercial vegetables.

CONCLUSIONS

By documenting and promoting the use of wild edible plants (WEPs), this research aims to improve food security and nutrition among marginalized populations by increasing awareness to macronutrients and micronutrients found in these plants, as well as exploring ways to incorporate them into local diets. Additionally, it seeks to preserve traditional knowledge and advocate for the development of sustainable, community-based food systems.

[1]Montpellier Interdisciplinary Center on Sustainable Agri-Food Systems (Moisa), Cirad, Vientiane, Lao, People's Democratic Republic of; [2]Rural Economy and Climate Change Adaptation, National Agriculture and Forestry Research Institute, Vientiane, Lao, People's Democratic Republic of; [3]Rural Economy and Food Technology, National University of Laos, Vientiane, Lao, People's Democratic Republic of; [4]Performance of tropical production and processing systems (Persyst), Cirad, Vientiane, Lao, People's Democratic Republic of; [5]UMR-204, Institut de Recherche pour le développment/Université Montpellier/SupAgo, Research and Development Institute IRD Montpellier, Montpellier, France

BACKGROUND AND OBJECTIVES

Agroecology is a blueprint for sustainable food systems. Yet, only few empirical studies explore the links between agroecology and nutrition in Asia. Our research aims to assess whether agroecological practices are associated with agricultural biodiversity and dietary diversity in northern Laos.

METHODS

All women of reproductive age from 3 rural villages (n=220) were interviewed during the dry and wet season in 2024. Using open 24H-recalls, we computed the Minimum Dietary Diversity of Women (MDDW-10) (FAO, 2021) and the Non-Communicable Disease index, and we documented the supply sources of food consumed (production, purchases, free collection). Agroecological practices were assessed using indicators that refer to the Agroecology Assessment Framework (Agroecology Coalition, 2024). A structural equations model was used to provide a holistic analysis of the interplay between agroecology and nutrition.

RESULTS

Only 33% of women reached MDDW (3.9 +/-1.1 food groups in mean). Supply sources are complementary and not substitutable as they provide different food at different season. Specific agroecological practices are associated with greater diversity of production (as food groups produced) and higher women dietary diversity.

CONCLUSIONS

Identifying and supporting effective agroecological practices is essential for improving dietary diversity and strengthening the resilience of vulnerable populations in the context of climate change.

SOAP31_03

"SUSTAINABLE DIETS: ARE CONSUMER REPRESENTATIONS AND FOOD CHOICE CRITERIA ALIGNED?"

Oriane Chene[1]; Stéphanie Chambaron[1]; Gaëlle Arvisenet[1]; Marine Deniau[1]; Laurence Dujourdy[2]
[1]Human Food, CSGA, CNRS, INRAE, Institut Agro, University of Bourgogne, Dijon, France; [2]Research Support Service, Institut Agro, Dijon, France

BACKGROUND AND OBJECTIVES

Adopting a more sustainable diet is crucial for the well-being of ecosystems and populations. While many consumers believe their diets are already sustainable, the transition towards truly sustainable diets remains challenging. This discrepancy between perceived and real diet sustainability raises questions: what do sustainable diets really mean for consumers? To what extent do their representations of sustainability align with their criteria when choosing sustainable food?

METHODS

To address these questions, a two-part study was conducted in France. In the first part, French people representations were explored through a free word association task using the inductor expression "sustainable diets" (n=273). After triangulation, categories of concepts associated to "sustainable diets" were identified. The second part of the study consisted in an online food choice intention task. 253 participants were divided into two groups and instructed to make everyday food choices (control group) or sustainable food choices among a set of 360 food products. These products were balanced in terms of origin, processing, packaging, label, and plant- versus animal-based origin. This allowed us to observe the criteria associated with sustainable food choices in participants' mind. The RESULTS of both studies were then compared to see if there are common features between consumers' representations of sustainable diets and their sustainable food choices criteria.

RESULTS

The RESULTS indicated that participants primarily associated the concepts of sustainable diet to ecology, health, and local origin of food. The criteria associated to sustainable food choices included high nutritional quality, local production, fair trade, minimal processing, and no use of plastic. Noticeably, plant-based or animal origin was barely mentioned in the word association task, and in the choice task, no change in the proportions of food categories was observed.

CONCLUSIONS

Thus, the representations participants have about sustainable diets and their selection criteria of sustainable diets were quite aligned in our study. However, these representations and criteria of choices reveal a partial and biased understanding of the concept of sustainable diets, which is associated to specific product characteristics, such as local origin or healthiness, rather than the substitution of animal-based options by plant-based ones, which is essential for a sustainable diet. Our RESULTS highlight that consumers still have a long way to go before adopting really sustainable eating practices.

OPPORTUNITIES AND CHALLENGES POSED BY CLIMATE CHANGE IN THE UTILIZATION OF INDIGENOUS AND TRADITIONAL AFRICAN FOODS

Anselimo Makokha[1]; Sheila Kilonzi[2]
[1]Human and Nutrition Sciences, Jomo Kenyatta University Of Agriculture And Technology, Juja, Kenya; [2]Food Science and Nutrition, Karatina University, Karatina, Kenya

BACKGROUND AND OBJECTIVES

Indigenous African foods include foods obtained from indigenous and traditional crops and livestock. These foods have been utilized by Africans for a long time, and they are an integral part of their cultures and food systems. Climate change poses both opportunities and challenges in the utilization of these foods.

METHODS

A desk review of the opportunities and challenges posed by climate change on the utilization of tradititional and indigenous African foods was done. Search engines of Google Scholar, ResearchGate and Scopus were utilized, and the information filtered to retain relevant information for the article.

RESULTS

Climate change has adverse effects on food security in African countries. Prolonged droughts and frequent episodes of flooding result in loss of biodiversity, reducing the availability, production and utilization of traditional and indigenous African foods. Some of these foods are not cultivated or domesticated, but are obtained from the wild. Such foods include indigenous vegetables, fruits, mushrooms bush meat and insects. They are therefore more susceptible to loss of biodiversity and other vagaries of climate change. Decline in biodiversity is causing permanent loss of some of these foods. Government policies and mitigation measures in most African countries have often focused on the crops that were recently introduced, such as maize and rice, to the exclusion of indigenous crops. But climate change has also presented opportunities for promotion of the cultivation and increased utilization of indigenous and traditional African foods. Generally both traditional and indigenous crops are more tolerant to the local climatic conditions, including higher tolerance for drought conditions. They are also less susceptible to local diseases. Those that are cultivated have lower dependency on production inputs, such as fertilizer and pesticides. Hence they also have higher potential for production as organic foods, whose demand is increasing. There is also growing interest from mainstream research institutions and researchers on neglected and underutilized crops.

CONCLUSIONS

In conclusion, climate change poses challenges, including threat of extinction for some traditional and indigenous African foods that may lead to decreased utilization of these foods . But there are also promising opportunities for comparatively more sustainable production and utilization of these foods under climate change conditions.

IMPACT OF THE INCORPORATION OF ANIMAL- AND PLANT-ORIGIN OIL BODIES IN FOLLOW-ON FORMULAS ON LIPID AND PROTEIN DIGESTIBILITY

Mathilde Cancalon; Olivia Ménard[1]; Yann Le Gouar[1]; Jordane Ossemond[1]; Julien Jardin[1]; Eric Lacroux[2]; Romain Valentin[2]; Claire Bourlieu Lacanal[3]; Didier Dupont[1]; Romain Jeantet[4]; Jeehyun Lee[4]; Amélie Deglaire[4]
[1]STLO, INRAE, Rennes, France; [2]Laboratoire de Chimie Agro-industrielle, INRAE, Toulouse, France; [3]IATE, INRAE occitanie, Montpellier, France; [4]STLO, Institut Agro Rennes-Angers, Rennes, France

BACKGROUND AND OBJECTIVES

Despite WHO recommendations, only 34% of infants are still breastfed at six months. Infant follow-on formulas (IFF) are widely used as a substitute for breast milk. The lipid fraction of IFF is typically based on a blend of refined vegetable oils obtained through solvent extraction that have a considerable environmental impact. Such process affect the structural organization of lipids within the matrix, consequently affecting their digestion. There is a current growing interest in the use of oil bodies (OB), such as oleosomes derived from oilseed crops. The present aim was to incorporate OB into IFF and evaluate their digestibility.

METHODS

IFF powders were produced with different fat sources: plant oils (PO), a mix of vegetable oils and animal-origin OB (PO/aOB), and a mix of plant- and animal-origin OB (pOB/aOB). The digestibility of rehydrated IFFs was assessed using a dynamic *in vitro* digestion system (DIDGI®, INRAE) with digestive parameters set to mimic the physiological conditions of a six-month-old infant.

RESULTS

All IFF had a standardized lipid content of 33 g.L-1 of reconstituted formula. However, their fatty acid profiles differed due to the bovine-origin OB (dairy cream), which introduced short-chain saturated fatty acids absent in PO. The protein content was standardized, averaging 14 g.L-1 of reconstituted formula. However, their protein types varied, particularly in pOB/aOB, where 20% of total proteins came from the plant-origin OB mix. Confocal imaging showed relatively similar aggregated structures during the gastric phase for the three IFFs. However, particle size analysis of the digesta revealed different size distribution profiles along the gastric digestion, with differences reported for pOB/aOB IFF *vs.* the other IFFs without OB. Lipid and protein hydrolyses were also followed during the gastric and intestinal digestion, as well as vitamin E bioaccesssibility, with ongoing analyses.

CONCLUSIONS

The present study enabled the design of innovative IFF incorporating plant OB extracted through more sustainable processes, as well as the development of an *in vitro* digestion model mimicking a 6-month-old infant.

SOAP31_06

THE IMPACT OF NEGATIVE FOOTPRINT ILLUSION AND FOOD FORM PERCEPTION ON SUSTAINABLE EATING BEHAVIORS

Gizem Uzlu Dolanbay[1]; Yildiran Hilal[2]
[1]Nutrition and Dietetics, Istanbul Gelişim University, İstanbul, Türkiye; [2]Nutrition and Dietetics, Gazi University Faculty of Health Sciences, İstanbul, Türkiye

BACKGROUND AND OBJECTIVES

The negative footprint illusion is a cognitive bias that occurs when adding perceived eco-friendly or healthy attributes to a product makes its total environmental impact appear lower than it actually is. This illusion plays a critical role in sustainable eating behaviors and carbon footprint assessments. This study aimed to investigate differences in carbon footprint estimates among three groups evaluating fast-food combinations and to examine the influence of food form on sustainable eating behaviors in two groups exposed to contrasting food presentation sequences.

METHODS

This experimental design study included 132 healthy adults (70.5% female, mean age 29.3 ± 8.7 years). Participants were divided into five groups: Groups 1, 2, and 3 assessed the carbon footprints of a cheeseburger, a cheeseburger with apple, and a cheeseburger with fries, respectively. Groups 4 and 5 evaluated food forms presented sequentially: one starting with a meat patty with bread and salad followed by a hamburger and the other vice versa. A questionnaire including demographic characteristics, the Behaviors Scale Towards Sustainable Nutrition (BSSN), and carbon footprint evaluation metric was applied to all participants. Data were analyzed using SPSS 24.0.

RESULTS

Carbon footprint estimates varied significantly across Groups 1, 2, and 3 ($p=0.001$). Group 2 had significantly lower estimates than Group 3 ($p=0.001$), highlighting the negative footprint illusion Group 2 also had the highest BSSN score (102.3 ± 18.05), while Group 3 had the lowest (88.1 ± 20.6). Groups 4 and 5 differed significantly in both carbon footprint perceptions, and BSSN scores ($p<0.001$, $p=0.022$, respectively). Food form and presentation order influenced perceptions, with Group 4 reporting higher scores than Group 5. A moderate positive correlation was found between BSSN scores and carbon footprint estimates ($r=0.347$, $p=0.012$).

CONCLUSIONS

The negative footprint illusion and food form perception affect carbon footprint assessments and sustainable behaviors. Sequential presentation of food forms alters participants' perceptions, suggesting the importance of context in dietary education and policy interventions. These findings highlight the need for targeted strategies to bridge the gap between sustainable attitudes and behaviors.

SOAP31_07

THE EFFECT OF FORTIFICATION ON IN VITRO IRON AND ZINC BIOAVAILABILITY IN PLANT-BASED MEAT ALTERNATIVES

Tugba Kose[1]; Tessa De Bie[2]; Renzi Wang[1]; Ans Eilander[2]; Anne Wanders[2]; Paul Sharp[3]
[1]Department of Nutritional Sciences, King's College London, London, United Kingdom; [2]Nutrition and Health, Unilever Foods Innovation Centre - Hive, Wageningen, Netherlands; [3]Shool of Food Science & Nutrition, University of Leeds, Leeds, United Kingdom

BACKGROUND AND OBJECTIVES

Plant-based diets are increasingly popular due to their perceived health benefits and positive environmental impact. However, there are concerns that long-term adherence to plant-based diets could result in nutritional deficiencies, especially for minerals found in abundance in animal foods. Therefore, plant-based meat substitutes may be a vehicle for fortification to provide a source of bioavailable minerals. This study investigated the iron (Fe), zinc (Zn) and calcium (Ca) content and bioavailability from unfortified and Fe and/or Zn fortified plant-based mince (PBM) compared with animal mince.

METHODS

Total and bioaccessible mineral levels in animal mince, and PBM were determined using microwave digestion and in vitro simulated gastrointestinal digestion, respectively. Mineral bioavailability was assessed by exposure of Caco-2 cells to the digested food samples and measuring mineral uptake into the cells using Inductively Coupled Plasma Mass Spectrometry (ICP-MS). Total phytate levels were measured to calculate the phytic acid:mineral molar ratio (PA:Fe, PA:Zn, PA:Ca) as indication of the mineral bioavailability.

RESULTS

Fe bioavailability from animal mince was significantly greater than from unfortified PBM. Fortification of PBM with Fe reduced the PA:Fe molar ratio to below 10, and increased Fe bioavailability compared with the unfortified PBM. Total Fe uptake from fortified PBM was equivalent to that from animal mince. Following fortification of PBM with Zn, the PA:Zn ratio remained high (>14), and bioavailability was not enhanced compared with the unfortified PBM ($P>0.1$).

CONCLUSIONS

This study highlights that Fe-fortified PBM can improve Fe bioavailability and provide similar amounts of Fe compared to beef mince, whereas more research is needed for Zn fortification of PBM. Fortification can be a promising approach to reduce the phytic acid:mineral molar ratio to mitigate the inhibitory effect of phytic acid on mineral bioavailability.

IN VITRO HUMAN GASTROINTESTINAL DIGESTIBILITY AND COLONIC FERMENTATION OF WHEY, CASEIN AND EDIBLE YEAST-BASED PROTEINS

Jonna Koper[1]; Juliette Caron[1]; Ccori Martinez Tuppia[1]; Sabrina Telki Baeyens[1]; Elyse Parent[1]; Francois Machuron,[1]; Isabelle Mouly[1]; Bosco Nabil[1]
[1]R&D, Lesaffre, Marcq-en-Barœul, France

BACKGROUND AND OBJECTIVES

Transitioning food systems and in particular human protein consumption away from animal-based, carbon- and resource-intensive proteins to more sustainable sources has become a major topic for nutritional research community. On top of plant-based proteins, with fermentation technology, yeast-based proteins (YBP) could represent plausible alternative protein sources with high nutritional quality and with lower environmental impact. Herein we propose to study YBP nutritional profile, digestibility and metabolic response. YBP was compared with whey and casein as reference animal proteins.

METHODS

A 5-hour in vitro simulated human digestion model was used to assess the digestibility and amino acid bio-accessibility of three independent YBP production batches with commercial whey and casein references. Dialysate and ileal effluent samples were collected hourly, then total nitrogen and free amino acids were quantified. We also evaluated the impact of the 3 sources of proteins digestates on human colonic microbial communities upon 48-hour Colon-on-a-Plate batch fermentation with faecal samples from 11 healthy donors. The microbial activity and composition were analysed by untargeted metabolomics and shotgun sequencing respectively.

RESULTS

The RESULTS showed that YBP, casein, and whey were comparable in terms of digestibility. Although YBP exhibited a different metabolomic fingerprint compared to casein and whey, the microbial activity, as measured by short chain fatty acid quantification, was significantly increased for all protein sources compared to the blank, with no significant difference between protein sources. Whey and casein resulted in a higher or lower abundance of certain bacterial taxa (8-times more *Clostridium phoceensis* and 8-times less *Bacteroides*) compared to YBP.

CONCLUSIONS

Overall, our in vitro data simulating human digestion suggests that YBP could be a relevant alternative to animal protein. While in vitro studies cannot fully replicate the complexity of in vivo digestion, they serve as useful alternatives to animal models for assessing human protein digestibility. Thus, further clinical follow-up studies are now warranted.

SOAP31_09

OPPORTUNITIES AND CHALLENGES OF AGROECOLOGICAL FOOD MARKETS TO ADDRESS URBAN MALNUTRITION: A CASE STUDY IN DAKAR, SENEGAL

Ninon SIRDEY[1]; Bezner Kerr Rachel[2]; Moustapha Seye[3]; Arlène Alpha[1]
[1]MoISA, CIRAD, Univ Montpellier, CIHEAM-IAMM, INRAE, Institut Agro, IRD, Montpellier, France; [2]Department of Global Development, Cornell University, Ithaca, United States of America; [3]LARTES-IFAN, UCAD, Dakar, Senegal

BACKGROUND AND OBJECTIVES

Agroecology is a holistic approach that draws on ecological and social justice principles with potential to transform food systems (FS) towards improved health and sustainability. While there is evidence that agroecological practices can improve food security and nutrition for farming households, there is less evidence in urban areas, particularly for low-income households. This study examines potential pathways of agroecological FS interventions on nutrition in urban areas, based on a literature review and an exploratory case study.

METHODS

Senegal was chosen due to the prevalence of malnutrition, and the dynamic civil society in support of agroecology, including for domestic markets. Three market locations were selected in Dakar and Thiès, based on the following criteria: urban or peri urban, agroecological food products sold, including fruits or vegetables, low-income consumers. Semi-structured interviews (n=40) were carried out with actors involved in agroecological food markets, including consumers, farmers, market vendors and development partners. Three focus groups and a survey with 120 women consumers were carried out.

RESULTS

The findings show the importance of affordability, market location, regular supply of produce, and public sensitization to overcome the perception that agroecology is reserved for the better-off. Health, food safety and quality are the main motivations for people to engage in the initiatives, whether they are consumers, vendors or farmers. In the absence of certification, these channels echo the connectivity principle of agroecology, building on short distribution networks and direct communication between consumers and vendors (who might also be farmers), as well as sharing values and knowledge around food and health. Trust is at the core of the relationship, which depends on vendors' capacity to genuinely respond to consumers' concerns. The survey will enable us to characterize the place of agroecological foods in urban diets and what factors increase consumption of agroecological products.

CONCLUSIONS

The study addresses research gaps on the agroecology – nutrition nexus and contributes to the agenda on sustainable and healthy diets by exploring the conditions under which agroecological FS could improve food behaviours and diets of economically and nutritionally vulnerable women in cities. The research considers the tension within agroecological approaches which seek to provide decent livelihoods to farmers while provisioning affordable healthy food for consumers on a regular basis, and emphasizes the place of trust, information and value-sharing in building agroecological FS with potential for nutrition.

CONFLICTS OF INTERESTS

SOAP31_10

COMBINING NUTRITIONAL VALUE WITH ENVIRONMENTAL IMPACT: A NOVEL APPROACH TO NUTRITIONAL LIFE CYCLE ASSESSMENT (NLCA)

Stephan Peters[1]; Manon Van Eijsden[2]; Olaf Larsen[3]; Jan Geurts[4]; Thom Huppertz[4]
[1]Sustainability, Nederlandse Zuivel Organisatie, Den Haag, Netherlands, Netherlands; [2]Buro Vlinder, Buro Vlinder, Amsterdam, Netherlands; [3]Athena Institute, Vrije Universiteit, Amsterdam, Netherlands; [4]Science & Technology, FrieslandCampina R&D, Amersfoort, Netherlands

BACKGROUND AND OBJECTIVES

In nutritional life cycle assessment (nLCA) nutrient provision is the key function of foods. This warrants replacing the traditional mass-based functional unit (FU) in LCA by a nutrient-based FU. However, such replacement causes several methodological issues and there is at present no uniform approach for integrating nutritional value into the FU of LCA. We propose a novel approach where the mass-based FU is adjusted for nutritional value, i.e., nLCA = LCA / nutritional value.

METHODS

To demonstrate our approach, we calculated the nLCA for 164 food items from the Dutch environmental impact database of foods (by RIVM). We used global warming potential (GWP, in kg CO2 eq/kg) as indicator of environmental impact. As a measure of nutritional value, we used the Qualifying Index (QI), a dimensionless, numerical value expressing the relation between nutrient density and energy density of a food. To calculate the QI we selected 21 qualifying nutrients, based on their contribution to the overall Dutch dietary intake. All QIs were calculated with and without capping to assess the influence of high nutrient levels and weighting was applied to calculate food-group-specific QIs.

RESULTS

For the majority of foods, the calculated QI was above 1, with higher values of QI representing higher nutrient density. The highest QI values were observed for vegetables and fish, whereas the lowest QI values were observed for fats, oils and grain products. GWP values were highest for protein foods and lowest for fruits, vegetables and grain products. For most foods, GWP decreased after nutritional adjustment, as their QI-values were >1. Most discretionary foods have QI values below 1 and, consequently, higher nutrient-adjusted GWP values. Food-group-specific weighting led to QI-values more in line with actual nutritional values and, accordingly, more distinctive GWP values. Additional analysis showed that the QI-nLCA methodology can be applied to compare individual foods, as well as meals and diets.

CONCLUSIONS

This study introduces a novel approach to nLCA, in which the original mass-based FU is corrected for by the QI, a numerical value expressing the relation between nutrient density and energy density of a food. This QI-nLCA enables a more comprehensive evaluation of foods, meals and diets. It can be applied to different environmental indicators and, as such, could add to evidence-based decision-making by policy makers in the field of healthy and sustainable nutrition.

PROTEIN DIGESTIBILITY, DIAAS AND ENVIRONMENTAL IMPACTS OF SOY-BASED MEAT ALTERNATIVES: THE EFFECT OF DIFFERENT PROCESSING OPERATIONS

Hammer Laila[1]; Corina Sägesser; Armin Siegrist; Mario Arcari[2]; Moritz Müller[2]; Ashley Green; Moritz Goessler; Christoph Denkel[2]; Reto Portmann[3]; Lotti Egger[3]; Alexander Mathys; Diego Moretti[1, 4]
[1]Departement of Research, Nutrition, Fernfachhochschule Schweiz (FFHS) - Hochschulcampus Gleisarena, Zürich, Switzerland, Zurich, Switzerland; [2]School of Agricultural, Forest and Food Sciences, Bern University of Applied Sciences, Zollikofen, Switzerland; [3]Biochemistry of milk and microorganisms, Agroscope, Bern, Switzerland; [4]FFHS, SUPSI - Scuola universitaria professionale della Svizzera italiana, Manno, Switzerland

BACKGROUND AND OBJECTIVES

Soybeans (*Glycine max*) are a versatile legume, being also widely used to produce meat alternatives. Limited data exists on the effect of well-defined food processing operations on protein digestibility and production linked environmental impact.

METHODS

We produced soy-based meat alternatives starting from “Protéix” soybeans and from a commercial soy protein concentrate (SPC, Alpha-8). Beans were de-hulled and fat extracted to partly defatted soy flakes (SWF), and further processed to SPC and soy protein isolate (SPI) at pilot scale. Each intermediate product was extruded with both low and high mechanical energy input and low and high moisture, respectively. *In vitro* digestion was conducted with the harmonized static INFOGEST protocol followed by in vitro assessment of protein quality and indispensable amino acid score (DIAAS) using the recommended amino acid pattern for 0.5–3 years old humans. An LCA with mass- and protein-based functional units (FUs) was conducted for SWF, SPC, SPI and their respective extrudates.

RESULTS

Digestibility increased with increasing degree of processing: with SWF (49.6%), SPC (55.5%) and SPI (92.3%) having increased digestibility. Extruded products from beans (SWF, SPC and SPI) or commercial SPC all had high (>95%) protein digestibility and DIAAS classified as “good” (DIAAS=75-99). Based on mass, the impacts are highest for SPI, followed by SPC, and SWF for both the ingredients and the extrudates. However, protein-based FUs can significantly alter the RESULTS.

CONCLUSIONS

Meat alternatives produced from soy have high protein digestibility and DIAAS consistent with a good quality protein source, and this is not markedly affected by extrusion processing parameters. When assessing the environmental impacts, the choice of FU is highly relevant.

SOURCES OF PROTEIN, CALCIUM, ZINC, IODINE, AND VITAMIN B12 IN UK ADULTS FOLLOWING CONTEMPORARY VEGETARIAN AND VEGAN DIETS: FINDINGS FROM FEED

Izabella Lawson,; Timothy J Key,; Keren Papier

BACKGROUND AND OBJECTIVES

Large differences in nutrient intakes have often been observed between adults consuming plant-based diets and those consuming diets containing meat and fish, highlighting protein, calcium, zinc, iodine, and vitamin B12 as nutrients of potential concern for vegetarians and vegans; we examined dietary sources of nutrient intakes in UK adults following these diets.

METHODS

Adults from across the UK were recruited into the Feeding the Future (FEED) study between February 2022 and December 2023. The cohort comprised 1562 self-defined omnivores, 1349 flexitarians, 568 pescatarians, 1292 vegetarians, and 1571 vegans who completed the online survey, providing detailed information on diet using a food frequency questionnaire. We calculated the percentage contributions of individual foods and drinks to daily protein, calcium, zinc, iodine, and vitamin B12 intakes in vegetarians and vegans. We also conducted a sex and energy adjusted regression analysis using the least absolute shrinkage and selection operator (LASSO) to identify top dietary contributors to these nutrients from all foods consumed.

RESULTS

The top contributors to protein were eggs in vegetarians (accounting for 5.4% of total protein intake) and wholemeal bread in vegans (5.4%). The largest proportion of calcium came from cheese in vegetarians (7.5%) and tofu in vegans (11.7%). The leading sources of iodine were semi-skimmed milk in vegetarians (11.6%) and soya milk in vegans (17.3%). The largest single sources of zinc were mycroprotein in vegetarians (8.0%) and nuts in vegans (6.5%). Semi-skimmed milk was the top contributor to vitamin B12 in vegetarians (14.2%) and yeast extract was the top source for vegans (27.5%). The leading contributors selected through LASSO regression were semi-skimmed milk for calcium, and yeast extract for vitamin B12, in vegetarians who consumed these foods. Among vegans, LASSO identified pea-protein shakes as a high contributor to protein intake, soya milk for calcium intake and mycroprotein for zinc intake.

CONCLUSIONS

In this large cohort of UK adults consuming contemporary diets, dairy products and eggs were major sources of protein, calcium, iodine, and vitamin B12 in vegetarians. In vegans, fortified products including bread, tofu, yeast extract, and plant-based milks were the leading sources of calcium, iodine and vitamin B12, and these foods were also important contributors to protein intake. Plant protein alternatives were also identified as significant contributors to protein and zinc intakes for vegetarians and vegans.

CONFLICTS OF INTERESTS

HOW CLIMATE CHANGE IS ACCELERATING THE GLOBAL NUTRITION TRANSITION TO ULTRAPROCESSED FOODS AND CHRONIC DISEASE: A CONCEPTUAL FRAMEWORK

Lindsey Smith Taillie[1]; Barry Popkin[2]
[1]Department of Nutrition, University of North Carolina in Chapel Hill, Chapel Hill, United States of America;
[2]Nutrition, University of North Carolina at Chapel Hill, Chapel Hill, United States of America

BACKGROUND AND OBJECTIVES

Over the last fifty years, the nutrition transition has transformed global diets, shifting much of the world's population to diets high in sweetened beverages (SSBs) and ultraprocessed foods (UPFs), driving rapid increases in obesity and related chronic diseases, particularly in low-and-middle-income countries. Simultaneously, climate and environmental change (CEC) have caused more frequent food supply disruptions, while the food industry's aggressive promotion of SSBs and UPFs have driven further health and CEC harms. These processes necessitate a complex conceptual model to guide research and policy, but previous models have not fully captured all elements. This study creates a model for the "climate-nutrition" transition and role of the food industry in exacerbating harms across dimensions.

METHODS

This narrative review combines a review of existing literature, global data on CEC events, global sales data on SSBs and UPFs, and illustrative case studies from low-and-middle income countries. We develop a conceptual framework based on the socio-ecological model, commercial determinants of health, and the nutrition transition to reflect the multi-directional relationship between CEC, diets, health, and the food industry.

RESULTS

Our new "climate-nutrition" transition model shows how CEC, including temperature increases, drought, extreme heat, and other events, disrupt food and water systems, increasing water insecurity and reducing the availability, affordability, and ability to prepare fresh and minimally processed foods. These events, coupled with food industry promotion of SSBs and UPFs through multi-pronged, aggressive, and increasingly personalized digital-based tactics, reduce intake of water and fresh and minimally processed foods while increasing reliance on packaged, shelf-stable products like SSBs and UPFs. These shifts increase chronic disease risk and increase CEC harms, including water overuse, plastic pollution, greenhouse gas emissions, and biodiversity loss. CEC also exacerbates chronic disease morbidity through multiple biological pathways (e.g., increased risk of heat stroke for people with hypertension). Case studies show how the food industry exploits CEC to promote its products (e.g., heat-wave-based ads for sugary drinks in Bangladesh, CEC-related food aid promoting sugary drinks in South Africa). The model shows how mandatory governmental policy action is the critical lever for halting this "climate-nutrition" transition.

CONCLUSIONS

CEC is accelerating the transition to SSBs and UPFs. Policy action is urgently needed to address the triple crisis of climate change, chronic disease, and food industry exploitation.

NUTRITIONAL AND CLIMATE-SMART FORMULATION OF GLUTEN-FREE COMPOSITE PASTA BASED ON LEGUMES, CEREALS AND LEAFY VEGETABLES GROWN IN AFRICAN COUNTRIES: FROM THEORETICAL DESIGN USING LINEAR PROGRAMMING TO SENSORY VALIDATION

Pauline Pinel[1]; Mélina Robert[2]; Joaquin Ameller[2]; Marie-Josephe Amiot-Carlin[3]; Sophie Drogué[4]; Claire Bourlieu Lacanal[5]; Valérie Micard[1]
[1]SABP, Institut Agro Montpellier, Montpellier, France; [2]IATE, Inrae Centre Occitanie-Montpellier, Montpellier, France; [3]Hérault, INRAE- Institut national de recherche pour l'agriculture, l'alimentation et l'environnement, Hérault, France; [4]UMR MoISA, INRAE Centre Occitanie-Montpellier, Montpellier, France; [5]IATE, INRAE occitanie, Montpellier, France

BACKGROUND AND OBJECTIVES

Ecological and nutritional challenges are driving us towards the use of climate-smart crops and the nutritional optimization of staple foods. The European Innofood Africa project aimed to address these challenges by developing the production, processing and consumption of African climate-smart crops. In this project, our objective was to develop nutritionally optimized pasta made from gluten-free wholegrain flours (legumes, cereals and other nutritious climate-smart crops) for European and African adults, to assess their acceptability and theoretical impact on meeting nutritional recommendations in 4 African countries.

METHODS

Pasta nutritional optimization was achieved using linear programming to meet the FAO's recommendations for essential macro- and micronutrients for adults, particularly women, in 1 meal (considering 3 meals/day). Pasta were produced by low temperature extrusion and drying, without additive, to preserve nutritional quality. Starch and protein *in vitro* digestibility, sensory evaluation and theoretical impact of their consumption on the capacity of African diet to cover nutritional needs was evaluated by replacing 25, 50 or 100% of the cereal food with these pasta in the baseline diet (based on a consumption survey in Kenya, Ethiopia, Uganda and South Africa conducted during Innofood Africa project).

RESULTS

Four gluten-free nutritionally optimized pasta were developed, all based on cowpea, with or without teff and/or amaranth leaves. The consumption of a portion of cooked pasta (100g of dry pasta) allowed to meet the FAO recommendations for protein, fibers, iron, zinc, B9 vitamin, and beta-carotene (for pasta containing amaranth leaves). All cowpea-based pasta had a low GI, protein digestibility similar to classical wheat pasta, and a higher protein quality (2 times higher PDCAAS due balanced essential amino acids). Consuming between 12.5 and 100g of cooked pasta helped meet zinc and iron recommendations in Kenya and Uganda, and allowed to meet vitamin A recommendation in South Africa. Cowpea-based pasta were found to be acceptable.

CONCLUSIONS

Nutritional optimization of pasta through formulation by linear programming can help help populations meet recommendations in key nutrients. Replacing durum wheat semolina entirely with gluten-free climate-smart crops (cowpea, teff and amaranth leaf flours), remained them acceptable to consumers and provided nutritional benefits without compromising their low glycemic index.

SOAP 34 - CLIMATE CHANGE, SUSTAINABILITY AND NUTRITION

SOAP34_01

A COMPARISON OF U.S. FEDERAL INFANT FEEDING POLICY CHANGES TO THE GLOBAL BREASTFEEDING COLLECTIVE'S POLICY RECOMMENDATIONS: IMPLICATIONS FOR PUBLIC HEALTH, CLIMATE, AND FOOD SYSTEM SUSTAINABILITY

Paige Harrigan[1]; Todd Schenk,[2]; Stella Volpe,[1]; Valisa Hedrick,[1]; Tuba Khan,[3]; Sarah Misyak,[1]
[1]Human Nutrition Foods and Exercise, Virginia Tech, Blacksburg, United States of America; [2]School of Public and International Affairs, Virginia Tech, Blacksburg, United States of America; [3]Department of Nutritional Sciences, Oklahoma State University, Stillwater, United States of America

BACKGROUND AND OBJECTIVES

The contribution of infant feeding to food system sustainability is an emerging are of research and policy. The Global Breastfeeding Collective (GBC) provides a set of policy priorities for countries to promote, protect and support breastfeeding and uses country scorecards to document progress toward meeting global objectives. The United States (U.S.) participates in the GBC. Previous research has documented that U.S. policies unevenly protect and support breastfeeding as a public health priority. This study assessed how U.S. federal infant feeding policy changes in legislation, regulation, and executive level presidential documents align with the GBC's policy recommendations and opportunities to promote sustainability links.

METHODS

Four online databases were used to identify policy changes in U.S. federal infant feeding legislation, regulation, and presidential documents between 2014-2023. This time-period overlapped with the COVID-19 pandemic and the 2022 U.S. infant formula shortage. Policies were coded by GBC priority topic areas.

RESULTS

Fifty-seven infant feeding policy changes between 2014- 2023 were identified. Of these, only 17 included an infant feeding policy change that aligned with at least one of the of the GBC policy priority topics. Most infant feeding policy changes (49) did not match GBC policy priorities. Nine policies had changes across both GBC and non-GBC policy topics. Non-GBC policy changes included infant formula, public non-workplace lactation spaces, and breastfeeding supplies.

CONCLUSIONS

Most changes to U.S. infant feeding policies related to infant formula. The lack of alignment between U.S. infant feeding policy changes and GBC policy recommendations suggests missed policy opportunities to support U.S. families across public health, climate, and food system sustainability objectives. However, promising policy changes outside of, but adjacent to, GBC priorities to strengthen breastfeeding were identified and could be considered for future GBC recommendations.

SOAP34_02

ALIGNMENT BETWEEN HEALTHINESS AND ENVIRONMENTAL IMPACT OF PACKAGED FOOD PRODUCTS

Bella Straeuli[1]; Lennert Veerman[2]; Simone Pettigrew[3]; Linda Cobiac[2]
[1]Food Policy, The George Institute for Global Health, Sydney, Australia; [2]School of Medicine, Griffiths University, Brisbane, Australia; [3]Food Policy, The George Institute for Global Health, Barangaroo, Australia

BACKGROUND AND OBJECTIVES

The food system is a major contributor to both rising global temperatures and the growing prevalence of chronic disease. Identifying foods that are unhealthy and have a high environmental impact is especially important for creating future sustainable food systems. There is limited research examining both the healthiness and environmental impact of food categories. This study sought to (i) assess alignment between healthiness and environmental impact across 16 packaged food categories and (ii) identify the food categories with a high proportion of foods that are both unhealthy and detrimental to the environment.

METHODS

Data were sourced from a database that included ~25,000 packaged food products from four Australian supermarket retailers. The Australian Health Star Rating and an estimation of greenhouse gas emissions (the recently developed 'Planetary Health Rating') were used. These measures were converted into binary indicators for the purposes of this study. Foods were considered (i) 'unhealthy' if they scored a Health Star Rating of <3.5 and 'healthy' if they scored ≥3.5; and (ii) to have 'high' environmental impact if they had a Planetary Health Rating of <3.5 and 'low' environmental impact if ≥3.5.

RESULTS

Around 20% of food and beverage products were classified as both healthy and low environmental impact. By comparison, 35% of products were classified as both unhealthy and high environmental impact. The food categories of *Confectionary* (80%), *Sugars, honey, and related products* (60%), and *Meat and meat alternatives* and *Snack foods* (both 55%) had especially high proportions of foods that were both unhealthy and had high environmental impact.

CONCLUSIONS

These RESULTS provide insights into the types of food products, especially those that are characterised by both low nutritional quality and high environmental impact, that could have fiscal and marketing policies applied to reduce consumption and production to optimise outcomes for people and the planet.

PERCEPTIONS AROUND FOOD ENVIRONMENT AND DIETARY DIVERSITY OF RURAL COMMUNITIES OF CHHATTISGARH, INDIA

Sahiba Kohli[1]; Ayushi Dhasmana[2]; Vidisha Sharma[2]; Sangeeta Sharma[2]; Praveen Devarsetty[3]; Vivekanand Jha[4]; Christopher Millet[5]; Suparna Ghosh-Jerath[2]
[1]Nutrition and Food Systems, The George Institute for Global Health, New Delhi, India; [2]Nutrition and Food Systems, The George Institute for Global Health India, New Delhi, India; [3]Primary Health Care, The George Institute for Global Health, Hyderabad, India; [4]Renal and Metabolic, The George Institute for Global Health, Delhi, India, India; [5]School of Public Health - Faculty of Medicine, Imperial College London, London, United Kingdom

BACKGROUND AND OBJECTIVES

Food environment, critical in shaping food choices (4-6), is undergoing transition and evolving dietary patterns are leading to poor dietary habits (7-9). Understanding food environments can inform interventions aimed at improving diet quality (10). This study aimed to assess perceptions around household food environment and dietary diversity among rural women belonging to Chhattisgarh, India.

METHODS

A cross-sectional study was conducted in 16 randomly selected hamlets (small clusters of households (HHs) within a village) across four administrative blocks of Sarguja district in Chhattisgarh. Data from HHs were collected on socio-demographic profile, perception around food environment (n=321), and dietary diversity of women of reproductive age (WRA) (n=320). Lived experience and perception on food environment was assessed using food environment profiling questionnaire; and a digital tool based on Minimum Dietary Diversity for Women (11) was used to assess dietary diversity (24-hour recall). Food Access Diversity Index (FADI) was calculated to assess variety of food accessed by HHs from natural sources.

RESULTS

Agriculture was the predominant occupation (81%), with most HHs (85%) accessing food from three to six sources, primarily government food programs (98%), local markets (97%), farmland (88%), kitchen gardens (74%), forests/open fields (33%). Paddy, wheat, pulses and maize were majorly grown crops in farmlands and green leafy vegetables, other vegetables and potatoes in kitchen gardens. Concerns around food quality (pesticide, chemical use, contamination and adulteration) were raised by almost half HHs. HHs indicated affordability constraints limiting market access for procurement of pulses, nuts, oils, vegetables and animal foods. Most were worried about declining interest in traditional foods among younger generations (81%) and indicated greater access to packaged foods (82%). Mean FADI of 0.28 ± 0.27 indicated low diversity in production and access to natural food sources. Mean DDS of women (3.65 ± 1.09) was low, with only one-fifth having an acceptable score of ≥5.

CONCLUSIONS

Despite diverse food sources, dietary diversity remains low. Differential perceptions regarding food environment in terms of access, availability, convenience, affordability and quality exist. Tailored, contextual messages that create value for traditional food while being cognisant of food access sources and preferences can be an important strategy to improve dietary quality and nutritional status of the community.

SOAP34_04

IS CULTURED CHICKEN MEAT A NUTRITIONAL ANALOG TO CONVENTIONAL MEAT?

Dominika Sikora[1, 2]; Piotr Rzymski[1]
[1]Department of Environmental Medicine, Poznan University of Medical Sciences, Poznan, Poland; [2]Doctoral School, Poznan University of Medical Sciences, Poznan, Poland

BACKGROUND AND OBJECTIVES

There is increasing interest in cultured meat technology. Cultured chicken meat (CCM) received approval in the United States in 2023, while an application to approve cultured foie gras was submitted in 2024 to the European Food Safety Authority. This study aimed to re-evaluate the nutritional value and safety of US-authorized CCM and confront it with European Union recommendations and the quality of conventional chicken meat.

METHODS

The study drew on data delivered to the US Food and Drug Administration by one US-based manufacturer of CCM and compared them to various nutritional and safety thresholds implemented in the European Union.

RESULTS

Comparing to conventional chicken meat, serum-free CCM revealed a lower content of protein, most indispensable amino acids, Mg, and vitamin B3. Yet, we observed higher levels of fat, saturated fatty acids, cholesterol, vitamins B5, B6, and A, and minerals Ca, Cu, Fe, K, Mn, Na, P, Se, and Zn. Toxic elements (As, Cd, Pb, Hg) fell within allowance thresholds, albeit serum-free CCM had higher levels of Cd and Pb than conventional chicken meat. Similar, inferior shifts to conventional meat were observed for serum-based CCM. Generally, the present study indicated that CCM meets the requirements of the European Union. However, it is vital to streamline the reproducibility of the manufacturing process due to observed variabilities in nutrient levels among tested lots. At the same time, analyzed data lacked tests of vitamin C, E, K, B1, B2, B4, and B12 levels to provide a comprehensive assessment.

CONCLUSIONS

This study shows some advantages but also shortcomings of the analyzed CCM. One should note that this study represents a re-evaluation of CCM offered by a single producer, and as long as the presented analysis extends the understanding of the nutritional quality of these cutting-edge food products, it should not be extrapolated to the entire field of cultured meat.

SOAP34_05

CO-CREATION APPROACHES TO INFORM SUSTAINABLE SCHOOL FOOD PROGRAM IMPLEMENTATION, EVALUATION, AND MONITORING PRACTICES

Nicole Weber[1]; Nina Trask[1]; Selina Quibrantar[1]; Annette Blais[1]; Mavra Ahmed[1]; Daniel Sellen[2]
[1]Department of Nutritional Sciences, University of Toronto, Toronto, Canada; [2]Anthropology, University of Toronto, Toronto, Canada

BACKGROUND AND OBJECTIVES

In 2024, the Canadian federal government committed $1 billion to implement a national School Food Program (SFP) aimed at ensuring more equitable access to nutritious food for children nationwide, addressing the present ad hoc nature of SFPs. However, evidence on key performance indicators for a sustainable and successful SFP strategy in Canada is lacking. Historically, Canadian school food policies that lacked evidence-informed evaluation and stakeholder perspectives have shown poor uptake, limited implementation and low sustainability. Building on previous research on SFP Coordinator perspectives, this study engaged key stakeholders within Canada's largest and most diverse school board in a co-creation initiative to assess and compare SFP strategies, incorporate school-level perspectives, and address gaps in evidence.

METHODS

Using a co-creation research design embedded within the RE-AIM and socio-ecological health promotion frameworks, this study leveraged critical stakeholder partnerships to enhance evidence gathering on sustainable SFP strategies in Canada. The research team collaborated with the school board’s Nutrition Liaison Officers (NLOs) to co-create a methodology to assess and compare the school level SFP practices and opportunities for long-term program resilience. This methodology was further refined through engagement with the school board's research committee and community partners, such as non-profit school food organizations and public health units, who provided insight on evaluation criteria.

RESULTS

Co-creation activities resulted in: 1) formation of a Project Advisory Committee (PAC) comprising the research team, school board research committee, an executive superintendent, the NLOs, principals, teachers, and SFP Coordinators, and 2) successful completion of a pilot in June 2024, which informed contextual adaptations for the full study. The PAC facilitated the incorporation of diverse perspectives on program strategies, reflecting the realities of school-level operations and challenges in embedding sustainable practices into SFPs, and identified key indicator variables for evaluation and monitoring.

CONCLUSIONS

This co-creation approach highlights the importance of integrating lived experiences and diverse expertise within the school and community to evaluate and design SFPs that are sustainable and equitable. These efforts align with global goals for health equity and resilience, contributing to advancement of sustainable food systems.

SHIFTING PROTEIN CHOICES ON AMERICA'S PLATES: INSIGHTS FROM NATIONAL SURVEYS ON REPLACING RED MEAT WITH LEGUMES AND FISH

Andrew Thorne-Lyman[1]; K.c. Angela[1]; Daphene Altema-Johnson[2]; Becky Ramsing,[2]; Dave Love[2]; Roni Neff[2]; Hyomin Lee[2]; Kate Schneider[3]
[1]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [2]Center for a Livable Future, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [3]N/a, Johns Hopkins School of Advanced International Studies, Washington, United States of America

BACKGROUND AND OBJECTIVES

Transitioning away from excess red meat consumption to increased intake of more sustainable alternatives is vital for lowering the environmental footprint of our food system and improving health. The objective of this study was to identify opportunities to increase the consumption of legumes and fish to help support a protein transition in line with health, sustainability and climate goals.

METHODS

A nationally representative survey was administered online in English and Spanish through the IPSOS-KnowledgePanel platform with (n=1020) respondents in the United States. The survey included questions about food preferences, barriers to consumption, dietary motivations, and willingness to shift dietary habits with a focus on legumes. Different messages to increase legume consumption were also tested. A similarly designed survey on sustainable seafood consumption will be administered in early 2025.

RESULTS

While only a third of the sample agreed with reported trying to make food and beverage choices that are good for the environment or for climate change, 80% were motivated by health concerns. Consumption of legumes was low, with 8.8% reporting never consuming them, 35.7% consuming them once a week or less, 40.6% consuming a few times a week, and 14.9% more frequently. However, 59% of participants expressed some interest in eating more. Primary reasons cited were increasing fiber intake (56.3%), eating healthier (49.3%), weight loss (32.3%), and reducing meat consumption (28.6%). Only 10.2% reported reducing the environmental footprint and 18.8% to lower costs as reasons to eat more legumes. Reported barriers to legume consumption included gas (25.4%), non-preferred taste (19.7%), and lack of knowledge about preparation METHODS(13.1%). Messaging related to lowered risk of diabetes and heart disease with increased consumption of legumes resonated with participants more than messaging about nutrients, sustainability, or recommended consumption frequency. When eating meals without meat, participants most often chose eggs (65.7%), seafood (61.6%), dairy (55.4%), and legumes (50.1%).

CONCLUSIONS

Efforts to promote sustainable food consumption patterns may be more successful through messaging related to health rather than climate change or sustainability messaging.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

CHARACTERIZING THE INDIGENOUS FOODS OF GARO TRIBAL COMMUNITY OF MEGHALAYA, INDIA

Suparna Ghosh-Jerath[1]; Ridhima Kapoor[1]; Rashi Saini[2]; Tarun Kumar Das[3]; Archna Singh[4]; Soli Padi[1]; Quisa Terokchi D. Shira[1]; Swati C Nair[1]
[1]Nutrition and Food Systems, The George Institute for Global Health India, New Delhi, India; [2]Department of Food and Nutrition, Institute of Home Economics, New Delhi, India; [3]Krishi Vigyan Kendra, I.C.A.R. Tura, Tura, India; [4]Department of Biochemistry, All India Institute Of Medical Sciences Delhi, New Delhi, India

BACKGROUND AND OBJECTIVES

Meghalaya, a biodiversity hotspot in India, supports vast array of flora and fauna [1]. Garo tribe, an indigenous community in Meghalaya, accesses wide diversity of foods [1]. Despite cultural importance of indigenous foods (IFs) among Garos, significant literature gap exists on their systematic documentation. A study was conducted among Garo tribe to characterize their IFs and explore factors influencing their access and consumption.

METHODS

Mixed method study conducted in 14 purposively selected villages of West Garo Hills district in Meghalaya. Focus group discussions (FGDs) and free-listing enquiries (n=14) captured information on IFs consumed, and factors affecting IF access and consumption. Based on transcripts, list was collated, including IFs known to community, their seasonality, habitat and saliency scores. Enlisted IFs were taxonomically identified through secondary review and verification by ethnobotanist. Additionally, registered rice lists were utilized to identify farmer registered local rice landraces. For identified IFs, nutritive values (NVs) were documented from secondary literature, while foods with no documented NVs were seasonally collected and sent to laboratory for nutrient analysis. Data analysis done in Atlas.ti.

RESULTS

FGDs revealed diverse list of 247 IFs, accessed from shifting cultivation (*Jhum*), farms, kitchen gardens, open spaces, forests, ponds/rivers, and markets. These foods comprised 88 cereals (35.6%), 4 pulses (1.6%), 35 green leafy vegetables (14.1%), 15 other vegetables (6.1%), 33 roots and tubers (13.4%), 20 fruits (8.1%), 7 mushrooms (2.8%), 41 flesh foods (16.5%), 4 seeds and condiments (1.6%). Among these, colocasia leaves (saliency score: 6.8), stream shrimp (6.5) and *Mi Sarengma* (local rice) (3.3) emerged as top-most salient foods. Till date, 69 IFs are taxonomically identified (44 from secondary review and 25 during fruiting and flowering season by ethnobotanist) and 29 farmer-registered indigenous rice varieties have been mapped from government rice gene pool registry. Documentation of NVs completed for 55 identified IFs, with most foods rich in iron, calcium, zinc and vitamin C. Despite Garo's rich traditional ecological knowledge, IF access is declining due to higher market dependence. Climate variation, reduced farm produce and changing *Jhum* landscape for commercial crop plantations cited as main reasons towards this shift.

CONCLUSIONS

Supportive policies needed to mitigate climate impacts and threats to Garo's traditional agroforestry systems, critical for sustaining agrobiodiversity and nutritional security.

CONFLICTS OF INTERESTS

THE BENEFITS OF TRIPARTITE ASSOCIATIONS (CEREALS/LEGUMES/LEAFY VEGETABLES) IN ADULT AND CHILD NUTRITION: EXAMPLE OF APPLICATIONS IN TWO STAPLE CEREAL-BASED FOODS: PASTA AND INFANT FLOURS

Mélina Robert[1]; Mathilde Cancalon[2]; Pauline Pinel[3]; Nathalie Barouh[4]; Youna Hemery[5]; Bruno Barea[4]; Valérie Micard[3]; Claire Bourlieu Lacanal[6]
[1]IATE, Inrae Centre Occitanie-Montpellier, Montpellier, France; [2]STLO, INRAE, Rennes, France; [3]SABP, Institut Agro Montpellier, Montpellier, France; [4]Qualisud, Univ Montpellier, CIRAD, Montpellier, France; [5]UMR QualiSud, Institut de Recherche pour le Développement (IRD), Cotonou, Benin; [6]IATE, INRAE occitanie, Montpellier, France

BACKGROUND AND OBJECTIVES

Despite the United Nations 2nd objective, malnutrition, in all its forms is rising. In 2022, WHO estimated that 2.5 billion adults over the age of 18 were overweight, while 9.2% of the world's population suffered from chronic hunger. Undernutrition affects children under five even more severely. Fighting against this double burden requires nutritional intervention and education policies combining several approaches. Nutritional optimization of staple foods based on locally-produced, climate-smart raw materials is one of them. Associating cereals and legumes chosen for their complementarity in essential amino acids and for their ω3 polyunsaturated fatty acid (PUFA) content, while minimizing their Anti-Nutritional Factors (ANF), is an effective strategy. These cereal/legume combinations can be enriched with leafy vegetables for additional fortification with iron, ω3 and antioxidants of interest.

METHODS

Tripartite cereal/legume/leafy vegetable combinations were determined by linear programming either to: i) meet the needs of adults in terms of protein, fiber, iron, zinc and vitamin B9, and then processed into pasta; or to ii) be suitable as complementary foods for children aged 6 to 24 months, and then produced in the form of Fortified Infant Flours (FIF). These matrices (after cooking) were subjected to an in vitro digestion procedure using the INFOGEST protocol (respectively adult model or 6-month-old child). The bioaccessibilities of proteins and starch (for pasta), and of lipids and proteins (for FIF) were characterized.

RESULTS

Four optimized pasta formulations were obtained from cowpea wholemeal flours with or without teff and/or Amaranth Leaf (AL), with i) a chemical score above 100, ii) a ω6/ω3 ratio below 5 and iii) coverage of the FAO nutritional recommendations for an adult. Compared with conventional wheat pasta (4% fiber), the optimized pasta (17% fiber) had the same or lower rapidly digestible starch, a good balance of essential amino acids and identical protein digestibility, despite higher levels of ANF. An optimized FIF (teff-wheat-soya flours based) fortified with DHA and ARA and added with 3% AL covered requirements in PUFAs (ω6/ω3=3.7), vitamins E, A and carotenoids. This FIF showed limited bioaccessibility of proteins and vitamin E, and good bioaccessibility of long-chain PUFAs.

CONCLUSIONS

Tripartite associations (cereals/legumes/leafy vegetables) optimized to cover the needs of adults or children are interesting for developing more plant-based, sustainable diets. These associations require in-depth biochemical characterization of the raw materials, of bioaccessibility of constituents and mastery of the manufacturing processes (even low tech).

SOAP34_11

ARE ULTRA-PROCESSED FOODS MORE AFFORDABLE? A COST COMPARISON OF ULTRA-PROCESSED AND NON-ULTRA-PROCESSED FOODS CONSUMED BY U.S. ADULTS

Jingyan Wang[1]; Yongyi Pan[1]; Sean B. Cash[1]; Fang Fang Zhang[1]
[1]Friedman School of Nutrition Science and Policy, Tufts University, Boston, United States of America

BACKGROUND AND OBJECTIVES

Over half of the daily calories consumed by US adults came from ultra-processed foods (UPFs). The widespread of UPF consumption may be due, in part, to its low cost. We evaluated the cost of UPFs in comparison to non-UPFs consumed by US adults.

METHODS

By linking the dietary intake data collected using 24-hour diet recalls to the Purchase to Plate National Average Prices (PP-NAP) of foods purchased from grocery stores by US households, we estimated the cost ($ per 100 grams and $ per 100 kcal) of UPFs and non-UPFs, defined based on the Nova classification, among 4,669 US adults aged 20+ years who participated in the National Health and Nutrition Examination Survey Cycle 2017-2018. All analyses were adjusted for sampling weights to account for the complex sampling design and survey nonresponses.

RESULTS

Overall, UPFs had a higher mean (SE) cost per 100 grams ($0.50 ± 0.01 vs. $0.24 ± 0.01) but a lower mean cost per 100 kcal ($0.38 ± 0.02 vs. $0.60 ± 0.02) than non-UPFs. Excluding processed culinary ingredients (Nova 2), unprocessed or minimally processed foods (Nova 1) had the lowest cost per 100 grams ($0.30) but the highest cost per 100 kcals ($0.54); processed foods (Nova 3) had the highest cost per 100 grams ($0.60) and UPFs had the lowest cost per 100 kcal ($0.31). Among food subgroups, highly processed animal protein foods (fast-food or reconstituted meat, poultry or fish) or starchy vegetables (fast-food or prepared potato products) had a higher mean cost per 100 grams but a lower mean cost per 100 kcal than unprocessed animal protein foods (meat, poultry, fish, and eggs) or unprocessed starchy vegetables (roots and tubers). Highly processed dairy (flavored dairy foods) or industrially processed grains had a higher mean cost than unprocessed dairy (milk and plain yogurt) or unprocessed grains in both per 100 grams and 100 kcals.

CONCLUSIONS

UPFs are cheaper sources of calories than non-UPFs (per 100 kcals) in the American’s diet. However, UPFs are more expensive than non-UPFs by weight (per 100 grams). Unprocessed or minimally processed foods have the highest cost per 100 kcals but the lowest cost per 100 grams.

CLIMATE CHANGE, URBANIZATION, AND OBESITY IN CHINA

Liping Liu,[1]; Huijun Wang,[2]; Shufa Du[3]
[1]Central Laboratory, Beijing Municipal Center for Disease Prevention and Control, Beijing, China; [2]Nutrition Monitoring Department, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China; [3]Department of Nutrition, University of North Carolina at Chapel Hill, Chapel Hill, United States of America

BACKGROUND AND OBJECTIVES

Climate change and urbanization are increasingly recognized as significant global factors that can impact public health. The objectives of this study are to examine the complex interactions among these factors and to inform strategies for addressing obesity, a global epidemic that contributes to an increased risk of many noncommunicable diseases.

METHODS

We analyzed data from 34,670 adults aged 20 and older who participated in the China Health and Nutrition Survey, an ongoing cohort study initiated in 1989 with follow-up through 2018. A 12-component urbanization index (with a maximum score of 110 points) was developed to measure urbanization levels in each community. Detailed diet and anthropometric data were collected from all participants. Weather data were obtained from a publicly available source. We employed generalized regression and logit models to explore the relationships between climate change, urbanization, and obesity.

RESULTS

In 2018, the average body mass index (BMI), prevalence of overweight and obesity, and average highest temperature were 24.3, 39.0%, and 87.9°F, respectively, compared to 21.7, 13.0%, and 84.5°F in 1989. A one-degree Fahrenheit increase in temperature was associated with a 2.7% higher likelihood of being overweight or obese (OR=1.27, 95% CI 1.023–1.032), an increase in BMI by 0.078 ($p < 0.0001$), and a reduction in physical activity by 8.3 minutes per week. Additionally, a 10-point increase in the urbanization index was linked to a 0.23°F rise in temperature.

CONCLUSIONS

Rising temperatures may contribute to an increased risk of overweight and obesity by reducing physical activity, while urbanization may exacerbate climate change. The interplay between climate change, urbanization, and obesity warrants further investigation.

SOAP34_14

INDIGENOUS FOOD KNOWLEDGE, PERCEPTION AND UTILIZATION IN THE EASTERN CAPE, SOUTH AFRICA

Zoe Nomakhushe Nxusani[1]; Zuma Mthokozisi[2]; Mbhenyane1 Xikombiso[1]
[1]Division of Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa; [2]Impact and Partnerships Division, Agricultural Research Council, Pretoria, South Africa

BACKGROUND AND OBJECTIVES

Indigenous foods have recently received worldwide attention due to their ability to contribute to higher-quality nutrition, more sustainable diets, and food and nutrition security. These foods can improve diet quality, food and nutrition security, provide income households and contribute to SDGs 1 – 3 and 12. Despite this claim, the utilization of these foods has decreased. The aim of the study was to explore the knowledge, perception and utilization patterns of indigenous foods.

METHODS

A descriptive cross-sectional analytical study using mixed methods. A quantitative research survey was conducted involving 407 households. The following constructs were measured; household-survey, individual dietary diversity and household food insecurity. The qualitative survey explored the knowledge, perception and utilization patterns of indigenous foods through focus group discussions, talking circles and in-depth interviews.

RESULTS

Among a list of 48 indigenous foods, *cucurbita pepo* 96.1% (n=391), *plectranthus esculentus* 95.3% (n=388), *tulbaghia violacea harv* 95% (n=387), *vachellia karoo* 94.1% (n=383), *ficus carica and lactarius corrungis* 93.4% (n=380) were highly known and consumed. More than half of the households (56.6%) were food secure and a medium score of the dietary diversity and consumption patterns. There was a significantly positive relationship between availability and accessibility ($r=0.615$, $p<0.001$), perception and consumption ($r=0.498$, $p>0.001$) of indigenous foods.

The qualitative RESULTS revealed that participants' knowledge and expertise in the utilization of the IFs was extensive. All participants had positive perception towards indigenous foods. Conversely, the younger generation appeared to lack knowledge and skills of utilizing these foods. They perceived these foods to be hazardous and for the impoverished, whereas the elderly knowledge holders viewed them as wholesome and nourishing.
CONCLUSIONS

This study adds to the vast literature on indigenous foods in South Africa. Because of its focus on indigenous knowledge systems, it allows for a deeper understanding of the issues communities deal with which affect the utilisation.

SOAP34_16

SPATIO-TEMPORAL ANALYSIS WITH ARTIFICIAL INTELLIGENCE OF CLIMATE CHANGE IMPACTS ON THE DOUBLE AND TRIPLE BURDEN OF MALNUTRITION IN THE MEKONG DELTA OF VIETNAM

Rolando Gonzales Martinez[1]
[1]Faculty of Spatial Sciences, University of Groningen, Groningen, Netherlands

BACKGROUND AND OBJECTIVES

Climate change projections made by the World Bank identify the Mekong Delta region in Vietnam as the area at greatest risk of flooding and heat-related mortality. These risks also threaten food availability and nutrition, as the Mekong Delta contributes to one-third of Vietnam's agricultural GDP, 50% of the country's rice production, 70% of fruit production, 65% of aquaculture production, 90% of exported rice, and 60% of exported fish.

METHODS

Spatio-temporal satellite images were analyzed using AI algorithms to map flood extents, land use changes, and heat stress over time. Digital ethnology, augmented by generative AI, was conducted to gather narratives on on the field, focusing on dietary habits, food access, and coping strategies such as migration caused by disasters.

RESULTS

Climate change has altered agricultural practices and dietary patterns through climate-related disasters. Flooding and extreme heat have reduced crop yields and impacted fish availability, resulting in decreased food diversity and an increased reliance on imported, calorie-dense foods. These shifts are further influenced by patterns of urbanization observed through VIIRS satellite imagery of night lights remote sensing. Generative AI-assisted ethnographies reveal widening inequalities in food access, disproportionately affecting women and children in marginalized communities, thereby exacerbating the double and triple burdens of malnutrition, particularly in the case of migration caused by climate disasters.

CONCLUSIONS

The Mekong Delta's agricultural productivity and nutritional health face increasing threats from climate-change-induced challenges, including flooding, extreme heat, urbanization, and disaster-driven migration. These factors have contributed to reduced crop yields, decreased fish availability, and a shift towards calorie-dense imported foods, worsening malnutrition, particularly among vulnerable populations such as women and children. Promoting diversified agricultural practices—such as integrating aquaculture with rice farming—can enhance income stability and food security. Additionally, investing in infrastructure to mitigate the impacts of flooding and salinity intrusion, such as improved irrigation systems and flood-resistant roads, is vital for sustaining agricultural productivity. Our findings highlight the importance of inclusive policies that engage marginalized communities and prioritize community programs of sustainable land and water management.

SOAP 37 - CLIMATE CHANGE, SUSTAINABILITY AND NUTRITION

SOAP37_01

ADVANCING CELLULAR AGRICULTURE: A CODE OF PRACTICE FOR CONTROLLED TASTINGS OF CULTIVATED MEAT

Boaz Van Driel[1]; Ira Van Eelen[1]; Hans Verhagen[2]
[1]-, Cellulaire Agricultuur Nederland Stichting, Delft, Netherlands; [2]-, Food Safety & Nutrition Consultancy, Zeist, Netherlands

BACKGROUND AND OBJECTIVES

The emergence of cultivated foods, eg meat and seafood derived from animal cell cultures, represent significant innovations. Recently, 2 novel food applications have been filed to EFSA and will undergo rigorous safety evaluations before EU market approval. Yet, while the underpinning technology progresses, the route to consume, taste, and review cultivated food products has remained closed, pending regulations. In '22, the NL Parliament, has passed a motion that enables tastings under strict conditions. We developed and tested a Code of Practice (CoP) designed for this process. This CoP provides a framework for safely conducting pilot-scale tastings of cultivated foods under controlled conditions prior to EU regulatory approval. It intends to facilitate and speed up innovation while ensuring participant safety and adherence to EU regulations. This CoP will help these developments.

METHODS

The CoP provides a process for obtaining an evaluation of a dossier for tastings from an independent expert committee. Risk assessment follows a lean adaptation of EFSA guidance, focusing on single or limited tastings rather than habitual consumption. Producers are required to provide comprehensive data on the cell-cultured product, including its composition, production process, potential allergens, microbiological status, and safety information for all constituents. Participation is limited to healthy adult volunteers who provide informed consent, have no allergy history with strict adherence to EU GDPR rules. Tastings are restricted to controlled environments with predefined participant limits.

RESULTS

An independent committee of toxicology, microbiology, medical, and ethical experts, evaluates safety based on submitted data, and issues only an unanimous no-objection. Each approved application allows for up to 10 tasting sessions within 1 year, with a maximum of 30 participants/session. All adverse events during or after tastings must be documented and reviewed. The CoP has been applied for 2 applications with no safety issues and full content by applicants and compagnies, supporting the approach towards increased innovation.

CONCLUSIONS

The CoP and evaluation by an independent expert committee, rooted in parliamentary support for advancing cellular agriculture in the NL, provides a robust framework for balancing innovation in cultivated food development with public health protection. This facilitates sensory evaluations critical to product development while adhering to EU regulatory requirements. The pilot phase, will be evaluated after 1 year. All this contributes to faster market introduction, increased food security and supports the EU protein strategy.

SOAP37_02

NUTRITIONAL VULNERABILITY TO CLIMATE CHANGE OF INDIGENOUS PERUVIAN AMAZON WOMEN THROUGH THE STUDY OF FEEDING PRACTICES DURING PREGNANCY

Rosa Mercedes Silvera-Ccallo[1]; Carol Zavaleta Cortijo[2]; Esperanza Reyes-Solari[3]; Nadia Irene Soldevilla-Pacheco[4]
[1]Zootecnia Faculty, National Agrarian University, La Molina, Peru; [2]Intercultural Citizenship and Indigenous Health Unit, Universidad Peruana Cayetano Heredia, San Martín de Porres, Peru; [3]Lima, Facultad de Salud Pública y Administración, San Martín de Porres, Peru; [4]Lima, Faculty of Social Sciences - UNMSM, Lima, Peru

BACKGROUND AND OBJECTIVES

Indigenous women from the Amazon have high prevalence rates of anemia. Reports indicate that 70% of women of childbearing age and 60% of pregnant Indigenous women suffer from this condition. Socio-environmental determinants related to these anemia rates have been identified; however, it is unknown how climate change could affect feeding practices and impact nutritional vulnerability during pregnancy. Hence, having a better understanding of feeding practices among Indigenous women during this period can contribute to the development of public policies that effectively respond to the nutritional needs of the Indigenous mother and child.

METHODS

A qualitative methodology with an ethnographic design, following a phenomenological approach, was applied. Semi-structured interviews (n=25) and two participatory workshops with twenty-five Indigenous Peruvian amazon women from the one district were conducted. The last pregnancy was used as a reference to investigate experiences regarding feeding practices in relation to climate variability. The theoretical framework of climate change vulnerability and global health was used for analysis, applying a priori and posteriori coding, which allowed relevant themes for the participants to emerge.

RESULTS

It was found that weather and climate variability influenced feeding practices during pregnancy. The forest, river, and farmland are relevant sources of nutrients, and food preferences shaped the diet. The pregnant woman's partner was a support in caregiving and tasks related to feeding practices during pregnancy. The failure of the marital alliance, the demands of social programs, and weak messages about feeding practices from health services exacerbated nutritional vulnerability.

CONCLUSIONS

Nutritional vulnerability among pregnant indigenous women iis aggravated by climate change due to exposure to key weather indicators and a shifting local climate, which hinder labour or increase workload. The traditional food system is affected when there is a failure in marital alliance, as lack of partner support6 reduces planting space and future food availability. Health worker counseling prioritizes the unborn child's health over the mother's, while social program obligations consume their time without compensation. Finally, their adaptive capacity relies on knowledge, skills, food preferences, and family and community networks, activated during climate emergencies or when facing fragile social systems.

SOAP37_03

TAILORING TRIALS OF IMPROVED PRACTICES (TIPS) TO IMPROVE CHILD FEEDING AND USE OF INDIGENOUS PRESERVED FOODS IN DROUGHT-AFFECTED KENYA: CONSIDERATIONS FOR CLIMATE SHOCKS

Everlyn Matiri[1]; Lacey Ramirez[2]; Abdinasir Elmi[1]; Joseph Gaithuma[3]; Rachel Kavithe[3]; Martin Waweru[1]; Margaret Kahiga[1]; Justine Kavle[2]
[1]USAID Nawiri, Catholic Relief Services, Nairobi, Kenya; [2]Public Health Nutrition, Kavle Consulting, Washington, United States of America; [3]Public Health Nutritionist, Kavle Consulting , Nairobi, Kenya

BACKGROUND AND OBJECTIVES

Drought-prone regions in northern Kenya, face challenges in achieving optimal child nutrition practices due to food insecurity exacerbated by climate-induced shocks. The assessment, part of the USAID BHA-funded Nawiri project led by Catholic Relief Services, aimed to implement evidence-based interventions in Kenya's ASAL counties of Isiolo and Marsabit by addressing gaps in complementary feeding and exploring traditional preserved animal-sourced foods. The objectives were to: i) examine the acceptability and feasibility of incorporating preserved animal-source foods into IYCF ii) understand the roles of fathers, and elder women in IYCF decision-making iii) identify actionable strategies for mothers implementing TIPS amidst persistent food insecurity.

METHODS

Data collection employed qualitative and participatory formative approaches, including in-depth interviews (IDIs) and Trials of Improved Practices (TIPs) with 60 mothers (17-52 year of age), IDIs with 12 elder women, focus group discussions (FGDs) with 26 fathers and IDIs with 8 stakeholders. TIPs sessions were conducted across two rounds—dry season (Round 1) and prolonged drought (Round 2). TIPs sessions in Round 1 included combined same-day TIPs #1 and #2 visits, using food frequency questionnaires, household observations, and counseling to address gaps in complementary feeding practices, followed by TIPs #3 visits 7–10 days later to assess mothers' experiences and refine recommendations. All transcript data was coded in Dedoose software to identify themes, sub-themes, and illustrative quotes.

RESULTS

Nearly all mothers introduced camel milk, often fed raw, as a first food, prior to one year of age. TIPs counseling demonstrated significant improvements in dietary diversity and feeding frequency during the dry season. Most mothers experienced success in implementing TIPs recommendations during Round 1 versus Round 2 and stopped chewing food for the child, gave preserved meat, and fed eggs. Traditional food preservation practices like drying and fermenting milk showed potential to enhance IYCF but were underutilized. Gendered divisions of labor and restrictive norms limited child access to nutrient-dense preserved foods as fathers and older women were often excluded from IYCF decision-making.

CONCLUSIONS

Integrating traditional food preservation METHODSinto IYCF programming, while addressing social and gender norms, is essential for enhancing dietary diversity and resilience in drought-prone areas. Community-led efforts that challenge harmful gender and cultural practices can foster inclusive participation of fathers and elder women to drive change.

SOAP37_04

BIODIVERSITY RICHNESS IN FOOD COMPOSITION TABLES AS A LEVERAGE TO INCREASE FOOD BIODIVERSITY IN SCHOOL MENUS. A CASE STUDY IN A RURAL ITALIAN MUNICIPALITY

Lorenza Mistura[1]; Silvia Lisciani[1]; Elisabetta Toti[1]; Catherine Leclercq[1]; Marika Ferrari[1]
[1]Research Centre for Food and Nutrition, Council for Agricultural Research and Economics (CREA), Rome, Italy

BACKGROUND AND OBJECTIVES

Increasing the consumption and production of biodiverse foods is essential to more sustainable food systems. The NUTRICO Project is dedicated to optimizing school menus considering the nutritional value and environmental impact of recipes. Biodiversity indicators are yet to be considered in this optimization process. Food composition data at the sub-species level are an essential requisite to include biodiverse foods in school menus.

Biodistricts are privileged areas to improve the sustainability of food systems thanks to the strong link between local food production and consumption. Thus, the current exploratory study was conducted in Tolfa, a rural municipality of the “Maremma Etrusca e Monti della Tolfa” Biodistrict, in central Italy.

The objective of the study is to assess the biodiversity of plant-based foods in the school menu and its potential for increase.

METHODS

The biodiversity richness of the Italian Food Composition Database (FCDB) was assessed at species and sub-species level (cultivars, varieties, wild, neglected and underutilized foods) for plant-based foods, based on their scientific and common name. The school menu was revised towards more sustainability through a participatory process with local stakeholders. Indicators of biodiversity were assessed before and after the revision. The potential for a further increase of biodiversity was assessed considering the sub-species data present in the Italian FCDB.

RESULTS

The Italian FCDB was shown to have a relatively high biodiversity richness of information; it contains data on plant-based foods from 113 species. For 28 of these species, one or more foods are described at the sub-species level -for a total of 80 sub-species- such as Brassica oleracea (cabbage) for which 7 sub-species are available.

After revision of the school menu for sustainability and variety, the overall number of species increased from 18 to 21 in vegetables, from 2 to 4 in cereals and from 3 to 5 in legumes. Foods described at sub-species levels were all in the vegetables group and increased from 3 to 5. The FCDB's richness at the sub-species level would allow for an increase in the number of sub-species included in the school menu, from 5 to 31.

CONCLUSIONS

Efforts to increase the availability of food composition data on biodiverse foods is worthy for consideration; it may facilitate the inclusion of more food biodiversity in optimized school menus.

Climate change, food security, and dietary diversity in the West African Sahel: A mixed METHODSstudy in Senegal

Daniel Acosta[1, 2]; Victoria Simoni Assuncao[3, 2]; Moustapha Seye[4]; Cheikh Ahmadou Bamba Seye[4]; Ndèye Sokhna[4]; Dame Seck[4]; Abdoul Majid Rabiou[4]; Renata Serra[5, 2]; Sarah Mckune[1, 2]
[1]Department of Environmental and Global Health, University of Florida, Gainesville, United States of America; [2]Sahel Research Group, University of Florida, Gainesville, United States of America; [3]College of Public Health and Health Professions, University of Florida, Gainesville, United States of America; [4]Laboratoire de Recherche sur les Transformations Économiques et Sociales (LARTES-IFAN), UCAD, Dakar, Senegal; [5]Center for African Studies, University of Florida, Gainesville, United States of America

BACKGROUND AND OBJECTIVES

Climate change is currently impacting agricultural and food systems across the globe, with countries located in the West African Sahel being among the most impacted. The Sahel has historically relied on rainfed agriculture and pastoral livestock production as main sources of livelihood, which are now under stress due to the impacts of climate change.

METHODS

This study used a mixed METHODSapproach, collecting quantitative data via surveys and qualitative data via interviews and Photovoice, a community-based participatory research methodology. The surveys used validated food security indicators such as the Household Food Insecurity Access Scale (HFIAS) and the Dietary Quality Questionnaire (DQQ) which are tools that allow to identify household food security and dietary diversity. Photovoice sessions focused on exploring elements of resilience and vulnerability to food security in households. Interviews explored food security, resilience and vulnerability to climate hazards, and the role of institutions in adaptation efforts to climate change. The research sites selected were Kaffrine and Linguère.

RESULTS

High levels of food insecurity were reported in all of the field sites. In Linguère, 48% of respondents had some degree of food insecurity, and 67% in Kaffrine. Preliminary data analysis from the DQQ shows that across all sites dietary diversity remains low. Furthermore, preliminary analysis of the qualitative data shows that households are currently facing significant barriers to healthy diets based on climate hazards, such as floods and droughts, which have upended livelihoods. Challenges to crop and livestock production due to climate change are compounded by economic factors (inflation) and geopolitical factors (regional conflicts and security).

CONCLUSIONS

Climate change is currently impacting food security and dietary diversity in the Sahel. There is a need to support agricultural and livestock systems to reduce the high levels of food insecurity reported in our findings. Focus should be given to nutrient-dense foods, such as animal-source foods, for which consumption is currently low.

SOAP37_06

FAST FOOD AND CLIMATE ISSUES: EXPLORING THE CONNECTION BETWEEN YOUNG CONSUMERS' CHOICES AND ENVIRONMENTAL AWARENESS

Marie Noste Bjørnbeth[1]; Ida Synnøve Grini[1]; Ragnhild Eg,[1]
[1]Consumer, Sensory and Innovation, Nofima, Ås, Norway

BACKGROUND AND OBJECTIVES

Despite heightened awareness and abundant information concerning climate issues and human influence, few recognize the food systems' impact on the environment, and sustainability fails to motivate the typical Norwegian consumer when making their food choices. However, environmental concerns differ between groups and young consumers demonstrate a greater ability to change and adapt to more sustainable food practices compared to older generations. This demographic could serve as catalysts for change and thus represents an optimal population for examination. In this qualitative study, we aimed to investigate the eating habits of young consumers and the extent to which these are influenced by sustainability considerations. These focus group interviews, along with other activities, will in turn help inform the development of targeted canteen interventions in Norwegian high schools.

METHODS

Data collection was carried out in the fall of 2024 using semi-structured focus group interviews. Participants were high school students aged 16 to 19 years. A total of 7 interviews including 39 participants were conducted.

RESULTS

In our study, Norwegian high school students say that they prefer fast food, such as Mc Donalds, Burger King and take-away pizza when socializing with peers. Healthier food options are more frequently consumed at home. Primarily motivated by price and convenience, sustainability is not a consideration in their food choices. The students also seem to believe that the sustainable food choice is the expensive one, whereas processed foods are described as cheaper, tasty and more accessible. They all appear aware and informed of the ongoing climate crisis, but they do not present perspectives that connects it to their food consumption, nor do they seem to think that we will experience a climate crisis in Norway in this generation.

CONCLUSIONS

The findings suggest that these Norwegian adolescents, aged 16–19, prioritize price, convenience and taste over sustainability when making food choices, especially in social settings. Despite being aware of climate change, they seem to perceive it as a distant issue with limited relevance to their own lives. This disconnect highlights the need for new approaches to motivate sustainable food practices. Targeted interventions, informed by the age group's way of thinking, could potentially bridge the gap between climate awareness and sustainable eating habits among young consumers.

ADHERENCE AND ACCEPTABILITY OF THE MYPLANETDIET STUDY RECOMMENDATIONS

Leona Lindberg[1, 2]; Anne P. Nugent[1, 3]; Katie Davies[3]; Ursula Leonard[4]; Aifric O'sullivan[3]; Eileen Gibney[3]; Mairead Kiely[4]; Elena Arranz[4]; Marie Conway; Sinead Mccarthy[5]; Jayne Woodside[2, 1]
[1]Institute for Global Food Security, Queen's University Belfast, Belfast, United Kingdom; [2]School of Medicine, Dentistry and Biomedical Sciences, Queen's University Belfast, Belfast, United Kingdom; [3]Institute of Food and Health, School of Agriculture and Food Science, University College Dublin, Dublin, Ireland; [4]Cork Centre for Vitamin D and Nutrition Research, School of Food and Nutritional Sciences, University College Cork, Cork, Ireland; [5]Department of Agrifood Buiness and Spatial Analysis, Teagasc Ashtown Food Research Centre, Scribblestown, Dublin, Ireland

BACKGROUND AND OBJECTIVES

Effective incorporation of the multiple dimensions of a defined sustainable diet into FBDGs has the potential to transform food systems to support human and planetary health (1). To better understand what a healthy and sustainable diet for the Irish context looks like, the MyPlanetDiet (MPD) study was developed (2,3). Since acceptability is an important dimension of a sustainable diet (4), the objective of this analysis was to measure the adherence to, and acceptability of the MPD study recommendations.

METHODS

The MPD study was a 12-week parallel RCT (2022-2023) assessing the efficacy of personalised dietary recommendations based on Ireland's Healthy Eating Guidelines (HEG) (5) (control) vs. personalised healthy and sustainable dietary recommendations (intervention) for nutritional adequacy, environmental impact and acceptability. Dietary intake was captured using 3 x 24-hr diet recalls via FoodBook24 (6) at baseline, midpoint and endpoint. Dietary adherence at baseline and endpoint was measured through the application of a graded points system to dietary intake data. Diet-related GHGEs (7) and the Healthy Eating Index (HEI) score (8) were calculated. Acceptability of the main food group recommendations was measured using a tolerability questionnaire at endpoint. Data were analysed using Independent samples t-tests, Pearson's and Spearman's correlation coefficients and Chi-Square tests. P values <0.05 were considered statistically significant.

RESULTS

Change in dietary adherence from baseline to endpoint was similar for the control (n=147) and intervention (n=150) groups (P=0.21). Greater adherence to the intervention diet was significantly correlated with reduced GHGEs (P=0.02) and increased HEI (P<0.001), whilst greater adherence to the control diet was significantly correlated with HEI only (P<0.001). Acceptability of the dairy recommendation (1.5-2 vs. 3 servings/day for intervention vs. control groups), was lower in the intervention group, with 39% of intervention participants vs. 52% of control participants finding it 'easy/very easy' (P<0.05). Acceptability of red meat, fruits & vegetables, wholegrains, fish and treat food recommendations was not significantly different between the two study groups.

CONCLUSIONS

Personalised healthy and sustainable dietary recommendations for the Irish context showed similar adherence to those based on Ireland's current HEG, whilst also resulting in lower diet-related GHGEs. However, adjustments to the dairy recommendations are required to increase the acceptability of these healthy and sustainable dietary guidelines.

SOAP37_10

MODELING CHANGES IN CONSUMPTION PATTERNS AND NUTRIENT AVAILABILITY FOR WOMEN OF REPRODUCTIVE AGE USING ALTERNATIVE CLIMATE SCENARIOS THROUGH 2050

Caleb Millliken[1]; Anna Aceituno[1]; Timothy Sulser[2]; Chessa Lutter[3]; Maureen Black[4]; Robert Beach[1]
[1]Environment Practice Area, RTI International, Research Triangle Park, United States of America; [2]Foresight and Policy Modeling, International Food Policy Research Institute, Washington, United States of America; [3]Food Security and Agriculture, RTI International, Washing, United States of America; [4]Early Childhood Development, RTI International, Research Triangle Park, United States of America

BACKGROUND AND OBJECTIVES

Climate change is a major threat to food security and nutrition. Changes in weather patterns, extreme weather, and land use changes negatively impact agricultural productivity while elevated atmospheric CO2 concentrations reduce nutrient content. We model changes in consumption patterns and resulting nutrient availability for women of reproductive age in sub-Saharan Africa and South Asia using alternative climate scenarios through 2050.

METHODS

Using the International Food Policy Research Institute's (IFPRI's) International Model for Policy Analysis of Agricultural Commodities and Trade (IMPACT) economic model of the global food and agriculture system, we project changes in per capita consumption of over 40 major food categories under alternative climate scenarios through 2050. These projections are combined with data from the Global Expanded Nutrient Supply (GENuS) and Global Dietary Database (GDD) to estimate the nutrient content of food categories and baseline per capita consumption of each food category by young women of reproductive age (15-24) and relative to the overall population in each country or region. Changes in per capita availability of foods and the resulting available macro- and micronutrients are estimated for women aged 15-24 by country in 2050 for each climate change scenario relative to a no climate change baseline. We chose Burkina Faso, Chad, Madagascar, Malawi, Rwanda, Uganda to represent sub-Saharan Africa, and Bangladesh, Pakistan, and India to represent South Asia, based on dietary data availability in the model.

RESULTS

Incorporating climate change impacts tends to reduce projected food availability for women of reproductive age in key food groups, particularly grains, such as maize and rice, which are sometimes fortified with micronutrients. Compared to a no climate change scenario, in sub-Saharan Africa countries considered, consumption of maize is projected to decrease by 7-9% in 2050 in a high-emissions climate change scenario, while in South Asia climate change is projected to decrease consumption of rice by 3% in 2050. Maize and rice are a source of iron, zinc, and other key nutrients in these geographies as they make up a large portion of the diet and can be fortified. The negative effect of climate change on animal-source products, fruits and vegetables is more variable, though important for nutrient availability.

CONCLUSIONS

Projections of the effect of climate change on food consumption and nutrient availability for women 15-24 allow us to explore the potential for nutrition and food security interventions to mitigate negative impacts on maternal and child health.

SOAP37_11

PLANT-BASED DIETS AMONG YOUNG WOMEN IN SCOTLAND: ‘UNLESS IT'S AFFORDABLE, CONVENIENT, HEALTHY, AND FAMILIAR, IT’S A NO’

Cristina Stewart[1]; Tess Davis,[1]; Esther K Papies,[1, 2]
[1]MRC/CSO Social and Public Health Sciences Unit, School of Health and Wellbeing, University of Glasgow, Glasgow, United Kingdom; [2]Behavioural Science Institute, Faculty of Social Sciences, Radboud Universiteit, Nijmegen, Netherlands

BACKGROUND AND OBJECTIVES

Reducing meat and dairy consumption and moving towards more plant-based diets is a recognised climate change mitigation strategy with health co-benefits. However, for dietary shifts to be successful, they must be realistic and convenient. Among young people in the UK, barriers to adopting plant-based diets include the perceived inconvenience, particularly regarding meal preparation, and lack of knowledge about plant-based products. This study aimed to explore the factors influencing food choices, and how individuals define and use plant-based and convenience food in their everyday lives.

METHODS

We conducted semi-structured Zoom interviews with 30 women (aged 18-24) in Scotland between August and November 2024. 53% of participants were meat-eaters, 33% were meat-reducers and 13% did not eat meat. Participants discussed their food purchasing and consumption habits, factors affecting food choice, and their interpretation of, and experiences with, plant-based foods and convenience foods. Data were analysed using reflexive thematic analysis within a critical realist framework.

RESULTS

Families and social circles strongly shaped food choices, reinforcing meat consumption as the norm. Meat dishes were viewed as the safe and familiar default, while plant-based options were perceived as the inferior alternative. Participants often interpreted ‘plant-based’ exclusively as plant-based meat alternatives, which were seen as expensive, unhealthy, and overly processed. Concern about unknown ingredients were common, driven by both health and taste considerations. Cost was the primary driver of food choices, frequently outweighing all other factors. Health concerns played a role but were often used as a justification for meat consumption. Environmental concerns were low priority, with participants demonstrating limited or vague understanding of the environmental impact of food. Though convenience was valued and important, traditional convenience foods like ready meals were rejected in favour of batch cooking, quick prep meals, and pre-prepared components.

CONCLUSIONS

This study highlights the need to redefine and reposition both plant-based and convenience foods as healthy, affordable and familiar options among young women. Further, as health motivations are driving food choices in the opposite direction, the health benefits of increased plant-based wholefoods and reduced meat consumption should be emphasised in government and industry messaging.

SOAP37_14

ADVANCING NUTRITION AND WOMEN'S EMPOWERMENT IN BURUNDI: A MID-TERM REVIEW OF A MARKET SYSTEMS DEVELOPMENT PROJECT

Olivier Karerwa[1]; Alexis Irakoze[1]; Dieudonne Kajangwa[2]; Aloys Nzigamasabo[3]; Virginia Cavedoni[4]; Karen Mejos[5]
[1]Operations, World Vision International, Bujumbura, Burundi; [2]Program Development and Quality Assurance, World Vision International, Bujumbura, Burundi; [3]Department of Food Science and Technology, University of Burundi, Bujumbura, Burundi; [4]Fragile & Low Income Country, World Vision Australia, Burwood East, Australia; [5]Impact Evidence Building, World Vision Australia, Burwood East, Australia

BACKGROUND AND OBJECTIVES

In Burundi, over 60% of the population grapples with food insecurity, exacerbated by climatic changes. An agrifood market systems development project addresses these challenges in three target provinces, focusing on improving dietary practices, diversifying income, and boosting bio-fortified food production. The project also promotes gender equality, inclusion and empowerment, particularly among women in marginalised communities and people with disability. A mid-term review was conducted between March and April 2024 to assess project progress and refine priorities for implementation.

METHODS

A quasi-experimental mixed-METHODSapproach was employed for the review, with comparisons made to baseline data collected in 2022. Household survey data was collected from a stratified random sample of 1,015 participants, including 765 project beneficiaries, 150 people with disability, and 100 women from marginalised communities. Differences between baseline and endline were calculated and analysed, employing independent T-tests for continuous indicators and Chi-square tests for categorical indicators to identify significant changes in outcome variables.

RESULTS

The mid-term review revealed significant improvements in dietary diversity among women and children aged 6-23 months, increasing by 9.5% and 7.6% respectively. Households consuming nutrient-dense foods rose by 10%, and a third of the households reported increased income attributed to the sale of agricultural surplus facilitated by use of higher quality seeds and improved cultivation techniques. All surveyed beneficiaries (100%) reported growing a variety of nutrient-rich crops, including maize, vitamin A-fortified orange-flesh sweet potatoes, and high iron-fortified beans, compared to 84.0% at baseline. Notably, women-headed households (61%) demonstrated higher income growth compared to male-headed households (39%) and made more progress in adopting the promoted crops.

CONCLUSIONS

The project's interventions are leading to improved food and nutrition security for households through increased production, financial access and income diversification in the targeted households. However, disparities persist among women-headed households, marginalised communities, and people with disabilities, highlighting the need for more targeted support to achieve broader social inclusion and sustain these gains across all outcomes.

POLICY RESPONSES, IMPLEMENTATION BARRIERS AND OPPORTUNITIES TO ADDRESS CLIMATE CHANGE VULNERABILITY TO THE UK FOOD SYSTEM: POLICY REVIEW AND STAKEHOLDER INTERVIEWS

Grace Turner[1]; Laura Cornelsen,[2]; Rosemary Green[3]; Cherry Law[4]
[1]Public Health, Environment and Society , London School of Hygiene and Tropical Medicine, Letchworth Garden City, United Kingdom; [2]Department of Public Health, Environments and Society, Faculty of Public Health and Policy, London School of Hygiene & Tropical Medicine, London, United Kingdom; [3]Centre on Climate Change and Planetary Health, London School of Hygiene & Tropical Medicine, London, United Kingdom; [4]Agri-Food Economics and Marketing, University of reading, Reading, United Kingdom

BACKGROUND AND OBJECTIVES

Climate change will increasingly impact global food systems. The UK has a highly complex food system with long supply chains, and is dependent on imports, some of which is from increasingly climate-vulnerable countries as well as experiencing its own environmental challenges. It is critical that current policy responses are understood to identify potential vulnerabilities and subsequent consequences for food and nutrition security. The aim of this study is to understand the UK food system policy responses and opportunities to further address climate change vulnerability through reviewing European food policy strategies in concurrence with interviews with key UK policy stakeholders.

METHODS

Firstly, a policy scoping review of national food strategies (NFS) and climate change risk assessments (CCRAs) in the UK and Europe was conducted to map and compare policies and actions being implemented in response to the risks from climate change on food systems. Food strategies were included if in the WHO EURO region and were translated into English. In addition, semi-structured interviews with UK policy-makers and stakeholders were conducted to identify barriers and levers for implementation of food system policy responses to climate change in UK. Participants were recruited through national UK networks. Interview questions structured by the following themes: policy responses, barriers and facilitators, collaboration, evidence needs, inequalities. Semi-structured online interviews were analysed using the Framework Method. Ethical approval granted from the LSHTM Ethics Committee.

RESULTS

In this review, 89 NFS and 42 CCRAs were analysed. More than half of national food strategies included policies to address or adapt to climate risks, with most policies focusing on food production and agricultural risks. Across NFS and CCRAs, the key health outcomes of which policies addressed focused on food security and reducing food-borne disease. 22 stakeholder interviews were conducted with representatives across the UK food system domains. Key limate food policy barriers included knowledge gaps, funding and capacity, complexity of the UK food system, lack of collaboration and opposing agendas e.g. net zero and sustainable diets being prioritised over food system adaptation and resilience.

CONCLUSIONS

The UK food system is vulnerable to future climate risks and there is some evidence of key policy implementation to respond. However, UK stakeholders indicate that many barriers persist creating challenges for future innovation to ensure the food system is resilient, equitable, safe and healthy.

TRACKING DIETARY SHIFTS FOR LOWER CARBON FOOTPRINT IN ITALIAN HOUSEHOLDS

Anouk Reuzé[1]; Tony Carr[1]; Sarah Nájera Espinosa[1]; Biondi Beatrice[2]; Mazzocchi Mario[2]; Rosemary Green[3]; Pauline Scheelbeek[1]
[1]Population Health, London School of Hygiene & Tropical Medicine, London, United Kingdom; [2]Department of Statistical Sciences, Alma Mater Studiorum - Università di Bologna, Bologna, Italy; [3]Centre on Climate Change and Planetary Health, London School of Hygiene & Tropical Medicine, London, United Kingdom

BACKGROUND AND OBJECTIVES

Dietary shifts are established as major pathways to curb greenhouse gas emissions (GHGE). Whilst some recent studies assessed the environmental footprint of diets, few studies had explore the different strategies that consumers have implemented in their diet to reduce their carbon footprint. Our aim was to explore the dietary shifts of consumers that have lowered their carbon footprint over time.

METHODS

Food purchase data from approximately 6,000 Italian households were collected between 2019 and 2024. Food-related GHGE were assessed using life cycle assessment. Households who have successfully reduced their food-related GHGE over the period 2019-2024 were identified and called “champions". Total volume of food purchases and their associated GHGE and expenses were assessed at both time points. Patterns of dietary changes among “champions” were identified through a latent class analysis using food purchase changes. Sociodemographic characteristics were also described.

RESULTS

Among consumers, 315 "champions" were identified. This reduction was mainly achieved through decreased consumption of animal-based foods and increased intake of plant-based foods such as fruits and vegetables. We identified distinct patterns of dietary changes among the champions, which were associated with sociodemographic factors.

CONCLUSIONS

These findings emphasize the need for tailored strategies that consider demographic and behavioral differences to promote widespread adoption of sustainable dietary practices.

RESILIENCE EFFORTS FOR SUSTAINABLE HEALTH: DEFINING AND CONTEXTUALIZING COMMUNITY NUTRITION RESILIENCE

Ana Lorraine Dela Vega[1]; Maria Theresa Talavera[1]; Nancy Tandang[2]; Angelina Dr. Felix[3]; Maria Ana Quimbo[4]; Josefina Dizon[4]
[1]Institute of Human Nutrition and Food, UPLB College of Human Ecology, Los Baños, Philippines; [2]Institute of Statistics, College of Arts and Sciences, University of the Philippines Los Baños (UPLB), Los Baños, Philippines; [3]Institute of Human Nutrition and Food, University of the Philippines Los Baños (UPLB), Los Baños, Philippines; [4]College of Public Affairs and Development, University of the Philippines Los Baños (UPLB), Los Baños, Philippines

BACKGROUND AND OBJECTIVES

Resilience efforts are still in the early stages, and there is a pressing need to accelerate our understanding of these initiatives. The nutrition capacities of local communities to withstand the effects of disasters depend on a clear understanding of the local context and how program implementers align their initiatives with existing systems. Currently, there is no clear definition of community nutrition resilience. Thus, the study aimed to describe the definition of community nutrition resilience and understand its capacities and contextualize it in the local health system.

METHODS

The study applied qualitative research design. It involved a comprehensive literature review of published materials from 2010 to 2024. The study identified 30 articles relevant to the study. Then, an in-depth interview was conducted with 16 purposively selected respondents in Quezon Province, Philippines which include nutrition program implementers at municipal and village level.

RESULTS

The community's nutritional resilience was situated within the broader framework of the health resilience system. In the context of disaster, community nutrition resilience was defined as the capacity of communities to absorb, adapt, and transform geared towards attaining optimum nutritional status and promoting the population's well-being to reduce vulnerability to shock and stress. The capacities of community nutrition resilience were also formulated. Absorptive capacity refers to the community's capability to deliver quality and adequate nutrition services using available resources focusing on preparedness and response during disasters, calamities, or emergencies. Adaptive capacity pertains to the community's ability to maintain nutrition and related services at a consistent level, even with reduced or alternative resources during recovery and rehabilitation. Transformative capacity involves transforming the nutrition functions and structure of the community to adapt to changing environments, particularly focusing on activities and strategies during prevention and mitigation.

CONCLUSIONS

There is a clear recognition that community nutrition resilience falls within the broader health system context. The study effectively clarifies the concept of community nutrition resilience and its underlying capacities in the face of disasters, providing valuable insights that can guide program implementers and policymakers in advancing more effective and sustainable resilience efforts.

SUSTAINABLE DIET PATTERNS: A COMPARATIVE BETWEEN VEGAN, VEGETARIAN, PRO-VEGETARIAN AND OMNIVOROUS DIET

Eduardo Casas-Albertos[1, 2, 3]; ÁNgela Alcalá-Santiago[1, 2, 3]; María Reina-Borrego[1]; Noelia María Rodríguez-Martín[4]; Beatriz Sarriá[5]; Celia Rodríguez-Pérez[1, 3]; María Dolores Ruiz[1, 3]; Belén García-Villanova[1]; Reyes Artacho[1]; Adela Castelló[6, 7]; Esther Molina-Montes[1, 3, 2, 7]
[1]Departament of Nutrition and Food science, University of Granada (UGR), Granada, Spain; [2]Epidemiology and Public Health, Instituto de Investigación Biosanitaria (ibs.GRANADA), Granada, Spain, Spain; [3]Nutrition and Food Science, Instituto de Nutrición y Tecnología de los Alimentos "José Mataix Verdú" (INYTA), Granada, Spain, Spain; [4]Vegetal proteins, Instituto de la Grasa-CSIC, Carretera de Utrera, Seville, Spain; [5]Department of Metabolism and Nutrition, Institute of Food Science, Technology and Nutrition (ICTAN-CSIC), Madrid, Spain, Spain; [6]7Cancer and Environmental Epidemiology Unit, National Centre for Epidemiology, Instituto Salud Carlos III (ISCIII), Madrid, Spain; [7]Epidemiología y Salud Pública (CIBERESP), CIBER, Madrid, Spain

BACKGROUND AND OBJECTIVES

In the last decades, interest on vegan, vegetarian and flexitarian diets has increased all around the World. In Europe followers of vegan and vegetarian diets comprise at least 10–15% of the population [1,2]. However, current knowledge about vegetarian diets remains limited, and their ability to meet nutritional requirements is often questioned. Therefore, it is mandatory to characterize the different non-meat patterns to better understand their nutritional and consumption profiles.

METHODS

Cross-sectional study based on data from the OMIVECA study (in Spain) using a 175-item food frequency questionnaire. Frequencies were transformed into grams/day (g/d) and adjusted for total caloric intake. Foods were grouped into 28 groups and intake was compared according to the type of diet using Analysis of Variance ANOVA (significance level: 5%). Several quality indices were built and compared between the groups: three pro-vegetarian diet indices [3], the Mediterranean Diet score [4] and the EAT-Lancet index [5]. Principal component analysis (PCA), K-Means and hierarchical clustering analyses were applied to characterize the dietary patterns. In PCA, dietary patterns were characterized based on factor loadings for each component (>±0.2).

RESULTS

A total of 596 participants were included (72.8% women, mean age: 25.8±8 years); 129 were vegan/vegetarian. Daily consumption of vegetables, mushrooms and potatoes was significantly higher in the non-omnivore groups (>450g/d) compared to omnivores ($p<0.001$). The three diet indexes were correlated between each other (rho = 0.5-0.6) and omnivores scored lower than the rest of the groups ($p<0.001$). In the PCA, a dietary pattern featuring the vegan diet was identified (explained variance: 15.2%), consisting of: dairy (-0.25), meat and meat products (-0.32), fish (-0.22), vegetables, mushrooms and potatoes (0.24), legumes (0.26), vegetable protein (0.35) and vegetable drinks (0.30). The second pattern, associated with a healthy vegetarian diet, accounted for 7.1% of the variance: eggs (0.26), fish (0.22), fruits (0.26), whole grains (0.29), pastries (-0.31), prepared foods (-0.33), sauces (-0.32). Two other patterns were associated with an unhealthy vegetable diet and omnivorous diet, with a total explained variance of 33%. The clustering METHODSunraveled four dietary patterns with different intake profiles.

CONCLUSIONS

RESULTS of the OMIVECA study reveal significant differences in eating habits between omnivores, vegetarians and vegans, beyond the exclusion of foods of animal origin.

Associations between monthly hydroclimatic indicators and nutritional/ health outcomes in children under-5 years old in southern Madagascar: RESULTS of HydroNut project

Laure Ngabirano[1]; Alan Ricardo Patlan Hernandez[2]; Myriam Ait Aissa[1]; Tom Heath[3]; Jean Lapegue[3]; Jacques Gardon[4]; Simon Carrière[4]; Dieynaba N'diaye[1]
[1]Research, Analysis and Learning Service/Expertise and Advocacy Department, Action contre la Faim, Montreuil, France; [2]Univ Rennes, Inserm, EHESP, Irset (Institut de recherche en santé, environnement et travail) - UMR_S 1085, F-35000 Rennes, France; [3]Water, Sanitation and Hygiene Service /Expertise and Advocacy Department, Action contre la Faim, Montreuil, France; [4]Hydrosciences, Institut de Recherche pour le Développement, Montpellier, France

BACKGROUND AND OBJECTIVES

Climate crisis affects human health, including nutrition, yet evidence remains limited. We investigated how hydroclimatic factors are associated with health and nutrition outcomes as part of the HydroNut project.

METHODS

Time series data on monthly nutritional (severe acute malnutrition (SAM)) and health (acute respiratory infections (ARI), diarrhea and malaria) outcomes of children under five, along with hydroclimatic indicators (rainfall and leaf area index (LAI)), were collected for Amboasary (2014–2021) and Betioky (2016–2021) districts in Madagascar. Associations were assessed using negative binomial regression models adjusted for seasonality and trends providing the relative risk (RR) and its 95% confidence interval (95% CI). Lagged effects were also explored.

RESULTS

Data covered 54–90 months, depending on the indicator and district. In Amboasary and Betioky respectively, crude models showed positive associations of rainfall with SAM (RR [95%CI]=1.005 [1.002-1.007]; 1.003 [1.000-1.005]), diarrhea (1.002 [1.001-1.004]; 1.004 [1.001-1.006]), and ARI only in Betioky (1.002 [1.000-1.004]). Similar stronger associations were observed for LAI with SAM (3.138 [2.174-4.530]; 2.122 [1.504-2.994]), diarrhea (1.925 [1.512-2.450]; 2.220 [1.701-2.898]), and ARI in Betioky (1.813 [1.368-2.401]). Overall, lag effects appeared within three months for rainfall and two months for LAI, showing a protective role between months 4–10 according to district and outcome. Malaria showed negative associations, turning positive after 4–7 months for rainfall and 2–6 months for LAI.

CONCLUSIONS

Child health risks like SAM, ARI, and diarrhea increase within three months of rainfall or two months of LAI increases. These associations may be explained by post-rainfall microorganisms' proliferation, affecting children through multiple pathways. These diseases can be risk factors for SAM, which may set in before the effects of rain on harvests. Understanding these mechanisms is crucial to improving public health and humanitarian responses by implementing anticipatory actions to mitigate climate-related health risks.

SOAP50_08

CONSUMPTION OF MILK, MEAT, EGG AND FISH IN THE NORWEGIAN DIET HAS CHANGED CONSIDERABLY IN 85 YEARS

Karianne Spetaas Henriksen[1]
[1]Head of Nutrition, Norwegian Meat and Poultry Research Center, Animalia AS, Oslo, Norway

BACKGROUND AND OBJECTIVES

The consumption of animal-sourced foods (ASF), i.e. milk, meat, egg and fish, has historically been high in Norway compared to countries in other parts of the world. ASF provides essential nutrients and energy in the Norwegian diet. However, the diet has changed significantly in the last 85 years. In the public debate and in a research context, livestock-derived foods receive considerable attention. The impression is that consumption is high and increasing. This study aims to provide an overview of the consumption of ASF in the Norwegian diet over the last 85 years.

METHODS

Data was retrieved from food supply from 1939 to 2023. Edible portions of ASF have been calculated using various methods. Food waste has been accounted for.

RESULTS

The total consumption of ASF has changed considerably between 1939 to 2023. For milk, the reduction is down by approximately 230 liters/capita/year (45 %) as drinking milk is reduced, especially since the 1970s. The consumption of meat is doubled, to 55,1 kg/capita/year, mainly due to the increased consumption of pork and poultry. Fish consumption is down by 55 %, to 11,7 kg/capita/year, while egg consumption has increased by 84 %, to 11,4 kg/capita/year.

The changes in meat and milk consumption cause considerable changes in energy and protein supply from ASF. The energy supply from ASF is reduced by 29 % and protein supply by 15 % from 1939 to 2023. This is mainly due to reduced consumption of milk. The increase in meat consumption has not compensated for the decrease in reduced energy supply from milk. However, the increase in meat consumption has to a larger extent substituted the reduced protein supply from milk.

CONCLUSIONS

ASF has been an important part of the Norwegian diet for the last 85 years. However, there has been a major shift between milk and meat consumption during this period. As a result, energy and protein supply from ASF have changed considerably. To understand dietary patterns, it is crucial to evaluate changes in comparable food groups over time.

SOAP50_09

EVALUATION OF PLATE WASTE IN A MAJOR HOSPITAL IN A LOW-AND MIDDLE INCOME COUNTRY

Laurene Boateng[1]; Aisha Ayamdago,[1]; Anna Amoako-Mensah,[1]
[1]Department of Dietetics, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES

Food waste is a pressing global issue, contributing to environmental, economic, and social challenges. About one-third of food produced for human consumption (approximately 1.3 million tons) is wasted annually, accounting for 8% of global greenhouse gas emissions, primarily methane, a potent contributor to global warming. Hospital food waste in particular has implications for both the environment and the nutritional status of hospitalized patients. There is a dearth of evidence on hospital food waste in low- and middle-income countries (LMICs). This study thus sought to quantify food waste from in-patient meals, identify factors contributing to waste, and describe disposal practices in a hospital in a LMIC.

METHODS

A mixed-method, cross-sectional study design was employed to recruit 108 in patients. Lunch meals were weighed before and after consumption to quantify waste, excluding non-edible portions. Semi-structured questionnaires identified reasons for waste, and interviews with waste management staff provided insights into disposal practices. SPSS version 26 was used for data analysis which included descriptive statistics, chi-square tests, regression analysis, and thematic analysis. Ethical approval for the study was sought and obtained from the Ethics and Protocol Review Committee of the School of Biomedical and Allied Health Sciences with protocol identification number SBAHS/AA/DIET/11004748/2023-2024. Informed consent was obtained from each participant.

RESULTS

Average plate waste prevalence of 23.58% was observed. Chi-square analysis showed that factors such as gender ($p=0.044$), satisfaction with variety of food served ($p=0.018$), and quantity of meal consumed ($p<0.001$) significantly influenced food waste. Predictors of food wastage included sex, portion size, and meal satisfaction. Landfilling was the primary disposal method, with key informants citing challenges like poor segregation, inadequate composting facilities, and staff shortages.

CONCLUSIONS

Hospital food services have some of the highest rates of plate waste compared to other foods service settings. This significantly impacts environmental sustainability and nutritional status of patients. This study highlights the need for targeted interventions, such as improved food utilization in hospital settings and improved food waste management practices, to reduce food waste and align with UN Sustainable Development Goals for food waste reduction.

CONFLICTS OF INTERESTS

SOAP50_10

ADHERENCE TO THE PROVEGETARIAN FOOD PATTERNS AND ALL-CAUSE MORTALITY IN A MEDITERRANEAN MIDDLE-AGED POPULATION

Ainara Martinez-Tabar[1]; Vanessa Bullon-Vela[2]; Carmen Sayon-Orea[2]; Silvia Carlos-Chilleron[2]; Miguel Ruiz-Canela[2]; Miguel A. Martínez-González[3]; Maira Bes-Rastrollo[2]
[1]Preventive Medicine and Public Health, University of Navarra, Pamplona, Spain; [2]Dpt. Preventive Medicine and Public Health, University of Navarra, Pamplona, Spain; [3]Department of Preventive Medicine and Public Health, University of Navarra, Pamplona, Spain

BACKGROUND AND OBJECTIVES

A provegetarian food pattern (PVG) that prioritizes the consumption of plant-based foods without completely excluding animal-based foods has been associated with health benefits. However, not all plant-based foods are healthy. We prospectively evaluated the association between provegetarian food patterns and total mortality in the X cohort.

METHODS

The X Project is a Mediterranean cohort study involving X university graduates. A PVG food pattern was calculated using a previously published score, assigning positive scores to plant-based foods and inverse scores to animal-based foods. Participants were categorized into quintiles based on their adherence to this pattern. Additionally, healthy (hPVG) and unhealthy (uPVG) provegetarian food patterns were derived. Cox regression models, adjusted for potential confounders were used and E-values were calculated to assess residual confounding.

RESULTS

Data from 17,989 participants were analyzed, with a mean baseline age (standard deviation) of 38 years (±12). During a median follow-up of 12 years, 460 deaths were identified. Participants with higher adherence to the overall and healthy provegetarian food patterns showed a lower risk of total mortality compared to those with lower adherence, after adjusting for multiple confounding factors: [PVG: HR Q5 vs. Q1:0.68 (95% CI: 0.50-0.93); p for trend= 0.020]; [hPVG: HR Q5 vs. Q1: 0.65 (95% CI: 0.47-0.90); p for trend= 0.016]. However, no association was found between the uPVG food pattern and mortality [uPVG: HR Q5 vs. Q1: 1.31 (95% IC: 0.93-1.83); p for trend: 0.037]. No major degree of overlap was found between the Mediterranean food pattern and the PVG food pattern or hPVG food pattern. The Pearson's correlation coefficient between these food patterns were 0.38 and 0.54 respectively. For the multivariate adjusted RESULTS in our study, the E-values for the PVG and hPVG estimates were 2.30 and 2.45, and for the confidence intervals: 1.35 and 1.46, respectively.
CONCLUSIONS

Better adherence to a provegetarian pattern, which prioritizes the consumption of healthy plant-based foods, reduces the risk of all-cause mortality in the X cohort. An unhealthy provegetarian food pattern was not associated with all-cause mortality in a Mediterranean middle-aged population.

CONFLICTS OF INTERESTS

SOAP50_11

SYSTEMATIC REVIEW OF PUBLIC FOOD PROCUREMENT POLICIES IN EUROPE TO ADDRESS CLIMATE, FOOD AND HEALTH OUTCOMES

Silvia Pastorino[1]; Green Rosemary[2]; Milner James[1]
[1]Public Health and Policy, London School of Hygiene & Tropical Medicine, London, United Kingdom;
[2]Epidemiology and public health, London School of Hygiene & Tropical Medicine, London, United Kingdom

BACKGROUND AND OBJECTIVES

Changing food consumption in high-income countries toward diets that reduce climate change and environmental degradation while achieving healthy outcomes co-benefits has never been more urgent. One policy tool increasingly used by governments in European countries to affect heath, environment and social outcomes and drive systemic change is public food procurement (PFP). However, little is known about the impacts of implemented public procurement policies. The aim of this systematic review is to evaluate the evidence on the impact of PFP policies used by national and local governments in European countries to drive positive climate, environmental and health changes.

METHODS

Ten scientific databases and government food policies for all included countries were screened as data sources. Articles were included if they analysed policies at a national, regional or city-level affecting European populations and involved Implemented or evaluated PFP policy or interventions involving environmental sustainability in the design, aim or outcome.

RESULTS

We identified 3,634 records in the published literature. After double screening, 89 articles were retained for full text screening. Most studies outlined implemented sustainable policies strategies as well as scope and barriers to implementation. Of these eight studies evaluated various outcomes of implemented sustainable PFP policies. Key themes of environmental sustainability were organic food procurement, local or regional procurement and shorter supply chains, reduced greenhouse gas (GHG) emissions, animal protein reduction and increased plant foods. Policies were either implemented at national or municipality level, with large cities being key drivers of change. Schools were the most mentioned sector among policies only affecting one sector. Policies evaluations showed significant reductions in (GHG) emissions and meat intake following implementation of sustainable PFP policies in European municipalities. Improved school meal policies particularly when coupled with experiential educational activities and a whole school food environment Increased fruit and vegetables and promoted sustainable food knowledge.

CONCLUSIONS

Sustainable PFPs are a key policy tool to drive positive environmental and health changes with the potential to affect a large number of individuals and drive and orient a large amount of food productions. Policies affecting schools have the added benefit of helping develop sustainable eating habits.

SOAP50_12

RESPONSE OF SMALLHOLDER FISHERFOLKS ON THE GHANA VOLTA TO CLIMATE VULNERABILITIES AND THE EFFECT ON LIVELIHOODS AND FOOD SECURITY

Faith Agbozo[1]; Johnpaul Amenu[1]; Philothea Kitsi[1]; Albrecht Jahn,[2]; Ina Danquah,[3]
[1]Department of Family and Community Health, University of Health and Allied Sciences, Ho, Ghana; [2]Institute of Global Health, University of Heidelberg, Heidelberg, Germany, Heidel, Germany; [3]Hertz-Chair Innovation for Planetary Health and Center for Development Research, University of Bonn, Bonn, Germany

BACKGROUND AND OBJECTIVES

Climate change disproportionately affects the vulnerable, posing serious threats to development. Aim: to determine the climatic vulnerabilities experienced by fisherfolks on the Ghana Volta Lake and the effect on their livelihoods, food security and nutritional status.

METHODS

This cross-sectional survey comprised 521 randomly-selected household heads predominately involved in fishing-related activities on the mainland and island communities of the Ghana Volta Lake basin. Using validated instruments, we measured indices for climate vulnerability and coping strategies as key exposures. Data was thematized per vulnerability intensity and differences determined descriptively. Predictors for poverty as outcome was tested using ordinal regression and the adjusted odds ratio (OR) reported at 95% confidence intervals (CI).

RESULTS

Overall, 13.2% experienced critical climate vulnerabilities with a significant difference between the male and female-led households (15.0% vs 8.4%). Stressed (51.1%), crisis (27.8%), and emergency coping METHODS(19.2%) were adopted in response. On the poverty continuum, 53.9% were extremely poor while 3.1% were least poor. Diets of 15.7% and 27.3% was poor and borderline. Food insecurity was 21.5% (4.0% mild, 7.9 moderate, 9.6 severe). Anemia was 52.7%. Key adaptation measures were fishing in deeper/dangerous areas of the lake (36.1%), migration (31.7%), catching immature fish (25.9%), and investing in postharvest storage (24.9%). Independent fishing-related risk factors associated with critical climate vulnerabilities were using motorized canoe (OR:4.13, 95% CI:1.77-9.66), years of fishing experience (OR:0.94, 95% CI:0.91-0.98) and knowledge on climate mitigation measures (OR:16.59, 95% CI:7.68-35.86). Poverty was associated with critical climate vulnerability (OR:3.63, 95% CI:1.16-11.30), part-time fishing (OR:4.77, 95% CI:1.03-22.03), using a larger canoe (OR:3.31, 95% CI:1.63-6.74), towed dredged net fishing method (OR: 2.75, 95% CI:1.01-7.49), selling the fish catch in a processed form and adopting emergency (unhealthy) coping mechanisms (OR:2.81, 95% CI:1.05-7.47). Climate vulnerabilities did not significantly affect food security but it effected household diet quality and anemia levels, with females having a higher odds.

CONCLUSIONS

Over half live in extreme poverty and face food insecurity while many rely on risky coping mechanisms, emphasizing the urgent need for targeted adaptation strategies that integrate climate resilience into poverty alleviation efforts.

KEEPING BREAD FLOUR NUTRITIOUS: A FOOD SYSTEMS PERSPECTIVE ON THE UK WHEAT AGRI-FOOD SYSTEM

Apple Espino[1, 2]; Stephan Haefele,[3]; June Po,[2]; Kate Wellard,[2]; Andrew Mead,[1]
[1]Intelligent Data Ecosystem, Rothamsted Research , Harpenden, United Kingdom; [2]Natural Resources Institute, University of Greenwich (Medway Campus), Gillingham, United Kingdom; [3]Sustainable Soils and Crops, Rothamsted Research , Harpenden, United Kingdom

BACKGROUND AND OBJECTIVES

Wheat is a major global staple crop, providing essential nutrients and energy. Enhancing wheat's nutritional quality across value chains (VCs) can be a sustainable approach to achieving food security and nutrition, amidst evidence of nutrient decline in wheat and the impacts of climate change. This study aims to assess the nutritional quality of bread flour within the UK wheat VCs by examining nutrient variability in commercially retailed bread flour, the associated factors to variability and the cost per unit of nutrient, and exploring producers' and millers' perceptions of nutrition standards for wheat, flour and bread.

METHODS

A mixed-METHODSapproach was employed, including a survey of 143 milling organizations across the UK. Eight millers, selected based on sustainability goals and operational scale, formed as case studies with in-depth interviews using the Value Chain Analysis for Development (VCA4D) framework. Survey data were analysed descriptively, and interview transcripts were thematically analysed. Bread flour samples (white, brown, wholemeal) from 143 mills were analysed for protein and trace minerals and the cost per unit of each nutrient was calculated. Multivariate analysis was conducted to explore the impact of variety, milling practices, farming practices, and sourcing regions on nutrient concentrations. Triangulated findings from the survey, qualitative interviews, and nutrient analyses were used to identify drivers of flour nutritional quality across the wheat agrifood system in the UK.

RESULTS

Of the 143 surveys distributed, 24% were completed. Local wheat imports were common, with regional preferences for specific varieties (e.g., YQ population wheat). About 56% of miller-respondents sourced their grains from organic farms. Small-to-medium millers prioritised old wheat varieties, grain provenance, traceability, and organic practices, linking these to flour's nutritional quality. Commercial millers viewed mandatory fortification of white flour as essential for meeting the population's nutrition needs, while small millers were limited to producing wholemeal flour. Nutrient variations in bread flour between millers were influenced by wheat variety, milling methods, and farming practices. Regional differences in the availability, cost, and key micronutrients of bread flour were also observed.

CONCLUSIONS

With evidence of declining nutrients in wheat, a systems approach is essential to identify entry points for maintaining or improving its nutritional quality. Key factors to explore within VCs include wheat variety selection, milling practices, fortification, and agronomic methods, ensuring the wheat agri-food system can sustainably deliver nutritious flour for all.

PROMOTING ENVIRONMENTAL HEALTH AND COMMUNITY NUTRITION EQUITY THROUGH INDIGENOUS KNOWLEDGE IN AFRICA

Akolaa Rosemary Anderson[1]
[1]School of Natural and Environmental Sciences, University of Environment and Sustainable Development, Somanya, Ghana

BACKGROUND AND OBJECTIVES

Indigenous knowledge plays a crucial role in promoting environmental health and community nutrition equity. This study aimed to explore how traditional agricultural practices, and dietary habits contribute to improving food security, biodiversity, and reducing malnutrition in Africa.

METHODS

The study employed qualitative methods, collecting data through semi-structured interviews with 60 community leaders, farmers, and nutrition experts across five regions in Ghana. Data analysis focused on identifying themes related to traditional agricultural practices, indigenous diets, and policy recommendations.

RESULTS

The findings revealed that traditional practices, such as intercropping and organic soil management, significantly enhanced food security and biodiversity preservation. Indigenous diets were identified as nutrient-dense and culturally appropriate, leading to noticeable reductions in malnutrition rates among communities. Participants stressed the importance of aligning indigenous knowledge with modern development strategies to address pressing challenges effectively.

CONCLUSIONS

The study concluded that indigenous knowledge is a valuable resource for addressing environmental and nutritional challenges in Africa. Policymakers are urged to integrate these practices into sustainable development policies while ensuring strong connections between policies and their practical implementation to foster equity and sustainability.

POTENTIAL HEALTH BENEFITS OF A DIET RICH IN ORGANIC FRUIT AND VEGETABLES VERSUS A DIET BASED ON CONVENTIONAL PRODUCE: A SYSTEMATIC REVIEW

Nathalie Komati[1]; Jean-Pierre Cravedi[1]; Jean-Michel Lecerf[2]; Luc Belzunces[3]; Delphine Tailliez[1]; Claire Chambrier[1]; Johanna Calvarin[1]; Marie-Josephe Amiot-Carlin[4]
[1]Île-de-France, Agence pour la Recherche et l'Information en Fruits et Légumes (APRIFEL), Paris, France; [2]Nord, Département Nutrition et Activité Physique, Institut Pasteur de Lille, Lille, France; [3]Provence-Alpes-Côte d'Azur, INRAE, Laboratoire de Toxicologie Environnementale, UR 0406 A&E, Avignon, France; [4]Hérault, MoiSA, Univ Montpellier, CIHEAM-IAMM, CIRAD, INRAE, Institut Agro, IRD, Montpellier, France

BACKGROUND AND OBJECTIVES
Over the past decade, there has been growing interest in the production and consumption of organically grown food. Scientific studies have shown that organic fruits and vegetables (FV) are of higher quality in terms of nutrient and pesticide levels, although it is difficult to conclude that these products are potentially better for health than conventional FV. To date, three systematic reviews have been conducted in 2010, 2012, and 2019 to evaluate the effect of consuming organic FV on health, but none have demonstrated a real benefit due to heterogeneity of RESULTS and biases in studies. As the literature has expanded since then, this review was conducted to determine whether current evidence shows that a diet rich in organic FV is healthier than one based on conventional products.
METHODS

A systematic search was conducted using the PubMed and Web of Science databases to identify articles published between January 2003 and December 2022. Articles were analyzed uniformly by two reviewers, using a specific summary sheet template, and scored from 1 to 5. The level of evidence and the quality of studies conducted in humans were assessed using the JADAD score and the Haute Autorité de Santé (HAS) method. The PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) approach was followed.

RESULTS
A total of 12 human studies were included. The studies often presented contradictory or contradictory effetcs RESULTS and methodological limitations. Only six of the twelve studies found significant associations between organic food consumption and the health effects.
CONCLUSIONS

Current data do not allow for a firm conclusion to be drawn on a greater health benefit of a diet rich in FV based on organic products compared with a diet based solely on conventional products. Currently available data are insufficient and study designs (participants, exposures, durations, health outcomes, and residual confounding factors) are highly heterogeneous. Well-designed interventional studies are needed.

CONFLICTS OF INTERESTS
The authors have no conflict of interest.

BACKGROUND AND OBJECTIVES

In the Sub-Saharan Africa, there exists aboriginal spices, herbs, condiments produced by processing seeds or exudate and other seasoning agents likes local salts, processed insects and fishes as well as wild edible mushrooms. The sahelian part mostly rely on local herbs, processed plant seeds and traditional salts to season meals.The goal is to unveil the diversity of local seasoning agents of tropical Africa, their properties on diseases and opportunities.

METHODS

Field and literature surveys were conducted in local spices consumption areas. Samples collected and mixtures produced were characterized (lipids, protein, carbohydrate, phenolic and volatile compounds, minerals elements, aromatic and volatile compounds, health properties) through physicochemical methods.

RESULTS

Over 30 different less-known spices were reported, herbs, condiments in the form of salts, fermented pulses/seeds, wild mushrooms, insects, fermented/dried fishes. The spices are in the form of dried fruits, bark, roots and sap of trees, bulbs, leaves of plants. They are sources of phenolic compounds (1.05g/100g to 38.8 g/100g), fats (1.95 g/100g to 53.36 g/100g) (ω-3 and ω-6), protein (4.2 g/100g to 13.97 g/100g), hundreds of aromatic/volatile compounds with flavoring properties. They are claimed and used for their health promoting properties and supported by scientific evidences (chronic diseases, enzymes and hormone stimulation antimicrobials). The herbs are aromatic (*Occimum graticimum* African basilic, African thyme…), some acidic (*Hybiscus sabdarifa*, *Adansonia digita…*) used mosltly in Sahel for food seasoning. The fermented seeds/pulses (*Parkia biglobosa*) contain compounds like ammonium, amines, free amino acids, short chain fatty acids, pyrazynes alcohols. Local seasoning salts are sources of minerals (Na: 4%, K: 95%, Mg: 0.1%, Ca: 0.29 %, Zn: 0.0025%, Cr: 0.019%) and impar characteristic taste to meals. About 14 mushrooms impar taste due to octenol, esters, volatile FFA, ketones and are source of proteins 8.1 to 46 %, fat 1.5% to 20, minerals 7.4 to 14.1 % and mycosterol. Wild edible insects (>85) unlike fermented/smoked fishes are consumed for proteins, as seasoning in the various tropical Africa zones.

CONCLUSIONS

https://doi.org/10.1017/jns.2026.10126 Published online by Cambridge University Press

The present work highlights the necessity of promoting the recognition, role played by indigenous spices, herbs, condiments and other seasoning agents on health, nutrition (sodium) and carbon footprint; enhance tastes (spicy/pungent, umami, acid, sour ….).

SOAP20_10

PROTEIN QUALITY OF SOUTH AFRICAN POTATOES

Carmen Muller[1]; Beulah Pretorius[2]; Hettie Schönfeldt[2]
[1]Animal Sciences, University of Pretoria, Pretoria, South Africa; [2]Department of Animal Science, University of Pretoria, Pretoria, South Africa

BACKGROUND AND OBJECTIVES

To meet the growing need for alternative sources of high quality protein, research on various supplementary crops is encouraged to determine the true and total nutritional value of food protein. Alternative sources of protein can make a significant contribution to protein intake of vulnerable individuals especially in countries where high quality proteins from animal source foods is scarce.

METHODS

For this project the protein quality and quantity of four of the most commonly consumed potato cultivars in South Africa were evaluated. Protein content was determined using both the nitrogen to protein conversion factor as well as by summation of amino acids for four of the potato tubers. Chemical scores of essential amino acids, the essential amino acid index and the protein digestibility corrected amino acid score (PDCAAS) were calculated according to the FAO expert consultation on 'Dietary protein quality evaluation in human nutrition (2013)'. A faecal digestibility value of 90, derived from a calf, was used for potatoes. The digestible indispensable amino acids score (DIAAS) was also calculated according to the 2013 FAO Report using calf true ileal amino acid digestibility coefficients.

RESULTS

Protein content for the tubers varied between 1.65g/100g and 2.14g/100g when using protein conversion (Jones 6.25) and 1.64g/100g and 2.14g/100g when using the sum of amino acids with significant differences found between the amino acid content of the different tubers. All PDCAAS values were truncated to 1 which may mean that valuable information was lost due to truncation. DIAAS values for the different tubers ranged between 99 and 114. When using the essential amino acid index and DIAAS all four potato cultivars that were analysed can be classified as containing protein of good quality. Leucine was found to be the first limiting amino acid in potatoes, which is an amino acid that is commonly limited in plant based products.

CONCLUSIONS

Even though potatoes are not typically considered as a source of protein, due to the its low protein content, the unique amino acid composition allows potatoes to be regarded as a plant based food that contains high quality protein.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

SOAP20_11

EXPANDING THE THAI FOOD COMPOSITION DATABASE: VITAMIN D CONTENT IN COMMONLY CONSUMED FISH AND MUSHROOMS

Kunchit Judprasong[1]; Piyanut Sridonpai[1]; Prapasri Puwastien[1]; Konpong Boonyingsathit[1]
[1]Food and Nutrition Academic and Research Cluster, Institute of Nutrition, Mahidol University, Nakhon Pathom, Thailand

BACKGROUND AND OBJECTIVES

Vitamin D deficiency is prevalent in Thailand across all age groups. However, a comprehensive database of vitamin D content in Thai food is lacking. This study aimed to address this gap by quantifying various forms of vitamin D in commonly consumed fish and mushrooms.

METHODS

Ten fish and ten mushroom species were selected based on their popularity in Thai cuisine. Samples were homogenized, freeze-dried, and analyzed using liquid chromatography-tandem mass spectrometry (LC-MS/MS) to identify and quantify seven vitamin D forms (vitamin D2, D3, D4, ergosterol, 7-dehydrocholesterol, 25-OH D2, and 25-OH D3).

RESULTS

Vitamin D3 was the predominant form in fish. Common silver barb, red Nile tilapia, and Nile tilapia showed the highest levels (48.5, 31.0, and 19.8 µg/100g fresh weight, respectively), while other fish contained lower amounts (2.4-5.7 µg/100g). In contrast, mushrooms primarily contained vitamin D2. White Shimeji and Lung Oyster mushrooms had the highest content (7.96 and 6.21 µg/100g fresh weight, respectively), while other species displayed lower levels (0.06-2.30 µg/100g). This novel vitamin D data has been incorporated into the publicly accessible Thai Food Composition Database.

CONCLUSIONS

This study provides the first comprehensive data on vitamin D content in commonly consumed fish and mushrooms in Thailand. This information enriches the Thai Food Composition Database, enabling dietary assessments and potentially informing strategies to combat vitamin D deficiency in the population.

SOAP20_13

POSITIVELY CULINARY AS A MODEL FOR ORGANIZATIONAL TRANSFORMATION TOWARDS A FOOD-FIRST, HUMAN-CENTRIC MINDSET THAT ENHANCES CULTURE AND DRIVES SUSTAINABLE BUSINESS GROWTH

Laetitia Rocha[1]; Kristen Wilk[2]
[1]R&D, PepsiCo Beaumont Park R&D, Leicester, United Kingdom; [2]R&D, PepsiCo, Chicago, United States of America

BACKGROUND AND OBJECTIVES

Positively Culinary (PC) at a multinational Food and Drink company is a transformative program to enhance food science, gastronomy and life quality for Global R&D (3000 associates) by proliferating a “food-first” mindset that imparts food system thinking, DE&I and sustainable business growth. PC’s strategic approach includes creating meaningful food experiences that deeply resonate with consumers and drive change towards a food-centric, inclusive culture with diverse human needs at the core. PC can serve as a model for impactful transformation at organizations worldwide.

METHODS

PC utilized a 3-pronged structured change management framework to drive adoption then sustain mindset and behavioral changes over time: 1) skill-focused training, 2) events & engagement, 3) external perspectives. As an example, product developers (PD) enrolled in hands-on cooking instruction by professional chefs to help connect food science and industrial METHODSto at-home cooking techniques. PC events immersed PD in topics such as evidence-based nutrition guidance for incorporating whole grains into food and consumer diets. PC Advisory Board (multidisciplinary external experts from behavioral and nutrition science to anthropology) guided PC curricula and delivered diverse perspectives.

RESULTS

In 2023-24, employees completed 2000 trainings. Over 150 leaders and associates engaged with 7 external experts, resulting in 18 key insights that influenced organizational changes and 11 initiatives with business application. DE&I events surpassed projected attendance; 90% agreed objectives were met. Proprietary Food Culture workshops with 92 PDs influenced mindset and technical output: products developed after PC scored high in consumer evaluations (ex. overall liking 7.7/9 and 89-93% agreed product met expectations).

CONCLUSIONS

The comprehensive, multifaceted PC program revolutionized the work of R&D by instilling a food-first mindset among technical teams. PC trainings enhanced PD innovation processes to include both food science and the context of food in people's lives, with proven impact on the end consumer. PC will serve as a model beyond R&D at its parent Food & Drink company and can for other organizations that seek culture and mindset transformation, and sustainable business growth. SOAP20_15

FROM KNOWLEDGE TO ACTION: UNDERSTANDING STUDENTS' WASTE DISPOSAL PRACTICES

Avita Usfar[1]; Nadhila Beladina[1]; Esther Novalia[1]; Azka Fitri[1]; Iwan Ariawan[1]
[1]Research, Reconstra Utama Integra, Jakarta, Indonesia

BACKGROUND AND OBJECTIVES

Plastic waste is a global environmental issue, with approximately 1 to 2 million tons entering the oceans each year, causing considerable harm to marine life and ecosystems. The country has implemented several key regulations aimed at achieving zero waste and improving waste management. A government regulation in 2012 mandated waste reduction, recycling, and reuse. A presidential regulation in 2017 targets a 30% reduction in waste and processing of at least 70% of the remaining waste by 2025. Schools play a role in educating students on environmentally friendly practices. However, only 10% of the schools in the country received this award. The study aims to provide insights into practices regarding the disposal of packaged wraps by adolescents, and to identify gaps between their environmental knowledge and actual behaviors.

METHODS

Eight focus group discussions were held with 39 students from four junior and senior high schools in November 2024. The schools were purposively selected. Data were gathered and analyzed thematically.

RESULTS

Students primarily dispose of packaged wraps in trash bins available in all schools, though not all schools differentiate between organic and non-organic waste. When recycle bins are full, students often use other bins that are still empty. Some schools have special place to throw plastic bottles. Outside school, finding trash cans can be challenging, leading some students to hold onto wrappers until they find a bin or throw them away at home. However, if the wrap is wet or dirty, some students discard it on the road.

CONCLUSIONS

The study identifies a significant gap between students' knowledge and their actual waste disposal practices. To improve waste management, schools should implement clearly labeled bins for organic, non-organic, and recyclable waste, and ensure they are emptied regularly. Increasing the availability of trash bins along common routes can help reduce littering. Additionally, scaling up the use of organic wrapping and conducting regular educational sessions can foster a deeper understanding and commitment to proper waste disposal among students.

Is there an association between depression and omega-3 fatty acid status? - RESULTS of a cross-sectional study in children and adolescents

Eva Hohoff[1]; Laura Schlarbaum[1]; Raphael Hirtz[2]; Corinna Grasemann[3]; Anke Hinney[4]; Johannes Hebebrand[5]; Manuel Föcker[6]; Lars Libuda[1]

[1]Institute of Nutrition, Consumption and Health, Paderborn University, Paderborn, Germany; [2]Center for Child and Adolescent Medicine, Helios University Hospital Wuppertal, Witten/Herdecke University, Wuppertal, Germany; [3]Clinic of Pediatrics and Adolescent Medicine, Ruhr-University Bochum, Bochum, Germany; [4]Section of Molecular Genetics in Mental Disorders, University Hospital Essen, Essen, Germany; [5]Center for Translational Neuro- and Behavioral Sciences, University Hospital Essen, University of Duisburg-Essen, Essen, Germany; [6]Department of Child and Adolescent Psychiatry, University Hospital Münster, Münster, Germany

BACKGROUND AND OBJECTIVES

Omega-3 fatty acids (Ω3-FA) supplementation is discussed as a therapeutic approach for depression. While meta-analyses of randomised controlled trials in adults showed heterogeneous RESULTS, only few studies are available in children and adolescence. The aim of this study was to analyse the relationship between Ω3-FA status and depression in children and adolescents.

METHODS

The analyses were based on data from 327 patients (11-19 years; 66% ♀) admitted to a child and adolescent psychiatry (2016-2020). Eicosapentaenoic acid (EPA), docosahexaenoic acid (DHA), as well as the Ω6-FA arachidonic acid (all in % of total fatty acids) were measured in whole blood. The Ω3 index was calculated as the sum of EPA and DHA. Depression severity was assessed using the Beck Depression Inventory II (BDI-II), the Diagnostic System for Mental Disorders using self-assessment (DISYPS-S) and external assessment by parents (DISYPS-P). Linear regression models (BDI-II) and logistic regression models (DISYPS-S and DISYPS-P) were used to analyse the relationship between FA status and depression.

RESULTS

Only one participant had an Ω3 index (median 4.17%) within the recommended range of 8-11%. No association was found between Ω3-FA status and the BDI-II. However, an increase in Ω3 index [OR 1.55 (CI 1.04; 2.30), p=0.03] and DHA status [OR 1.64 (1.06; 2.53), p=0.03] was associated with an increased risk of parent-reported depression (DISYPS-P), but not self-reported depression (DISYPS-S). Similarly, arachidonic acid status was inverse associated only with DISYPS-P [OR 0.76 (CI 0.58; 0.99), p=0.04].

CONCLUSIONS

Our RESULTS indicate that the Ω3-FA status in children and adolescents with mental disorders is generally below the desirable range. It remains unclear whether improving the Ω3-FA status, for example through supplementation, could have a positive longitudinal impact on depression in this stage of life. The findings of this cross-sectional analysis could be an argument against this hypothesis, as we found that a higher Ω3-FA status was rather associated with a greater risk of depression.

BACKGROUND AND OBJECTIVES

The effects of lifestyle interventions on metabolism in people with type 2 diabetes (T2D) are usually studied in controlled clinical trials and reported as group average values. However, mounting evidence indicates that the metabolic response to nutrient intake and physical activity is highly personal. Continuous glucose monitoring (CGM) offers an opportunity to gain insight in the direct and personal response of circulating glucose concentrations to lifestyle behaviors. We aimed to investigate the potential of using CGM to train algorithms for use for (real-time) personalized lifestyle recommendations to improve glucose (self)management.

METHODS

In a real-world study, 38 people with T2D used CGM and recorded contextual data for 11 periods of 4 days of which 3 control periods and 8 intervention periods (2x low carbohydrate diet, 2x Mediterranean diet, 2x walking after each meal and 2x ‘active day’ (hourly 5-minute exercise bouts). Oral glucose tolerance tests were performed to quantify insulin resistance and beta-cell functioning. Statistical modelling techniques were used to predict 2h glucose and to investigate interindividual differences in effects of lifestyle on CGM metrics.

RESULTS

On overage, low carbohydrate diet, walking after meal and active day, but not the Mediterranean diet resulted in a lower mean glucose (±SD; respectively, 7.6±1.8, 8.0±2.0, 8.0±2.0 and 8.5±2.3 mmol/L) as compared to control (8.1± 1.9 mmol/l). The magnitude and direction of effects on other CGM metrics varied between interventions as well. For instance, the low carbohydrate diet sorted most beneficial effects for people with both insulin resistance and poor beta-cell function, as compared to individuals with primarily a poor beta-cell function. RESULTS of a linear mixed effect model identified carbohydrate intake (g) in the past 5 minutes as well as in the past 30 minutes, sleep duration during the previous night (h) and physical activity (metabolic equivalents) over the past 12 hours and in the past and future 30 minutes as the most prominent determinants of glucose concentrations in the short run. The magnitude of effects of carbohydrate intake and physical activity on glucose levels differed substantially between individuals.

CONCLUSIONS

Lifestyle interventions affect glucose profiles within 4 days. Lifestyle effects seem to be related to the level of insulin resistance and beta-cell function, underlining the importance of personalized treatment. Pending further validation, predictive models developed in this study could be used for self-management tools for personalized lifestyle treatment of T2D.

DYNAMIC GLYCEMIC ADAPTATIONS FOLLOWING LONG-TERM FASTING: PRELIMINARY INSIGHTS FROM THE FASTFORWARD STUDY

Marie Knufinke[1, 2]; Elena Katharina Stroppel[1]; Françoise Wilhelmi De Toledo[1]; Ferdinand Von Meyenn[2]; Robin Mesnage[1, 3]
[1]Development & Holding, Buchinger Wilhelmi, Überlingen, Germany; [2]Department of Health Sciences and Technology, ETH Zurich, Zürich, Switzerland; [3]Department of Nutritional Sciences, King's College London, London, United Kingdom

BACKGROUND AND OBJECTIVES

Fasting has emerged as a promising intervention for metabolic health, with growing evidence that fasting-induced improvements in glycemic control can have therapeutic effects for individuals affected by type 2 diabetes. Although metabolic adaptations during the first days of fasting are well described, little is known about the transition back to normal eating. The FastForward study examines glycemic metrics and metabolic adaptations during long-term fasting and the 14 days following the breaking of the fast.

METHODS

From our ongoing prospective observational study, we analysed preliminary data from 100 participants (65% women, 35% men) who underwent Buchinger fasting for 5 to 28 days, followed by 1–4 days of food reintroduction in a controlled clinical setting. Venous blood samples were collected at three time points: pre-fasting, on the morning of breaking the fast, and 1–4 days post-fasting, measuring HbA1c, insulin and fasting glucose. Continuous glucose monitoring (CGM) was initiated on the morning of breaking the fast.

RESULTS

Participants had a mean age of 55 years (range: 21–75) and a mean BMI of 30 ± 12 kg/m². Twenty percent were prediabetic or had type 2 diabetes. Participants lost 3.75 ± 2.23 kg during fasting. Blood glucose (96.2 ± 23.9 mg/dL), insulin (12.2 ± 16.9 mIU/L) and HbA1c (6.0 ± 3.76%) decreased during fasting by 10.0 ± 2.8 mg/dL, 4.4 ± 1.9 mIU/L and 0.52 ± 0.34%, respectively. This decrease persisted after food reintroduction. The proportion of participants with time below range (range: 70–180 mg/dL) was higher on the day of fasting termination (5.7 ± 0.6%) and the first day post-fasting (4.6 ± 0.6%) compared to the subsequent food reintroduction days (<3.5%). This was accompanied by increased glucose variability, as reflected by the mean coefficient of variation, which rose from 15.5 ± 0.8% on the day of breaking the fast to 21.2% ± 0.9% on the first day of food reintroduction. This heightened variability persisted up to the fourth day of food reintroduction. These data show heightened metabolic sensitivity immediately after fasting, and a persistence of fasting-induced glucose-lowering effects for up to a week after the food is reintroduced.

CONCLUSIONS

Our findings show heightened glycemic variabilit in the initial days of food reintroduction after fasting, followed by stabilization and improved glycemic control. These RESULTS underscore the potential of therapeutic fasting to normalise glycemic regulation and suggests an importance of post-fasting nutritional guidance to optimize outcomes.

SOAP26_04

SERUM METABOLOMES AND PROTEOMES LINKING CIRCULATING MONOUNSATURATED FATTY ACIDS TO ATHEROSCLEROSIS PROGRESSION AND CARDIOVASCULAR MORTALITY

Zhang Yu[1, 2]; Ru Dongmei[1]; Haili Zhong[1]; Hu Wei[1]; Ju-Sheng Zheng[3]; Yuming Chen[1]
[1]Department of Epidemiology, Sun Yat-sen University, Guangzhou, China; [2]Department of Epidemiology, Harvard T.H. Chan School of Public Health, Boston, United States of America; [3]School of Medicine, Westlake University, Hangzhou, China

BACKGROUND AND OBJECTIVES
Few studies have explored the link between circulating monounsaturated fatty acids (MUFAs) and cardiovascular health, and the RESULTS are mixed. We aim to evaluate the relationship between circulating MUFAs and the progression of carotid intima-media thickness (CIMT), as well as cardiovascular mortality, and whether these associations are mediated by certain metabolomes or proteomes.
METHODS

Circulating MUFAs were measured in erythrocyte membranes within the Guangzhou Nutrition and Health Study (GNHS) (n=2872) and in serum within NHANES (n=6835). Metabolomes and proteomes were analyzed in subsamples of 2618 and 915 GNHS participants at middle-term of the follow-up period, respectively. CIMT progression at the common carotid artery (CCA) and carotid bifurcation (BIF) was monitored via ultrasound over 9.6 years in GNHS, with measurements taken every three years. Mortality data was obtained through follow-up in NHANES.

RESULTS

In GNHS, higher total circulating MUFA levels were linked with increased odds of CCA-CIMT progression, with a multi-adjusted odds ratio (OR) of 1.50(95% CI: 1.18-1.93) for the highest vs. lowest tertile. Specific MUFAs showed varied ORs: 0.73(0.58-0.92) for C16:1n-7, 1.59(1.25-2.03) for C18:1n-9, and 1.61(1.25-2.06) for C20:1n-9. Linear mixed-effect models indicated that mean differences in CCA-CIMT changes increased for total MUFAs, C18:1n-9, and C20:1n-9, but decreased for C16:1n-7, C22:1n-9, and C24:1n-9 over time. Metabolome scores (including Oxoglutaric acid, 3-Hydroxyisovaleric acid, Adipic acid, and Nonanoic acid) mediated 35.07% of the C16:1n-7 association and 17.18% of the C18:1n-9 association, while proteome (including UNC79, ApoC1, FINC, IC1, PGRP2, and ApoE) scores mediated 17.54% and 13.59% of the C18:1n-9 and C20:1n-9 associations. NHANES data indicated higher MUFA levels were associated with increased all-cause mortality, with multi-adjusted hazard ratios (HRs) for quintile 5 vs. 1 of 1.40(1.06-1.85) for total MUFA, 1.69(1.33-2.16) for C16:1n-7, 1.53(1.19-1.95) for C18:1n-7, and 1.30(1.00-1.68) for C18:1n-9.

CONCLUSIONS

Elevated total circulating levels of MUFAs, especially oleic acid (C18:1n-9), were associated with increased atherosclerosis progression and mortality risk, potentially mediated by metabolomes including Adipic acid, Nonanoic acid, and proteomes including UNC79, ApoC1.

BACKGROUND AND OBJECTIVES

A more deleterious cardiometabolic risk profile has been associated with low gut microbiota richness. A relationship between gut microbiota richness and the diversity of consumed dietary fibers has also been reported. The consumption of a multi-fiber enriched bread for 2 months has been associated with improvements in insulin sensitivity and cholesterol profile, in parallel to modifications of gut microbiota composition and functions; however, the underlying mechanisms are not fully understood. This study aimed at 1) characterizing the effects of the multi-fiber dietary intervention on circulating metabolites using untargeted metabolomics and 2) identify multi-level regulations by combining metabolic, metagenomic and metabolomic data.

METHODS

In a randomized double blinded cross-over design, 39 at-cardiometabolic risk subjects consumed daily for 8 weeks 150g of standard bread vs. 150g of bread enriched with a 7-selected fibers mix (5.6g vs 16.4g of fiber respectively; 4-week washout). Before and after each intervention periods, plasma samples were analyzed using untargeted metabolomics. The identified metabolites were clustered into biological functions related to biological systems to ease data interpretation, completed by an enrichment pathways' analysis of individual metabolites to relate RESULTS to molecular regulations. Also, full data integration aggregating full metagenomic, metabolomic and metabolic datasets was performed.

RESULTS

Allocated from a total of 226 identified metabolites, 16 (over 57) biological functions (including metabolic disorders, inflammation/anti-oxidant, xenobiotics, energy metabolism) clustered in 6 biological systems (aspects of primary metabolism, vascular outcomes, xenobiotics processing, cell defense, microbial metabolic system and host metabolic systems) were differently impacted by the two breads and represented 60 biochemical pathways. Secondly, after the multi-fiber dietary intervention, multi-level co-regulations analysis between metabolomic, metagenomic and metabolic parameters showed a microbiota cluster as the possible starting point of concerted sequential regulations leading to reported improvement in insulin sensitivity and lipid profile.

CONCLUSIONS

Our deep-phenotyping approach revealed a broad and diversified biological effects induced by a multi-fiber bread consumption in at-cardiometabolic risk individuals, among which the microbiota regulation appeared as the starting point providing beneficial changes in cardiometabolic profile.

CLUSTERING AND PREDICTING VERY SHORT-TERM NUTRITIONAL OUTCOMES FOLLOWING INITIAL DIAGNOSIS OF RESTRICTIVE ANOREXIA NERVOSA: A CROSS-DISCIPLINARY APPROACH

Jean Philippe Charrat[1]; Catherine Massoubre[2]; Aurélia Gay[3]; Natacha Germain[1]; Bogdan Galusca[4]
[1]Endocrinology, Jean Monnet University, TAPE laboratory, CHU de Saint-Etienne, Saint-Priest-en-Jarez, France; [2]Psychiatry, Eating Disorders Referral Center, Jean Monnet University, TAPE laboratory, CHU de Saint-Etienne, Saint-Priest-en-Jarez, France; [3]Psychiatry, Jean Monnet University, TAPE laboratory, CHU de Saint-Etienne, Saint-Priest-en-Jarez, France; [4]Endocrinology, Eating Disorders Referral Center, Jean Monnet University, TAPE laboratory, CHU de Saint-Etienne, Saint-Priest-en-Jarez, France

BACKGROUND AND OBJECTIVES

No prior research has investigated the very short-term outcomes of restrictive anorexia nervosa (AN-R) in an outpatient setting. Predictive markers of early BMI progression remain insufficiently explored. The objectives of this study were to characterize BMI progression phenotypes in outpatients during the initial three months follow-up following diagnosis and to identify their biological and psychometric predictors.

METHODS

Data were collected from 130 female patients between 2017-2021. BMI trajectories were segmented into five profiles using K-Means clustering. Psychometric markers included DEBQ (restriction, emotionality, externality), EDI-2, and FRS-Q2 (Figure Rating Scale: subscale “ideal body silhouette”), while biological markers included prealbumin, IGF-1 and vitamin B12. ANOVA and Tukey post hoc tests assessed inter-cluster differences, then logistic regression and ROC analysis identified BMI evolution predictors.

RESULTS

Metric quality analysis of clustering indicated: a good intra-cluster homogeneity (Within-Cluster Sum of Squares (WCSS)=4.3); a balanced trade-off between cluster cohesion and separation, capturing the subtle BMI evolution patterns (Davies-Bouldin Index (DBI)=1.0; Calinski-Harabasz Index (CHI)=53.2). Five different BMI evolution profiles over three months were identified: C1 (Delayed progression), C2 (Continuous decline), C3 (High progression), C4 (Moderate progression), and C5 (Critical stagnation). 64% (n=83) patients demonstrated consistent favorable BMI progression, whereas 36% (n=47) experienced stagnation or decline. Higher IGF-1 level was a strong predictor of a better outcome at 1 month (AUC=0.821). Lower albumin levels (AUC=0.769) and higher FRS-Q2 scores (AUC=0.785) predicted a moderate, but consistent, BMI increase at three months. These two markers combined in a multivariate model showed strong predictive power (AUC=0.897). Lower DEBQ restriction scores (AUC=0.827) and higher FRS-Q2 scores (AUC=0.830) were also strong predictors of a significant and continuous BMI increase at three months. These last two markers combined in a multivariate model were confirmed as strong predictors (AUC=0.897; R^2(N)=62%, $p<0.05$).

CONCLUSIONS

BMI evolution in AN-R can be classified into distinct profiles with specific biological and psychometric predictors. Integrating these into tailored treatments may improve short-term outcomes. Future studies should refine models via interdisciplinary approaches for better individualized care.

INFLUENCE OF TYPE 2 DIABETES RISK GENES AND FREE SUGAR INTAKES ON BIOCHEMICAL MARKERS OF GLUCOSE METABOLISM IN HEALTHY ELDERLY INDIVIDUALS

Cristina Alvarez-Martin[1]; Del Rio Inés[1]; Benavent María[1]; Ubeda Natalia[1]; Angela García-González[1]; María Achón[1]; Violeta Fajardo[1]; María Purificación González[1]; Rocío de la Iglesia González[1]; Elena Alonso-Aperte[1]
[1]Departamento de Ciencias Farmacéuticas y de la Salud, CEU San Pablo University, Madrid, Spain

BACKGROUND AND OBJECTIVES

Type 2 diabetes (T2D) has a strong association with genetic predisposition, involving both individual genes and multiple genetic variants that increase disease risk. This study aimed to investigate the influence of genetic polymorphisms and free sugar intakes in biochemical markers of glucose metabolism in individuals aged 65 and older, without T2D, and not taking oral antidiabetics.

METHODS

One hundred and ten volunteers were genotyped for eight polymorphisms in genes associated with T2D risk (*MCR4, TCF7L2, MTNR1B, GCKR, FTO, CDKAL1, IGF2BP2*) and high sugar intake (*FGF21*). Diet was assessed using 3 day records and blood samples were analyzed for fasting plasma glucose and glycated hemoglobin.

RESULTS

Average age was 69.5 years and 72.5% were women. Free sugar consumption was low (0,0 – 5,0 g/day) and plasma glucose levels and glycated hemoglobin were within normality ranges. Data analysis showed a significant relationship between the rs4402960 *IGF2BP2* genotypes and alterations in glycated hemoglobin (5,8 % GG, 5,7 % GT and 6,0 % TT, p=0.01). Additionally, differences in fasting plasma glucose levels were observed between rs10830963 *MTNR1B* genotypes (90,5 mg/dl (CG+GG) *vs*. 84,0 mg/dl (CC), p=0.04). There were no significant differences in free sugar consumption according to genotypes.

CONCLUSIONS

In healthy individuals aged 65 and older, genotypes for known T2D risk polymorphisms are not associated with higher levels of plasma glucose or glycated hemoglobin, except for rs4402960 *IGF2BP2 and* rs10830963 *MTNR1B*. These genes may serve for early identifiers of individuals at risk of TD2.

SOAP26_11

GLYCEMIC CONTROL FOLLOWING A DIET HIGH IN SLOWLY DIGESTIBLE STARCH IN TYPE 2 DIABETIC PATIENTS

Alexandra Meynier[1]; Rafaela Neto[1]; Maeliss Chisbert[2]; Castell Anne-Laure[2]; Laurie Van Den Berghe[2]; Julie-Anne Nazare[2]; Sophie Vinoy[1]
[1]Nutrition Research, Mondelez R&D, Paris Saclay Tech Centre, Saclay, France; [2]CarMeN Laboratory, Universite Claude Bernard Lyon1, INSERM, INRAE, Hospices Civils de Lyon, CRNH Rhône-Alpes, Oullins-Pierre-Bénite, France

BACKGROUND AND OBJECTIVES

Carbohydrate quality and its impact on glycaemia has been widely studied and it has been demonstrated that the glycemic response of starchy food can be reduced by selecting starches which are slowly digested. For this reason, we screened the starch digestibility of commercial starchy food products to design diets High in Slowly Digestible Starch (H-SDS diet) or Low in Slowly Digestible Starch (L-SDS). The objective of this work was to validate that consumption of H-SDS diet improves acute glycemic control in patients with type 2 diabetes (T2D).

METHODS

The study is a 12-weeks randomized, controlled, parallel study that evaluated the long-term metabolic impact of H-SDS and L-SDS diets in 51 subjects with T2D. The glycemic profile was monitored using a Continuous Glucose Monitoring System (CGMS). Glycemia peak, delta glycemia, incremental area under the curve (iAUC), total area under the curve (tAUC) for a 120- and 240-minutes interval after each meal were calculated. We analyzed the correlation between SDS or SDS/available carbohydrates and postprandial glycemic parameters applying a quadratic model followed by a linear model if no quadratic effects were observed. The model effects were: SDS and SDS2, or SDS/CHO and $(SDS/CHO)^2$, and subject as random effect.

RESULTS

The RESULTS indicate that the difference in SDS consumption between H-SDS diet and L-SDS diet is statistically significant (mean=63 ± 1 g/day for H-SDS and 17 ± 1 g/day for L-SDS; $p<0.0001$). Statistical analysis shows highly significant linear relationship between glycemia peak and MAGE in the SDS effect model ($p<0.0001$), as well as tAUC0-120. A quadratic effect of SDS was observed on MIME glycemia delta peak, iAUC 0-120 and 0-240.When evaluating ratio SDS/CHO, a linear effect of SDS/CHO is observed on glycemia peak, MIME glycemia delta peak and tAUC 0-120 and 0-240. SDS/CHO^2 effect is seen on MAGE and iAUC 0-240. Further analyses will be performed to better understand these effects.

CONCLUSIONS

A diet high in SDS shows positive effects on postprandial glycemic control in patients with T2D and could be considered as a strategy in dietary prescriptions for this population. In addition, the modulation of starch consumption is inexpensive and practical to employ by subjects with diagnosed T2D.

NUTRITIONAL FACTORS IN PEOPLE WITH NEUROMOTOR DISABILITY UNDERGOING FLAP SURGERY FOR OSTEOMYELITIS ASSOCIATED PRESSURE ULCERS: AN INTERIM ANALYSIS OF A SINGLE-CENTER PROSPECTIVE OBSERVATIONAL STUDY

Estelle Mayan[1]; Hélène Le Liepvre[1]; Yacine Diaw[1]; Emma D'anglejan[2]; Damien Marmouset[3]; Haude Chaussard[3]; Latifa Noussair[4]; Léa Sellier[1]; Aurélien Dinh[2]; François Genêt[1]; Vincent T. Carpentier[1]

Paris Saclay University, Garches, France; [2]Infectious Disease Department, Raymond Poincaré Hospital, AP-HP. Paris Saclay University, Garches, France; [3]Department of Orthopaedic Surgery, Perioperative Unit for Disabled People (UPOH), Raymond Poincaré Hospital, AP-HP. Paris Saclay University, Garches, France; [4]Microbiological Laboratory, Raymond Poincaré Hospital, AP-HP. Paris Saclay University, Garches, France

BACKGROUND AND OBJECTIVES

People with neuromotor disability, particularly those with spinal cord injuries, are at high risk of osteomyelitis associated pressure ulcers. In our perioperative unity for disabled people, patients are treated by a musculocutaneous flap surgery with the help of a multidisciplinary team made of physical medicine and rehabilitation doctors, surgeons, and allied health professionals, including nutritionists. Although pressure ulcers are often associated with undernutrition, the risks of surgical failure in this context have not been sufficiently explored. The aim of this study is to identify the nutritional factors associated with surgical failure in this specific population.

METHODS

This prospective, single-center, observational study included adult patients with neuromotor disability admitted for flap surgery to treat osteomyelitis-associated pressure ulcers since February 2023. Nutritional data were collected from medical records, including structured data collection for nutritional assessment, anthropometric data and biologic data (at admission before surgery). Endpoints included success at 12 months (primary endpoint) and at 30-45 days (secondary endpoint). Associations between nutritional variables and surgical success were statistically analyzed. Failures are defined by skin breakdown, recurrence of pressure sores or local infection.

RESULTS

One hundred forty-six patients were included, aged 53 (16) years, and the majority of whom were men (116/146, 79%). Eighty-three per cent of patients had a spinal cord injury. Body mass index (BMI) was 25 (6). Albumin level was 32 (5) g/L and 25-(OH)-vitamin D levels was 20 [13; 27] ng/mL, both below the normal reference values. One hundred eleven (76%) were either malnourished (30/146, 21%) or at risk of malnutrition (81/146, 55%). One hundred fifteen (79%) patients were receiving renutrition, with or without nutritional supplements, including 97 (66%) receiving oral nutritional supplements. Only 71/146 (49%) met their protein and energy requirements. The prevalence of false dietary beliefs was 14%. Surgery success rates were 111/135 (82%) at day 30–45 and 45/56 (80%) at month 12. False dietary beliefs were associated with surgery failure at day 30–45 (p-value < 0.03).

CONCLUSIONS

False dietary beliefs appear to be a risk factor for failure in pressure ulcer surgery in this population. Targeted nutritional education and early identification of these beliefs may be strategic in improving therapeutic outcomes.

CIRCADIAN HUNGER FEELING IN SUBTYPES OF ANOREXIA NERVOSA: HETEROGENEITY OF HUNGER FEELING IN ANOREXIA NERVOSA

Natacha Germain[1]; Gay Aurélia[2, 1]; Massoubre Catherine[1]; Bogdan GALUSCA[3]
[1]TAPE research group, Jean Monnet University, Saint-Etienne, France, Jean Monnet University - North Campus Hospital, Saint-Priest-en-Jarez, France; [2]Psychiatry, University hospital of Saint-Etienne,, Saint, France; [3]Endocrinologie, CHU Saint-Étienne, Saint-Priest-en-Jarez, France

BACKGROUND AND OBJECTIVES

Anorexia Nervosa (AN) is an eating disorder characterized by self-imposed food deprivation, leading to undernutrition. The primary therapeutic goal is to help patients overcome self-starvation and achieve weight gain, with the regulation of hunger being a key factor. However, the knowledge on hunger perception in AN remains limited. Few studies have explored this area, and many conflate the distinct concepts of hunger feeling, wanting, and liking. This study aims to evaluate hunger feeling (HF) perception in patients suffering from AN over the nycthemeron, compared to a control group.

METHODS

HF perception was recorded over three days at eleven time points per 24-hour period using a validated Visual Analogic Scale (VAS) in 570 participants: 336 with restrictive AN (AN-R), 101 with binge-purge AN (AN-BP), 54 weight-recovered patients (AN-Rec), 28 with atypical AN (AAN), and 51 healthy volunteers (CON). Anthropometric, biological, metabolic and psychological parameters were also recorded.

RESULTS

HF perception followed a circadian rhythm, with three peaks before each meals, in all groups. Mean total HF perception was reduced in AN-R (9.2±0.4 vs. 11.7±0.8, p=0.02383) and AN-Rec (8.8±0.9, p=0.0239) compared to Controls. Distribution of HF perception in each AN groups was different from that of CON (AN-R: 10.5% of extremely high HF and 34.5% of extremely low HF, p=0.0001; AN-BP: 4% and 30.5% respectively, p=0.004; AN-Rec: 9% and 37% respectively, p<0.0001; AAN: 11% and 36% respectively, p<0.0001). Despite these differences, the majority of patients with AN accepted meals. Total VAS score was positively correlated with the age of the patients, the duration of the disease, the weight, the resting energy expenditure, B9 vitamins and osteocalcin plasma levels, DEBQ external eating, EDI2 bulimia, and EDI2 body dissatisfaction scores in AN groups. Total VAS score was negatively correlated with albumins, proteins, and B12 vitamin plasma level, DEBQ restrained eating, DEBQ emotional eating, EDI2 drive to thinness, EDI2 ineffectiveness, EDI2 interceptive awareness, EDI2 maturity fears, and BECK score in AN groups.

CONCLUSIONS

HF in AN is heterogeneous and does not seem to improve after weigh recovery. HF seems to be linked to psychological parameters rather than somatic ones. HF does not seem completely linked to meal acceptation. Phenotyping HF could be helpful to choose therapeutic approach.

SOAP26_15

IMPACT OF OLIVE OIL AND MEDIUM- AND LONG-CHAIN TRIGLYCERIDES ON CARDIOMETABOLIC MARKERS, PLASMA METABOLOME, AND GUT MICROBIOME IN METABOLIC SYNDROME

Pan Zhuang[1]; Xuzhi Wan[2]; Yu Zhang[3, 1]; Jingjing Jiao[2]
[1]Department of Gastroenterology, The First Affiliated Hospital of College of Medicine, Zhejiang University, Hangzhou, China; [2]Department of Endocrinology, The Second Affiliated Hospital, School of Public Health, Zhejiang University School of Medicine, Hangzhou, China; [3]Department of Food Science and Nutrition, College of Biosystems Engineering and Food Science,, Zhejiang University, Hangzhou, China

BACKGROUND AND OBJECTIVES

The type of cooking oil used is a crucial factor influencing dietary quality. In this study, we investigated the effects of medium- and long-chain triglycerides (MLCTs) versus olive oil (25–30 g/day) over six months on cardiometabolic health.

METHODS

In this 6-month double-blind, randomized controlled trial, 240 patients with MetS were randomly assigned to receive olive oil or MLCT oil (25-30g). The primary outcome was the changes of cardiometabolic markers. Secondary outcomes included changes in plasma metabolome and gut microbiome and their mediation effects on MetS indicators.

RESULTS

We report that both olive oil and MLCT significantly improve cardiometabolic markers, including reductions in body weight, waist circumference, BMI, body fat, and serum triglycerides (TG), alongside increases in android and gynoid muscle mass, without a decrease in total calorie intake. Notably, MLCT lowered diastolic blood pressure, while olive oil decreased fasting blood glucose levels. Mediation analyses revealed that the TG-lowering effects of both oils were mediated by distinct plasma lipoprotein profiles. Plasma metabolomics further identified increases in leucine (MLCT), and valine and ethanol (olive oil) as key modulators of improved lipid metabolism. Gut microbiota analysis demonstrated a rise in probiotic *Akkermansia* and *Enterococcus* species associated with reduced TG levels for both oils, with *Akkermansia* linked to increased plasma leucine and improved TG profiles. Moreover, *Ruminococcus*, enriched by MLCT, appeared to mediate lipid metabolism through HDL-4-TG. Baseline microbiome profiles predict weight loss in response to these oils better than plasma metabolome and clinical data.

CONCLUSIONS

Our findings highlight the differential impacts of olive oil and MLCT on the plasma metabolome and gut microbiota in metabolic syndrome, underscoring the role of baseline microbial profiles in determining anti-obesity efficacy.

SOAP 38 - FOOD SCIENCE, GASTRONOMY AND LIFE QUALITY

SOAP38_01

DEVELOPING THE GREEK BRANDED FOOD COMPOSITION DATABASE (HELTH): UPDATE AND EXPANSION METHODOLOGY

Stefania Xanthopoulou[1]; Antonis Vlassopoulos[1]; Panagiotis Lorentzos[1]; Maria Kapsokefalou[1]
[1]Food Science and Human Nutrition, Agricultural University of Athens, Athens, Greece

BACKGROUND AND OBJECTIVES

Branded Food Composition Databases (BFCDs) are valuable tools to study the modern foodscape. In Greece, the first BFCD, Hellenic Food Thesaurus (HelTH), was developed in 2021 and included data for ~5,000 packaged foods through data collection from online supermarkets. The dynamic nature of the food market requires from BFCDs a constant update and expansion to match changes in the foodscape and, taking advantage of new tools, to meet high quality criteria.

METHODS

The first update of HelTH was carried out through field research in two phases from July 2023 to September 2024. The 'Composition and Labeling Information System' (CLAS) software was used to assist data collection and curation. From July to October 2023 (Phase 1), researchers indexed all branded foods available in four mega supermarkets in Attica from a major retailer. In phase 2, July to September 2024, food supplement data were collected from 16 pharmacies in Attica. Foods are categorized using LanguaL thesaurus to maintain consistency with HelTH's previous version and are described with EFSA's FoodEx2 system to align with international standards for food composition databases. Nutritional composition, ingredient lists, and qualitative information (claims, symbols, allergens, additives) were extracted for all products as shown on pack.

RESULTS

The updated version of HelTH includes data on 10.941 products, consisting of 8.952 packaged foods and 1.989 food supplements sold in the Greek market—44% more products than the previous version. To the existing HelTH's food categories were added new food groups including dietary supplements, baby foods, packaged fresh fruits and vegetables, coffee and tea, water, chewing gums, oils, vinegars, spices, and additives. A small proportion of foods (<25%) were discontinued between the two versions, while preliminary analysis does not provide evidence of extensive product reformulation. Tailored data collection strategies beyond the major supermarket chains are still required for the mapping of organic, traditional and special diet foods.

CONCLUSIONS

Regular data collection is a key element in the update and expansion of BFCDs. The systematic update of HelTH using a dedicated software increased the ease of data collection and curation, allowing for higher volume data and accuracy. In this newer version, HelTH further improves its value and impact as a comprehensive tool for the international research community, clinical and dietetic practice, the food industry and consumer.

BACKGROUND AND OBJECTIVES

Diet plays a fundamental role in shaping the intestinal microbiota, especially during infancy when lactation or formula feeding is crucial for gut and systemic health. Modified proteins, such as those formed through the Maillard (glycation) reaction, alter the bioavailability of nutrients and impact the gut microbiome. These changes influence infant growth, gut metabolites, and their systemic effects. The production of short-chain fatty acids (SCFAs) by intestinal bacteria, essential for colonic health, depends on the availability of specific substrates like carbohydrates and amino acids. However, protein modifications during infant formula processing, such as the formation of Amadori compounds and dietary advanced glycation end-products (d-AGEs), may reduce nutrient utilization efficiency and potentially contribute to oxidative stress and inflammation. While Amadori compounds can serve as precursors for SCFA production, there is no evidence that d-AGEs can be metabolized into beneficial gut-derived metabolites.

This study aims to investigate how food processing-induced protein modifications, specifically those resulting from the Maillard reaction, influence the gut microbiota's ability to act as a bioremediator. By examining the interaction between modified dietary compounds and the gut microbiome, the research seeks to understand their effects on microbial activity, SCFA production, and overall gut health, with implications for optimizing infant formula composition.

METHODS

After conducting *in vitro* digestibility analysis and proteomic characterization of two minimally heat-treated experimental infant formulas with differing protein glycation levels, we evaluated the effects of their modified amino acids on the intestinal microbiota and related metabolites in weanling rats. These experimental formulas were compared with a commercial infant formula and an extensively hydrolyzed formula.

RESULTS

Statistical analyses revealed significant changes in the bacterial composition after two months of dietary treatment. Beta diversity was influenced by protein hydrolysis levels, resulting in variations of the relative abundances of specific taxa, such as *Intestinimonas*, and relative metabolite patterns.

CONCLUSIONS

These findings suggest distinct intestinal microbiota and metabolomics profiles due to protein hydrolysis and glycated amino acids intake in weanling rats.

SOAP38_05

POTENTIAL OF BROWN ALGAE-BASED PRODUCTS AS SAFE ANTIOXIDANT AND PREBIOTIC DIETARY THERAPIES ACROSS THE LIFE CYCLE

Migdalia Arazo-Rusindo,[1]; Gonzalo Rivera,[2]; Conrado Camilo,[3]; Francisco Pérez-Bravo,[2]; Oscar Castillo-Valenzuela,[3]; María Salomé Mariotti-Celis[3]
[1]Nutrición y Dietética, UST, Santiago, Chile; [2]Nutrigenomics Laboratory, Nutrition Department, INTA, Santiago, Chile; [3]Faculty of Medicine, Nutrition and Dietetics School, Universidad Finis Terrae, Providencia, Chile

BACKGROUND AND OBJECTIVES

Regulating oxidative stress is crucial for healthy aging, yet aging and inflammation impair nutrient absorption (1). Brown algae, rich in mannitol and phenolic compounds, show promise as a prebiotic and antioxidant raw material for dietary therapy (1). However, they may contain high levels of sodium and heavy metals, which can compromise the safety of algae-based products (2). This study aims to explore the impact of gastrointestinal digestion on the bioaccessibility of minerals, mannitol, polyphenols, phlorotannins, and antioxidant capacity in brown algae products across the life cycle.

METHODS

Three brown algae (*Durvillaea incurvata*) products —sustainable powder extract reconstituted in tap water at sub cytotoxic concentration, micronized capsule, and cooked salad —underwent *in vitro* digestion using the static models for adults and older adults of INFOGEST to evaluate the impact of aging and matrix physicochemical characteristics on the bioaccessibility of minerals, mannitol, polyphenols, phlorotannins, and antioxidant capacity within these food matrices.

RESULTS

The bioaccessibility of mannitol, minerals, and phenolic compounds in brown algae products was significantly higher under adult gastrointestinal conditions, with increases ≥50% compared to older adults. Physiological changes with aging may impair the effective delivery of these compounds. After digestion, mineral levels slightly decreased probably due to a chelating effect from fiber. The extent of bioaccessibility varied by food matrix: mannitol and phenolic compounds increased up to 20-fold for powder extracts compared to cooked salads, while antioxidant capacity ranged from a 4.6% increase for cooked salads to a 29-fold increase for micronized capsules.

CONCLUSIONS

This study highlights the promise of brown algae products as antioxidant and prebiotic dietary therapies due to their high bioaccessibility of mannitol and phenolic compounds. However, the presence of minerals poses safety challenges, underscoring the need for further research to understand and control mineral content. Optimizing these products to enhance bioactive components while minimizing mineral levels will be crucial for their safety and efficacy across different age groups.

BACKGROUND AND OBJECTIVES

In 2050, ageing population will reach 35% of European population. The deleterious self-perpetuating vicious circle between undernutrition and sarcopenia precipitates the entry of elderly people into dependence and increases the risk of infection and mortality (1, 2). Based on the existence of a gut-muscle axis and the role of microbiota in supplying energy and defence to host (1, 2), we aim to isolate a probiotic strain that could protect muscle mass and that could be incorporated in protein-rich foods, especially dedicated to old people.

METHODS

The fecal sample of one patient with a short bowel syndrome (SBS) was used as a source of new strains, because we have shown the the gut microbiota of SBS is very rich in *Lactibacillacea* providing energy of host (3,4). The lactic acid strains from the SBS-patient faeces(5) have been screened with different sequential steps of selection, that include safety characteristics and a functional pipeline. The neamatode *Caenorhabditis elegans* model was used to select a strain able to protect muscle integrity. Then, 18 months aged rats (protocol n° 20374-2019060714134169V3) under moderate caloric restriction (75% of ad libitum), mimicking frail individuals were fed (or not) with selected bacterial strains. Body composition, muscle mass, insulin sensitivity (OGTT, HOMA-IR, insulin-signalling pathway in muscle) and signalization were assessed.

RESULTS

Lacticaseibacillus casei CNCM-I5663 strain promotes longevity and maintains the mitochondrial networks of wall muscles in *C. elegans*. The worms fed with strain CNCM-I5663 exhibited a fragmented mitochondrial morphology less rapidly than worms + OP50 (a referent strain) (45.3 % for CNCM-I5663 *versus* 78.5 % for OP50 at day 13, $p < 0.001$) and conserved a tubular mitochondrial morphology for a longer time (31.9 % for CNCM-I5663 *versus* 21.1 % for OP50 at day 4, $p < 0.001$). This strain improves insulin sensitivity (HOMA-IR after 2 months of supplementation with probiotic, ANOVA, $p=0.056$) and preserves the mass of the rats' hindlimb muscles by 12% compared to the restricted controls (ANOVA, $p<0.05$)(5). Given the beneficial properties of the CNCM-I5663 strain in protecting muscle mass, we have incorporated it into small cheese and finger foods rich in proteins.

CONCLUSIONS

Functional finger foods rich in proteins and probiotics are promising strategy to reinforce the nutritional intake of older persons.

SOAP38_07

DETERMINATION OF THE NUTRITIONAL AND SENSORY PROPERTIES OF SRI LANKAN TRADITIONAL DIYABATH (FERMENTED COOKED RICE)

AHGS Udari[1]; Tharanga Thoradeniya[1]; Sharmila Jayasena[1]; Carukshi Arambepola[2]; Himalee De Silva[3]; Darshi Thoradeniya[4]; Vithanage Pujitha Wickramasinghe[5]
[1]Department of Biochemistry and Molecular Biology, University of Colombo, Colombo, Sri Lanka; [2]Department of Community Medicine, University of Colombo, Colombo, Sri Lanka; [3]Faculty of Indigenous Medicine, University of Colombo, Colombo, Sri Lanka; [4]Department of History, University of Colombo, Colombo, Sri Lanka; [5]Department of Paediatrics, University of Colombo, Colombo, Sri Lanka

BACKGROUND AND OBJECTIVES

'Diyabath', a traditional meal prepared from fermented cooked rice is commonly prescribed as a dietary therapy for gastro-intestinal track related ailments by indigenous medical practitioners in Sri Lanka. However, neither a complete nutritional analysis nor the specific health benefits of 'diyabath' have been thoroughly explored yet. The aim of this study is to analyze the nutritional composition, antioxidant capacity and sensory properties of 'diyabath' from three rice varieties in Sri Lanka.

METHODS

The cooked rice of three selected rice varieties; red (RR), parboiled (PR) and Ma vee (TR-a traditional local variety) were soaked in water and fermented overnight for 12 hours. A flavor infusion comprising of coconut milk, salt and local spices were added to the above at the end of fermentation. Samples of each 'diyabath' preparation were chemically analyzed for macronutrients, mineral composition, fatty acid profiles and antioxidant activity. Sensory quality evaluation of the three 'diyabath' preparations was performed by a panel of 52 members using a 9-point hedonic scale.

RESULTS

The protein, fat and carbohydrate percentages of 'diyabath' ranged from 1.3 ± 0.01 to 1.7 ± 0.04%, 0.37 ± 0.02% to 1.2 ± 0.00%, and 14.6 ± 0.00 to 14.9 ± 0.00 respectively. The percentage daily value (%DV) of protein per serving of 'diyabath' ranged from 6.1 to 8.8% which is appreciable for a non-dairy fermented food. Substantial amounts of iron and magnesium were reported in all three 'diyabath' recipes ranging from 1.58 ± 0.00 to 5.3 ± 0.1 (mg/kg) and from 57.6 ± 2.00 to 122.14 ± 2.1 (mg/kg) respectively. The %DV per serving of 'diyabath' for iron was in between 2 to 15% and for magnesium 3.15 to 8.78%. The predominant fatty acid present in all three 'diyabath' recipes was C12:0 Lauric acid which is the primary fatty acids found in coconut milk. Furthermore, 'diyabath' made from PR, RR and TR reported a high antioxidant capacity, 16.11 ± 0.54, 20.83 ± 0.42 and 20.68 ± 0.28 (mgTrolox equivalent/1g) respectively, comparable to or even exceeding those found in well-established antioxidant rich foods. In the sensory evaluation, the highest mean rank scores for the tested sensory attributes were observed in the 'diyabath' made from PR.

CONCLUSIONS

The RESULTS show that 'diyabath' is a rich source of important nutrients and antioxidants. Given its vegan-friendly composition and sustainable production from left over rice makes it a promising option for promoting both health and sustainable food practices. Further research is needed to optimize its preparation to maximize its value as a functional food.

BEHAVIOR OF PROCESS-INDUCED CONTAMINANTS DURING IN VITRO DIGESTION OF PEA-BASED PRODUCTS

Federica Secco[1]; Even Le Roux[2]; Dinh Hieu Nguyen[3]; Michael Howsam[3]; Frédéric J Tessier[3]; Véronique Bosc[2]; Barbara Rega[2]
[1]UMR SayFood, Paris-Saclay University, INRAE, AgroParisTech, Graduate school BIOSPHERA, Palaiseau, France; [2]UMR SayFood, Paris-Saclay University, INRAE, AgroParisTech, Palaiseau, France; [3]UMR1167 RID-AGE, Lille University, INSERM, CHU Lille, Lille, France

BACKGROUND AND OBJECTIVES

In the context of more sustainable lifestyles, the use of vegetable instead of animal proteins has raised the question of replacing traditional ingredients, such as milk, meat, or even cereals, with legumes. These ingredients contain higher concentrations of precursors for the Maillard reaction, caramelization, and oxidation which, after high-temperature processing, could generate reactive dicarbonyl compounds and advanced glycation end-products (AGEs), potentially hazardous for human health.The first goal of this study was to investigate the formation, reactivity, and bioaccessibility of these newly formed process-induced compounds (NFCs) after cooking and during the digestion of a pea-based in comparison with a wheat-based cake product. Secondly, the influence of the food matrix structure on the digestion process and therefore on NFCs reactivity is also considered.

METHODS

A cake model based on a reconstituted flour containing pea protein isolate and maize starch was developed and compared with a wheat-based cake reference. Cakes were baked in an instrumented oven and submitted to the in vitro INFOGEST static digestion. Relevant analytes including dicarbonyl compounds, furanic compounds, and AGEs were extracted and quantified in the cakes and after the gastric and intestinal phases of the digestion using UHPLC-DAD, UHPLC-MS-QToF and HPLC-MS/MS. Cake structure and matrix organization was characterised as whole, ground powder and during the digestion.

RESULTS

Before digestion, among the NFCs tested, 3-deoxyglucosone and 5-HMF were most abundant. The pea-based formulation yielded higher concentrations of NFCs than the wheat-based one. During digestion, furanic compounds decreased, glyoxals and AGEs increased, while deoxyglucosones were more stable. Pea-based and wheat-based cake had slightly different structures and different macromolecular organization in the matrix; this had an impact on the release of NFCs precursors and on NFCs reactivity during the digestion.

CONCLUSIONS

At the end of the digestion, although the different NFCs behaved differently, their final amounts remained high. At each digestion step, NFCs concentrations resulted from an equilibrium between formation and consumption reactions determined by the different gastric and intestinal environments, cake composition, digestibility and structure.This line of research could, in future, contribute to the optimisation of industrial processes to limit the generation of NFCs during the production of legume-based processed food.

SOAP38_09

SELECTING THE TYPE OF GRAINS AND PARTICLE SIZE DISTRIBUTION TO MODULATE STARCH DIGESTIBILITY AND GLYCEMIC RESPONSE

Alexandra Meynier[1]; Tiffany Sepanski[2]; Sophie Vinoy[1]
[1]Nutrition Research, Mondelez R&D, Paris Saclay Tech Centre, Saclay, France; [2]Global R&D Biscuit, Mondelēz International, East Hanover, United States of America

BACKGROUND AND OBJECTIVES

Cereals and pseudo-cereals present a huge variety in term of shape and color but also of nutrition composition and starch structure. Acting on particle size and grain integrity may influence on the availability of nutrients and thus on their metabolic impact. We studied here the impact of different grains with different distributions of particle size on starch digestibility and on glycemic and insulinemic indexes in Humans.

METHODS

Rotary molded biscuits were made with gluten free flours acting both on the types of grains and the ratio between flours and groats. 8 types of biscuits were made: 4 products made with oat and brown rice flours and oat groats with different ratios of flours/groats (55/45, 65/35, 75/25 and 85/15). 4 other biscuits were made with fonio and sorghum used as flour or as grains in biscuits produced with a ratio of flours/grains of 55/45. Starch digestibility was measured in all products with Englyst method. Glycemic and insulinemic indexes (GI; II) and response parameters following consumption of these products were evaluated in humans. Product portions provided 50g of available carbohydrates. The study was performed on 12 healthy normal-weight subjects who tested all the 8 biscuits according to a cross-over design.

RESULTS

Starch digestibility analyses show high Slowly Digestible Starch (SDS) content in all the products (18 to 23 g/100g). In products containing fonio and sorghum, the SDS content was greater win products with grains compared to the one with flour (23 versus 19 g/100g for fonio and 20 versus 23 g/100g for sorghum). The macronutrient composition was overwise similar. GI values for all the products were low ranging from 49 to 36. II were between 45 and 56 keeping low insulin secretion.

CONCLUSIONS

The type of grains and the use of bigger size particle impact strongly starch digestibility and allows to get products with low glycemic and insulinemic indexes. Use of these gluten free grains and the use of bigger size particles would allow to modulate glucose metabolism and potentially lead to long term beneficial health effects.

SOAP38_11

UNRAVELING THE ROLE OF FOODS AND RECIPES AS MODULATOR OF INFLAMMATORY RESPONSE IN “REAL LIFE” NUTRITION

Mauro Serafini[1]; Marina Ramal-Sanchez[1]; Chiara Bravo-Trippetta[1]; Veronica D'Antonio[1]; Elena Corvaglia[1]; Donato Angelino[1]
[1]Department of Biosciences and Technology for Food, Agriculture and Environment, University of Teramo, Teramo, Italy

BACKGROUND AND OBJECTIVES
Diet may induce or prevent low-degree chronic inflammation, ubiquitous condition for all nutrition-related degenerative diseases. Despite in “real life” conditions, foods are consumed into a meal as recipes and undergo digestive processes, majority of the evidence are limited to single undigested food extracts highlighting a clear bias in understanding the RESULTS to deliver to Consumers. We aim to assess the role of 30 foods and 30 recipes, following digestive process, as modulator of *in vitro* inflammatory response in “real life” condition.
METHODS

A three-culture model was developed by co-culturing human CaCo-2 enterocyte-like and HT29-MTX-E12 mucus-producing goblet-like colon cells, then adding human monocyte THP-1 cells to the basolateral compartment. The inflammatory status was induced using 100 nM of phorbol-12- myristate-13-acetate (PMA) for 20 hours. Foods and recipe, previously processed and in vitro digested (Brodkorb *et al.* (2019) were added at 4 different concentrations to the apical section of the inflamed model for 4 h. Supernatants from the basolateral compartment were collected and analyzed for cytokines production (IL-6, TNF-α, IL-12p70, IL-18 and IL-8) using automated ELISA Simple Plex automated immunoassay. The anti-inflammatory drug Prednisolone was added as positive control.

RESULTS
Four different concentrations (D4, D3, D32, D1) of broccoli (BD), orange (OrD), sausage (SD) and pasta with tomato sauce and basil (PTD) have been analyzed. RESULTS showed the significant reduction induced by BD and OrD concentrations, ($p<0.05$ for BD and OrD on TNF-α and IL-6; $p<0.01$ for BD on IL-8) with respect to the control group. SD and PTD induced a significant reduction on TNF-α and IL-6 ($p<0.05$). Experiments with pasta, vegetarian, meat and fish recipes, processed foods as well as comparison between different procedure of cooking are currently ongoing and RESULTS will be presented at the Conference.
CONCLUSIONS
RESULTS shows the anti-inflammatory role of BD and OrD and suggest a modest activity for SD and PTD. Once all the food and recipes will be analyzed we will increase the knowledge about the association between diet, inflammation and wellbeing. Moreover, we will provide a valuable tool for nutritionists to optimize dietary advices to modulate inflammation as well as increasing consumer's awareness on the importance of anti-inflammatory foods and recipes.Funding:NextGenerationEU. PEAS IN THE SPOTLIGHT: EXPLORING THEIR ALLERGENIC POTENTIAL THROUGH A SYSTEMATIC REVIEW

Rispah NG'ANG'A[1]; Liangzi Zhang[2]; Federica Orsenigo,[3]; Nathalie Juge,[1]; Claire Domoney,[4]; Pete Wilde,[1]; Cathrina Edwards,[1]; Clare Mills,[3]
[1]Food, Microbiome and Health, Quadram Institute Bioscience, Norwich, United Kingdom; [2]Food and Nutrition National Bioscience Research Infrastructure, Quadram Institute, Norwich, United Kingdom; [3]School of Biosciences, The University of Surrey, Guildford, UK, Surrey, United Kingdom; [4]Biochemical and Metabolism, John Innes Centre, Norwich, United Kingdom

BACKGROUND AND OBJECTIVES

The increasing adoption of plant-based diets has raised concerns over the potential emergence of new food allergies, including those linked to alternative protein ingredients derived from peas (*Pisum sativum* L.). This study aims to evaluate current knowledge on immune-mediated adverse reactions to peas and to identify the specific proteins responsible for these reactions.

METHODS

The protocol (PROSPERO record: CRD42024612967) employs two complementary frameworks to address the research objectives. First, a Population-Outcome (PO) framework addresses the primary question: “What evidence exists that immune-mediated adverse reactions or allergies are caused by the ingestion of peas and pea-derived ingredients?” Second, a modified Population-Exposure-Comparator-Outcome (PECO) framework focuses on the secondary question: “Which pea protein molecules are recognized by the immune system and cause IgE-mediated allergies to peas and pea-derived ingredients?” Searches were conducted across three databases—MEDLINE (OVID), ISI Web of Science, and Scopus—using validated filters and agreed-upon search terms to identify relevant studies. Studies will be selected based on predefined inclusion and exclusion criteria. Risk of bias will be assessed using standard tools, and the quality of evidence regarding pea allergenicity was graded. Data synthesis involved both quantitative and qualitative methods, as appropriate.

RESULTS

From the three databases, 364 records were exported to the Rayyan platform, and duplicates were removed, retaining 201 papers. These papers are currently under review and are being screened based on the pre-defined inclusion and exclusion criteria. The study is expected to be completed by May 2025.

CONCLUSIONS

The outcomes of this systematic review will provide insights into the allergenic potential of peas and their derived ingredients, contributing to evidence-based decision-making in food production and labelling.

SOAP 51 - FOOD SCIENCE, GASTRONOMY AND LIFE QUALITY

SOAP51_01

SCALING UP THE STANDARDIZED PRODUCTION OF A FUNCTIONAL FOOD INGREDIENT FOR TARGETING GESTATIONAL DIABETES MELLITUS (GDM) BASED ON QUINOA PEPTIDES

Adrian Gonzalez[1]; Dolores Busso,[2, 3, 4]; Andreina Arias,[4, 2]; Ronald Skewes,[5]; Sebastián Illanes,[3, 4, 2]; Javier Enrione,[2, 5]
[1]Escuela de Fonoaudiología, Facultad de Odontología y Ciencias de la Rehabilitación, Universidad San Sebastián, Santiago, Chile; [2]Research and Innovation Center (CiiB), Universidad de los Andes, Chile, Santiago, Chile; [3]Center of Interventional Medicine for Precision and Advanced Cel (IMPACT), Universidad de los Andes, Chile, Santiago, Chile; [4]Program of Reproductive Biology, Universidad de los Andes, Chile, Santiago, Chile; [5]Biopolymer Research and Engineering Lab (BiopREL), Universidad de los Andes, Chile, Santiago, Chile

BACKGROUND AND OBJECTIVES

The production of potential antidiabetic quinoa peptides has been previously evaluated at a 1L processing volume. However, it is crucial to assess how scaling up the process impacts on both functionality a bioactivity, especially in the context of gestational diabetes mellitus (GDM), a condition with a high worldwide incidence. This research utilizes quinoa seeds, a recognized seed for its nutritional benefits, notably its protein content (~15%) and amino acid profile, as well as its ability to grow in diverse soil conditions, including low water availability. Evidence suggests that quinoa processing can yield bioactive quinoa peptide (BQP) with potential antidiabetic effects. **The objective** of this study was to produce and characterize quinoa peptides at 1L, 5L, and 25L of processing volumes and assess their bioactivity using antidiabetic protocols, including *in vitro* inhibition of dipeptidyl peptidase IV (DPP-IV) and *in-vivo* evaluation in a GDM mouse model (female mice fed a standard chow and high-fat diet (HFD) and treated with doses of 10, 50 and 100 mg/kg/day of quinoa protein hydrolysate.

METHODS

Quinoa peptides were produced by milling and sieving the seeds, followed by protein extraction by alkaline-acid method and hydrolysis with Alcalase 2.4L at three different production volumes (1L, 5L, and 25L). Physiochemically characterization focused on protein content, molecular weight, amino acid profile, surface charge, hydrophobicity, and peptide sequencing. Antidiabetic activity was assessed by *in vitro* DPP-IV inhibition and *in-vivo* oral administration in the GDM mouse model.

RESULTS

The RESULTS indicated that scaling up did not significantly affect the yield (71.4%±0.4% from quinoa seeds, $p>0.05$) of BQP (with a difference <5%). Physiochemically parameters were similar regardless of the processing volume. The protein content ranging from 70-75%, consistent with SDS-PAGE RESULTS showing similar protein bands. Key amino acids, including hydrophobic, cationic, and essential amino acids like leucine, were comparable, and the peptide lengths ranged mostly from 3 to 13 amino acids. In bioactivity, the in vitro inhibition of DPP-IV showed a slight decrease in their inhibition (IC50 1,29 vs 1,61 mg protein/mL, $p<0.05$). In the GDM mouse model, the 50 mg/kg/day dose of quinoa peptides showed a trend toward reduced glucose intolerance (15%) and fasting glucose (13%).

CONCLUSIONS

In conclusion, scaling up quinoa protein processing may serve as an effective modulator of glucose metabolisms, offering promise for the prevention of GDM.

SOAP51_02

IN VITRO DIGESTION OF POLYPHENOL-RICH FOODS: EFFECTS ON HYDROXYMETHYLFURFURAL (HMF) LEVELS

Esma Oğuz[1]; Mustafa Yaman[2]
[1]Nutrition and Dietetics, Kırklareli University, Kırklareli, Türkiye; [2]Moleculer Biologyand Genetics, Istanbul Sabahattin Zaim University, Kırklareli, Türkiye

BACKGROUND AND OBJECTIVES

Hydroxymethylfurfural (HMF) is a chemical compound formed during the thermal processing or storage of carbohydrate-rich foods. While small amounts of HMF are naturally present in foods and beverages, high levels have been associated with potential cytotoxic, genotoxic, and carcinogenic effects in vitro, raising concerns about its impact on health. This study aims to examine the changes in HMF levels before and after the *in vitro* digestion of polyphenol-rich foods and assess the potential role of polyphenols in modulating HMF levels during digestion.

METHODS

An in vitro gastrointestinal digestion model simulating the oral, gastric, small, and large intestine stages was used. Polyphenols (Aronia, Cornelian cherry, green tea, and Turkish coffee were subjected to this digestion process. HMF levels before and after digestion were analyzed using High-Performance Liquid Chromatography (HPLC).

RESULTS

When examining the HMF levels of polyphenols, it was found that Cornelian cherry reduced HMF the most both before and after digestion. Additionally, green tea was found to decrease HMF to the lowest extent compared to other polyphenols, both before and after digestion.

CONCLUSIONS

This study has shown that polyphenol-rich foods reduce HMF levels after in vitro digestion. The findings suggest that polyphenols may preserve their potential antioxidant properties during the digestion process, inhibiting HMF production and thereby supporting the positive health effects of food components.

THE MEDITERRANEAN DIET: ASSESSING KNOWLEDGE AND PERCEPTIONS AMONG STAKEHOLDERS AND YOUNG ADULTS

Filipa R. Pinto[1]; Beatriz Carmo[1]; Sónia Barroso[1]; Susana Mendes,[1]; Cristina Mora,[2]; Audrey Cavalieri[2]; Almudena Vázquez Merchán[3]; María José Benito Bernáldez[3]; ÖZlem Erdoğdu[4]; Maria M. Gil[5]; María De Guía Cordoba Ramos[3]

[1]Food Research, MARE-Politécnico de Leiria, Peniche, Portugal; [2]Scienze degli Alimenti e del Farmaco, UNIVERSITA DI PARMA, Parma, Italy; [3]Escuela de Ingenierías Agrarias - Instituto Universitario de Investigación en Recursos Agrario, Universidad de Extremadura, Badajoz, Spain; [4]Food Engineering, Aydın Adnan Menderes Üniversitesi, Efele, Türkiye; [5]Food Research, Colab +Atlantic, Lisboa, Portugal

BACKGROUND AND OBJECTIVES

The Mediterranean Diet (MD) is widely regarded as one of the most beneficial dietary patterns for health and one of the most sustainable, emphasizing local and seasonal food production, environmental preservation, and the cultural heritage of Mediterranean communities. It is characterized by a high consumption of plant-based ingredients, olive oil as the primary fat source, moderate intake of fish and white meat, and limited consumption of red meats and sweets. Despite its documented benefits—including improved cardiovascular health, reduced disease risk, and positive effects on mental well-being—adherence to the MD is declining, particularly among younger generations. This study aimed to assess the perceptions and understanding of the MD among two key groups: stakeholders in food and agriculture-related sectors and young adults aged 17-25 across four Mediterranean countries (Portugal, Spain, Italy, and Turkey).

METHODS

A total of 40 co-creation (CC) group sessions were held: 20 with stakeholders from the fisheries and agriculture, food production, catering, nutrition and retail sectors and 20 with consumers, young adults (YA). The sessions, organised in each country's mother tongue, followed a standardised script to ensure consistency. Each session lasted 60 min and, in the first part, participants discussed key questions such as: What does the Mediterranean diet mean?; What ingredients and recipes are associated with the Mediterranean diet?; What flavours are most appealing within this dietary framework?

RESULTS

The YA participants highlighted MD as a diet based mostly on *Mediterranean Products* (77 times) and *Healthy facts* (67 times), but also referred to it as *Plant-Based*, *Varied* and *Balanced*. Stakeholders added to these topics that it is associated with *Culture*, *Lifestyle* and *Seasonal and local products*. In terms of ingredients, the 10 most mentioned foods included vegetables, olive oil, fruit, pulses and fish in all four countries. The recipes and flavours associated with DM varied from country to country, reflecting the cultural and culinary differences in food preparation. Despite this, the recipes indicated reflect the principles of DM.

CONCLUSIONS

The RESULTS show that although MD is well known, some concepts need to be better publicised, especially among YA, and recipes need to be adapted to current lifestyles, particularly in terms of ease of cooking. The importance of adapting this diet to the present day is related to the fact that it is a diet that promotes health and sustainability.

SOAP51_04

NUTRA-COCO: CONSUMER PERCEPTIONS AND BEHAVIORS TOWARD MATURE COCONUT WATER AS A HEALTHFUL BEVERAGE

Myrna Benita Luna[1]; Abigail Ann Ching[1]; Luis Miguel Villegas,[2]
[1]Department of Food Science and Nutrition, University of the Philippines Diliman, Quezon City, Philippines; [2]Science, Technology, Engineering and Mathematics Department, Sto. Tomas Senior High School, Sto Tomas City, Batangas Philippines

BACKGROUND AND OBJECTIVES

Mature coconut water (MCW), often discarded as a by-product of the copra industry, is a significant underutilized resource, with an estimated 9.3 billion liters discarded annually in the Philippines. Consumers customarily prefer young coconut water (YCW) to MCW since the latter is bland and saltier. Past studies reported that MCW have bioactive properties, including flavonoids and abscisic acid, which exhibit anti-inflammatory effects. Also, MCW demonstrated potential in reducing blood glucose levels, improving insulin sensitivity, and enhancing liver function in diabetic animal models. Furthermore, Philippine MCW varieties contain potassium levels exceeding those of WHO-recommended oral rehydration solutions, underscoring their nutritional value.

METHODS

Given these health benefits from MCW, this study determined consumer perceptions and attitudes toward MCW as a viable health-promoting natural beverage. A survey involving 330 respondents (50 % male and 50 % female) from Metro Manila, Philippines, was administered online and in person.

RESULTS

Of the respondents aged 19 to 49, most were well-educated, with 81% holding college degrees, and more than half earned a monthly family income of PhP 19,040 to 66,640. Multiple correspondence analyses ($p < 0.05$) revealed that thirst, refreshment, enjoyment, taste, vitality, and energy were the primary motivators for natural beverage consumption. Respondents also preferred glass packaging and were willing to spend PhP 80–110 for a 250 mL MCW beverage, prioritizing availability and affordability as key purchasing factors. Moreover, participants ranked fresh fruit and vegetable juices as top choices based on the RESULTS of the point-biserial correlation analysis. RESULTS of the Wilcoxon Signed Rank Test ($p < 0.05$) showed that MCW was recognized primarily for its health benefits and nutritional and rehydration properties.

CONCLUSIONS

The study recommends incorporating natural flavorings and herbs to enhance sensory appeal and expand marketability. These findings highlight the demand for accessible, health-focused beverages and support the valorization of MCW to reduce food waste. With strategic product development and marketing, MCW can emerge as a competitive player in the natural beverage market.

SOAP51_05

COMPARISON OF DAIRY AND PLANT-BASED LIQUIDS FOR ENHANCING LUTEIN ABSORPTION IN HUMANS: A CROSSOVER INTERVENTION STUDY

Jan Neelissen[1]; Per Leanderson[1, 2]; Helen Karlsson[2, 1]; Stefan Ljunggren[1, 2]; Lena Jonasson[1]; Rosanna W. S. Chung[1]
[1]Department of Health, Medicine and Caring Sciences, Linköping University, Linköping, Sweden; [2]Occupational and Environmental Medicine Center, Linköping University Hospital, Linköping, Sweden

BACKGROUND AND OBJECTIVES
Lutein, a carotenoid with anti-inflammatory properties, is abundant in spinach. However, lutein is highly susceptible to degradation, and most domestic cooking METHODSfor spinach significantly reduce its content. In contrast, preparing spinach as a smoothie enhances lutein release in an in vitro digestion model. The same model also indicated that the type of liquid used in smoothies significantly influences lutein dissolution. It remains unclear whether these effects on lutein dissolution also impact lutein absorption.
METHODS

This study aimed to determine whether different liquids affect lutein absorption in humans using a crossover design. Sixteen participants (50% female), aged 50–75, were recruited via advertisement. Exclusion criteria included chronic gastrointestinal diseases, regular supplement use, lactose intolerance, veganism, and allergies to intervention materials. Participants were randomly assigned to consume either dairy- or plant-based spinach smoothies over three visits, which were spaced at least one month apart. All participants abstained from carotenoid intake for 24 hours and fasted for 12 hours before each visit. During the first visit, participants consumed a control spinach smoothie (i.e., 85 g spinach blended with water). In the second and third visits, they consumed smoothies prepared with one of the experimental dairy- or plant-based liquids in randomized order. In the dairy group, high-fat cow's milk and high-fat yogurt were consumed, while soymilk and coconut milk were tested in the plant-based group. Plasma samples were collected every 2 hours for 8 hours post-consumption. Chylomicron lutein was isolated via ultracentrifugation (24,000×g, 120 min, 10°C), extracted using a 95% ethanol:hexane mixture (3:4), and quantified using high-performance liquid chromatography. Total absorption of individual carotenoids over 8 hours was compared between beverages within each participant. The study was approved by the national ethical authority.

RESULTS

Preliminary data showed that the plant-based and dairy-based smoothies resulted in 2.41- and 1.4-fold higher levels of absorbed lutein, respectively, compared to spinach juice (n=3 per category, both $p<0.0001$). Analyses are ongoing.

CONCLUSIONS
These perliminary RESULTS suggest that the consumption of smoothies may be a more efficient method to increase lutein availability.

SOAP51_08

FISH OIL MITIGATES GLYCOLIPID METABOLISM DISORDERS INDUCED BY CHRONIC POTATO CHIP CONSUMPTION VIA THE GUT-LIVER AXIS

Xuzhi Wan[1, 2]; Pan Zhuang[1]; Jingjing Jiao[3]; Yu Zhang[1, 2]
[1]Department of Gastroenterology, The First Affiliated Hospital of College of Medicine, Zhejiang University, Hangzhou, China; [2]Department of Food Science and Nutrition, College of Biosystems Engineering and Food Science, Zhejiang University, Hangzhou, China; [3]Department of Endocrinology, The Second Affiliated Hospital, School of Public Health, Zhejiang University School of Medicine, Hangzhou, China

BACKGROUND AND OBJECTIVES

Fried potato is associated with a global rise in metabolic diseases and raises substantial health concerns. However, limited studies have addressed adverse effects of fried potato diet and their prevention strategies. This study aims to uncover detrimental effects of long-term potato chip consumption on glycolipid metabolism and evaluate the protective role of fish oil supplementation.

METHODS

A 13-week feeding experiment was conducted using male C57BL/6J mice to evaluate the effects of long-term potato chip consumption and the effect of fish oil supplementation. The levels of fasting glucose, insulin resistance (HOMA-IR), and lipid profiles were measured. Histological analysis was conducted on liver, pancreas, and adipose tissues. Transcriptomic profiling of liver tissues was performed using RNA sequencing, while metagenomic analysis of gut microbiota and untargeted metabolomics of plasma and liver were carried out to investigate microbial and metabolic alterations.

RESULTS

RESULTS revealed that potato chip consumption significantly increases body weight, cholesterol, blood glucose, and insulin resistance, alongside liver, pancreas, and adipose tissue damage, which was ameliorated by fish oil intervention. Transcriptional analysis revealed that fish oil supplementation could ameliorate inflammation, gluconeogenesis, and lipid synthesis. Moreover, metagenomics and metabolomics uncovered that fish oil treatment improved gut health by evaluating the abundances of probiotics *Bifidobacterium pseudolongum*, *Lactobacillus reuteri*, and *Lactobacillus johnsonii* and raising hepatic docosahexaenoic acid, while reducing hypoxanthine and xanthine. The beneficial effect are attributed to the modulative role of fish oil supplementation in microbiota-derived enzymes, including L-lactate dehydrogenase (EC:1.1.1.27) and acetate kinase (EC:2.7.2.1), involved in gluconeogenesis and lipid synthesis. The benefit of the regulation of the role of the enzyme in the microorganism derivatives，which are included in L-Hydroxygenase（EC：2.7.2.1） and Ethylacetate enzyme（EC： 1.1.1.27），which are involved in fatty generation and fatty synthesis.

CONCLUSIONS

In conclusion, fish oil attenuates glycolipid metabolism disorders due to long-term potato chip diet, which could be mediated by the alterations in gut microbiome and hub metabolites linking gut to liver.

[1]Biosciences, Université Félix Houphouet-Boigny, Abidjan, Ivory Coast

BACKGROUND AND OBJECTIVES

In Côte d'Ivoire, one of the purpose of the school feeding policy is to fight against child malnutrition which prevalence was estimated at 23% according to data from demographic and health survey (DHS) in 2021. This school food policy is mainly based on using local agricultural production, in particular vegetables, cereals and legumes for the preparation of school meals. The aim of this study was to process two common local legumes (Vigna unguiculata or niébé and Vigna subterranea or voandzou) into tofu type vegetable meat and to assess their nutritional value for school-age children.

METHODS

For this study, one kilogram of each legume seeds were cleaned, washed in potable water and soaked overnight. The soaked seeds were mixed with water (1:2;w/v) and ground to obtain milk after filtration. The milk was then subjected to pasteurisation (80°C/3min) and citric acidic coagulation. Afterwards, the coagulum was extracted and pressed into solid blocks to obtain fresh tofu type vegetable meat. Proteins content and amino acid profile of vegetable meat from niébé and voandzou were determined by Kjeldahl and High Performance Liquid Chromatography methods, respectively. As for mineral composition, it was assessed by Atomic Absorption Spectrometry method. Oxalates and tanins content of vegetable meat were determined using standard method for antinutritional factors evaluation.

RESULTS

The production yield of fresh tofu type vegetable meat were 69.54±2.53 and 57.53±1.57% for niébé and voandzou, respectively. The proteins content varied from 14.06 to 15.09% and the amino acid profile highlighted predominance of isoleucine (0.75-0.80%), leucine (0.66-0.76%) and tryptophan (0.80-0.86%). The mineral content of tofu type vegetable meat were as follow: calcium (320-345 mg/100g), magnesium (53-55 mg/100g), iron (2.4-2.7 mg/100g) and zinc (1.6-1.8 mg/100g). Antinutritional factors of tofu type vegetable meat from niébé and voandzou showed low values of oxalates (0.10-0.12%) and tanins (0.11-0.14%) contents.

CONCLUSIONS

Tofu type vegetable meat produced from niébé and voandzou are considered as good sources of proteins and minerals and may be used in school canteens as fish substitute after processing in baked, smoked, roasted of fried form.

CRACKING THE CODE OF AIR-FRIED POTATO CHIPS: THE EFFECT OF FISH OIL TREATMENT ON ADVANCING SAFETY, NUTRITION, AND FLAVOR ATTRIBUTES BY FOODOMICS-BASED PROFILING

Yingyu Huang[1]; Haoyu Li[1]; Xinxin Yu[1]; Fan Zhang[1]; Anli Wang[1]; Xuzhi Wan[1]; Jingjing Jiao[2]; Pan Zhuang[3]; Yu Zhang[1]
[1]Department of Food Science and Nutrition, College of Biosystems Engineering and Food Science, Zhejiang University, Hangzhou, China; [2]Department of Endocrinology, The Second Affiliated Hospital, School of Public Health, Zhejiang University School of Medicine, Hangzhou, China; [3]Department of Gastroenterology, The First Affiliated Hospital of College of Medicine, Zhejiang University, Hangzhou, China

BACKGROUND AND OBJECTIVES

Potato chips are popular snacks known for their flavor and crispiness, but the thermal frying process can generate harmful contaminants and reduce essential nutrients. This study examines the potential of fish oil treatment to mitigate thermal processing contaminants and improve nutritional and sensory quality of potato chips, focusing on how thermal processing duration and fish oil treatment affect contaminants, bioactive compounds, and flavor attributes.

METHODS

Chemical profiling was conducted using UHPLC-Q-Exactive-HRMS to identify and quantify compounds, while ChemRICH analysis was used to evaluate chemical enrichment and highlight bioactive compound categories.

RESULTS

RESULTS showed that thermal processing significantly altered chemical profiles, including notable increase in indoles, pyridines, and pyrazines versus a significant decrease in cyclic amino acids and butyrates. Especially, the process induced the formation of harmful Maillard reaction products (hMRPs), such as acrylamide and furan, and reduced beneficial bioactive compounds, including γ-aminobutyric acid (GABA). Notably, fish oil treatment reduced the formation of hMRPs, preserved GABA, and enriched the chips with n-3 polyunsaturated fatty acids. Additionally, fish oil treatment decreased the levels of indoles and indoleacetic acids, thus reducing bitterness of chips and enhancing characteristic aroma of fish oil.

CONCLUSIONS

These findings suggest that fish oil use during air-based thermal processing may improve both safety and nutritional quality of potato chips and potentially enhance their sensory attributes. However, the oxidation risk of fish oil during frying should be considered. Future research should focus on how fish oil affects hMRPs, prevents oxidation, and optimizes thermal processing conditions to reduce the health risk of fried foods.

BACKGROUND AND OBJECTIVES

Background: Undernutrition remains a critical global health issue, contributing to nearly half of deaths in children under five. Beyond dietary insufficiency, the gut microbiota plays a pivotal role in modulating nutritional and metabolic health. Addressing undernutrition through microbiota-directed therapeutic approaches can be a promising strategy to enhance nutrient assimilation and metabolism. Finger millet, being a perfect blend of phenolics, dietary fibers, and micronutrients, holds potential to restore dysbiotic gut microbiota in undernourished children. This study aimed to develop a microbiota-directed finger millet (MDFM) premix and assess the sensory evaluations and acceptability of the same compared to existing wheat and rice-based diet (Balamrutham).

METHODS

Germinated finger millet (GPU-28 variety) and dates powder were used to reformulate the premix(F1) by replacing the existing Balamrutham blend(F2). Sensory analyses of various recipes (premix, laddu, idly, porridge, dosa) were conducted using a 5-point hedonic scale with untrained panelists, including mothers, teachers, and caretakers, at Anganwadi centers. Statistical analysis was performed using a t-test. Feeding trials were carried out for 2 weeks to assess acceptance and consumption rates among children.

RESULTS

The premix F1 achieved a superior mean sensory score of 4.8 ($p < 0.05$), with panelists strongly favoring its flavor, texture, and aroma. Among recipes, idly prepared with F2 demonstrated the highest overall acceptability ($p < 0.05$) due to its texture. In feeding trials, children consumed > 75% of each product, indicating high acceptability. Despite the control product receiving marginally higher scores in some attributes, both F1 and F2 formulations were well-accepted.

CONCLUSIONS

MDFM product has shown good acceptability supporting the feasibility of implementing this intervention. This premix is expected to exert promising gut-modulatory effects, contributing to improved gut health which will eventually support sustainable growth of these children. Randomised control trial on this product is warranted to know the efficacy.

EFFECT OF AQUEOUS LEAVES EXTRACT OF MORINGA OLEIFERA ON SOME HEMATOLOGICAL PARAMETERS

Abolade Fabunmi[1]; Ifabunmi Oduyemi Osonuga[1]
[1]Department of Phsyiology, Faculty of Basic Medical Sciences, Olabisi Onabanjo University, Sagamu, Sagamu, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES

Despite advancements in modern medicine, rural communities in Nigeria continue to rely on *Moringa oleifera* for managing diseases such as diabetes and anaemia due to its therapeutic properties. This study aimed to find the effect of oral administration of aqueous leaves extract of *Moringa Oleifera* on hematological parameters in adult male Wistar rats.

METHODS
The experiment involved 20 male Wistar rats (180–200g), divided into four groups of five rats each. Group 1 (control) received water and standard rat feed. Groups 2, 3, and 4 were administered 150 mg/kg, 300 mg/kg, and 450 mg/kg of the extract, respectively, for 30 days. Data were analyzed using SPSS 20.0,Student's t-test and ANOVA. RESULTS were presented as Mean ± Standard Deviation (SD), with statistical significance set at $P < 0.05$.
RESULTS

The mean and SD of the effect of *Moringa Oleifera* on hematological parameters are presented in Table 1. For **PCV**, a non-significant decrease ($P > 0.05$) was observed in the low and medium dose groups, while the high dose group showed a non-significant increase ($P > 0.05$) compared to the control. **WBC** levels significantly decreased ($P < 0.05$) in all dose groups compared to the control. **Hb** and **RBC** showed a non-significant decrease ($P > 0.05$) across all dose groups relative to the control.

Table 1: Effect of *Moringa Oleifera* on Hematological Parameters (PVC, WBC, Hb, RBC)

Parameter	Group 1 (Control)	Group 2 (Low dose)	Group 3 (Medium dose)	Group 4 (High dose)
PCV	40.60±0.89%	38.00±2.12%	38.60±2.70%	41.20±3.19%
WBC	7970.00±97.47 × 103 / mm3	7100.00±158.11 × 103 / mm3	6560.00±610.74 × 103 / mm3	6760.00±270.19 × 103 / mm3
Hb	13.36±0.21 mg/dl	12.84±0.52 mg/dl	13.16±0.64 mg/dl	13.18±0.55 mg/dl
RBC	7.08±0.13 × 106 / mm3	6.48±0.50 × 106 / mm3	6.48±0.61 × 106 / mm3	6.50±0.58 × 106 / mm3

CONCLUSIONS

In conclusion, *Moringa oleifera* may decrease hematological parameters with consistent intake, suggesting it should be consumed in low quantities. This study provides a basis for determining safe dosage ranges for developing herbal products

Keywords: *Moringa Oleifera*, Hematological Parameters, Male Wistar rats.

SOAP 25 - GLOBAL HEALTH AND PLANETARY NUTRITION

SOAP25_01

Validation of two portion size estimation METHODSfor use with the Global Diet Quality Score application

Mourad Moursi[1]; Marieke Vossenaar[1]; Joanne E. Arsenault[1]; Winnie Bell[1]; Megan Deitchler[1]
[1]Intake - Center for Dietary Assessment, FHI 360, Washington DC, United States of America

BACKGROUND AND OBJECTIVES

Measuring diet quality is crucial for policies and programs aimed at delivering better nutrition. The Global Diet Quality Score (GDQS) app collects data on diet quality by assessing portion size at the group level with ten 3D cubes of pre-defined size. Playdough (PD) was proposed as a possible alternative method. Unlike the other 24 food groups, the portion size categorization for the liquid oils food group is estimated by an algorithm in the GDQS app, based on the types of foods and dishes reported as consumed. The objective of this study was to assess whether the GDQS app using cubes or PD as the portion size estimation method with the GDQS app provided equivalent data to the GDQS metric estimated by participant-weighed records (WFR) for the same 24-hour reference period.

METHODS

The study was carried out with 170 participants 18 years or older. Each participant estimated foods consumed and portion sizes using: 1) WFR; 2) GDQS app interview with estimation by 2 methods, cubes and PD. The order of cubes vs playdough was randomized by respondent. The two one-sided paired t-test for equivalence (TOST) was used to assess equivalence between the GDQS-WFR and GDQS-cubes or GDQS-PD. *A priori*, the acceptable equivalence margin was defined as 2.5 GDQS points. The Kappa coefficient of agreement was used to quantify agreement between WFR and GDQS risk of poor diet quality outcomes (low, moderate, high) and food group consumption (low, medium, high, or very high) using the cubes or PD

RESULTS

The TOST showed that the GDQS-WFR and the GDQS-cubes or GDQS-PD were equivalent within the pre-specified bound of 2.5 points ($p=0.006$ for cubes and $p<0.001$ for PD). Both the cubes ($\kappa = 0.5685$, $p < 0.0001$) and the PD ($\kappa = 0.5843$, $p < 0.0001$) METHODSshowed moderate agreement with WFR when classifying individuals at risk of poor diet quality outcomes. Kappa coefficients showed substantial to almost-perfect agreement for the cubes and PD METHODSin comparison to WFR for 22 of the 25 GDQS food groups. Liquid oils showed much lower agreement ($\kappa = 0.059$, 27.7% agreement, $p=0.009$).

CONCLUSIONS

The GDQS app using the cubes or PD was equivalent to WFR in assessing diet quality as measured by the GDQS metric. These findings contribute to the growing body of research validating simplified tools for dietary assessment and pave the way for more frequent and accessible evaluations of diet quality to better inform policies and programs globally.

METADATA DRIVEN DISCOVERY: A GLOBAL EFFORT OF DATA INTEROPERABILITY FOR HUMAN AND PLANETARY HEALTH

Jenny Gallo[1]; Sarah Brinkley[2]; Laporte Marie-Angélique[3]; Chi-Ming Chien[4]; Jessica Prenni[5]; Elizabeth Arnaud[3]; Maya Rajasekharan,[1]; John De La Parra[6]; Selena Ahmed[7]
[1]Food for Nutrition and Health, International Center for Tropical Agriculture (CIAT), Palmira, Valle del Cauca, Colombia; [2]Biodiversity for Food & Agriculture, Bioversity International, Rome, Italy; [3]Digital Inclusion, Bioversity International, Montpellier, France; [4]The Periodic Table of Food Initiative, Verso Biosciences, San Francisco, United States of America; [5]Horticulture and Landscape Architecture, Colorado State University, Fort Collins, United States of America; [6]Global Food Portfolio, The Rockefeller Foundation, New York, United States of America; [7]Periodic Table of Food Initiative, American Heart Association, Inc, Dallas, United States of America

BACKGROUND AND OBJECTIVES

The Periodic Table of Food Initiative (PTFI) is a pioneering global effort to create an open, publicly accessible database cataloging the world's edible biodiversity through multi-omics data, uncovering the vast and largely uncharted "dark matter" of food. A significant challenge with existing food composition datasets is the lack of interoperability, particularly for PTFI which integrates multi-omics data via a decentralized ecosystem of global partners. Standardized and structured metadata are critical to enhancing the power and usability of these datasets, ensuring they can be accurately aggregated, analyzed, and reused to generate meaningful insights into the intricate connections between food composition, health, and sustainability

METHODS

We developed the PTFI Core Metadata module, comprising 45 mandatory metadata elements1 designed to capture essential information about the food collection event (e.g., when and where the food was collected), the food specimen (a specific collected entity), and derived samples (from a parent specimen). The core metadata incorporate two widely recognized ontologies: the Food Ontology (FoodOn) and the National Center for Biotechnology Information (NCBI) taxonomy

RESULTS

The PTFI Core Metadata has been implemented and released in the PTFI database MarkerLab2, alongside multiomics data from 500 foundational foods analyzed to date. The collected metadata enable comparison of variation in food composition between 182 biological species across 65 food families. Additionally, metadata enable comparison between different treatments, such as processing method (e.g., raw, processed, cooked) from 36 species; comparison of varying production systems (e.g., conventional, organic, wild, farmed, grain-fed, grass-fed) from 34 species; and comparison of diverse sources (e.g., field, fresh market, supermarket) across 32 species. For finer resolution metadata of field-harvested foods, we are developing an expansion module to capture agricultural practices linked to variations in food composition, ensuring scalability across food systems and applications

CONCLUSIONS

Our standardized metadata framework bolstered by the power of community-maintained ontologies not only facilitates data sharing and interoperability but adds context to the PTFI multiomic food data, promoting a more dynamic global platform for diverse users seeking to elucidate the nutritional "dark matter" of food

SOAP25_03

UNEQUAL PLATES, UNEVEN HEALTH: EXAMINING NUTRITION DISPARITIES IN RURAL AND URBAN INDIA

R Sendhil[1]; Pouchepparadjou Anandan[2]
[1]Department of Economics, Pondicherry University, Kalapet, India; [2]Department of Agricultural Economics and Extension, Pandit Jawaharlal Nehru College of Agriculture and Research Institute, Puducherry, India

BACKGROUND AND OBJECTIVES

Nutrition status and health are the ultimate outcomes of dietary diversity that determine human capital quality. With changing dietary patterns in rural-urban India, the present study examines the effect of dietary diversity on nutrition status and health outcomes, followed by prioritizing regions for improvement.

METHODS

Data marshaled from the National Sample Survey Office and the National Family Health Survey was used to construct the dietary diversity index (DDI) using Simpson's approach, the nutrition status index (NSI) using per-capita nutrients intake, and the health outcome index (HOI). NSI and HOI were estimated using the principal components approach. Multivariate regression was executed to capture the causal effect of DDI on NSI and HOI. Finally, biplot analysis was done to prioritize regions for better nutritional status and health outcomes.

RESULTS

Dietary diversity indicated that most Indian states consume less/moderately diversified foods. Calorie intake witnessed significant reductions over time, corroborating its linkage with dietary diversity. Per-capita protein-intake remained steady, whereas fat-intake increased and was higher in urban-India. Concerning children's health outcomes, stunting increased in coastal states during 2019-20 relative to 2015-16. Wasting increased in Andhra Pradesh, Assam, and Bihar. Underweight increased in Kerala, Andhra Pradesh, Assam, West Bengal, and Gujarat. Overall, malnutrition (HOI) increased across regions. Men whose body mass index (BMI) is below normal decreased across regions, and obesity increased in all. Women whose BMI is below normal decreased, and obesity increased in the majority. Anemic pregnant women increased majorly in southern states. Regression indicated a significant causal relationship between DDI and NSI/HOI. Regional prioritization registered a strong linkage between DDI, NSI, and HOI.

CONCLUSIONS

The dietary diversity level is low in most regions, which is reflected in the nutritional status and health outcome level, especially in children and women. It is suggested to reduce the inequality and variation accompanied by increasing the composition of fooditems in the consumption basket, especially by spending more on nutrient-dense commodities.

USING MID-UPPER ARM CIRCUMFERENCE (MUAC) Z-SCORE TAPE FOR COMMUNITY PEDIATRIC NUTRITION RISK ASSESSMENT AND MONITORING: EXPERIENCES AND LESSONS FROM SOUTHWESTERN KENYA

Dominic Bassah[1]; Emilie Mcclintic[1]; Ina Danquah,[2, 3]; Amy Sharn[4]; Suela Sulo[5]; Erick Agure[3]; Grace Wothaya Kihagi[3, 2]; Raissa Sorgho[1, 3]
[1]Center for Wellness and Nutrition, Public Health Institute, Sacramento, United States of America; [2]Heidelberg Institute of Global Health (HIGH), Medical Faculty and University Hospital, University of Heidelberg, Heidelberg, Germany; [3]Hertz-Chair Innovation for Planetary Health and Center for Development Research, University of Bonn, Bonn, Germany; [4]Global Medical Affairs and Research, Abbott Nutrition, Columbus, United States of America; [5]Global Medical Affairs and Research, Abbott Nutrition, Chicago, United States of America

BACKGROUND AND OBJECTIVES

In 2023, Community Health Volunteers (CHVs) and the Ministry of Health (MoH) staff were trained to use the novel MUAC z-score tape for household anthropometric measurements in southwestern Kenya as part of a randomized controlled trial titled ALIMUS-We are Feeding! In this qualitative sub-study, we aimed to understand the experiences and lessons learned from using the MUAC z-score tape for screening and monitoring.

METHODS

Focus Group Discussions (FGDs) were used to explore the experiences of CHVs and MoH staff, who used the MUAC z-score tape for the nutrition screening of 617 children aged between 23 and 59 months. Two FGDs were conducted with CHVs (n=14) and one with MoH staff (n=7). Trained facilitators led discussions using a semi-structured interview guide in Luo and Swahili. FGDs were recorded, transcribed, translated, and analyzed using thematic analysis.

RESULTS

Broad emerging themes included the acceptability of the MUAC z-score tape, perceived areas of improvement, and barriers to using the new tool for household nutrition screening. Participants had a positive opinion of using the MUAC z-score tapes emphasizing the expanded age categories, the inclusion of the age-specific z-scores, and additional color-coding for nutritional status. Barriers to using the MUAC z-score tape included the tape's durability and the font size of the markings on the tape. Acceptability for use at health posts by MoH staff was impacted by a lack of awareness and understanding of the novel information provided by the tape. Buy-in from community members proved essential to the screening process.

CONCLUSIONS

The findings highlight how enhancements to the MUAC z-score tape could facilitate community-based nutrition screening and monitoring. They also underscore the critical role of frontline community health workers in shaping the implementation of public health programs and the importance of providing proper training to such staff before community-level program implementation.

PREVALENCE OF STUNTING IN CHILDREN UNDER FIVE YEARS IN INDONESIA: A SYSTEMATIC REVIEW AND META-ANALYSIS

Divine Grace Domingo[1]; Lindesi Yanti[2]; Casman Casman[3]; Kee-Hsin Chen[4]; Anung Ahadi Pradana[5]
[1]Department of Global Health and Health Security, Taipei Medical University, Taipei City, Taiwan; [2]STIKes Hesti Wira Sriwijaya, STIKes Hesti Wira Sriwijaya, Palembang, Indonesia; [3]2 Faculty of Health Science, Horizon University Indonesia, West Karawang, Indonesia; [4]Faculty of Nursing, Taipei Medical University, Taipei City, Taiwan; [5]Faculty of Nursing, Taipei Medical University, Taipei, Taiwan

BACKGROUND AND OBJECTIVES

Stunting, a growth disorder defined as a height-for-age below two standard deviations of WHO reference standards, is mainly caused by inadequate nutrition and recurrent infections during the first 1,000 days of life. Indonesia has the second-highest rate of stunting among children under five in ASEAN countries, yet the exact prevalence across its provinces has not been comprehensively reported, which is crucial for evaluating the success of national and provincial programs.

METHODS

Four electronic databases (PubMed, CINAHL, EMBASE, and the GARUDA database) were searched without any language or year restriction for relevant articles from their inception to October 2024. Studies investigating the prevalence and associated factors for stunting in children under five in Indonesia were included

RESULTS

A total of 67 studies were included. The findings revealed that the included studies covered 22 of 34 provinces in Indonesia and the overall pooled prevalence of stunting in children under 5 years was determined to be 38.7% (95% CI: 35.4%–42.1%.) Publication bias was not detected while the sample size influenced the heterogeneity between the studies. Multiple related factors, including the child's sex, visits to community health centers, carbohydrate and protein intake, immunization status, vitamin A supplementation, and birth weight, demonstrated significant variation in the pooled prevalence.

CONCLUSIONS

The findings of this study address stunting in children under five by adopting a multifactorial approach, emphasising the importance of diet and micronutrient supplementation, healthcare access, and immunisation, alongside ongoing monitoring and interventions tailored to the specific needs of children.

PHYSICAL ACTIVITY LEVEL, NON-AEROBIC FITNESS AND BODY COMPOSITION IN VEGETARIAN AND OMNIVOROUS ADULTS: A COMPARATIVE ANALYSIS OF A CROSS-SECTIONAL STUDY

Mahenderan Appukutty,[1]; Mun Hong Cheah Joseph[2]; De Hui Tan[2]; Helmi Mohd Zaidi Muhammad[1]; Yit Siew Chin[2, 3]; Poh Ying Lim[4]; Yoke Mun Chan[5, 3]
[1]Faculty of Sports Science and Recreation, Universiti Teknologi MARA (UiTM), Shah Alam, Selangor Darul Ehsan, Malaysia; [2]Department of Nutrition, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Serdang, Malaysia; [3]Research Centre of Excellence, Nutrition and Non-Communicable Diseases, Universiti Putra Malaysia, Serdang, Malaysia; [4]Department of Community Health, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Serd, Malaysia; [5]Department of Dietetics, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Serdang, Malaysia

BACKGROUND AND OBJECTIVES

Despite the numerous health benefits of a plant-based diet, poor health outcomes can arise from an unbalanced diet. Although plant-based diets and vegetarianism are becoming increasingly popular, relatively little data remains on the link between vegetarians and omnivorous counterparts between diet type, physical activity, fitness and body composition.

METHODS

A total of one hundred and ninety-three Malaysian adults participated, with a mean age of 41.9 ± 13.4 years. The participants were categorised as vegetarians (V) (n=106) and omnivores (O) (n=87). Self-administered questionnaires were distributed to all participants, and their physical activity level data were assessed using the Global Physical Activity Questionnaire (GPAQ). Body composition measures [BMI, body fat mass, fat-free mass, visceral fat level, and body fat percentages] were calculated using a bioelectrical impedance analyser (BIA). The hand grip test was used to assess muscular and hand strength using a hand dynamometer. The non-aerobic aspects of physical fitness (muscle strength/power, flexibility, balance, and body composition) were assessed using the sitting-rising test (SRT).

RESULTS

Four categories of vegetarian diets have been identified: vegan (23.5%), lacto-ovo (53%), ovo (4.9%), and lacto (18.6%). There were no differences by ethnicity (Chinese: V: 57.5%; O: 59.8%; Indian: V: 42.4%; O: 40.2%) or sex (male vs female: V: 34.9%, 65.1%; O: 44.8%, 55.2%). Vegetarianism was practised for an average of 15.8 ± 13.6 years. Physical activity, handgrip strength, and SRT did not significantly differ between vegetarians and omnivores ($p > 0.05$). There was a significant correlation ($p < 0.05$) between the body composition variables (body fat mass, fat-free mass, visceral fat level, and BMI). Nonetheless, there was no discernible difference in body fat percentages between vegetarians and non-vegetarians ($p > 0.05$).

CONCLUSIONS

Although dietary patterns varied significantly between groups, with vegetarians consuming fewer animal-derived products and more plant-based foods, linear regression analysis revealed no differences or associations between dietary patterns, body composition, physical activity levels, and non-aerobic fitness. These findings emphasise the need for further research to elucidate the specific impact of dietary patterns on body composition, physical activity, and fitness levels. An appropriate health education programme on healthy eating is required based on preferences from the five major food groups.

STRENGTHENING SALT REDUCTION POLICY FOR MALAYSIA THROUGH MAXIMUM SALT TARGETS OF SELECTED FOOD GROUPS: ENGAGEMENT WITH INDUSTRY STAKEHOLDERS

Suzana Shahar[1]; Qian Ong Ying[2]; Hasnah Haron,[3]; Nurul Fatin Malek Rivan[3]; Hamdan Mohamad,[4]; Musaalbakri Abdul Manan[5]; Wan Zunairah Wan Ibadullah[6]; Viola Michael,[7]; Feng He,[8]; Sonia Pombo[8]; Graham A Macgregor[8]

BACKGROUND AND OBJECTIVES

In 2013, the WHO recommended that all member states aim to reduce population salt intake by 30% by 2025. Since then, more countries, including Malaysia, opted for structural or regulatory approaches. Setting maximum salt targets for food industries to adhere to is one of the strategies. Thus, this study has been conducted to set a maximum salt targets for specific food categories and evaluate the stakeholder, ie. food industry responses.

METHODS

Following a stepwise approach by Dawns et al. (2015) for setting national salt targets, this study systematically proposed maximum salt targets for 14 food categories under the Food Regulation 1985. The steps involved: (1) identifying major contributors to dietary salt; (2) selecting target food categories; (3) establishing target levels, and (4) engagement with food industry stakeholders.

RESULTS

In Step 1, secondary data from the 2019 Malaysian Community Salt Survey revealed a mean salt intake of 7.9 g/day in adults, with the major contributor to salt intake being cooked food (meals prepared outside home). Salt levels in foods were also obtained from previous market surveys on sauces, instant noodles and street foods conducted between 2017 to 2021. A total of 14 food categories identified under the Food Regulation 1985 were selected for salt target setting, based on their contribution to dietary salt intake and their inclusion in the ongoing revision of the Malaysia Food Act 1983 (Step 2). Literature reviews and discussions led to proposing the 75th percentile of sodium levels as the maximum salt target, which was then revised based on consumption data (Step 3). An engagement with 40 representatives from food industries indicated mixed opinions and emphasised the needs for supports on technology and training for reformulation.

CONCLUSIONS

This study has established maximum salt targets for 14 food categories, through a step wise approach, paving the way for mandatory or voluntary policy interventions. Nevertheless, the acceptance among food industries was a concern; of which continuous supports is detrimental. There is a need to further evaluate the success of the implementation through periodically monitoring and engagement with the stakeholders.

LOW TRANSFERRIN LEVELS ARE ASSOCIATED WITH MORTALITY IN KENYAN CHILDREN WITH SEVERE ACUTE MALNUTRITION

Kelvin Mokaya Abuga[1]; John Muriuki[1]; Isaac Egesa[1]; Beth Mugure[1]; Charles Newton[1]; Manfred Nairz[2]; Calman A Maclennan[3]; Anthony Scott[1, 4, 5]; Thomas Williams[1, 6, 5]; Sarah Atkinson[1, 5, 7]; Philip Bejon[1, 5]
[1]Epidemiology and Demography, KEMRI-Wellcome Trust Research Programme, Kilifi, Kenya; [2]Internal Medicine II, Medical University Innsbruck, Innsbruck, Astria, Austria; [3]Jenner Institute, University of Oxford, Oxford, United Kingdom; [4]Department of Infectious Disease Epidemiology, London School of Hygiene and Tropical Medicine, London, United Kingdom; [5]Nuffield Department of Clinical Medicine, University of Oxford, Oxford, United Kingdom; [6]Department of Infectious Disease and Institute of Global Health and Innovation, Imperial College, London, United Kingdom; [7]Department of Paediatrics, University of Oxford, Oxford, United Kingdom

BACKGROUND AND OBJECTIVES

Severe acute malnutrition (SAM), characterized by severe wasting (marasmus) or nutritional oedema (kwashiorkor), is associated with high mortality, even with management according to WHO guidelines. We hypothesized that disruption of iron status, leading to increased risk of bacteraemia, may underlie high mortality in children with SAM.

METHODS

We analysed integrated clinical and laboratory data from 111,703 paediatric admissions between August 1998 and June 2024. Transferrin and other biomarkers of iron status were longitudinally assessed in Kenyan children with SAM at admission (n=362), and 7 (n=210) and 14 (n=149) days post- admission, and among underweight (n=437) and nourished (n=2,280) community children from Kenya, Uganda, Burkina Faso and The Gambia.

RESULTS

Children with SAM had a two-fold increased risk of bacteraemia and mortality compared to those without SAM (adjusted odds ratio (aOR) 2.1 [95% CI 1.9, 2.2]; P<0.0001). Admissions with kwashiorkor had a 54% increased risk of bacteraemia (aOR 1.5 [1.4, 1.7]), and a 45% increased risk of mortality (aOR 1.4 [1.3, 1.6]) compared to those with marasmus. Specifically, children with kwashiorkor had a 2.5-fold or more increased risk of *Escherichia coli* and *Klebsiella pneumoniae* bacteraemia, and had lower transferrin levels (0.8 g/L [95% CI 0.7, 0.9]) than those with marasmus (1.9 g/L [1.7, 2.1]; P<0.0001) or community children (2.7 g/L [2.6, 2.7]; P<0.0001). Each 1 g/L decrease in transferrin levels was associated with an 87% increased risk of mortality (aOR 1.87 [1.32, 2.64, 2.86], P=0.0003) and mortality increased exponentially as transferrin levels decreased below 1.5 g/L. Kwashiorkor was also associated with higher transferrin saturation and lower hepcidin, albumin, and soluble transferrin receptor levels compared to marasmus or community-based children.

CONCLUSIONS

Low transferrin may be a risk factor for bacteraemia and mortality in SAM patients, and the risk increases along a continuum of decreasing transferrin levels. Further studies are needed to elucidate the underlying biological mechanisms linking low transferrin levels to poor outcomes, and potential interventions.

SOAP25_12

IMPACT OF HOUSEHOLD USE OF MULTIPLE MICRONUTRIENT-FORTIFIED BOUILLON CUBES ON CHILD DEVELOPMENT OUTCOMES AMONG CHILDREN 2 TO 5 YEARS OF AGE IN NORTHERN GHANA

Emily R. Becher[1]; Sika M. Kumordzie[1]; Jennie Davis[1]; Charles D. Arnold,[1]; Xiuping (Jenny) Tan[1]; K Ryan Wessells[1]; Ahmed Fuseini[2]; Katherine P. Adams[1]; J. Marjorie Haskell[1]; Steve Vosti,[3]; Seth Adu-Afarwuah[2]; Reina Engle-Stone,[1]
[1]Department of Nutrition, Institute for Global Nutrition, University of California, Davis, Davis, CA, United States of America; [2]Department of Nutrition and Food Science, University of Ghana, Legon, Accra, Ghana; [3]Dept. of Agricultural and Resource Economics, University of California, Davis, Davis, United States of America

BACKGROUND AND OBJECTIVES

Many children in low- and middle-income countries are at risk of not reaching their developmental potential, in part due to malnutrition. Micronutrients are required for brain development; interventions to improve micronutrient status may improve developmental outcomes among children. This study examined the impacts of household use of multiple micronutrient-fortified bouillon cubes, compared to a control bouillon cube, on selected child development outcomes.

METHODS

Children 2-5 y (n=689) were recruited from 14 rural and 14 urban/semi-urban clusters in northern Ghana for the CoMIT Project (NCT05178407), a double-blind household-randomized controlled trial. The intervention cube intervention cube was formulated to provide 200 ug vitamin A, 80 ug folic acid, 1.2 ug B12, 4mg iron, 3 mg zinc per day; both intervention and control cubes contained 30 ug/g iodine. Study cubes were delivered to households every two weeks for 9 months. Child development was assessed prior to randomization (baseline) and at the end of the intervention. We used the Malawi Developmental Assessment Tool (MDAT) to assess gross motor, fine motor, personal social and language development, and the Early Years Toolbox Go/No-Go Task (EYT GNGT) to assess inhibition. For each outcome, minimally-adjusted (controlling for baseline values, recruitment site, and child age and sex) and fully-adjusted (controlling for additional pre-specified covariates significantly associated with the outcome) ANCOVA models were used to estimate endline mean differences between the intervention and control groups.

RESULTS

Of 670 children randomized, 637 completed the endline MDAT and 633 completed the endline EYT GNGT. Children enrolled in the intervention group had greater endline age adjusted z-scores for language development (1.11 vs. 0.95 mean; p = 0.004) and gross motor development (0.75 vs. 0.69; p = 0.015). However, personal social, fine motor and inhibition scores did not differ between groups at endline.

CONCLUSIONS

The intervention of household use of multiple micronutrient fortified bouillon cubes had a small positive effect on language and gross motor development outcomes. The magnitude of the impact was analogous to ~1 IQ point, which is similar to the impacts of other nutrition interventions on child development outcomes. This indicates the potential for bouillon fortification to improve some child development outcomes among pre-school age children. Further research is necessary to understand potential pathways of impact.

EFFECTIVENESS OF CONTEXT-ADAPTED IMPROVED DIET AND COUNSELING ON RECOVERY OF CHILDREN FROM MODERATE ACUTE MALNUTRITION (MAM) IN BANGLADESH: A CLUSTER RANDOMIZED CONTROL TRIAL

Md. Abdul Alim[1]; Md. Munirul Islam[2]; Benjamin Guesdon,[3]; Md. Abdul Hasan[4]; Ahmed Tahmeed[5]; Stefaan De Henauw[6]; Souheila Abbeddou[1]
[1]Public Health and Primary Care, Ghent University, Ghent, Belgium; [2]Nutrition Research Division, icddr,b, Dhaka, Bangladesh; [3]Research, Analysis and Learning Service/Expertise and Advocacy Department, Action contre la Faim, Montreuil, France; [4]Nutrition and Health Department, Action Contre la Faim, Dhaka, Bangladesh; [5]Nutrition Research division, International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B), Dhaka, Bangladesh; [6]Department of Public Health and Primary Care, Ghent University, Ghent, Belgium

BACKGROUND AND OBJECTIVES

Supplementary feeding programs with standardized nutritional supplements are routinely implemented for the management of MAM in humanitarian contexts. In its latest guideline on acute malnutrition, the WHO however called to revisit the role of nutritious home food as an integral part of the prevention and management of MAM, and to assess the efficacy of different approaches to dietary management of moderate wasting, including the use of available home foods in different contexts (1). Accordingly, we sought to evaluate the effectiveness of an approach based on improved nutritional counseling (INC) and home food fortification in the management of MAM children aged 6-59 months, in rural Bangladesh.

METHODS

We conducted a two-arm cluster RCT in 20 community clinics in Teknaf sub-district. In the intervention arm, 280 child-caretaker dyads received INC, cooking demonstration of traditional recipes and 15-micronutrient powder sachets, every two weeks. In the control arm, they received a nutritional supplement (WSB++). The duration of MAM management was set at 4 months, followed by a 6 months follow-up period. Anthropometry, morbidity and adherence were recorded at each visit. Primary outcomes were recovery rate, time to recovery, rate of weight gain and nutritional status after 4 months. We studied the effect of intervention using regression models adjusted for clustering and baseline characteristics.

RESULTS

Of the 560 children enrolled in the study, 3.8% (21/560) defaulted or were lost to follow-up before the end of the treatment period. At the end of the 4-month period, 57.0% (307/539) were no longer acutely malnourished, and 2.8% (15/539) deteriorated to severe acute malnutrition. We found no statistically significant difference between treatment groups in recovery rates, nor in nutritional status achieved after 4 months. Adjusted analyses showed that rates of weight gain, of 1.53 g/kg/day in the control group and 1.34 g/kg/day in the intervention group, were unaffected by the type of treatment received (p=0.326). Post-treatment RESULTS were also similar between treatment groups.

CONCLUSIONS

Our study shows that an alternative approach to MAM management can be as effective as a classical program using a standardized nutritional supplement. In future analyses, we will assess the levers and barriers to the effectiveness of the different approaches, as well as their cost-effectiveness. Further studies in other contexts are required to investigate the promising prospect of managing MAM by improving access to nutritious foods at home, or by fortifying foods at home, rather than by administering nutritional supplements.

BACKGROUND AND OBJECTIVES

Food group-based questionnaires collect data on consumption of food groups to construct proxy indicators of quantitative intakes, such as the minimum dietary diversity for women (MDD-W). How to collect valid food group data requires careful inquiry. The objective of this study was to test whether a short list of commonly-consumed "sentinel" foods can accurately capture consumption of each food group at population level.

METHODS

Quantitative dietary intake survey data from an initial 10 countries (Bangladesh, Brazil, China, Colombia, Ethiopia, Mexico, Netherlands, Switzerland, United Kingdom, United States) were analyzed, supplemented with 27 additional countries from Europe that had national dietary intake surveys. Each food item was classified into the 29 food groups of the Diet Quality Questionnaire (DQQ), and assigned a generic item name; e.g. short-grain rice and long-grain rice are both called "rice". For each country, items were ranked by number of unique people consuming each item. The cumulative percentage of people consuming the food group was tabulated to identify the number of items needed to capture 90%, 95%, 99%, and 100% of people who consumed each food group.

RESULTS

Across countries, a mean of 3 food items per food group were required to capture ≥95% of people consuming the food group, ranging from an average of 1 item (eggs) to 9 items (other fruits). The number of items varied by country; for example, 12 "other fruits" captured 95% of consumers in Colombia, while only 4 were required to capture 95% in Ethiopia. Summing the number of sentinel foods required for all 29 food groups of the DQQ, an average of 79 food items captured ≥90% of people consuming each food group; 100 items captured ≥95% of people; 143 items captured ≥99% of people, and 239 items captured 100% of people.

CONCLUSIONS

Food group consumption can be measured accurately at population level using short lists of sentinel foods, and does not require an exhaustive food list. Careful identification of the most commonly-consumed items is important for the validity of the sentinel food method. A global collective effort of >1,000 people has identified an average of 126 sentinel foods per country in 140 countries, which have been used in collecting dietary data in the Gallup World Poll and the Demographic and Health Surveys since 2020.

Digestive, Clinic University Navarra, Pamplona, Spain; [6]CIBERobn, Carlos III Health Institute, Madrid, Spain; [7]Diet and Lifestyles, Instituto de Investigación Sanitaria de Navarra (IdiSNA), Pamplona, Spain

BACKGROUND AND OBJECTIVES

The Planetary Health Diet (PHD) is a novel dietary pattern and presents similitudes to the Mediterranean Diet (MedDiet). Our study aimed to investigate and compare the association between adherence to a priori PHD index and two well-known Mediterranean indexes, and micronutrient intake adequacy.

METHODS

We assessed 18259 participants at baseline with a validated semi-quantitative food frequency questionnaire. Inadequate intake of 19 micronutrients was evaluated using the estimated average requirement (EAR) cut-point approach and the probabilistic approach. Logistic regression analyses were conducted to estimate the probability of failing to meet EAR for ≥ 3 micronutrients.

RESULTS

Overall, subjects in the higher adherence quartile of the PHD and MedDiet had a lower risk of overall inadequacy. The adjusted OR for failing to meet ≥ 3 EAR was 0·24 (95% CI 0·21-0·27) for the PHDI, 0·12 (95% CI 0·11-0·13) for Mediterranean Diet Adherence Screener, and 0·09 (95% CI 0·08-0·10) for Mediterranean Diet Score (fourth v. first quartile) using the probabilistic approach method. Our findings showed that greater adherence to the PHD was associated with a lower risk of micronutrient inadequacy, although the MedDiet proved to have better nutritional adequacy by far.

CONCLUSIONS

It would be best when recommending the PHD to prioritize nutritionally dense foods, such as those that conform the MedDiet pattern.

THE WORLD FOOD MAP: A TOOL FOR UNDERSTANDING BIOCULTURAL FOOD DIVERSITY FOR RESILIENT AND SUSTAINABLE FOOD SYSTEMS

Chris Vogliano[1]; Betül T.M. Uyar[2]; Anna W. Herforth[2]
[1]Global Nutrition, Wageningen University & Research, Wageningen, Netherlands; [2]Division of Human Nutrition and Health, Wageningen University and Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES

Diets worldwide often lack the diversity needed to meet nutrient needs and protect against disease. Investing in sustainable food systems is crucial to ensure access to diverse foods that support health, culture, and biodiversity. Neglected and underutilized species (NUS) have been overlooked despite their nutrient density, climate resilience, and cultural significance, offering solutions to challenges in nutrition, sustainability, and food equity. This research aims to map common and NUS globally in an accessible online format to support investment in sustainable food systems and biocultural diversity.

METHODS

Commonly consumed foods from over 100 countries, identified from over 1,000 key informant interviews done by the Global Diet Quality Project in 2021-2024, were mapped onto each country, organized by food groups. A scoping review, landscape analysis, and expert consultations were conducted in collaboration with leading botanical research institutions to identify and classify additional edible species and NUS. These species were mapped across global biomes. New food composition analysis on NUS is carried out by the Periodic Table of Food Initiative (PTFI). Geospatial mapping tools and global datasets are used to map these pieces of information.

RESULTS

The World Food Map includes over 1,500 commonly consumed foods. These are mapped by country, showing regional patterns of common food consumption. Based on consultation with botanical researchers, biomes and primary and secondary crop centers of origin were identified as the key layers onto which each NUS are mapped. Food composition data for these priority species reveals an array of health-related compounds, in addition to nutrients. Priority NUS in 10 focus countries were selected as strong candidates for investment in sustainable food systems to support diverse, healthy diets. Web-based development is ongoing to include these RESULTS on the map interface, to be completed by 2026.

CONCLUSIONS

The World Food Map currently is the first systematic catalogue of the most commonly-consumed foods in each country. Furthermore, NUS have been identified for integration into the platform, linked to new food composition data. Future work can enrich sustainability and cultural metadata around each species. Integrating NUS into the World Food Map offers actionable insights to enhance dietary diversity, climate resilience, and cultural heritage, supporting evidence-based policies, research, education, and market strategies.

Instituto de Investigación Sanitaria de Santiago (IDIS), Santiago de Compostela, Spain; [6]Unit of Pediatric Endocrinology, Pediatric Service, Hospital Clínico Universitario Lozano Blesa, Zaragoza, Spain; [7]ISGlobal, Barcelona Institute for Global Health, Barcelona, Spain

BACKGROUND AND OBJECTIVES

Addressing the global burden of childhood obesity requires dietary solutions that prioritize both individual health and environmental sustainability. The Planetary Health Diet (PHD) proposes a novel dietary pattern designed to meet individual nutritional needs while minimizing environmental impact, however, its effects on cardiometabolic (CM) health remain broadly unstudied, especially in pediatric populations. In contrast, the Mediterranean Diet (MD) is widely supported for its cardiometabolic benefits. This study aims to evaluate the adherence to the PHD and MD in a cohort of Spanish children with overweight/obesity, and to assess cross-sectional associations with cardiometabolic biomarkers and body composition measures.

METHODS

A total sample of n=612 children with overweight/obesity were studied. Dietary data was derived from at least two 24-h recalls and child-specific indexes of adherence to the MD and the PHD were calculated. CM biomarkers included lipid profile and glycemic status. Body composition was evaluated via Tanita scales. The associations between the adherence to both dietary patterns and the CM health and body composition were studied using multivariable lineal models adjusted for age, sex, Tanner stage, origin, physical activity and sociodemographic status.

RESULTS

Children showed a moderate-to-low adherence to the MD, with a mean score of 6 points out of 11, and a low adherence to the PHD, with a mean score of 41 points out of 140. Statistical analyses did not show significant associations between MD or PHD adherence scores and CM biomarkers. For the PHD, a higher adherence was associated with a significantly higher amount of total lean mass (LM, kg): low adherence PHD: LM 39.6 (38.6-40.5); medium adherence PHD: LM 41.6 (40.7-42.5); high adherence PHD: LM 41.1 (40.1-42.0).

CONCLUSIONS

The overall adherence of a Spanish pediatric cohort to the MD and the PHD is moderate to low. PHD adherence showed a significant cross-sectional association with lean mass. The broader implications of MD and PHD adherence on cardiometabolic health and longer-term health outcomes needs to be further explored in longitudinal cohort studies.

SOAP41_02

THE ASSOCIATION OF PLANT-BASED DIET INDEX WITH DIET QUALITY, ANTHROPOMETRIC MEASUREMENTS, AND BLOOD MARKERS IN ADOLESCENTS

Seda Nur Köktürk[1]; Hülya Yardımcı[2]
[1]Nutrition and Dietetics, Ankara University Graduate School of Health Sciences, Ankara, Türkiye; [2]Nutrition and Dietetics, Ankara University Faculty of Health Sciences, Ankara, Türkiye

BACKGROUND AND OBJECTIVES

Plant-based diets have gained significant attention in recent years due to their ability to reduce carbon and water footprints and greenhouse gas emissions. Plant-based foods are classified into healthy and unhealthy categories, and their consumption is used to calculate healthy (hPDI), unhealthy (uPDI), and overall PDI (oPDI) scores. This study aims to investigate the relationship between plant-based diet index scores and adolescents' anthropometric measurements, blood markers, and diet quality.

METHODS

A total of 205 adolescents (59.0% female) were included in the study. Participants completed a food frequency questionnaire that included healthy and unhealthy plant-based foods as well as animal-based foods. Anthropometric measurements, including height, waist circumference, body weight, body fat percentage, lean body mass percentage, and triceps skinfold thickness, were recorded. Participants' dietary habits were also assessed through a questionnaire. The diet quality of adolescents was evaluated using the KIDMED index. Statistical analyses included chi-square tests, One-way ANOVA, and logistic regression.

RESULTS

When PDI scores were divided into tertiles, no significant differences were found in anthropometric measurements and biochemical markers for any PDI score. However, diet quality scores were significantly different between the tertiles of hPDI and uPDI. uPDI was inversely associated with diet quality, with lower odds for medium (OR = 0.89, 95% CI: 0.86–0.94) and high diet quality (OR = 0.78, 95% CI: 0.72–0.85). Conversely, hPDI showed a positive association, with higher odds for medium (OR = 1.05, 95% CI: 1.00–1.10) and high diet quality (OR = 1.15, 95% CI: 1.05–1.25). oPDI was not significant in Model 1 but became significant with adjustments for covariates ($p < 0.001$).

CONCLUSIONS

This study highlights the significant association between plant-based diet indices and diet quality in adolescents. While PDI scores did not show any notable differences in anthropometric and biochemical measures, both hPDI and uPDI tertiles demonstrated significant differences in diet quality. These findings emphasize the importance of considering both healthy and unhealthy plant-based food consumption in promoting overall diet quality. Further research is needed to explore the broader health implications of these diet indices.

SOAP41_03

"THOUGHT FOR FOOD": A SYSTEMATIC REVIEW OF HOW PSYCHOLOGICAL FACTORS AFFECT SUSTAINABLE FOOD CHOICES

Louise Glenisson; Hallez Lotte[1]; Smits Tim[1]
[1]Communication Science, KU Leuven, Leuven, Belgium

BACKGROUND AND OBJECTIVES

Shifting consumers' food choices towards a more sustainable dietary pattern is necessary to transition to a food system that benefits society on an environmental, social and economic level. Given the critical role of consumers in the food system, this review aims to summarize the evidence on consumers' psychological state variables -e.g. attitudes, values, emotions- and their influence on a range of sustainable food outcomes (i.e., food perceptions, attitudes, intentions, purchase and consumption).

METHODS

Three online databases (i.e., Web of Science, PubMed, Scopus) were searched for quantitative and qualitative studies (2014-2024), evaluating this relationship between psychological variables and sustainable food outcomes. After various rounds of screening, we identified 290 articles for full-text analysis.

RESULTS

The majority of studies (*n*=201; 69.3%) focused on organic foods as a primary outcome, while socially and economically sustainable food products (e.g., fair trade, local food etc.) were fairly neglected (*n*=15; 5.0%). The analysis identified several key psychological state categories in relation to sustainable food outcomes. Relevant for intervention communications, we found strong evidence for the positive effect of specific attitudes (e.g., attitude towards meat alternatives) but not for more general pro-environmental attitudes. There was also strong evidence for an association between knowledge and sustainable food outcomes. Given the limited food knowledge among consumers (Palumbo et al., 2019; Skeaff et al., 2017), furthering this knowledge or literacy could foster more sustainable food consumption. Additionally, perceptions and beliefs about plant-based eating need further investigation as findings indicate that some consumers hold beliefs about the healthfulness of plant-based diets that actually discourage their adoption of these foods.

CONCLUSIONS

Certain variables (e.g. attitudes, self-identity, knowledge, etc.) demonstrated strong evidence of association with sustainable food outcomes, highlighting their potential importance for stakeholders aiming to improve sustainable food consumption among the population. However, the current lack of experimental research limits the ability to determine causality, making this an essential area for future investigation.

SOAP41_04

ADHERENCE TO THE EAT-LANCET DIET IS ASSOCIATED WITH HIGHER MICRONUTRIENT INTAKE: FINDINGS FROM A CROSS-SECTIONAL STUDY OF COMMUNITY-DWELLING OLDER ADULTS IN GASABO DISTRICT, CITY OF KIGALI, RWANDA

Theogene Habumugisha[1]; Stubbendorff Anna[2]; Tembo Penias[3]; Matsiko Eric[4]; M. S. Engebretsen Ingunn[5]; Elisabeth Måren Inger[6]; Kaiser Matthias[7]; Alida Melse-Boonstra[8]; Karin Borgonjen-van den Berg[9]; Jutta Dierkes[10]

[1]Centre for International Health, Department of Global Public Health and Primary Care, University of Bergen, Bergen Norway; [2]Department of Nutritional Epidemiology, Lund University, Lund, Sweden; [3]Arnold School of Public Health, Department of Epidemiology and Biostatistics, University of South Carolina, Columbia, United States of America; [4]Department of Human Nutrition and Dietetics, University of Rwanda, Kigali, Rwanda; [5]Centre for International Health, Department of Global Public Health and Primary, University of Bergen, Bergen, Norway; [6]Department of Biological Sciences, University of Bergen, Bergen Norway; [7]Centre for the Study of Sciences and Humanities, University of Bergen, Bergen, Norway; [8]Division of Human Nutrition and Health, Wageningen University and Research, Wagening, Netherlands; [9]Division of Human Nutrition and Health, Wageningen University and Research, Wageningen Netherlands; [10]Centre for Nutrition, Department of Clinical Medicine, University of Bergen, Berge, Norway

BACKGROUND AND OBJECTIVES

Dietary patterns around the world have adverse effects on health and the environment, with Sub-Saharan Africa facing a challenge of undernutrition alongside rising rates of non-communicable diseases. Adopting the reference diet proposed by the EAT-Lancet Commission can reduce the environmental burden and improve health outcomes. However, potential impact of this diet on micronutrient adequacy, particularly in older adults in low-income settings, has not been investigated. This study examines adherence to the EAT-Lancet diet and its association with micronutrient intake among older adults in the Gasabo district, Kigali, Rwanda.

METHODS

This cross-sectional study involved 334 older adults aged 55 to 93 years from the Gasabo district. Dietary intake was assessed using two non-consecutive 24-hour recalls, and socio-demographic data were collected through interviews. Adherence to the EAT-Lancet diet was evaluated using a 42-point index based on food group consumption where a higher score indicated better adherence. Micronutrient intake was analysed in relation to adherence tertiles. Multivariable regression models, adjusted for age, sex, and energy intake, were used to assess associations between diet adherence and micronutrient intake.

RESULTS

The EAT-Lancet adherence score ranged from 13 to 36, with a mean of 24.2. Higher adherence was associated with increased consumption of whole grains, vegetables, fish, and nuts, while red meat, dairy, and poultry intake declined. Adherence was positively associated with energy intake and intake of several micronutrients, including retinol-equivalents, thiamine, folate, vitamin B12, and iron. However, the association with riboflavin intake was negligible, and zinc and potassium intake showed no significant association after adjusting for energy intake.

CONCLUSIONS

Higher adherence to the EAT-Lancet diet improves the intake of several micronutrients important for healthy aging in this population of predominantly older, poor adults in Kigali. However, the potential for nutrient gaps, particularly in riboflavin, highlights the need for context-specific dietary adaptations to ensure nutritional adequacy in older populations in Rwanda.

SOAP41_05

THE NOVA SCREENER: AN EASY-TO-OPERATE AND LOW-COST TOOL FOR ASSESSING AND MONITORING HEALTHY AND SUSTAINABLE DIETS

Leandro Cacau[1]; Maria Laura Louzada[1]
[1]Department of Nutrition, Universidade de São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES

The Nova screener is an easy-to-operate and low-cost instrument designed to assess food consumption according to the degree of food processing. It allows for the generation of two diet quality scores: the Nova score for ultra-processed foods (Nova-UPF) and the Nova score for minimally processed plant-based foods (Nova-WPF). This study aims to evaluate whether the scores generated by the screener can predict adherence to a healthy and sustainable diet measured by a comprehensive method

METHODS

Data were obtained from the NutriNet-Brasil study, an ongoing, fully online multicentric cohort. A subsample (n=812) completed the Nova screener and a 24-hour dietary recall (24h-DR) on the same day, enabling a comparison between the Nova scores and health and sustainable diet indicators (nutrient inadequacy score, adherence to the EAT-Lancet diet and environmental impact indicators) derived from the 24h-DR. Nova-WPF and Nova-UPF scores were calculated based on the reported consumption frequency (yes/no) of 33 WPF items and 23 UPF items, respectively, and categorized into tertiles. The number of nutrients with inadequate consumption were determined using WHO cutoffs for added sugars, saturated fat, trans fat, fiber, sodium, and potassium (range 0-6). Adherence to the EAT-Lancet sustainable diet was assessed using the Planetary Health Diet Index (PHDI, range: 0–150 points). Environmental impact was evaluated through carbon and water footprints. Linear regression models were built and all analyses were adjusted for sex, age, education, and region of the country.

RESULTS

Participants in the highest Nova-WPF tertile ($\geq$9 points) had, on average, higher PHDI scores (+14.4 points), lower inadequacies in the consumption of critical nutrients (-1.12 points), and reduced mean carbon (-0.43 kg CO2eq/1000 kcal) and water footprints (-0.21 L/1000 kcal). Conversely, those with high Nova-UPF scores ($\geq$3) had lower PHDI scores (-4.08 points) and higher inadequate consumption of critical nutrients (+0.72 points), with no significant association observed for environmental footprints.

CONCLUSIONS

The Nova diet quality scores derived from the Nova screener demonstrate significant associations with indicators of healthy and sustainable diets, particularly through the Nova-WPF score. These findings highlight the screener's potential as a tool for monitoring comprehensive dietary quality.

SOAP41_06

RISK RANKING OF MYCOTOXINS AND TOXIC METAL ELEMENTS IN PLANT-BASED MEAT AND DAIRY ALTERNATIVES UNDER PROTEIN TRANSITION SCENARIOS

Sofie Schryvers[1]; Jung Christian[2]; Schmitz Lea[1]; Carl Lachat[1]; Jacxsens Liesbeth[1]
[1]Department of Food Technology, Safety and Health, Faculty of Bioscience Engineering, Ghent University, Ghent, Belgium; [2]Department of Exposure, German Federal Institute for Risk Assessment (BfR), Berlin, Germany

BACKGROUND AND OBJECTIVES

Food safety risks associated with an increased consumption of plant-based meat (PBMA) and dairy alternatives (PBDA) remain unexplored. Here, we assessed mycotoxins and toxic metal elements exposure and the associated health risks related to the consumption of PBMA and PBDA.

METHODS

We simulated diets by replacing animal-source proteins (i.e. milk and meat) with their plant-based alternatives in the diet of European children, adolescents and adults. A risk ratio method, based on the hazard quotient (HQ), was applied to rank contaminant-related food safety risks. A systematic review was organised to collect and aggregate PBMA and PBDA contamination data in Europe. Occurrence data for toxic metals (e.g. inorganic arsenic (iAs), lead (Pb), cadmium (Cd) and nickel (Ni)) in milk and meat from the European Food Safety Authority (EFSA) were used to allow for a more fair comparison of exposure when substituting animal-source foods with plant-based alternatives.

RESULTS

The highest risks were identified for mycotoxins in PBMA, in particular for the sum of aflatoxins (sum AF), alternariol monomethyl ether (AME), aflatoxin B1 (AFB1) and alternariol (AOH), with HQs for adults of 62.7, 34.6, 12.4 and 2.2 in the lower bound scenario (LB), respectively. In the milk substitution model (LB), HQs exceeding one were calculated for children, with HQs of 4.9 (sum AF) and 1.4 (AFB1), indicating a potential food safety risk. With regards to toxic metals, much lower HQs were found when substituting milk and meat consumption with PBDA and PBMA, however the exposure to most toxic metals would clearly increase. A potential food safety risk, based on the replacement of meat consumption with PBMA, was identified for the nephrotoxic effects of Pb (HQ of 1.0 in LB scenario) in adults. The highest risks for PBDA were identified for iAs (HQ of 0.3 in LB scenario).

CONCLUSIONS

These preliminary outcomes show that the exposure to chemical contaminants, should not be neglected in the transition to more sustainable dietary patterns in Europe.

SOAP41_08

TOWARDS UNDERSTANDING THE BIOCHEMICAL DIVERSITY OF NATIVE AND UNDERUTILIZED PACIFIC ISLAND FOODS

Vincent Lal[1]; Gina Kennedy[2]; Rupantri Raju,[3]; Barbara Burlingame[4]
[1]School of Agriculture, Geography, Environment, Oceans and Natural Sciences, The University of the South Pacific, Suva, Fiji; [2]Alliance Bioversity CIAT, Alliance Bioversity CIAT, Washington, United States of America; [3]Environment, Climate and Resilience, Pacific Horticultural and Agricultural Market Access Plus (PHAMA Plus) Program, Suva, Fiji; [4]Riddet Institute, Massey, Palmerston North, New Zealand

BACKGROUND AND OBJECTIVES

There are over 11 million people living in small islands scattered across the vast ocean of the Pacific Island Region. The region consists of three island groups: Micronesia, the Melanesia and the Polynesia. The region has a notable increase in population moving from rural to urban areas in the Pacific Islands. Over time such rural to urban drift has led to wide ranging dietary changes from the more traditional or indigenous root crop-based cuisines to a higher reliance on imported food. It is also noteworthy that across most of the Pacific Islands, incidence non-communicable disease is also on the rise and the region has among the highest per capital of diabetes in the world. One of the reasons for high NCDs may be a result of individuals' not consuming sufficiently diverse or nutritious food. The objective of this paper is to present the food compostion research in Pacific Islands over the last 84 years as well as new Global initiatives such as the Periodic Table of the Food Initiative (PTFI) and new food composition data related to native Pacific Island Foods.

METHODS

A review of literaure of Pacific food composition was conducted using desktop analysis. Additionally, over 900 Pacific Island Foods and recipes were analysed as part of an FAO project on Pacific Island Food Composition Tables. Food samples were gathered across Fiji and some Pacific Island Countries and analysed at the Analytical Laboratory at the University of the South Pacific using AOAC and Food Analysis methods. Recently, 35 native and underutilised foods from the Pacific Islands (i.e. Fiji, Solomon Islands, Vanuatu and Samoa) have been collected and analysed for their nutritional value, including fatty acids and mineral content. Fatty acids and mineral content were analysed using AOAC and PTFI platforms.

RESULTS

Food composition initiatives in the Pacific Islands began in the late 1940s and early 1950s by the South Pacific Commission (now Pacific Community) with a focus on commonly consumed Pacific Island Foods. In the 1970s much of the food composition work focused on the issues relating to the rise of non-communicable diseases. Subsequent work has focussed on food composition data, including new data on fatty acids and mineral content in Pacific Island Foods.

CONCLUSIONS

An overview of influential developments and stakeholders within the food composition program of the Pacific Islands as the current and future direction are presented in this talk. Also first data on food composition of select native and underutlised Pacific foods is presented.

SCOPING REVIEW OF INTERVENTIONS ADDRESSING FRUIT AND VEGETABLE AVAILABILITY, AFFORDABILITY, ACCESS, OR ACCEPTABILITY

Ilana Cliffer[1]; Mercy Mwambi[2]; Eddah Tandi Lwoga[3]; Christelle Komlan[4]; Sandhya Kumar[5]; Pepijn Schreinemachers[6]
[1]Healthy Diets, World Vegetable Center, ESEA, Bangkok, Thailand; [2]Enabling Impact, World Vegetable Center, ESA, Arusha, Tanzania, United Republic of; [3]ICT and Mathematics, College of Business Education, Dar es Salaam, Tanzania, United Republic of; [4]Enabling Impact, World Vegetable Center, WCA, Cotonou, Benin; [5]Agroecology, CIFOR-ICRAF, Nairobi, Kenya; [6]Healthy Diets/Enabling Impact, World Vegetable Center, ESEA, Bangkok, Thailand

BACKGROUND AND OBJECTIVES

Globally, fruit and vegetable (FV) consumption falls far below the World Health Organization recommendation of 400 g/person/day, putting millions of people at risk of diet-related diseases. Increasing FV consumption requires simultaneous improvements in the availability, affordability, access to, and acceptance of FV. In addition, it necessitates an approach of inclusion towards socially, economically, or physically marginalized groups. We investigated the state of the literature on fruit and vegetable interventions at all levels of the food system (e.g., production, distribution, marketing, consumption) to understand which have been implemented to improve FV availability, affordability, access, acceptability, and equity, and to what extent interventions have covered multiple areas simultaneously.

METHODS

We searched PubMed, Web of Science, Scopus, CAB abstract, Google Scholar, and several grey literature databases to identify literature with a clear objective of addressing fruit and/or vegetable availability, affordability, access, or acceptability. We restricted dates from 2000 until the date of the search (March 2024). English and French language studies were included, and no restrictions were set on study design or location. After screening by two reviewers, data from included studies were extracted, and studies were assessed for methodological quality and risk of bias. Descriptive analyses were done to identify common themes in FV interventions, populations studied, study locations, and outcomes assessed.

RESULTS

We identified 14,700 articles, 881 of which were ultimately included. Only 16.9% of studies were conducted in low- and middle- income settings (LMICs). Populations were mainly school children (31.8%), general adults (20.5%), infants and young children (12.6%) or adult women (10.1%). The most common intervention type was nutrition education (56.9%), followed by school meals (7.8%) and market information systems (7.4%). Outcomes assessed were mainly fruit and vegetable intake (83%), adoption of healthy practices (29.9%), diet diversity (24.2%), and FV preferences and attitudes (22.3%). About half of the studies assessed a single outcome area (e.g., availability, accessibility, etc.) (49.7%), and only 3% assessed all five areas. Acceptability was the most frequently evaluated (89.1%), and only 10.3% assessed social inclusion.

CONCLUSIONS

Few FV interventions were conducted in LMICs, where there is the highest prevalence of malnutrition and FV underconsumption. More interventions are needed that cut across the spectrum of all areas of the food system and target vulnerable populations.

SOAP41_10

ASSESSING THE RELEVANCE OF THE FOOD INSUFFICIENCY INDICATOR IN FRANCE

Nolwenn Paquet[1]; Mathilde Gressier[1]; Marianne Blehaut[1]; Lucas Tranchant[2]; Antoine Bernard De Raymond[3]
[1]Data & Economie, Crédoc — Centre De Recherche Pour L'étude Et L'observation Des Conditions De Vie, Paris, France; [2]CRESPPA, Université Paris 8, Paris, France; [3]INRAE, Bordeaux School of Economics, Bordeaux, France

BACKGROUND AND OBJECTIVES

In the absence of a legal definition in France, the concept and measure of food insecurity is debated. There is no standardized method for tracking it, and food insecurity is not regularly monitored by public authorities. The current consensus in international literature relies on two approaches to study food insecurity. First, household-centered tools such as the U.S. Household Food Security Survey Module or the reduced Coping Strategy Index (rCSI) consist in several questions which can be aggregated to obtain a synthetic score. Second, food insufficiency is based on a simple question and assesses whether individuals sometimes or often declare that they have not enough to eat. Already used in the French INCA3 survey, this simple and inexpensive approach is suitable for large-scale surveys and could become a practical tool for field workers in identifying vulnerability situations. The aim of this study is to evaluate the relevance of food insufficiency as an approach to food insecurity in France and to assess its comparability with more complex measures. It aims at providing insights to improve the assessment of food insecurity in developed countries.

METHODS

An online survey was conducted among a representative sample of the general population, with questions on dietary status and behaviors, as well as several measures of financial constraints, food insecurity and food insufficiency. The survey was conducted in two waves of about 1,500 individuals. To ensure sufficient statistical power, individuals declaring having not enough to eat were oversampled, adding about 350 individuals. Survey RESULTS were weighted to ensure representativity. Correlations (using Cramer's V) between the food insufficiency indicator and other indicators approaching food insecurity were calculated.

RESULTS

Preliminary findings from the first wave revealed that 14% of the population reported sometimes or often not having enough food. These people were more likely to report being unable to eat meat or fish every other day for financial reasons, restricting their diet, worrying about running out of food or adopting coping strategies identified in the rCSI. A strong correlation (Cramer's $V > 0.3$) was observed between food insufficiency's indicator and these other ones. Further analyses will be conducted to determine whether individuals who self-identified as food insecure by different indicators share similar profiles.

CONCLUSIONS

Despite its simplicity, the food insufficiency indicator is a robust and reliable tool for assessing individuals' food situations. Its simplicity could support its inclusion in regularly conducted surveys and in social workers' assessment of potential beneficiaries' situations.

BACKGROUND AND OBJECTIVES
Diarrhoea, a major cause of death in children under 5, prevalent across sub-Saharan Africa (SSA). Further, across SSA, communal eating from a shared bowl, CB-E, is a cherished practice, often preceded by Communal Bowl Hand Rinsing (CB-HR) with 2 or more washing hands in a shared bowl without soap. CB-HR increases the risk of pathogen transmission by acting as a reservoir. Our systematic review evidenced CB-HR as a risk factor for diarrhoea and other hand-transmitted pathogen outbreaks. No qualitative or intervention studies were found. Through a mixed-METHODSstudy with water, sanitation and hygiene (WASH) experts at 2 key NGOs across SSA and in-depth qualitative research in Mali, we explored the perspectives on pre-meal CB-E and CB-HR (including beliefs and barriers to improved hand hygiene for better infant health outcomes) and its spread across 16 SSA countries.
METHODS

Online survey invitations were sent from WaterAid and Save the Children to all 19 countries with WASH experts. Follow-up semi-structured interviews (SSI) were held with a sample of consenting experts in English, French, or Portuguese. The extent and details of CB-E and CB-HR were summarised. Further, we recorded 59 SSI and 26 focus group discussions (FGDs) across rural and urban Mali with mothers, grandmothers, fathers and elders.

RESULTS
51 experts from 15 countries across SSA responded to the survey. Experts reported CB-E and CB-HR were practiced in all 15 countries, widespread and among various groups and situations including schools and gatherings like funerals or religious events. 20 interviewed experts discussed drivers, including culture (e.g. strengthening family bonds), poor WASH facilities and awareness of health risks. Experts were unaware of targeted interventions by any agency, but stressed the unmet need across SSA. In Mali, FGDs confirmed CB-E and CB-HR were commonplace, rooted in tradition for the purposes of social cohesion and family unity with practices varying slightly in households. There was some awareness of the infection risks. Detailed RESULTS on the systematic review, expert survey interviews and qualitative data from Mali will be presented.
CONCLUSIONS

CB-E and CB-HR are practiced widely across SSA and persist throughout decades of food safety, improvements in WASH facilities and outbreaks or epidemic-related education. Despite knowledge of associated risks, cultural influences mean the practices continue.

BENCHMARKING THE NUTRITION-RELATED COMMITMENTS OF FOOD COMPANIES IN SENEGAL

Mane Hélène Faye[1]; Yassarath Onifade[1]; Adama Diouf[1]; Fatou Fall[1]; Stefanie Vandevijvere[2]; Gary Sacks[3]; Kelly Garton[4]; Nicole Idohou-Dossou[1]; Boyd Swinburn[4, 3]
[1]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Universite Cheikh Anta Diop (UCAD), Dakar, Senegal; [2]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium; [3]Global Centre for Preventive Health and Nutrition (GLOBE), Institute for Health Transformation, Deakin University, Melbourne, Australia; [4]School of Population Health, Faculty of Medical and Health Sciences, The Universty of Auckland, Auckland, New Zealand

BACKGROUND AND OBJECTIVES

Unhealthy food environment contributes to the adoption of unhealthy diets, a major risk factor for Non-Communicable Diseases (NCDs). It is recognized that food companies have a crucial role to play in shaping the food environment. The aim of this study was to assess the transparency, comprehensiveness and specificity of food companies' (FCs) policies and commitments towards population nutrition, obesity and prevention of NCDs.

METHODS

The main 37 FCs, including food and non-alcoholic beverage manufacturers [FBMs] (n=25), supermarkets (n=5) and quick service restaurants [QSRs] (n=7) operating in Senegal, were included in the evaluation. FBMs were selected based on their market share, represented by their product portfolio's diversity. Supermarkets and QSRs were identified based on their popularity and the number of stores they own. Policies and commitments were collected through a review of the relevant documentation in the six key domains of the Business Impact Assessment on Obesity and Population-level Nutrition (BIA-Obesity) tool i.e. "Corporate strategy", "Product formulation", "Nutrition labelling", "Product and brand promotion", "Product accessibility" and "Relationship with other organizations". They were then scored by an expert panel according to the criteria of transparency, specificity and comprehensiveness.

RESULTS

Ten out of thirty-seven companies made no commitment to population nutrition. The overall performance of FCs ranged from 0% to 65.4% (median score 14.2%) with FBMs leading (median score: 22.9) and QSRs at the lowest (median score 0). The best performing domain was "Corporate strategy" (median score: 25%), led by FBMs, while the lowest performing domains were "Product promotion", "Product accessibility" and "Nutritional labelling", with median scores of 0%, 4.2% and 5.5%, respectively. Within the supermarket sector, the best performance was in the domain of "Product formulation". Median scores for all domains were zero percent (0%) for QSRs. Foreign companies performed better than local companies, but policies/commitments related to "Product formulation" and "Product accessibility" were scarce for both, in the supermarket sector.

CONCLUSIONS

This study highlights that corporate commitment to population nutrition is relatively low, especially for local companies across key domains of the BIA-Obesity tool. The government must therefore introduce incentive policies for greater transparency in food companies reporting to strengthen accountability for improving population nutrition.

SOAP41_13

DRIVERS OF OVERWEIGHT AND OBESITY AMONG GHANAIAN WOMEN: A MULTIVARIATE DECOMPOSITION ANALYSIS

Joseph P. Mensah[1]; Afua Tetteh[2]; Emmanuel Anaba[2]; Laura Gray[1]; Isaac Boadu[2]; Maxwell Konlan[2]; Robert Apkaribo[1]; Richmond Aryeetey[2]
[1]School of Medicine and Population Health, The University of Sheffield, Sheffield, United Kingdom; [2]School of Public Health, University of Ghana, Legon, Accra, Ghana

BACKGROUND AND OBJECTIVES

Overweight and obesity are increasing globally, with Ghana experiencing a consistent rise. Among Ghanaian women, the prevalence has significantly increased over the past two decades, raising public health and socioeconomic concerns. This study aims to identify and quantify the key drivers of overweight and obesity among women of reproductive age in Ghana, analysing how these factors have contributed to prevalence changes over time.

METHODS

Data from the Ghana Demographic and Health Surveys (GDHS) for 2003, 2008, 2014, and 2022 were utilised. Multiple binary logistic regression models assessed associations between overweight and obesity and various covariates, including age, wealth, and education. A multivariate decomposition analysis quantified the contributions of these factors to the observed trends in overweight and obesity prevalence.

RESULTS

The prevalence of overweight and obesity among Ghanaian women increased significantly, reaching 50% in 2022. Socioeconomic factors, such as wealth and education, alongside urban residence, age, and region, were the most significant drivers. Women in the wealthiest quintile had approximately three times the likelihood of being overweight and over six times the risk of obesity compared to women in the poorest quintile. Decomposition analysis revealed that 22.5% of the increase in overweight and obesity prevalence was attributable to changes in population characteristics.

CONCLUSIONS

The growing prevalence of overweight and obesity among Ghanaian women is not only driven by population characteristics such as wealth and educational status, but primarily the evolving influence of these drivers. These RESULTS suggest that shifts in how drivers like age, marital status, and wealth affect obesity are crucial in understanding the changes in obesity prevalence. This study highlights the complexity of obesity trends and the need for tailored interventions that account for the diverse and evolving factors influencing weight outcomes in Ghana.

INVESTIGATING LINKAGES BETWEEN SOIL HEALTH, FOOD COMPOSITION AND HUMAN HEALTH

Daniel Abera,[1]; Reginald Adjetey Annan[2]; Linda Nana Esi Aduku[3]; Endale Amare[4]; Charles Apprey,; Teshome Asefa[4]; Feyissa Challa,[5]; Gina Kennedy[6]; Herman Erick Lutterodt,; Lyndon Sackey[3]; Masresha Tessema[7]; Selena Ahmed[8]
[1]Nutrition, Ethiopia Public Health Institute, Addis Ababa, Ethiopia; [2]Department of Biochemistry and Biotechnology, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana; [3]PTFI Center of Excellence, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana; [4]Nutrition, Environmental Health and Non-communicable disease, Ethiopia Public Health Institute, Addis Ababa, Ethiopia; [5]Referral and Reference Laboratories, Ethiopian Public Health Institute, Addis Ababa, Ethiopia; [6]Principal Scientist, Alliance of Bioversity and CIAT, Falls Church, United States of America; [7]Food Science and Nutrition Research Directorate, Ethiopian Public Health Institute, Addis Ababa, Ethiopia; [8]Periodic Table of Food Initiative, American Heart Association, Inc, Dallas, United States of America

BACKGROUND AND OBJECTIVES

Globally, but especially in Sub-Saharan Africa, the impact of human practices on soil health, food composition and human health is understudied. The objective of this project is to track nutrients from soils to food to humans from samples obtained in Ethiopia and Ghana, to understand the determinants of food quality and linkages to human and planetary health.

METHODS

A cross-sectional sample of farms (n=120) were purposively selected in Ethiopia (n=60) and Ghana (n=60) to represent diverse regions within the countries and to take into account areas where gold mining is practiced. Soil samples, food samples, human serum and stool samples of farming households and dietary assessment, were collected. Soil, food and serum samples will be analyzed for mineral and hazardous metal content. Soil samples will be analyzed for soil quality parameters and soil microbiome. Food samples will be analyzed for proximates and fatty acid content. Serum samples will be analyzed for complete blood count and inflammatory markers. Stool samples will be analyzed for gut microbiota. Data analysis will include independent group t-tests or Mann-Whitney test. Correlation coefficients with statistical significance will be used to determine the association between soil health parameters and food composition parameters. Chi-square analysis will be used to determine the status of soil health, food composition, and human health. Regression analysis will be conducted to determine the odds/risk of inflammation, heavy metal contamination, and poor nutritional status associated with the quality of food consumed.

RESULTS

Preliminary RESULTS show some variations in soil physicochemical characteristics, between the gold mining and non-mining farms in Ghana. Anaemia prevalence in Ghana is almost twice among the mining households (46%) compared to the non-mining households (28%). In Ethiopia prevalence of anaemia is 16% for women and 24% for men. Anthropometric measurements in study sites of Ethiopia show that 41% of adolescent girls, 34% of men, and 27% of women are underweight (BMI<18.5 kg/m²). Additional RESULTS on soil, food composition and biochemical parameters are forthcoming.

CONCLUSIONS

This study of soil, food composition, dietary intake, human serum and gut microbiome allows a unique and much needed exploration connecting the health of our soil, to the quality of our food, to human health and nutrition outcomes. Aided by advancements in omics techniques, afforded by the Periodic Table of Food Initiative, we can obtain robust assessments of food quality and link these to rich metadata on agricultural practices.

SOAP41_15

COMPARISON OF THE ASSOCIATION BETWEEN THE EAT-LANCET SUSTAINABLE DIET OR THE TRADITIONAL MEDITERRANEAN DIET WITH ALL-CAUSE AND CARDIOVASCULAR MORTALITY IN THE MOLI-SANI STUDY COHORT

Marialaura Bonaccio[1]; Emilia Ruggiero[1]; Augusto Di Castelnuovo[1]; Giuseppe Grosso,[2]; Simona Costanzo[1]; Simona Esposito[1]; Chiara Cerletti[1]; Maria Benedetta Donati[1]; Giovanni De Gaetano[1]; Licia Iacoviello,[1]
[1]Epidemiology and Prevention, IRCCS Neuromed Mediterranean Neurological Institute, Pozzilli, Italy;
[2]Biomedical and Biotechnological Sciences, University of Catania, Catania, Italy

BACKGROUND AND OBJECTIVES

The Planetary Health Diet Index (PHDI) was recently introduced to assess adherence to the EAT-Lancet reference diet, which aims to promote human health while ensuring environmental sustainability. This dietary pattern prioritizes plant-based foods and recommends limiting the consumption of animal-based foods, such as red meat, dairy products, and fish. While the traditional Mediterranean diet (MD) also focuses on plant-based foods, it is not strictly vegetarian, permitting moderate consumption of fish and white meat. Additionally, the MD features olive oil as the main fat source, and includes moderate wine consumption during meals. However, it is unclear whether following a planetary health diet leads to better survival outcomes than adhering to the traditional MD. Therefore, we investigated the association between the PHDI, MD, and all-cause and cardiovascular (CV) mortality in a Mediterranean population.

METHODS

Longitudinal analyses were run on 22,893 men and women (mean age 55.4±11.7 years) recruited in the Moli-sani Study, established in Italy in 2005-2010. Food intake was assessed at baseline through a 188-item food frequency questionnaire. The PHDI was calculated as described by Bui et al., which addresses some limitations of previous scores by evaluating 15 food groups, resulting in an index that can range from 0 to 140. The Mediterranean Diet Score (MDS; range 0-9) was used to assess adherence to the MD.

RESULTS

The mean values of the PHDI and the MDS were 79.4 (SD=80.0) and 4.4 (SD=1.6), respectively, with a weak correlation between the two indices (Spearman correlation coefficient = 0.26). Over a median follow-up of 13.1 years, a total of 2,565 deaths were recorded, including 909 from CV diseases. Multivariable-adjusted hazard ratios (HRs) for total mortality associated with the PHDI or MDS were 0.93 (95% CI 0.82-1.06 for Q5 vs. Q1) and 0.79 (95% CI 0.69-0.91 for Q5 vs. Q1), respectively. For CV mortality, HRs were 1.09 (95% CI 0.88-1.36 for Q5 vs. Q1) for the PHDI and 0.79 (95% CI 0.63-1.00 for Q5 vs. Q1) for the MDS.

CONCLUSIONS

In this large Mediterranean cohort, adherence to the traditional MD was associated with significantly lower all-cause and CV mortality rates, whereas adherence to a planetary health diet was not. These RESULTS, if validated by future longitudinal studies, would question, at public health level, the effectiveness of promoting a planetary health diet over the traditional MD, especially in Mediterranean populations.

SOAP48_01

KNOWLEDGE, ATTITUDE, AND PRACTICE ON SUSTAINABLE DIET AMONG NUTRITION AND DIETETIC STUDENTS AND PROFESSIONALS: A SCOPING REVIEW

Salma Luthfiyah Sani[1]; Naila Yaumima Rahma[2]; Rachmi Ilma Zahtira[3]; Fitria Nusa Eka Pratiwy[1]; Yuga Putri Pramesti[1]; Annisa Alifaradila Rachmayanti[1]
[1]Division of Medicine, University College London, London, United Kingdom; [2]Global Nutrition, Wageningen University & Research, Wageningen, Netherlands; [3]Human Nutrition, University of Glasgow, Glasgow, United Kingdom

BACKGROUND AND OBJECTIVES

Nutrition and climate challenges are increasingly interconnected, highlighting the urgent need for a transition to more sustainable dietary patterns. Nutritionists and dietitians are the key health professionals who promote changes in individuals and society's dietary habits and consumption behaviors. This review aimed to examine the knowledge, attitudes, and practices of sustainable diets among nutrition and dietetic students and professionals.

METHODS
A systematic search was performed in two databases (Ovid and PubMed) from inception to November 2024. The included studies were articles in English, studies assessing knowledge, attitude, and practice about sustainable diet, studies involving nutrition and dietetic students or professionals, and studies other than review and commentary articles. Two authors screened the articles independently, and the narrative summary was presented to synthesize RESULTS. Mixed METHODSAppraisal Tool was used to evaluate the quality of included studies.
RESULTS
Out of 3,214 articles, eight studies met the inclusion criteria, with a total of 3,757 participants ranging from nutrition and dietetic students, dietitians, and other health science students and professionals. The studies were conducted in Spain (n=3), Canada (n=2), Australia, the United Kingdom, and Europe. Study designs included cross-sectional (n=4), qualitative (n=2), and mixed-METHODS(n=2) with various survey instruments. Overall, participants had moderate to high knowledge and a multidimensional understanding of sustainable diets. There was also a positive attitude regarding sustainable diet, such as confidence in defining sustainable dietary patterns and expression of interest in having related training. However, practice incorporating sustainable diet principles was relatively low, with a small proportion of dietitians moderately practicing (38%) and receiving training on a sustainable diet (25%). Although a sustainable food system has been introduced in education curricula, there is a need to improve the module comprehensively and strengthen literacy through continuous professional development. Some studies identified barriers related to implementation of a sustainable diet, such as structural and behavioral factors, lack of education, inadequate regulation, and differing ideological views.
CONCLUSIONS

While most participants recognize the environmental impact of diet and express a strong interest in sustainable diet, the practical application remains limited. Educational program improvement and professional development are crucial to bridging these gaps. Further research is warranted to expand the investigation, particularly in Asian and African contexts.

SOAP48_02

INCIDENCE AND PERSISTENCE OF MODERATE ACUTE MALNUTRITION (MAM) IN A LONGITUDINAL COHORT OF REFUGEE CHILDREN: WHICH CHILDREN ARE AT HIGHEST RISK AND IN NEED OF ACTIVE MANAGEMENT?

Charlotte Margaret Wright[1]; Benjamin Guesdon,[2]; Ada L. Garcia[3]; Frederick Ho,[4]
[1]Human Nutrition, University of Glasgow, Glasgow, United Kingdom; [2]Nutrition and Health Research, Action contre la Faim, Montreuil, France; [3]Human Nutrition, School of Medicine, Dentistry and Nursing , University of Glasgow, Glasgow, United Kingdom; [4]Public Health, University of Glasgow, Glasgow, United Kingdom

BACKGROUND AND OBJECTIVES

Screening and intervention approaches for MAM are unclear, but increasingly, Mid-Upper-Arm-Circumference (MUAC) alone is used. A large longitudinal case series from refugee camps in Cox's Bazaar, Bangladesh, identifying MAM using both MUAC and Weight-For-Height-Z scores (WHZ) provides the opportunity to examine how each performed, the relation to growth and survival, and which children might benefit from active management.

METHODS

Monthly MUAC, weight and height routinely collected to age 24m were retrieved on all children born between 2012-2017, as well as information on mortality. Children with any WHZ and or MUAC in MAM range (MUAC 115-125cm; WHZ -2 to -3) between age 6-24m were defined as Screen Positive (spMAM) and treated with counselling and food supplements. Mean MUAC, WHZ, Weight-For-Age-Z scores (WAZ) and Height-For-Age-Z scores (HAZ) were calculated for 3-monthly age bands. Children who had one measurement reaching spMAM but a 3-monthly average above the MAM range were defined as transient.

RESULTS

Of the 4131 eligible, 1587 (38%) children had spMAM; 40.3% were first diagnosed using MUAC, 41.3% with WHZ and 18.5% with BOTH; 42% were transient and only 1.3 % progressed to severe malnutrition (MUAC < 115cm or WHZ < -3). Transience was most common for those identified by WHZ only (68%) compared to MUAC only 25%, BOTH 21%. There was more prior decline in WAZ (suggesting acute malnutrition) in WHZ (mean [SD] -0.59 [0.4]) and BOTH (-0.61 [0.5]) compared to MUAC only (-0.25 [0.5] $p<0.001$), while a WAZ increase was seen in 14.4% with low MUAC, but only 1.1% WHZ. At screen severe stunting (HAZ <-3SD) was already commoner in low MUAC (22%) compared to WHZ 9.3% or BOTH 8.9% ($p<0.001$). At 24m severe stunting was present in 40% of MUAC, 22% WHZ and 28% BOTH, compared to 12% of non-MAM. Transient cases showed the least mean decline in HAZ to age 24m (-0.47; persisting MUAC -0.55, WHZ -0.66, BOTH -0.61; $p<0.001$). Of 44 deaths after age 6m, 21 occurred in MAM children. Only children with BOTH were more likely to die than never MAM (relative risk = 3.2 95% CI 1.5 -6.8).

CONCLUSIONS

Screening via MUAC identified more stunting, but tended to miss acute malnutrition. WHZ identified more acute short term weight loss. These data suggest that recent WHO recommendations permitting MUAC only screening and restricting therapeutic foods to children with persistent or relapsing MAM (1) would greatly reduce the number of children actively treated, but the safety of this approach needs to be formally tested.

POLICY COHERENCE FOR HEALTHY DIETS: A MULTI-COUNTRY ANALYSIS

Stella Nordhagen[1]; Mahamadou Tankari[2]; Jamie Morrison[3]; Julie Collins[4]; Wondwosen Tefera[5]; Fatima Kareem[6]
[1]Knowledge Leadership Team, GAIN, Genève, Switzerland; [2]Akademiya2063, Akademiya2063, Dakar, Senegal;
[3]Policy Support, Global Alliance for Improved Nutrition, London, United Kingdom;
[4]Akademiya2063, Akademiya2063, Washington, United States of America;
[5]Akademiya2063, Akademiya2063, Addis Ababa, Ethiopia; [6]Akademiya2063 (former), Akademiya2063 (former), Berlin, Germany

BACKGROUND AND OBJECTIVES

Good nutrition depends critically on the adoption of healthy diets by all. This goal, however, is influenced not only by sector-specific health and nutrition policies, but also by policies in other sectors (e.g., agriculture, trade) that shape food systems. Improving diet quality thus requires for policies across sectors to be aligned as opposed to working against one another. This is the essence of food systems policy coherence (FSPC): The alignment of policies that affect the food system with the aim of achieving health, environmental, social, and economic goals, to ensure that policies designed to improve one food system outcome do not undermine others. However, while FSPC is an appealing concept, its assessment in practice is not straightforward, and there has been limited analysis of how policy coherence manifests for promoting healthy diets, specifically. We thus sought to analyse how policies across sectors contribute to or detract from achieving the goal of healthy diets for all.

METHODS

We developed and applied a new diagnostic tool that allows users to identify areas of coherence/non-coherence among food system policies and suggest ways to improve coherence. This tool identifies potential ways in which policies in each of six areas (health, agriculture, environment, social, industrial/economic, trade) could affect 10 food systems outcomes, including the goal of healthy diets for all, and translates these into multiple-choice questions. The tool is implemented using an approach combining document review of food-related policies and key-informant interviews with local policy experts. We applied it in 9 low- and middle-income countries in Africa and Asia.

RESULTS

We identified concrete ways in which policies in all six sectors could positively or negatively affect the goal of healthy diets. For example, agricultural research or extension services may be incoherent with healthy diets by favouring staples, oilseeds, or sugar crops to the detriment of more nutrient-dense foods, or be coherent with them by providing support for biofortification. RESULTS from the 9 countries suggest that, in general, health and social policies tend to be highly coherent with nutrition goals, whereas policies related to trade, environment, and agriculture are less so. However, there are opportunities for improvement in all sectors. RESULTS were also highly varied, suggesting that there are lessons to be learned across countries in terms of formulating coherent nutrition-related policies.

CONCLUSIONS

The new tool allows diagnosing area of coherence and non-coherence in terms of how policies support the adoption of healthy diets, highlighting area for future intervention.

SOAP48_05

UNHEALTHY FOOD CONSUMPTION IS NOT ASSOCIATED WITH WEIGHT-FOR-LENGTH Z SCORE AMONG JORDANIAN CHILDREN 6-23 MONTHS

Yanlin Ren[1, 2]; Regina Brown[1, 2]; Hala Nawaiseh[3]; Afnan Alghanmi[1, 2]; Kamal Kasturi[1, 2]; Nour Elshabassi[1, 2]; Robin Shrestha[2, 4, 1]; Shibani Ghosh[1, 2, 4]; Ian Moore[1, 2]
[1]Friedman School of Nutrition Science and Policy, Tufts University, Boston, United States of America; [2]Feed the Future Jordan Nutrition Innovation Lab, Friedman School of Nutrition Science and Policy, Tufts University, Boston, United States of America; [3]Department of Nutrition and Food Technology, College of Agriculture, University of Jordan, Amman, Jordan; [4]Feed the Future Food Systems for Nutrition Innovation Lab, Tufts University, Boston, United States of America

BACKGROUND AND OBJECTIVES

The dietary quality of Jordanian children 6-23 months has deteriorated over the last three decades. Foods high in fat, sodium, and calories, but low in micronutrients have been linked to excessive weight gain. We investigate the relationship between unhealthy food consumption (UFC) and weight-for-length z-score (WLZ) among Jordanian children 6-23 months.

METHODS

We analyzed secondary data from the 2023 Jordan Population and Family Health survey (N=1,241). Data were cleaned and analyzed in STATA 18.5. The outcome was WLZ (2006 WHO). The key exposure was UFC (WHO/UNICEF 2021 IYCF indicator). A binary indicator for UFC was used to denote whether a child consumed candies, fried carbohydrates, or sweet pastries. The number of these food groups a child consumed was represented by a continuous UFC score (0-3). Covariates were child's sex, governorate, wealth quintile, and mother's education. We conducted bivariate tests of association for the outcome and covariates using Pearson's correlation, pairwise mean comparisons, and Student's t-test. We used a multivariate ordinary least squares (OLS) model to assess the relationship between UFC and WLZ. Sensitivity analyses involved interaction terms (ufc*governorate/wealth quintile, governorate*wealth quintile/mother's education) and examining marginal differences between subcategories of all covariates. All statistical analyses were adjusted for survey design and sample weights.

RESULTS

The mean WLZ was 0.71 and median 0.69. Seven percent of children were classified as overweight (WLZ>2) and 65% of all children consumed at least one UFC. UFC (binary or continuous) was not statistically significantly associated with WLZ. All else equal, on average, WLZ varied significantly by geographic location with children living in northern Jordan (governorate of Jerash) exhibiting higher WLZ than those in central Jordan (governorate of Amman) (β=0.318, 95% CI=0.061-0.619, p=0.039). Compared to children whose mother had none to 5 years of education, children whose mother completed 6 years of education had higher WLZ (β=0.725, 95% CI=0.086-1.36, p=0.026).

CONCLUSIONS

UFC was not but geographic location, maternal education, and household wealth were associated with WLZ among Jordanian children 6-23 months in 2023. Future research should look at other METHODSof defining unhealthy food, such as using the updated NOVA ultra-processed food index, and consider including sugar-sweetened beverages into the definition.

SOAP48_06

HEALTHY PUBLIC FOOD PROCUREMENT IS POSSIBLE! AN IMPACT EVALUATION OF ULTRA-PROCESSED FOOD RESTRICTIONS IN A LARGE NATIONAL SCHOOL PROGRAM

Ana Clara Duran[1]; Matheus Milosz[2]; Paula Pereda[2, 3]
[1]Center for Food Studies and Research, UNICAMP Universidade Estadual de Campinas, Campinas, Brazil; [2]Economics, Universidade de São Paulo, São Paulo, Brazil; [3]Núcleo de Estudos Epidemiológicos em Nutrição e Saúde, Universidade de São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES

In 2020, Brazil's School Feeding Program (PNAE) innovated by mandating that no more than 20% of national funds be spent on processed and ultra-processed foods (P&UPF). An analysis of procurement data from all Brazilian municipalities examined the policy's immediate impact on such expenditures.

METHODS

This study utilizes national food procurement data from all 5,570 municipalities in Brazil, covering the periods before (2015–2019) and after (2021–2022) the implementation of restrictions on purchasing P&UPF. A difference-in-differences model was applied to assess whether these restrictions led to significant reductions in P&UPF procurement. Given the nationwide implementation of the restrictions, municipalities were identified as controls if their P&UPF procurement expenditures had consistently remained below the policy threshold (20% of the national transfers for PNAE food procurement) before 2020—that is, municipalities that already complied with the restrictions. These control municipalities were then compared with municipalities whose P&UPF procurement expenditure levels had exceeded the 20% threshold in the years leading up to the policy enactment. We then checked for regional heterogeneity and whether further adjustment for municipality per capita gross domestic product (GDP), number of students served in each school system, percentage of schools with kitchen and cafeteria, and the percentage of transfers that municipalities used to procure foods directly from family farmers.

RESULTS

Municipalities with prior P&UPF procurement expenditure levels exceeding the 20% threshold exhibited a 10.9 percentage point greater reduction in the proportion of federal transfers allocated for P&UPF procurement. After adjusting for potential confounders, this reduction increased to 12.0 percentage points. On average, 80% of the total P&UPF expenditure was allocated specifically to UPF. Similar RESULTS emerged when examining expenditures solely for UPF. Notably, substantial regional heterogeneity was observed, with significant reductions across all Brazilian macro-regions except for the South.

CONCLUSIONS

Our findings indicate that implementing restrictions on P&UPF procurement for school meals is feasible, effectively reduces Brazilian students' exposure to UPF, and serves as an innovative model for operationalizing healthy food procurement policies on a national scale.

FACTORS ASSOCIATED WITH MICRONUTRIENT-RICH FOOD, BREASTMILK SUBSTITUTE, AND UNHEALTHY FOOD CONSUMPTIONS AMONG JORDANIAN CHILDREN 6-23 MONTHS

Yanlin Ren[1, 2]; Regina Brown[1, 2]; Hala Nawaiseh[3]; Afnan Alghanmi[1, 2]; Kamal Kasturi[1, 2]; Nour Elshabassi[1, 2]; Robin Shrestha[2, 4, 1]; Ian Moore[1, 2]; Shibani Ghosh[1, 2, 4]

BACKGROUND AND OBJECTIVES

Complementary feeding practices in Jordan have worsened in the last three decades. The prevalence of consuming micronutrient-rich food groups (MNRF) has declined over time. We investigate the factors associated with MNRF, breastmilk substitutes (BMS), and unhealthy food consumption (UFC) among Jordanian children 6-23 months.

METHODS

We analyzed secondary data from the 2023 Jordan Population and Family Health survey (N=2,061). Data were cleaned and analyzed in STATA 18.5. We assessed whether children consumed each of the following food groups: dark green leafy vegetables (DGLV), Vitamin-A rich fruits and vegetables (VAFV), eggs, legumes or nuts (L/N), meat (fish/poultry/organ meat), animal-source foods (ASF), yogurt or cheese, animal milk, formula or animal milk, candies, fried carbohydrates, and sweet pastries. We also assessed UFC, which was defined as the consumption of candies, fried carbohydrates, or sweet pastries. Covariates included governorate, wealth quintile, mother's education, child's age, and child's age squared. We used a multivariate logistic regression model to assess the relationship between food group consumption and covariates. All statistical analyses were adjusted for survey design and sample weight.

RESULTS

Only 20% of children consumed a plant-based MNRF (DGLV, VAFV, L/N), 40% of children consumed an animal-source MNRF (eggs, meat, yogurt/cheese), while 50% consumed a UFC. As children age, the odds of being introduced to MNRF and UFC increase (OR>1 and $p<0.05$ in all models). Higher maternal education attainment was associated with higher odds of consuming candies and fried carbohydrates (OR>2 and $p<0.05$ in all models). Higher wealth status was associated with higher odds of consuming DGLV, eggs, and formula or animal milk (OR>1 and $p<0.05$ in all models).

Differences in consumption of MNRF existed by geographic location. Compared to central Jordan (governorate of Amman), children living in southern Jordan (governorate of Aqaba) had around 60% lower odds of consuming DGLV (OR=0.36, 95% CI=0.14, 0.93) and VAFV (OR=0.43, 95% CI=0.19, 0.93); children living in northwest Jordan (governorate of Mafraq) had 40% lower odds of consuming meat (OR=0.54, 95% CI=0.32, 0.90).

CONCLUSIONS

Consumption of MNRF differs by geographic location, maternal education, and child's age. Nutrition interventions should focus on increasing the consumption of plant-based MNRF.

SOAP48_09

MULTIDISCIPLINARY APPROACHES INCORPORATING "MOTTAINAI" AND JAPANESE CULINARY TRADITION CONCEPTS, FOOD LITERACY AND ART TO PROMOTE PLANETARY HEALTH IN FAMILIES OF SCHOOL-AGED CHILDREN: A PRE- AND POST-INTERVENTION STUDY

Ada L. Garcia[1]; Hattie Bracey[1]; Saeko Yazaki[2]
[1]Human Nutrition, School of Medicine, Dentistry and Nursing, University of Glasgow, Glasgow, United Kingdom; [2]Religious Studies, School of Critical Studies, University of Glasgow, Glasgow, United Kingdom

BACKGROUND AND OBJECTIVES

Tackling food waste and unhealthy food choices requires a multidisciplinary approach. We piloted an adult workshop (1) combining concepts of mindful eating, food literacy, diet sustainability, Japanese culture, culinary traditions and the principle of "Mottainai (What a Waste!)"; Mottainai is rooted in ethical and religious principles which call for more sustainable lifestyles (2, 3). We aimed to 1) adapt the workshop to families with school-aged children and incorporate art to facilitate engagement, and 2) evaluate its effectiveness.

METHODS

The study design was a pre-post evaluation of an intervention (2x2h participatory workshops) with children and parents. Workshop 1 consisted of 1) Food consciousness and Mottainai talk with "Eating using the 5 senses" activity; 2) Talk on food choices and production systems; 3) Plate painting based on Charles Rennie Mackintosh and Willow Patterns. Workshop 2 consisted of 1) Eating for Health and the Environment, talk with activity to plan a meal considering food miles and CO2 production, 2) Traditional Japanese cuisine and home cooking, and the importance of eating slowly and food presentation. 3) Sushi making and eating nutrient-rich foods. The impact of the workshops was evaluated using pre-post questionnaires and 5-point Likert items that assessed changes in intention to practice different principles of Mottainai and sustainable food practices. Sociodemographic data and qualitative feedback were also collected.

RESULTS

A total of 15 parent-child dyads attended both workshops. Following the workshops, children's knowledge of food production systems and food waste increased from 7 (IQR 4-8) to 9 (IQR 9-10) (maximum possible score 10, $p<0.001$), and they indicated an increased willingness to engage with food mindfulness, e.g. chewing slowly (increase from 3, IQR 3-4 to 4, IQR 4-5, $p=0.003$) and appreciating special/traditional foods (pre-median score 4, IQR 3-5, post-median 4, IQR 4-5, $p=0.026$). Additionally, the parents who attended reported a greater intention to consider human and planetary health in their food choices (pre-median score 38, IQR 33-40, post-median score 41, IQR 38-42, $p=0.007$), such as engaging with aspects of Mottainai, food consciousness and sustainability.

CONCLUSIONS

Multidisciplinary participatory workshops can effectively engage participants with Mottainai and food consciousness concepts and promote planetary health.

DIETARY PATTERNS IN TRANSITIONING RURAL AND URBAN AREAS

Linda Paulo[1]; Virissa Lenters[2]; Chillo Pilly,[3]; Wanjohi Milka[4]; Piedade Gonçalo,[5]; Mende Daniel,[5]; Harris Vanessa,[5]; Kamuhabwa Appolinary,[6]; Kwesigabo Gideon,[7]; Asselbergs Folkert,[8]; Klipstein-Grobusch Kerstin,[9]

[1]Development Studies, Muhimbili University of Health and Allied Sciences, Dar es Salaam, Tanzania, United Republic of; [2]Environmental Health & Toxicology, Vrije Universiteit Amsterdam, Amsterdam, Netherlands; [3]Internal Medicine, Muhimbili University of Health and Allied Sciences, Dar es Salaam, Tanzania, United Republic of; [4]Maternal and Child Health, African Population & Health Research Centre, Nairobi, Kenya; [5]Amsterdam Institute for Global Health and Development, Amsterdam UMC, locatie AMC, Amsterdam, Netherlands; [6]Clinical Pharmacy and Pharmacology, Muhimbili University of Health and Allied Sciences, Dar es Salaam, Tanzania, United Republic of; [7]Epidemiology and Biostatistics, Muhimbili University of Health and Allied Sciences, Dar es Salaam, Tanzania, United Republic of; [8]Cardiology, Amsterdam UMC, locatie AMC, Amsterdam, Netherlands; [9]Global Public Health and Bioethics, Julius Center for Health Sciences and Primary Care, Utrecht, Netherlands

BACKGROUND AND OBJECTIVES

Like other Sub-Saharan Africa (SSA) countries, Tanzania is undergoing socio-economic changes that impact lifestyles and dietary choices. Traditionally, differences in dietary habits between rural and urban areas in Tanzania and other SSA countries were prominent. However, recent research indicates converging lifestyles and dietary choices associated with increased risk of cardiometabolic diseases. The objective of the current study was hence to investigate differences and similarities in dietary patterns, energy, and food groups intake in urban and rural Tanzania

METHODS

Dietary habits were assessed by use of a Food Frequency Questionnaire (FFQ) for 442 respondents aged 44-65 years in urban (Ubungo -Dar es Salaam) and rural (Kilindi- Tanga) districts of Tanzania. Dietary patterns were determined using Principal Components Analysis (PCA). Bivariate analyses identified determinants of dietary patterns in urban and rural Tanzania.

RESULTS

Two dietary patterns, a “mixed pattern” characterized by whole grains, potatoes, fruits, vegetables, meat, fried potatoes and tubers, alcohol, sugar-sweetened beverages (SSB), sugar and sweets, and added oils and a “plant-rich pattern” characterized by whole grains, fruits, pulses and peas, seasoning vegetables and salads, SSB, sugar and sweets, and added oils were identified. Urban residents contributed more to the mixed pattern, while rural residents had a higher contribution to the plant-rich pattern. Overall, dietary diversity was greater in urban than rural Tanzania. The estimated median daily energy intake was 2,902 kcal (IQR: 1449.2) with a lower energy intake in rural (2,817 kcal, IQR: 1,274) as compared to urban residents (3,052 kcal, IQR: 1558) (p=0.021). The percent contribution to the median average daily energy intake for grains, fruits, and milk was higher in rural than urban participants. No differences were observed for meat, poultry and eggs.

CONCLUSIONS

We identified two distinct dietary patterns: a “mixed pattern” prominent in urban and a “plant-rich pattern” more common in rural. Urban diets were more diverse with slightly higher energy intake. These findings underscore the effects of urbanization on diets and the need for targeted nutritional intervention for both rural and urban populations.

CHARACTERIZATION, DETERMINANTS, AND HEALTHINESS OF DIETARY PATTERNS OF ADOLESCENTS ALONG THE RURAL-URBAN CONTINUUM IN VIETNAM

Kim Maasen[1]; Elise F. Talsma[1]; Phuong Nguyen[2]; Gabriela Fretes[2]; Lan M. Tran[3]; Rock R. Zagré[2]; Mai, T. Truong; Nga T. Hoang[4]; Marie Ruel[2]; Zsuzsa Bakk,[5]; Jef Leroy[2]; Inge Brouwer[2, 1]
[1]Division of Human Nutrition and Health, Wageningen University, Wageningen, Netherlands; [2]Nutrition, Diets & Health, International Food Policy Research Institute, Washington, United States of America; [3]Nutrition, Emory University, Atlanta, GA, United States of America; [4]Nutrition, National Institute of Nutrition, Hanoi, Vietnam; [5]Unit Methodology & Statistics of the Institute of Psychology, Leiden University, Leiden, Netherlands

BACKGROUND AND OBJECTIVES

Urbanization is driving changes in food environments and dietary patterns, especially in low- and middle-income countries. Understanding determinants of dietary patterns can inform food systems transformation and support consumers in achieving sustainable, healthy diets. Adolescence is a crucial period for establishing healthy food consumption habits. This study aims to characterize dietary patterns and their drivers in Vietnamese adolescents.

METHODS

As part of the CGIAR initiative Sustainable Healthy Diets Through Food System Transformation (SHiFT), we conducted a quantitative 24-hour recall involving adolescents aged 11-19 years in low- to middle-income areas (one small-town, peri-urban, urban) of North Vietnam (n=2861; 15% second recall). We identified dietary patterns using Latent Class Analysis, which creates mutually exclusive groups of consumers with similar dietary patterns. We explored determinants and healthiness of diets among adolescents mapped to these different patterns. Determinants were age, sex, area, food insecurity, and wealth status. Healthiness of diets was assessed as Global Diet Quality Score (GDQS)—healthy and unhealthy, higher scores is higher diet quality—and mean probability of adequacy (MPA).

RESULTS

The five dietary patterns identified were consumed by 26%, 24%, 20%, 15%, and 15% of adolescents, respectively. Pattern 5 was the least healthy, in terms of MPA (0.2 out of 1) and GDQS-Healthy (5 out of 32). Energy intake in this group was low, at 1750 kcal/day, with the main food groups consumed being rice and poultry. Individuals in this pattern were mostly living in the small town, food insecure, and belonged to the lowest wealth tertile households. Pattern 4 was the healthiest (MPA: 0.4; GDQS-Healthy: 11; GDQS-Unhealthy: 12 out of 17). Energy intake was higher (2004 kcal/day,) and adolescents in this group had higher intakes of fish, eggs, and liquid oil. They were more likely to reside in urban areas and from highest wealth tertile households. Other patterns had average intakes of all foods (Pattern 1), high consumption of meat and bread (Pattern 2) or consumption of unhealthy foods and mostly comprising girls (Pattern 3).

CONCLUSIONS

The least healthy dietary pattern was consumed mostly by small-town adolescents from low wealth and food insecure households, with low consumption of both healthy and unhealthy foods. They may be most at risk of undernutrition, and efforts to increase healthy food consumption are needed. For adolescent girls in Pattern 3, education and behavior change programs are necessary to shift their diets away from unhealthy foods.

SOAP48_15

UNDERSTANDING THE DRIVERS OF FOOD CHOICE IN ETHIOPIA: A LITERATURE REVIEW

Muhammad Asrullah[1]; Kim Maasen[1]; Elise Talsma[1]; Inge Brouwer[1]
[1]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES

Food choice is shaped by a complex interplay of sociocultural, economic, and environmental factors. In Ethiopia, a lower-middle-income country, traditional and cultural practices have long influenced dietary patterns. However, rapid urbanization and lifestyle changes are shifting eating habits, leading to greater consumption of processed foods. This literature review provides a comprehensive synthesis of the research on the drivers of food choice in Ethiopia.

METHODS

Literature searches were performed in the Web of Science and Scopus electronic databases, and Google Scholar was used to find additional publications not listed in these databases. During data extraction, the reference lists of the selected literature were reviewed to identify any studies potentially missed in the electronic searches. Data were categorized and analysed based on two main elements: (i) individual-based motives and (ii) dimensions of the food environment. A total of 23 studies conducted between 2018 and 2023 were synthesized, covering diverse population groups such as children, adolescents, pregnant and lactating women, adults, and households. The studies cover urban, rural, and peri-urban settings, offering insights into region-specific and population-specific drivers of food choice

RESULTS

A total of 41 individual-level motives were identified and categorized into seven clusters: 1) health and nutrition perceptions, 2) psychological factors, 3) sociocultural influences, 4) sensory appeal, 5) social interactions, 6) socio-demographic factors, and 7) ethical concerns. Our review found key regional differences in food choice determinants, with affordability, availability, and accessibility being the most studied dimensions. Urban areas showed a stronger focus on health and nutrition, while rural areas emphasized socio-demographic factors. Peri-urban areas, however, were significantly understudied. Population analysis highlighted that accessibility and promotional efforts were frequently studied motives of food choice among young children and adolescents, while motives of pregnant and lactating women were more into availability and health benefits. Notably, adolescents received the least research attention, indicating a gap in the literature

CONCLUSIONS

Our review highlights regional differences in food choice determinants, with urban areas focusing on health, rural areas on socio-demographic factors, and peri-urban areas understudied. The lack of research on adolescents and in peri-urban areas highlights the need for further study to inform targeted interventions for improving diet quality in Ethiopia.

EFFICACY OF A FAMILY-BASED WHATSAPP INTERVENTION IN PROMOTING ADEQUATE GROWTH IN AMAZONIAN CHILDREN

Ana Carolina Hovadick[1]; Lucas Damasio Faggiani[1]; Ana Alice De Araujo Damasceno[2]; Vanizia Barboza Da Silva[2]; Marly Augusto Cardoso[1]
[1]Department of Nutrition, Universidade de São Paulo, São Paulo, Brazil; [2]School of Nursing, Federal University of Acre, Cruzeiro do Sul, Brazil

BACKGROUND AND OBJECTIVES

The Brazilian Amazon faces a dual burden of malnutrition, with stunting and micronutrient deficiencies persisting alongside rising rates of overweight and obesity in children. Despite the promise of digital interventions to address malnutrition, their application in this region remains limited. This study evaluated the efficacy of a family-based WhatsApp intervention in promoting adequate growth among school-aged children.

METHODS

A randomized controlled trial was conducted with 266 parents or caregivers of children aged 7–8 years from a birth cohort. Participants were recruited via phone and social media in June 2023. The intervention group received persuasive multimedia messages via WhatsApp for 19 weeks, while the waitlist control group received usual care. Anthropometric measurements, including weight, height, and waist circumference (WC), were collected at baseline and post-intervention. Dietary intake and biochemical markers were also assessed, with data analyses ongoing. Statistical evaluations followed an intent-to-treat approach using paired/unpaired t-tests, Mann-Whitney U, and Wilcoxon Signed Rank tests (Stata 18.0; significance level $P<0.05$).

RESULTS

Baseline characteristics were balanced between groups. Post-intervention analysis revealed significant increases in weight, height, and height-for-age z-scores for boys and girls in both groups ($p<0.05$). The difference among boys' post-intervention was significant ($p<0.05$), with boys in the intervention group showing an increase in BMI-for-age z-scores, while those in the control group experienced a decrease.

CONCLUSIONS

This intervention highlights the potential of digital health strategies to address malnutrition in vulnerable populations. The increase of BMI-for-age z-scores among boys in the intervention group suggest a positive influence on growth patterns. These findings demonstrate the intervention's promise as a scalable solution for improving child health in underserved regions.

SOAP03_02

ENHANCING CHILD NUTRITION IN TIMOR LESTE: FEASIBILITY STUDY FINDINGS ON KEY FACTORS AND OPPORTUNITIES TO IMPROVE DIET QUALITY FOR CHILDREN 6-23 MONTHS

Elizabeth Kirkwood[1]; Neeloy Ashraful Alam[1]; Paul Vasconcelos[2]; Madeira Lilia[3]; Mu Li[4]; Michael Dibley[4]; Bunga Paramashanti[5]
[1]Faculty of Medicine and Health, Sydney School of Public Health, The University of Sydney, Camperdown, Australia; [2]Executive Director, HAMNASA, Dili, Timor-Leste; [3]M&E Officer, HAMNASA, Dili, Timor-Leste; [4]Faculty of Medicine and Health, School of Public Health, The University of Sydney, Camperdown, Australia; [5]Nutrition, Research Center for Public Health and Nutrition, National Research and Innovation Agency (BRIN), Jakarta, Indonesia

BACKGROUND AND OBJECTIVES

Child under-nutrition remains a critical public health issue in Timor-Leste. Despite efforts in food and nutrition interventions, inadequate complementary feeding practices contribute significantly to poor nutrition in early childhood, with 47% children <5 years stunted. This study explores caregivers' complementary feeding practices, identifying key drivers and opportunities to improve child feeding in Timor-Leste.

METHODS

We conducted in-depth interviews; with mothers (n=38), fathers (n=16), and grandparents (n=15) of children aged 6-23 months, and key informants (n=14) including health workers, village chiefs and NGO workers. Interviews were conducted in four purposively selected districts, identified based on suboptimal complementary feeding indicators and recommendations from UNICEF. Locally recruited, trained data collectors conducted the interviews. Respondents were purposively selected based on child age and socioeconomic status, with fathers and grandmothers. Interviews were translated into English and reviewed for quality assurance. We used deductive and inductive approaches and thematically analysed the data.

RESULTS

Health providers were the most trusted sources of information on complementary feeding, though family members, particularly grandmothers, also played an important role in providing guidance. Complementary feeding practices were influenced by cultural and practical factors, with porridge commonly introduced at six months, followed by vegetables, fruits, and occasionally animal-source foods. Barriers to optimal feeding practices included economic constraints, poor nutrition knowledge, and challenges in accessing diverse, nutritious foods. Opportunities for improving child nutrition include addressing household income poverty, access to nutrition counselling and support, promoting locally available nutritious foods, strengthening local food production, and fostering community engagement through health workers, NGOs, and mothers' support groups.

CONCLUSIONS

Improving children's dietary practices in Timor-Leste requires a comprehensive approach that combines culturally appropriate interpersonal counselling, increased access to nutritious foods, and support from trusted sources (health providers/family members). Collaboration between health workers, NGOs, community groups, and local leaders is essential to overcome financial barriers and enhance the nutritional status of children. This situational analysis will guide government programming to improve the diet of children 6-23 months.

SOAP03_05

WOMEN'S EXPERIENCES IN THE FOOD ENVIRONMENT AND ITS PERCEIVED EFFECT ON THEIR FRUIT AND VEGETABLE INTAKE: INSIGHTS FROM NORTHERN TANZANIA

Nishmeet Singh[1]; Lilia Bliznashka[2]; Fusta Azupogo[3]; Quinn Marshall[2]; Neha Kumar[2]; Evangelista Malindisa,[4]; Kidola Jeremiah,[4]; Sonja Hess[3]; Joyce Kinabo[5]; Deanna Olney[2]; Lindsay Jaacks[1]; Alexandra Bellows[1]
[1]Global Academy of Agriculture and Food Systems, The University of Edinburgh, Edinburgh, United Kingdom; [2]Nutrition, Diets, and Health, International Food Policy Research Institute, Washington, United States of America; [3]Institute for Global Nutrition, University of California, Davis, Davis, United States of America; [4]Mwanza Research Centre, National Institute of Medical Research, Mwanza, Tanzania, United Republic of; [5]Agriculture, Sokoine University of Agriculture MAIN CAMPUS, Morogoro, Tanzania, United Republic of

BACKGROUND AND OBJECTIVES

There is limited information about the linkages between consumer behaviours for healthy diets and related food environment drivers in low-income and rural contexts. We examined how women living in rural Tanzania experience the food environment by assessing their buying patterns, perceptions, and accessibility, for fruit and vegetables (F&V), and the association of these factors with women's reported F&V intake.

METHODS

We used cross-sectional data for 2597 women living in 33 villages across five districts in Arusha and Kilimanjaro regions in Tanzania. Self-reported buying patterns and perceptions included F&V buying frequency, sources, year-round availability, and convenience. Accessibility was assessed using geospatial analysis as distance and time between home and F&V selling centres. We administered a 30-day recall non-quantitative food frequency questionnaire to assess F&V intake. We conducted a descriptive analysis of women's experience indicators and tested their association with an F&V intake score using multivariate linear and two-part regression models controlling for covariates (women: education, occupation, marital status; household: size, wealth, food insecurity).

RESULTS

The mean age (SD) for women was 38.2 (6.2) years. 81% and 89% of women reported buying fruits and vegetables for home consumption respectively. Relative to fruit, more women reported buying vegetables daily (F:5%; V:35%). Fruits were perceived as slightly more available year-round (F:65%; V:60%) but less convenient to buy (F:65%; V:80%) and distance (km) and time (mins) to fruit sources were greater compared to vegetable sources (median distance (SD)- F: 4.7 (6.1); V: 1.5 (4.9); median time (SD)- F: 20 (46.5); V: 16(43)). 24% and 94% of women reported daily intake of F&V respectively. Lower intake of F&V was associated with buying weekly compared to daily (adjusted mean difference or average marginal effects (95% CI), F:-0.92 (-1.36, -0.47, $p<0.01$); V: -0.47 (-0.85, -0.09, $p<0.05$)), and the perception that F&V were sometimes versus mostly available (F: -0.31 (-0.44, -0.18 $p<0.01$); V: -0.61 (-1.1, -0.13, $p<0.05$)). Longer distance (> median) was negatively associated with vegetable intake but not fruit intake (V:-0.54 (-0.93, -0.16, $p<0.01$). Time was not associated with the intake of F&V.

CONCLUSIONS

Buying frequency, year-round availability and distance to the source were associated with women's reported F&V intake in northern Tanzania. These findings indicate that increasing availability and accessibility in the food environment may improve the intake of fresh foods.

SOAP03_06

ASSOCIATION BETWEEN NUTRITIONAL STATUS, DIARRHOEA INFECTIONS AND FEEDING PRACTICES IN CHILDREN AGED 6-59 MONTHS IN URBAN AREAS IN CAMEROON

Marlyne Mananga[1]; Boris Massoume[2]; Sylvain Pechangou[2]
[1]Department of Biochemistry/Faculty of Sciences, Université de Yaoundé 1- NGOA EKELLE, Yaoundé, Cameroon; [2]Biochemistry, Faculty of Science, University of Yaounde I, Yaoundé, Cameroon

BACKGROUND AND OBJECTIVES

Childhood malnutrition and diarrhoea with their severity are closely linked to poor feeding practices. Most children under 59 months have had at least one diarrhoea infection. Knowledge of good nutritional practices appropriate to children's age and environment is key to preventing these childhood diseases. This study aimed to evaluate the association between nutritional status, diarrhoea infections and feeding habits in children aged 6-59 months in urban areas in Cameroon.

METHODS

A cross-sectional study was carried out in three Health Districts. A total of 217 mother-child pairs were included. A structured questionnaire was used to collect data on socio-demographic factors and feeding practices. Anthropometric measurements were taken according to the standardised method of the World Health Organization (WHO). Z-scores were used to assess nutritional indices. A sub-sample of 50 children with diarrhoea was used to assess biochemical and microbiological parameters, including stool cultures Logistic regression was used to investigate the determinants of malnutrition and diarrhoea infections.

RESULTS

The prevalence of stunting, underweight, and diarrhoea were 23.96% (18.28-29.64), 15.66% (10.82-20.49) and 23.04% (17.04-28.59) respectively. The highest proportion of diarrhoea (13%) was observed among children aged 6-11 months whose mothers started diversifying their diet early. Microbiological analysis revealed that 23% of diarrhoea was caused by yeasts (18.3%), followed by *Entamoeba histolytica* (2.7%). Among the mothers, the age group that reported a significantly higher prevalence of undernutrition was 18-24 years [odds ratio (95% CI): 0.464 (0.233-0.915), P <0.027]. The person who frequently feeds the child (neighbours, community members) was the factor associated with the high prevalence of diarrhoea [odds ratio (95% CI): 0.285 (0.126-0.626), P <0.01].

CONCLUSIONS

The RESULTS suggest that there is a need for a community-based intervention that focuses more on good hygiene practices in infant and young child feeding for community members responsible for the feeding and nutrition of the child in the absence of the parents.

SOAP03_09

SUGAR AND SWEETENER CONSUMPTION AMONG ADULTS AND 11-18 YEAR OLD YOUNGS IN HUNGARY

Emese Antal[1]; Pilling Robert[2]; Hargittay Csenge[3]; Torzsa Peter[3]
[1]TET Platform, Semmelweis University, Doctoral College, Health Sciences Division, Budapest, Hungary; [2]Semmelweis University, Health Sciences, TÉT Platform Egyesület, Budapest, Hungary; [3]Department of Family Medicine, Semmelweis University, Faculty of Medicine, Budapest, Hungary

BACKGROUND AND OBJECTIVES

The TET Platform conducted representative surveys in 2022 and 2024 on adults' sugar and sweetener consumption habits and attitudes towards sweetness. A survey of 11-18 year olds was carried out in 2017 and will be repeated in 2025 in collaboration with the Department of Family Medicine at Semmelweis University.

Aim: The aim of the research was to find out the taste preferences of Hungarian adults and young people aged 11-18 years, and to investigate which products they prefer sweet tastes. The aim was also to investigate attitudes towards and knowledge of sugar, alternative sugars, intense sweeteners.

METHODS

Adults were surveyed by a self-administered questionnaire in 2022 and repeated in 2024. An online panel survey of 1,000 consumers was conducted. The sample is representative of the national population aged 18+ by age, gender, region and municipality type. Statistical analysis was performed using SPSS 25.0. Three types of research have been or are being carried out in the context of the survey of 11-18 year olds: 1. prospective diet diary-based research, 2. questionnaire-based survey, 3. anthropometric studies.

RESULTS

The survey of adults found that more than 60% of respondents prefer sweet flavours and that the preference for sweet flavours is mainly related to gender and age. The sweet tooth of older people stands out among the age groups. Health consciousness also seems to have an important influence. The survey of 11-18 year olds showed that the average energy from carbohydrates (52 E%) was close to the lower limit of 55 energy percent of the recommendation, but within this, energy from added sugars exceeded the maximum recommended 10 energy percent (12%). By nutrient profile analysis, the primary sources of intake of added sugars were also monitored, with sugar and honey being the first (41% of intake), followed by sugared soft drinks and fruit juices with 10% or less fruit content (14%), fruit products with added sugar (9%), milk and milk products (6%) and cereal products with added sugar (6%).

CONCLUSIONS

Family doctors and health professionals have a major role to play in education, including the reduction of anomalies in sugar and sweetener consumption habits.

SOAP03_10

Beyond ingredients, METHODSand dinners: feasibility of expanding the role of recipes in child feeding

Alison Spence[1]; Melissa Burton[1]; Karen Campbell[1]; Kathleen Lacy[1]
[1]Institute for Physical Activity and Nutrition (IPAN), Deakin University, Geelong, Australia

BACKGROUND AND OBJECTIVES

Parents need supports to achieve healthy food provision for young children. Despite the proliferation of recipes, minimal evidence exists regarding their use and role. Recipes typically target food provision and main meals, but have potential to influence other aspects of the home food environment impacting child food intakes, such as parental feeding practices and between-meal snacks, through their design and embedded messaging. This research aimed to explore parents' views of such tailored recipes.

METHODS

Recipes for families with young children were designed in various formats, such as ideas for basic combinations of 2-3 foods/ingredients, "5 ways with" various fruits and vegetables, and a focus on snacks. Messaging to promote healthy home food environments was embedded within recipes as "Feeding Kids Tips", for example, promoting modelling and family meals. These were incorporated in an app intervention supporting parents managing toddler fussy eating. Australian parents of 1- to 3-year-old children were recruited via Facebook, given 2-6 weeks' access to the app, and invited to participate in semi-structured interviews about their recipe use, preferences and views on the app recipes and "Feeding Kids Tips". A Pragmatic Approach to thematic analysis was applied.

RESULTS

Most of the 27 parents interviewed already used recipes regularly, but more commonly for main meals than snacks. Parents had variable interest in recipes for snacks, with some feeling they didn't need snack recipes, at least while their child was young, or that snacks were "whatever you can grab". Despite this, the basic combinations of 2-3 foods/ingredients and "5 ways with [vegetable/fruit]" were generally viewed positively by parents, which they suggested labelling as "quick/easy snack ideas". Most parents viewed the "Feeding Kids Tips" favourably, considering them "good reminders" and "a really good idea combining information in one spot". Though whether and how parents thought they would use the information was variable.

CONCLUSIONS

Recipes likely offer untapped opportunities within health promotion. In supporting parents with practical ideas of nutritious snacks, presenting "quick/easy snack ideas" may appeal to parents more than "recipes". Embedding messages about healthy home food environments within recipes for families shows feasibility, and future research should test efficacy.

SOAP03_12

VEGETARIAN DIET AND LIKELIHOOD OF BECOMING CENTENARIANS: A PROSPECTIVE STUDY

Kaiyue Wang[1]; Yaqi Li[1]; Yuebin Lv[2]; Guliyeerke Jigeer[1]; Huang Yilun[1]; Xiuhua Shen[3]; Xiaoming Shi[2]; Gao Xiang[1]

[1]School of Public Health, Institution of Nutrtion, Fudan University, Shanghai, China; [2]National Institute of Environmental Health, Chinese Center for Disease Control and Prevention, Shanghai, China; [3]School of Public Health, Department of Nutrtion, Shanghai Jiao Tong University School of Medicine, Shanghai, China

BACKGROUND AND OBJECTIVES

Inverse associations between vegetarian diet and health-realted outcomes have been observed among middle-aged and older adults (≥60 years); however, the role of vegetarian diet on exceptional longevity, especially in adults aged ≥80 years, remained unexplored.

METHODS

Included in this prospective nested case-control study were 6,181 participants aged 80+ years from the Chinese Longitudinal Healthy Longevity Survey (CLHLS), a nationally representative cohort established in 1998. The participants were classified as omnivores and vegetarians according to the dietary intake data collected by a simplified food frequency questionnaire. The primary outcome was living to 100 years old by 2018 (the end of follow-up). Multivariable conditional logistic regression models were used to evaluate the associations between vegetarian dietary patterns and the likelihood of becoming centenarians, and adjusted odds ratios (ORs) and 95% confidence intervals (CIs) were estimated. Subgroup analysis stratified by the body mass index (BMI) of participants was further conducted.

RESULTS

A total of 1,721 centenarians (cases) were identified and 4,460 non-centenarians who deceased before reaching 100 years (controls) were matched them with by age, sex, and year of entry. Compared with omnivores (n=5,007), vegetarians (n=1,174) had a lower likelihood of becoming centenarians, with an OR (95%CI) of 0.81 (0.69-0.95). Similar patterns were observed across vegetarian subgroups: pesco-vegetarians (OR: 0.78, 95%CI: 0.61-0.99), ovo-lacto-vegetarians (OR: 0.91, 95%CI: 0.72-1.14), and vegans (OR: 0.73, 95%CI: 0.54-0.98). The observed association was stronger in underweight individuals (BMI <18.5 kg/m2, *P*- interaction = 0.039), with an OR (95%CI) of 0.73 (0.58-0.91) for vegetarian diet and becoming centenarians, but no significant association was detected in those with BMI ≥18.5 kg/m2 (OR: 0.92, 95%CI: 0.74-1.15).

CONCLUSIONS

Among individuals aged 80 years and older, we observed that adherence to vegetarian diet was associated with lower likelihood of becoming centenarians. Our findings underscored the importance of maintaining a balanced diet with a suitable mix of animal- and plant-derived foods for exceptional longevity, particularly in the underweight oldest-old.

SOAP03_13

THE IMPACT OF HIGH-QUALITY DIETARY PATTERNS ON THE PREVENTION OF CHRONIC LIVER DISEASES: A META-ANALYSIS OF OBSERVATIONAL STUDIES

Linjie Zhang[1]; Sui Jing[2]
[1]Research Institute for Environment and Health, Nanjing University of Information Science and Technology, Nanjing, China; [2]Research Institute for Environment and Health, Nanjing Univeisity of Information Science and Technology, Nanjing, China

BACKGROUND AND OBJECTIVES

While conventional research primarily focuses on the impact of individual nutrients or specific foods on chronic liver diseases, the cumulative influence of various dietary patterns on the risk of these diseases remains underexplored. The objective of this study was to assess the most current evidence on the relationship between dietary patterns and chronic liver disease risk through a meta-analysis of observational studies.

METHODS

A systematic literature search was conducted using PubMed and Web of Science databases up to November 2024 to identify studies on the effects of five widely recommended dietary patterns—AHEI, HEI, AMED, DASH, and HPDI—on chronic liver diseases. We applied predefined inclusion and exclusion criteria to screen, quality-assess, and extract data from the studies.

RESULTS

A total of 44 articles encompassing included 32 cross-sectional studies, 56 cohort studies, and 11 case-control studies involving over 65,000 participants were included in the analysis. A random effects model was used to evaluate the associations between dietary patterns and chronic liver disease outcomes. The analysis revealed significant negative associations between the following dietary patterns and chronic liver diseases: AMED (OR=0.64, 95% CI: 0.54–0.75), AHEI (OR=0.69, 95% CI: 0.59–0.87), DASH (OR=0.80, 95% CI: 0.74–0.86), HEI (OR=0.68, 95% CI: 0.61–0.76), and HPDI (OR=0.75, 95% CI: 0.71–0.78). Subgroup analysis showed that AMED had a significant protective effect against chronic liver disease in North America (OR=0.65, 95% CI: 0.51–0.84) and Europe (OR=0.54, 95% CI: 0.44–0.66). AHEI showed a significant association in the case-control studies (OR=0.34, 95% CI: 0.13–0.89).

CONCLUSIONS

The findings suggest that adherence to healthy dietary patterns may reduce the risk of developing chronic liver diseases. These RESULTS underscore the potential of dietary modifications in liver disease prevention and management.

SOAP03_15

THE ROLE OF FOOD BUSINESS OPERATORS IN EFFECTIVELY MONITORING AND REPORTING ADVERSE REACTIONS TO (NOVEL) FOOD PRODUCTS

Mirte Florie[1]; Kitty Verhoeckx[2]; Remco Havermans,[3]; Alie De Boer[1]
[1]Food Claims Research Centre, Campus Venlo, Faculty of Sciences and Engineering, Maastricht University, Venlo, Netherlands; [2]Dermatology department, UMC Utrecht, Utrecht, Netherlands; [3]Laboratory of Behavioural Gastronomy, Maastricht University Campus Venlo, Venlo, Netherlands

BACKGROUND AND OBJECTIVES
The global food system is under pressure from population growth, urbanization, and shifting consumer preferences. Novel plant-based proteins are emerging as potential solutions, but could also lead to a rise in food allergies due to changes in protein intake. Even though novel food authorisations require allergenicity assessment, current METHODSare inadequate, and communication pathways between risk regulators, risk assessors and the food industry as well as consumers about potential (development of) allergenicity seem undefined. Hence, we study the role of food business operators (FBOs) in effectively monitoring and reporting adverse reactions to (novel) food products. These findings will feed into the development of a Post-Market Monitoring (PMM) system to monitor and analyse the adverse reactions.
METHODS

Firstly, a variety of FBOs was invited to complete an online questionnaire to assess their current reporting processes, communication methods, and handling of allergy-related adverse events. Based on their questionnaire responses, selected FBOs participated in (online) interviews for gaining deeper insights into their reporting systems, challenges they encounter, and communication strategies within their supply chain. To conclude, a focus group with FBOs was held to actively discuss the interview findings and explore improvements and preferences regarding the - to be developed - PMM system.

RESULTS
Preliminary RESULTS show that FBOs face several challenges in monitoring adverse reactions to (novel) foods, particularly regarding food allergies. Amongst others, distinguishing between a food allergic reaction, intolerance or poisoning seems challenging. Most FBOs had established consumer care lines to receive complaints, but systematic procedures for analyzing and reporting the events were inconsistent. Small and medium-sized manufacturers often relied on manual tracking systems, while larger manufacturers integrated automated databases to categorize and prioritize reports. The FBOs recognize the importance of monitoring and reporting adverse reactions to novel foods.
CONCLUSIONS

Current approaches to dealing with suspected reported allergies are fragmented and lack consistency. A harmonized PMM system is essential to address these challenges. This system should provide standardized reporting templates, clear guidelines on managing allergy-related events, and structured pathways for data exchange among stakeholders in- and outside the supply chain. This underscores the need for collaborative efforts across the food chain to ensure the safe introduction and acceptance of novel foods.

SOAP 06 - PUBLIC HEALTH AND NUTRITION THROUGHOUT LIFE CYCLE

SOAP06_01

CREATIVE LOCAL SOLUTIONS: INNOVATIVE ALTERNATIVE PRODUCTS FOR PREVENTION AND TREATMENT OF MALNUTRITION IN LOW-RESOURCE SETTINGS IN AFRICA

Asrat Tolossa[1]; Daniel Sila[2]; Alice Yugi[3]; Penina Muoki[4]; Miriam Chang[1]; Sarah Bauler[5]
[1]Health and Nutrition, World Vision Canada, Toronto, Canada; [2]Food Science, JKUAT, Nairobi, Kenya; [3]Health and Nutrition, World Vision Kenya, Nairobi, Kenya; [4]Food Science, IFPRI-Kenya-HP, Nairobi, Kenya; [5]Health and Nutrition, World Vision International, Boone, United States of America

BACKGROUND AND OBJECTIVES

Globally, more than 3.1 billion people were unable to afford a healthy diet in 2021, with at least 735 million people facing hunger in 2022. During the same period, 2.4 billion people globally were food insecure (FAO et al., 2023). In Kenya, malnutrition of all forms has continued to be a concern among women, children, and other vulnerable groups, particularly in urban slums and arid and semi-arid regions. Approximately 18% of children under age five years of age are stunted, 5% are wasted, 3% are overweight, while 10% are underweight (KDHS, 2022). All these are pointers to the health burden caused by food and nutrition insecurity, unhealthy diets, and lifestyle changes.

The ongoing nutrition and gender equality project called REACTS-IN funded by Global Affairs Canada, is working closely with the county government and Jomo Kenyatta University of Agriculture and Technology (JKUAT) to develop local nutrition products called PAMSAD and PAMSAD+ for prevention and treatment of malnutrition among children 6 months to 5 years of age in a sustainable manner.

METHODS

Local and biofortified crops promoted by the project such Orange Fleshed Sweet Potato, High Iron Beans, pearl millet, ground nut, and omena (fish) were used to develop the products. Two recipes were made through proportionate blending of the flours to give optimal nutrient density and acceptability (PAMSAD). An enriched sample was also made by adding omena flour (PAMSAD+). Laboratory testing for macronutrients, vitamins, and minerals was done at JKUAT food fortification laboratory.

RESULTS

The two flour blends PAMSAD and PAMSAD+ provided the recommended daily calorie and protein amount for catch-up growth. Case 1. Blend of pearl millet(50%)+ groundnut flour (20%)+ sweet potato (15%)+ bean flour (15%) PAMSAD, Kcal=827 and Proteine =26gm Case 2. Blend of 50% pearl millet, 15% ground nut flour, Sweet potato flour, 15% bean flour, 20% omena: PAMSAD+ Kcal=810, and Protein =41gm. The recipes recommended were supposed to be close to the PD/HEARTH recommendation.

CONCLUSIONS

Sensory analysis of the samples revealed that the omena blend (PAMSAD+) was rated low in aroma, taste and general acceptability than PAMSAD. PAMSAD will be promoted by care group volunteers targeting 25,000 children between the age of 6 months to 5 years in Elegeyo Marakawit county.

SOAP06_02

EFFECT OF MEAT CONSUMPTION ON COPD: A SYSTEMATIC REVIEW AND META-ANALYSIS

Gao Xinyue[1]; Yanni Zhang[1]; Sui Jing[1]
[1]Research Institute for Environment and Health, Nanjing Univeisity of Information Science and Technology, Nanjing, China

BACKGROUND AND OBJECTIVES

Chronic obstructive pulmonary disease (COPD) is a global public health issue and a major cause of morbidity and mortality in both developed and developing countries. Meat consumption is considered one of the factors influencing the risk of COPD. The current studies have not conducted a comprehensive analysis that includes various types of meat consumption such as fish, cured meat, red meat, processed meat, and unprocessed meat. There is a need for systematic and comprehensive research to clarify the relationship between meat consumption and the risk of COPD. The aim of the study is to conduct a comprehensive systematic review and meta-analysis to summarize the existing data on the association between meat consumption and the risk of COPD.

METHODS

This meta-analysis searched the literature published in PubMed and Web of Science before October 2024 on the effects of meat on COPD, and included a total of 15 articles through manual selection, quality assessment, and data extraction of search RESULTS strictly following inclusion and exclusion criteria.

RESULTS

The RESULTS showed that the odds ratio (OR) for total meat consumption and the risk of COPD was 1.15 (95% confidence interval (CI): 1.01 to 1.31; $p < 0.001$), indicating that total meat consumption is associated with an increased risk of COPD. Our analysis revealed that fish consumption (OR: 0.84; 95% CI: 0.72–0.97) and unprocessed meat consumption (OR: 0.93; 95% CI: 0.81–1.07) had protective effects on COPD risk. However, processed meat consumption (OR: 1.18; 95% CI: 1.02–1.37) and cured meat consumption (OR: 1.64; 95% CI: 1.41–1.90) was significantly associated with an increased risk of COPD. In addition, subgroup analysis of the effects of gender and country on the risk of COPD illustrated that meat consumption increased the risk of COPD in all individuals (OR: 1.23; 95% CI: 0.91–1.67) and was more significant in Asian (OR: 1.30; 95% CI: 0.87–1.97) and American countries(OR: 1.24; 95% CI: 0.87–1.78).

CONCLUSIONS

Our study comprehensively investigated the relationship between meat consumption and COPD risk and found that meat consumption was associated with an increased risk of COPD.

ASSOCIATIONS BETWEEN MATERNAL NUTRITIONAL STATUS AND BREASTMILK COMPOSITION

Muttaquina Hossain[1]; Md. Ahshanul Haque[1]; Md. Munirul Islam[1]; Lindsay Allen[2]; Carlito B Lebrilla[3]; Tahmeed Ahmed[1]

[1]Nutrition Research Division, icddr,b, Dhaka, Bangladesh; [2]Obesity and Metabolism Research, USDA ARS Western Human Nutrition Research Center (WHNRC), Davis, United States of America; [3]Nutritional and Clinical Glycomics Research, University of California, Davis, Davis, United States of America

BACKGROUND AND OBJECTIVES

Maternal nutrition influences infant health by affecting breastmilk (BM) composition. In Bangladeshi slums, high child malnutrition rates suggest a link between maternal nutritional status and BM quality. This study examined the association between maternal nutritional status and BM macronutrient and micronutrient composition in a Bangladeshi slum.

METHODS

A descriptive study was conducted over six months among lactating mothers of infants under six months. Participants were grouped by body mass index (BMI): 34 normal-weight (BMI $\geq$ 18.5 kg/m^2) and 23 underweight (BMI < 18.5 kg/m^2). BM samples were analyzed for energy, macronutrients, total fat, major fatty acids, amino acids, human milk oligosaccharides (HMOs), and micronutrients. Linear regression models adjusted for maternal age, dietary diversity, and lactation period. Statistical significance was set at $p < 0.05$.

RESULTS

BM from underweight mothers had significantly lower levels of carnitine (β: -1.49, 95% CI: -2.51, -0.49), vitamin B3 (β: -329.6, 95% CI: -601.14, -58.16), vitamin B7 (β: -2.7, 95% CI: -4.79, -0.61), and iodine (β: -5.36, 95% CI: -9.46, -1.25) compared to normal-weight mothers. Other macro and micronutrients (energy, carbohydrate, protein, fat, vitamins A, E, and other B vitamins, minerals) were lower in underweight than normal-weight mothers' BM, these differences were not statistically significant. No significant differences were found for major fatty acids or HMO groups between two groups of mothers.

CONCLUSIONS

Maternal undernutrition is associated with poorer BM macronutrient and micronutrient composition. Addressing maternal malnutrition in urban slums is critical to improving BM quality and supporting infant growth and development.

SOAP06_04

THE EFFECTS OF DAILY CONSUMPTION OF RUMINANT MILK ON DIGESTIVE COMFORT IN OLDER WOMEN

Shien Ping Ong[1]; Jody Miller[1]; Warren Mcnabb,[2]; Richard Gearry[3]; Chris Frampton[3]; Nicole Roy[1]
[1]Department of Human Nutrition, University of Otago, Dunedin, New Zealand; [2]Sustainable Nutrition Initiative, Riddet Institute, Massey University, Palmerston North, New Zealand; [3]Department of Medicine, University of Otago, Christchurch Campus, Christchurch, New Zealand

BACKGROUND AND OBJECTIVES

Digestive discomfort can deter bovine milk consumption and has led to increasing interest in ovine and caprine milks due to perceived digestive and nutritional benefits. However, studies examining their effects on gastrointestinal comfort in the older population are limited. The main objective of the YUMMI study was to investigate how consumption of bovine, ovine or caprine milk affects digestive comfort in older women.

METHODS

In this 12-week multi-arm, parallel, multi-centre, single blinded randomised controlled trial, healthy women (n = 165; 68.1 ± 5.4 y) with low habitual milk intake were randomised to one of four intervention groups: habitual diet supplemented with 500 mL of either bovine, caprine, or ovine milk daily; or a habitual diet with no additional milk (control). Digestive comfort (reflux, abdominal pain, indigestion, diarrhoea, constipation) was assessed via the Gastrointestinal Symptom Rating Scale (GSRS), administered weekly, and a daily bowel habit diary for number of complete spontaneous bowel movements (CBSM) and stool form using the Bristol Stool Form Scale (BSFS).

RESULTS

Mean (SD) changes in GSRS abdominal pain scores from baseline to week 12 (primary outcome) were -0.03 (0.65), -0.05 (0.49), 0.02 (0.47), and 0.02 (0.35) for the caprine, ovine, bovine and control groups, respectively. Similar mean changes at week 12 were observed for all GSRS domains, and for CBSM and BSFS scores, with no significant differences between the groups (all p values > 0.05). However, some early differences were observed between groups. From baseline to week one, mean abdominal pain scores increased more in the caprine group than control group, by 0.2 points (95% CI 0.0, 0.4). At week two, mean constipation scores increased more in the caprine group (by 0.3 points (95% CI 0.0, 0.6)), and in the ovine group (by 0.4 points (95% CI 0.1, 0.7)) compared to control. A greater increase in mean indigestion scores was observed in the caprine group, by 0.3 points (95% CI 0.0, 0.6). From baseline to week two and three, mean BSFS scores significantly decreased in the ovine group compared to the control group, by -0.5 points (95% CI -0.8, -0.2) and -0.4 points (95% CI -0.8, -0.1), respectively. No significant differences were observed after the second and third weeks.

CONCLUSIONS

The inclusion of two cups of bovine, caprine and ovine milk is well tolerated by older women after an initial acclimatisation period. These findings could inform dietary recommendations and interventions for this growing population group.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

SOAP06_05

CONSUMPTION OF ULTRA-PROCESSED FOODS AND PREVALENCE OF DYSLIPIDEMIA: THE FILIPINO WOMEN'S DIET AND HEALTH STUDY

Soye Kim[1]; Chae-Eun Jeong[1]; Grace H. Chung[2, 3]; Sangmo Hong[4]; Sung Hoon Yu[4]; Chang Beom Lee[4]; Jung Eun Lee[1, 3]

[1]Department of Food and Nutrition, College of Human Ecology, Seoul National University, Seoul, Korea, Republic of; [2]Department of Child Development & Family Studies, College of Human Ecology, Seoul National University, Seoul, Korea, Republic of; [3]Research Institute of Human Ecology, Seoul National University, Seoul, Korea, Republic of; [4]Division of Endocrinology and Metabolism, Department of Internal Medicine, Hanyang University Guri Hospital, Hanyang University College of Medicine, Guri-si, Korea, Republic of

BACKGROUND AND OBJECTIVES

Ultra-processed food (UPF) consumption has been linked to an increased cardiovascular disease (CVD), but evidence regarding their association with dyslipidemias remains scarce in Southeast Asian populations. The aim of the study was to examine the cross-sectional associations of consumption of UPF with the prevalence of dyslipidemias in Filipino immigrant women in Korea.

METHODS

A total of 581 Filipino women married to Koreans in the Filipino Women's Diet and Health Study (FiLWHEL) were included in the study. UPF was identified from NOVA classification of food using 24-hours recalls. Blood samples were collected from participants who fasted at least eight hours before blood collection. The primary outcomes of this study were circulating levels of serum fasting lipid profiles: triglycerides, high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C), and total cholesterol (TC). Impaired blood lipid profiles were defined as hypercholesterolemia (≥ 200mg/dL), Hypertriglyceridemia (≥ 150mg/dL), high LDL-C (≥ 130mg/dL), or low HDL-C (< 40mg/dL). The odds ratios (ORs) and 95% confidence intervals (CIs) were calcuated using logistic regression. Least square means (LS-means) and 95% CIs were calculated using generalized linear models (GLM).

RESULTS

Mean ± SD of UPF consumption (% energy) was 29.05 ± 18.72. Although the association was not statistically significant, UPF consumption and the prevalence of dyslipidemia showed a suggestive association across tertiles; ORs (95% CIs) for subsequent tertiles compared to the first tertiles were 1.21 (0.75-1.95), and 1.44 (0.76-2.76), respectively. In the subgroup analysis, individuals younger than the median age of 35 years with high UPF consumption had a potentially higher prevalence of dyslipidemia; ORs (95% CIs) were 2.82 (1.19-6.68), and 3.24 (1.10-9.57) for subsequent tertiles, compared to the 1st tertile (p for trend = 0.05). No significant associations were observed in individuals older than 35 years (p for trend = 0.91, p for interaction = 0.14) or in the body mass index (BMI) strata (p for interaction = 0.28). In GLM analysis, UPF consumption showed possible association with LDL-C (p for trend = 0.08) but was not significantly associated with other lipid profiles.

CONCLUSIONS

High UPF consumption was associated with a suggestively higher prevalence of dyslipidemia among individuals under 35 years old and showed a potential link to elevated LDL-C levels. No significant associations were observed for other lipid profiles or in BMI-stratified analyses.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

FOOD INTAKES AS PREDICTORS OF THE DEVELOPMENT OF OBESITY AMONG 5- TO 9-YEAR-OLD SOUTH AFRICAN CHILDREN: A COHORT STUDY

Herculina Salome Kruger[1, 2]; Cristian Ricci[3]; Tertia Van Zyl[1]; Makama Monyeki[4]; Hannah Ricci[3]; Ruan Kruger[5, 2]

[1]Centre of Excellence for Nutrition, North-West University, Potchefstroom, South Africa; [2]South African Medical Research Council Extramural Unit for Hypertension and Cardiovascular Dise, North-West University, Potchefstroom, South Africa; [3]Africa Unit for Transdisciplinary Health Research, North-West University, Potchefstroom, South Africa; [4]Physical Activity, Sport and Recreation Science, North-West University, Potchefstroom, South Africa; [5]Hypertension in African Research Team, North-West University, Potchefstroom, South Africa

BACKGROUND AND OBJECTIVES

Obesity is a public health problem among children in low-income countries. The aim of this study was to investigate factors linked to the development of obesity over four years in a cohort of South African children, aged 5-9y at baseline.

METHODS

In 2017, 1202 healthy children were recruited from Potchefstroom, South Africa to track early health related changes over 4 years. Parents completed sociodemographic and validated food group questionnaires on household income and their children's selection from healthy and unhealthy food groups. Weight and height of the children were measured, and WHO BMI z-score (BAZ) was calculated. Physical activity (PA) was determined by accelerometry in a subgroup of children. Measurements were repeated in 2021-2022 in 672 participants, when children returned to school full-time after the COVID-19 pandemic. Changes in frequency of food selection, PA and BAZ from baseline to end were assessed. Longitudinal associations between frequency of food selection, PA and BAZ from baseline and end, and the association with age and household income with 4-year change in BAZ were determined by mixed models.

RESULTS

Weekly intakes from the fast food group, sedentary time and BAZ increased significantly, whereas weekly intakes of sugar-sweetened beverages (SSBs), as well as moderate and vigorous PA (MVPA) decreased from baseline to end. At baseline and end household income was positively associated with BAZ. Despite a decrease in frequency of SSBs intake for the total group, daily intake of SSBs (7 times/week) versus no SSB intake was associated with an increase in BAZ ($p=0.04$). On the contrary, regular tea intake was associated with a decrease in BAZ. Having vegetables daily vs. never was also associated with a BAZ reduction ($p= 0.03$). After adjustment for age, sex and household income there were trends of similar associations between SSBs intake and BAZ, and vegetable intakes and BAZ (both $p=0.07$). Daily intake of milk vs. no milk ($p=0.01$), and unexpectedly, daily biscuits vs. none ($p=0.02$) were associated with a decrease in BAZ. In the subsample with PA data an increase in MVPA predicted a decrease in BAZ ($p<0.001$).

CONCLUSIONS

The prevalence of obesity increased markedly among young school-age children over four years, following the COVID-19 lockdown period. Strategies to increase vegetable and milk intakes, and to increase physical activity among primary school age children to prevent adiposity gains should be prioritised.

CONFLICTS OF INTERESTS

Salome Kruger is a member of the Research Grants Review Panel of the South African Sugar Association. The other authors declare no conflict of interest in relation to this work.

SOAP06_07

A PILOT PRODUCE PRESCRIPTION PROGRAM TO PROMOTE FOOD ACCESS AND FOOD LITERACY

Ashleigh Domingo[1]; Camille Machado[2]; Amy Cheng[3]; Jess Haines[4]
[1]Human Health and Nutritional Sciences, University of Guelph, Guelph, Canada; [2]Chronic Disease Prevention Program, Unison Health & Community Services, Toronto, Canada; [3]Urban Health Programs, Unison Health and Community Services, Toronto, Canada; [4]Department of Family Relations and Applied Nutrition, University of Guelph, Guelph, Canada

BACKGROUND AND OBJECTIVES

Household food insecurity remains a public health challenge in Canada. Produce prescription (PRx) programs have emerged as a strength-based intervention that leverages healthcare settings to improve food security and diet-related health outcomes. While the potential benefits of PRx interventions are becoming established in Canada, program utilization and integration within healthcare settings remain a challenge. Unison Health and Community Services (Unison), a non-profit organization, developed a pilot PRx program serving adults in two locations within Northwest Toronto, Canada. To improve program delivery, reach, and impact, we aimed to assess program implementation and utilization and their impact on food access, food literacy, and health outcomes.

METHODS

Unison's primary care team will refer individuals meeting the inclusion criteria (living on low income, experiencing challenges to food security, and having at least one chronic disease risk factor) to participate in the PRx program. Free access to fresh fruits and vegetables over 16 weeks, nutrition education, and personalized follow-up care will be provided. A pre-and-post-intervention survey will be used to evaluate the program. Semi-structured focus groups and key informant interviews with staff and program participants will be conducted in person and online over MS Teams. Interview transcripts will be analyzed thematically using a hybrid inductive-deductive approach. The Consolidated Framework for Implementation Research will guide an analysis of barriers and facilitators to program implementation.

RESULTS

This is an ongoing initiative, and the intervention is expected to be completed by March 2025. Data analysis will unfold throughout the coming months, with RESULTS expected in the spring of 2025.

CONCLUSIONS

PRx programs hold promise as an innovative approach for responding to participants' food-health-related needs and preferences. Findings will provide insights into program benefits and inform decisions on scaling the initiative across Unison’s five operating sites. As food prescribing models gain traction in Canada and globally, it will be critical for program planners and implementers to consider diverse food preferences and health needs of participants to improve program uptake and impact.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

SOAP06_08

THE BOLSILLO SALUDABLE PILOT LESSONS AND SCALING TOWARDS A NATIONAL PROGRAM FOR CHILE

Camila Corvalán[1]; Daniela Montes De Oca[2]; Sofía Bustos[3]; Isabel Pemjean[1]; Jonathan Lara-Arevalo[4]; Lindsey Smith Taillie[5]; Shu Wen Ng[5]
[1]CIAPEC, Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile; [2]Programa de Doctorado, Pontificie Universidad Católica de Chile, Santiago, Chile; [3]Corporación actuemos, Corporación Actuemos, Santiago, Chile; [4]Global Food Research Program, University of North Carolina in Chapel Hill, Chapel Hill, United States of America; [5]Department of Nutrition, University of North Carolina in Chapel Hill, Chapel Hill, United States of America

BACKGROUND AND OBJECTIVES

We will share lessons learned from designing and piloting a new smartphone app-based healthy incentive benefit program, Bolsillo Saludable, for low-income families to use on fruits and vegetables in ferias (open markets) and implications for scaling the program nationally.

METHODS

In formative work, we took a community-based approach by observation and informational interviews with key stakeholders (feria trade associations, feria vendors, feria users and non-users) in 3 geographic regions of Chile. Additionally, we used past social support programs and other auxiliary data to estimate benefit amounts, eligibility, cycle and allowed use, as well as programmatic cost implications to the government if scaled nationally. Importantly, we engaged various ministries (Social Development, Health, Finance, Agriculture) and a benefit distribution software company by sharing proposed program design components and options. Finally, in June-Aug 2024, we ran an 8-week feasibility pilot and conducted surveys (pre-post) and focus groups discussions among 30 participants (3) and 8 vendors in 1 feria (1).

RESULTS

Based on the formative work, families from the 40% most socially vulnerable segments of the country received an electronic monthly transfer of 16,000 CLP (approximately 17 USD) for each eligible household member, including children under 18 years old, students under 25 years old, and individuals with disabilities. While the feasibility pilot was not powered, the surveys showed increases in quantities of fruits and vegetables purchased and increases of likelihood of consuming various fruits and vegetables. In focus groups, beneficiaries reported substituting unhealthy snacks with fruit, the importance of limiting the benefit use to only healthy items and their willingness to navigate some of the limitations of the programs such as the limited availability of vendors. Vendors reported increases in their sales and social capital by more interactions with customers but a few reported concerns about cash-flow given the electronic payments and tax payments. Several beneficiaries and vendors noted some technical difficulties initially that were resolved within a week or two.

CONCLUSIONS

the pilot showed high acceptability of the program among beneficiaries and feria vendors. However, for successful scaling-up, it is essential to engage more feria vendors in the program. This could involve lowering or exempting the current 19% tax on goods and services for items purchased under the program.

SOAP06_09

COOKING AROUND THE WORLD: DIFFERENCES IN COOKING FREQUENCY BY GENDER AND FOOD SYSTEM TYPOLOGY ACROSS 135 COUNTRIES FROM 2018-2022

Julia Wolfson[1]; Bianca Carducci[2]; Jessica Fanzo[2]
[1]Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [2]Columbia Climate School, Columbia University, New York, United States of America

BACKGROUND AND OBJECTIVES

Cooking meals at home is often recommended as a strategy to consume a healthy diet and avoid ultra-processed foods and unhealthy dietary patterns. Evidence suggests that in some contexts cooking at home is associated with healthier diets. However, domestic cooking has traditionally been a highly gendered activity, and as food environments, economies, and social norms evolve globally, understanding of cooking behaviors in different contexts is needed particularly in light of changes to cooking and eating behaviors that occurred during the disruption caused by the COVID-19 pandemic.

METHODS

We analyzed repeated cross-sectional data from 135 countries with data from the 2018-2022 waves of the Gallup World Poll (n=638,192). Frequency of cooking lunch and dinner over the past seven days was assessed at the individual level. Frequency of eating home cooked lunch and dinner (regardless of who cooked the meal) over the last seven days was also measured. Using the Food Systems Dashboard, we classified countries into one of five food system typologies: 1) rural and traditional; 2) informal and expanding; 3) emerging and diversifying; 4) modernizing and formalizing; and 5) industrial and consolidated. We then used unadjusted and adjusted negative binomial regression models to examine trends in the associations between food system typology and frequency of cooking and eating meals at home from 2018-2022 overall and stratified by gender.

RESULTS

Across most food system typologies, mean number of days cooking, but not eating meals at home gradually increased between 2018 to 2019, peaking in 2020 (among females) and 2021 (among males) and then declined in 2022, trending towards pre-pandemic levels. Adjusted for covariates, participants from emerging and diversifying food systems cooked meals at home 13% (95% CI: 1·10, 1·16, P<0·001) more compared to participants in rural and traditional food systems. In all food system typologies and in all years females cooked more frequently than males. Overall, compared to males, females cooked meals at home 214% more frequently (P<0·001).

CONCLUSIONS

From 2018-2022, across the globe, females cook more than males and during the COVID-19 pandemic gender-based disparities in frequency of cooking meals at home were exacerbated. Cooking behaviors and norms should be considered for policy and public health efforts to improve diet quality and nutrition at the global, national, and local levels.

FOOD INSECURITY AND DIET IN FRANCE: A POST-INFLATION PERSPECTIVE

Mathilde Gressier[1]; Nolwenn Paquet[1]; Marianne Blehaut[1]; Antoine Bernard De Raymond[2]
[1]Data & Economie, Crédoc — Centre De Recherche Pour L'étude Et L'observation Des Conditions De Vie, Paris, France; [2]INRAE, Bordeaux School of Economics, Bordeaux, France

BACKGROUND AND OBJECTIVES

The recent “Gilet Jaunes” protests and the Covid-19 pandemic have highlighted the issue of food insecurity in France, showing that it remains a significant social and public health concern. Previous studies have shown that food-insecure individuals in France tend to have lower diet quality and consumed smaller amounts of fruits and vegetables. However, these studies were conducted before the recent increase in food prices. The aim of this study was to assess the prevalence of food insecurity in a more recent context and compare the dietary habits of food-insecure and food-secure individuals.

METHODS

A survey combining a dietary behavior questionnaire and a 24-hour dietary recall was conducted online among a representative sample of the general population. To ensure sufficient statistical power, individuals declaring having not enough to eat (food insufficiency) were oversampled. Two waves (summer and autumn) were conducted to account for seasonality with about 1500 (main sample) plus 350 (oversample) individuals recruited for each wave. Survey RESULTS were weighted to ensure representativity. Analyses focus on dietary patterns, food types consumed, and compliance with French nutritional recommendations.

RESULTS

Preliminary findings from the first survey wave revealed that 14% of the population reported sometimes or often not having enough food. While the average number of daily meals was similar between individuals with and without food insufficiency (3.66 vs. 3.67, difference not significant), the distribution of these meals varied. Food insufficient individuals were less likely to eat at breakfast or dinner, but more likely to eat after dinner. They also consumed fewer fruits and vegetables (consumed as such, excluding those in recipes) and showed differences in the types of fruits consumed. Additionally, the consumption of organic products was less frequent among food-insufficient individuals, though such products were not entirely absent from their diets.

CONCLUSIONS

These findings highlight that food insufficiency is not negligible in the general French population. Beyond issues of quantity, qualitative aspects of dietary intake—such as food types and nutritional diversity—emerge as critical concerns in terms of compliance with nutritional recommendations. Further analyses incorporating data from both survey waves and adjusted regression models will provide a more comprehensive understanding of these findings.

DIFFERENCES IN CHILD DIET QUALITY AND WEIGHT STATUS AT 2-5 YEARS BY DURATION OF U.S. SOCIAL SAFETY NET PROGRAM PARTICIPATION AND MEDIATION BY INFANT DIET QUALITY

Christabel A Domfe[1]; Charles D. Arnold[1]; Edward A Frongillo[2]; Lorrene D. Ritchie[3]; Shannon E. Whaley[4]; Lauren E Au[1]
[1]Department of Nutrition, University of California, Davis, Davis, United States of America; [2]Department of Health Promotion, Education, and Behavior, University of South Carolina, Columbia, SC, USA, Columbia, United States of America; [3]Nutrition Policy Institute, Division of Agriculture and Natural Resources, Oakland, CA, USA United States of America; [4]Research & Evaluation, Public Health Foundation Enterprises (PHFE) WIC, Irwindale, CA, USA, United States of America

BACKGROUND AND OBJECTIVES

For U.S. children in low-income households, social safety net programs like the Women, Infants, and Children (WIC), the Supplemental Nutrition Assistance Program (SNAP), and Medicaid (public health insurance) provide essential benefits in reducing disparities and improving health outcomes. The duration of participation in these programs has been shown to have a differential impact on health outcomes. The Infant Diet Quality Index (IDQI), measures nutrition during the first year of life and predicts later diet quality and weight status.

Objective: To assess whether differences in child diet quality and weight status from 2 to 5 years by duration of program participation are mediated by IDQI scores.

METHODS

This study analyzed data from the U.S. WIC Infant-Toddler Feeding Practices Study-2 to investigate how the duration of participation ("always," "sporadic," or "none") in WIC, SNAP, and Medicaid was associated with body mass index z-scores (BMIz), Healthy Eating Index (HEI-2020) scores, and HEI-2020 subscales – adequacy (food groups and nutrients to consume adequate amounts of) and moderation (food groups and nutrients to limit) – at ages 2-5 years. Using multivariable regression and causal mediation methods, IDQI scores were tested as a mediator of these associations.

RESULTS

Medicaid participation duration was not associated with HEI-2020 outcomes or BMIz. Those with any SNAP participation had lower HEI scores compared to those never on SNAP and the differences by duration of participation were mediated by IDQI, which explained up to 23%, 30%, and 20% of the differences in HEI-2020, HEI-2020 adequacy, and HEI-2020 moderation scores, respectively, between those always on SNAP and those never on SNAP. In contrast, participants who consistently enrolled in WIC had higher HEI scores than those who never or sporadically on WIC. This association was mediated by IDQI, which explained up to 8%, 12%, and 4% of the differences in HEI-2020, adequacy, and moderation scores, respectively. The IDQI mediated the associations between SNAP at 4 years and BMIz and WIC at 2 years and BMIz.

CONCLUSIONS

This study demonstrates the importance of understanding the association between the duration of social safety net program participation and child diet quality and weight outcomes and that infant diet quality practices may mediate these associations.

SOAP06_13

EXPLORING THE SIGNIFICANCE OF POLYPHENOL-BASED INTERVENTIONS IN TREATING DEPRESSION AND ANXIETY: A DOSE RESPONSE META- ANALYSIS AND SYSTEMATIC REVIEW OF RANDOMIZED CONTROLLED TRIALS

Roma Panwar[1]; Ngan Thi Kim Nguyen[2]; Shyh-Hsiang Lin[1]
[1]Nutrition and Health Sciences, Taipei Medical University, Taipei, Taiwan; [2]Nutrition Science, National Taiwan Normal University, Taipei, Taiwan

BACKGROUND AND OBJECTIVES

Polyphenols are naturally occurring compounds found in various plant-based foods and are widely known for their strong antioxidant and anti-inflammatory properties. These compounds have been found to alleviate the symptoms of many diseases. Previous clinical trials have highlighted their potential in reducing oxidative stress and inflammation, which are linked to mood disorders and mental health, however variations in bioavailability and individual responses highlighted the need for further studies to understand their full potential in treating depression and anxiety. Our meta-analysis and systematic review aim to assess the overall impact of polyphenol-based interventions in treating depression and anxiety.

METHODS

To perform this; PubMed, Web of Science, Cochrane Library, Embase and Scopus were systematically searched from their inception to March 2024. Studies were included in analysis; if they were in English and assessed the efficacy of polyphenol-based interventions in treating depression and/or anxiety via clinical trials (Randomized Controlled Trials or Cross Over Trials) in diverse populations (clinical or non-clinical populations). Pooled effect sizes were calculated using the random effect models with R version 4.3.3. Additionally, dose response meta-analysis was performed to understand the association between different doses and outcomes.

RESULTS

RESULTS indicated that polyphenol-based interventions possess potential to treat depression and anxiety disorders with statistically significant RESULTS; (1) depression with an effect size measured as standardized mean difference (SMD): -0.54; [95% CI: -0.74; -0.34] and anxiety with SMD : -0.50; [95% CI: -0.83; -0.16] as compared to control conditions. Funnel plot and Begg's test did not report any publication bias. With dose response analysis, it was observed that increase in dose was associated with decrease in effect size (outcome).

CONCLUSIONS

Our findings support the efficacy of polyphenol based interventions in improving depression and anxiety disorders highlighting the significance of such interventions for better public health. Identification of potential confounders (age, health status) provided valuable insights regarding the need of personalised polyphenol interventions to maximize their effectiveness in clinical populations suffering with depression and anxiety. Future RCTs should aim to clarify the role of specific polyphenols and explore the mechanisms through which they influence mental health outcomes (depression and anxiety) in populations of different age groups.

SOAP06_14

PREGNANCY WEIGHT GAIN AMONG SLUM-DWELLING PREGNANT WOMEN: A QUASI-EXPERIMENTAL STUDY

Mustafa Mahfuz[1]; Ar-Rafi Khan,[1]; Farzana, Fahmida Dil[1]; Gulshan Ara[1]; Tahmeed Ahmed[1]
[1]Nutrition Research Division, icddr,b, Dhaka, Bangladesh

BACKGROUND AND OBJECTIVES

Inadequate gestational weight gain is associated with adverse pregnancy outcomes and remains prevalent in low- and middle-income countries (LMICs). This study aimed to enhance pregnancy weight gain through home-based nutritional counseling and micronutrient supplementation in a slum setting of an LMIC.

METHODS

This quasi-experimental, community-based study enrolled pregnant women before 16 weeks of gestation, with follow-up until delivery. Women in the intervention group received monthly home-based nutritional counseling from trained community health workers and daily supplementation with iron-folic acid, calcium, and vitamin D. The control group received no intervention. Monthly anthropometric measurements were conducted until 36 weeks, followed by weekly measurements. Baseline socio-economic status, food security, dietary diversity, and pregnancy-related data were collected. Weight gain during the second and third trimesters was evaluated using US Institute of Medicine (IOM) guidelines based on baseline BMI. Multivariable logistic regression identified factors associated with pregnancy weight gain. Data were analyzed using STATA 15 and R 4.4.0.

RESULTS

Data from 237 women in the intervention group and 159 in the control group were analyzed. Mean pregnancy weight gain was significantly higher in the intervention group (9.8 ± 3.9 kg) than in the control group (8.5 ± 3.5 kg; $p < 0.05$). A greater proportion of underweight (39% vs. 17%) and normal-BMI women (29% vs. 13%) in the intervention group achieved optimal weight gain per IOM guidelines ($p < 0.05$). Preterm birth rates were lower in the intervention group (15% vs. 22%), while cesarean deliveries (56% vs. 58%) and low birth weight (28% vs. 27%) were similar. Multivariable logistic regression showed higher odds of adequate weight gain in the intervention group overall (aOR 2.8, 95% CI 1.4–5.8), among underweight (aOR 4.7, 95% CI 1.5–17), and normal-BMI women (aOR 2.7, 95% CI 1.2–6.2).

CONCLUSIONS

Home-based nutritional counseling and micronutrient supplementation improved pregnancy weight gain in undernourished and normal-BMI women in urban, resource-poor settings. Further research is needed to address birth outcomes such as low birth weight and high cesarean rates.

SOAP06_15

NUTRITIONAL STATUS AND DIETARY INTAKE OF 2–7-YEAR-OLD CHILDREN FOLLOWING VEGAN, VEGETARIAN, AND OMNIVOROUS DIETS

Topi Hovinen[1]; Venla Tilli[2]; Riitta Freese[2]; Elina Kettunen[2]; Suvi Itkonen[2]; Minnamari Edelmann[2]; Maijaliisa Erkkola[2]; Anu Suomalainen[1]; Liisa Korkalo[2]
[1]Research Programs Unit, Stem Cells and Metabolism, University of Helsinki, Helsinki, Finland; [2]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland

BACKGROUND AND OBJECTIVES

Little is known about how a vegan diet affects the nutritional status of the youngest children. To understand the potential risks and benefits, we studied the diet and nutritional status of children following vegan, vegetarian, or omnivorous diets.

METHODS

MIRA2 Study was a cross-sectional study conducted in Helsinki, Finland in 2021-2022. Families were invited through day care centres. Anthropometric measurements, 3-day food records, and blood samples were available from a sample of 27, 16, and 27 children following vegan, vegetarian and omnivore diets, respectively, aged 2 to 7 years.

RESULTS

The vegan group had a lower median [25th-75th percentile] protein intake (2.3 [1.9-2.7] vs. 2.9 [2.5-3.1] g/kg body weight/day), lower serum lysine (109.3 [103.1-118.6] vs. 134.7 [119.3-155.6] µmol/l) and higher serum glycine (549.9 [485.7-621.7] vs. 459.5 [417.2-482.8] µmol/l) concentrations than the omnivore group (multiple comparison adjusted p-values <0.05). Two (7%) children in the vegan, three (19%) children in the vegetarian and none in the omnivore group fulfilled criteria for mild anaemia (haemoglobin <112g/l). No differences in mean red blood cell volume, serum ferritin, serum folate, or serum transcobalamin-bound vitamin B12 concentrations were observed between groups, and the individuals with mild anaemia did not consistently group to any extreme in these markers related to possible causes of anaemia. Furthermore, no differences were observed for total serum 25-hydroxyvitamin D and plasma retinol concentrations. Vitamin D supplementation was nearly universal (100%, 100%, 92% for among the vegan, vegetarian and omnivore groups, respectively). All children following a vegan diet received vitamin B12 both from supplements and fortified products. No differences in the height-for-age z-scores based on the Finnish reference were observed.

CONCLUSIONS

In a child population where parents' adherence to supplementation recommendations for a vegan diet is high and use of fortified foods is widespread, a carefully executed vegan diet RESULTS in an adequate status of vitamins A, B12, and D. However, vegan and vegetarian diets in children may be associated with higher prevalence of mild anaemia. Findings on factors potentially related to haemoglobin concentrations remain inconclusive. The observed lower serum lysine concentrations warrant further research on protein quality in vegan diets.

CONFLICTS OF INTERESTS

SOAP 09 - PUBLIC HEALTH AND NUTRITION THROUGHOUT LIFE CYCLE

SOAP09_01

PREVALENCE AND FACTORS ASSOCIATED TO ANAEMIA AMONG ZAMBIAN WOMEN AGED 15 – 49 YEARS OLD. DATA ANALYSIS OF THE 2018 ZAMBIA DEMOGRAPHIC AND HEALTH SURVEYS

Given Chipili[1]; Angel Mukuka[2]; Betrand Tambe Ayuk[3]
[1]Department of nutritional Sciences , Mukuba University, Kitwe, Zambia; [2]Department of Mathematics, School of Education, Mukuba University, Kitwe, Zambia; [3]Public Health and Hygiene, University of Buea, Buea, Cameroon

BACKGROUND AND OBJECTIVES

Anaemia is one of the major public health concerns among women of child bearing age in globally. However, there is limited information on the factors associated with anaemia among women in Zambia. Therefore, the aim of this study was to determine the prevalence of anaemia and its associated factors among women age 15 – 49 years in Zambia using the 2018 Demographic and Health Survey data. We used secondary data from the 2018 demographic health survey (ZDHS)

METHODS

A total number of 13, 683 women who took part in the 2018 ZDHS, alongside the associated factors were included in the study. Data extraction from the ZDHS datasets, including data analysis (both descriptive and inferential) were undertaken using the Statistical Package for Social Sciences (SPSS) version 27. Descriptive statistical analysis was used to generate the frequencies/percentages. Binary logistic regression analysis was carried out to determine the most significant factors associated with anaemia among women in Zambia.

RESULTS

The prevalence of anaemia among women aged 15 – 49 years was 30%, with 16% being mildly, 13% being moderately, and 1% being severely anaemic. Anaemia prevalence was higher in women of ages 30 to 49 (31.3%) compared to that of women below 30 years old (29.7%). Similarly, anaemia prevalence was slightly higher among urban respondents (30.6%) compared to their rural counterparts (30.2%). Additionally, pregnancy status ((AOR =0.617; 95%CI = 0.538- 0.708, P =0.001), marital status (AOR1.324; 95%CI 1.196-1.467, P = 0.0001), employment status (AOR 1.086; 1.002 - 1.178 95%CI, P = 0.045), wealth index (AOR 1.152; 95%CI 1.020-1.300, p = 0.023), age (AOR 1.028; 95%CI 1.021 - 1.036, P = 0.0001), and total number of children ever born (AOR 0.922; 95%CI 0.898 - 0.945, P=0.0001) were associated with anaemia prevalence among Zambian women based on ZDHS.

CONCLUSIONS

The prevalence of anaemia among women in Zambia is high. Women should be sensitised on the importance of consuming iron rich foods and taking iron supplements during pregnancy. Emphasis should be more on the uneducated, unemployed, those with multiple births and low-income communities.

SOAP09_04

ASSOCIATION OF FOLATE AND VITAMIN B12 CONCENTRATIONS WITH ADIPOSITY AND LIPID PROFILE AMONG ADULT WOMEN

Abeer Aljaadi[1]; Arwa Alhothaly[1]; Dareen Barno[1]; Huda Alfahmi,[1]; Shuruq Alfahmi[1]; Wedad Azhar,[1]; Ashwaq Alharthi[2]; Mohammed Alwethaynani[3]; Afnan Salaka[2]
[1]Clinical Nutrition, Umm Al-Qura University, Makkah, Saudi Arabia; [2]Clinical Laboratory Sciences, Umm Al-Qura University, Makkah, Saudi Arabia; [3]Biochemistry (Laboratory and Blood Bank), Al-Noor Specialist Hospital, Makkah, Saudi Arabia

BACKGROUND AND OBJECTIVES

Vitamin B12 and folate are essential micronutrients that play crucial roles in human metabolism. Deficiencies in these vitamins have been linked to various health issues. There have been concerns about elevated folate concentrations after the implementation of folic acid fortification policies, especially in the context of vitamin B12 deficiency. This study investigates the association of serum folate and vitamin B12 concentrations with lipid profile and body composition in healthy adult females living in Saudi Arabia.

METHODS

This was a cross-sectional study of 157 apparently healthy adult Saudi females (18-60 years). Fasting blood samples were collected for folate, vitamin B12, and lipid profile analyses. Sociodemographic data were collected using a questionnaire. Anthropometric measurements were taken using standardized techniques, and body composition data was collected using a multi-frequency bioelectrical impedance device.

RESULTS

Women had a mean±SD age of 23.17±7.05 years and body mass index (BMI) of 23.6 ± 5.7 kg/m2. In total, 31% of the women had overweight or obesity (BMI≥ 25 kg/m2), and 36% had central obesity (waist circumference, WC ≥80 cm). The majority (>90%) had adequate serum vitamin B12 and folate concentrations, but 6.8% had insufficient vitamin B12 (≥200 - 300 pg/mL), and 16% exhibited elevated folate concentrations (>20 ng/mL). Significant correlations were found between lower vitamin B12 concentrations and adiposity indicators (overweight/obesity, WC ≥80 cm, and percent body fat >28%), and between lower serum folate concentrations and elevated WC ≥80 cm ($p< 0.05$). In multiple linear regression, higher serum folate concentrations were associated with higher total cholesterol [B=0.97 (95%CI: 0.14, 1.80)] and higher low-density lipoprotein [LDL, B=0.78 (95%CI: 0.05, 1.51)] concentrations, while vitamin B12 was positively associated with LDL [B=0.02 (95%CI: 0.00, 0.04)] after adjusting for age, BMI, smoking, and parity.

CONCLUSIONS

This study provides evidence of elevated folate status among Saudi women. Findings suggest that folate and vitamin B12 status play a role in adiposity and lipid profile, which needs to be further explored in men and other populations, taking into consideration dietary intakes and physical activity level.

SOAP09_07

ASSOCIATIONS BETWEEN SOCIO-DEMOGRAPHIC FACTORS, LIFESTYLE, DIETARY PATTERNS, AND SLEEP BEHAVIOURS AMONG A POPULATION OF CHINESE UNIVERSITY STUDENTS

Da Pan[1]; Di Jin[2]; Guiju Sun[1]
[1]School of Public Health, Southeast University, Nanjing, China; [2]Department of Nutrition, Nanjing Municipal Center for Disease Control and Prevention, Nanjing, China

BACKGROUND AND OBJECTIVES

Sleep disorders and insufficient sleep duration have become more common, especially among university students who encounter distinct challenges like academic stress and irregular schedules. This study aimed to investigate the relationships between socio-demographic characteristics, lifestyles, dietary patterns, and sleep behaviours among a population of Chinese university students.

METHODS

An investigation was conducted among 833 university students, collecting data on socio-demographic characteristics, lifestyles, dietary intake, and sleep behaviours. Dietary patterns were identified using factor analysis. Associations between variables, dietary pattern choices, and sleep outcomes were analysed using binary and ordinal logistic regression models, with adjustments for potential confounders.

RESULTS

Lower age was associated with fewer sleep problems. Males exhibited a higher prevalence of snoring and gasping, potentially linked to higher BMI. Individuals sleeping more than 8 hours having the lowest average BMI. Higher consumption of caffeine-containing beverages was associated with poorer sleep, while a diverse protein and plant-based diet showed a protective effect against certain sleep disturbances. Conversely, processed snacks and sweets diet negatively impacted sleep quality. Economic status emerged as a critical factor, with higher household income associated with healthier dietary patterns and fewer sleep disturbances. Conversely, lower income was linked to a greater likelihood of adopting a processed snacks and sweets diet, which negatively impacted sleep quality. National minorities were found to have a higher risk of sleep disturbances and were less likely to engage in diverse protein and plant-based, vegetable-rich, and legume and fish emphasis dietary patterns compared to Han participants. Additionally, lifestyle such as increased screen time was significantly associated with the choice of a processed snacks and sweets diet, further exacerbating sleep issues, while the impact of physical exercise on sleep was inconclusive.

CONCLUSIONS

These findings highlight the necessity of considering socioeconomic, cultural, dietary, and lifestyle contexts in developing interventions to improve sleep health.

PRESCHOOL STEM INTERVENTION MAY IMPROVE DIETARY QUALITY IN CHILDREN (3-5 YEARS): A QUASI-EXPERIMENTAL STUDY MEASURING SKIN CAROTENOIDS USING THE VEGGIE METER®

Virginia Stage[1]; Jocelyn Dixon,[1]; Ryan Lundquist,[1]; Elizabeth G. Blosser,[1]; Archana V. Hegde,[2]; Tammy D. Lee,; Jessica Resor,[2]; L. Suzanne Goodell,[3]
[1]Agricultural & Human Sciences, North Carolina State University, Raleigh, NC, United States of America; [2]Human Development and Family Science, East Carolina University, Greenville, NC, United States of America; [3]Food, Bioprocessing and Nutrition Sciences, North Carolina State University, Raleigh, NC, United States of America

BACKGROUND AND OBJECTIVES

Early exposure to fruits and vegetables (FV) can positively impact children's long-term dietary quality. This quasi-experiment study aimed to examine the effect of a preschool-based intervention on children's (3-5 years) dietary quality measured via skin carotenoid scores (SCS). The multi-level program was designed to improve children's dietary quality through early exposure to FV while engaging in high-quality science learning experiences.

METHODS

The study was conducted during the 2023-2024 school year in seven preschools serving families from historically marginalized backgrounds across three counties (one urban, two rural) in one state within the United States. The intervention group (IG) (*n*=12 classrooms) implemented the program, while the comparison group (CG) (*n*=15 classrooms) implemented the standard curriculum. Intervention teachers received 12 hours of training. IG children received 12 hands-on science activities, six food-based activities, and four outdoor gardening activities (January-May). Researchers measured children's height, weight, and SCS using the Veggie Meter®, a validated pressure-mediated reflection spectroscopy device (0-800 range). Scores reflected diet quality in the prior 6-8 weeks and were measured at baseline (T1), pre-intervention (T2), and post-intervention (T3). Repeated measures ANOVA was used to analyze changes over time and between groups.

RESULTS

A total of 182 children (52.7% female, 57.1% Black, 59.3% healthy weight) participated (*n*=87 IG, *n*=95 CG). Significant differences were observed at baseline between SCS and BMI z-scores. Both groups' SCS showed negligible increases (+4 points) during the first half of the school year (T1 to T2). During the intervention period (January-May), SCS increased in both groups (IG T2=253.1, T3=298.99; CG T2=226.59, T3=255.85). The rate of change in SCS over time was not significant between groups; however, the IG demonstrated a 33% greater gain in SCS compared to the CG.

CONCLUSIONS

The study findings indicate that the PEAS intervention may improve dietary quality among children (3-5 years) from limited resource families, as evidenced by greater SCS gains in the IG. Similar rates in SCS changes across groups underscore the need to explore other mechanisms impacting diet. Integrating FV into early STEM learning may be one method for improving dietary quality among children from families with marginalized backgrounds.

SOAP09_09

DIABETES INTERVENTION INVOLVING PERSON-CENTRED NUTRITIONAL EDUCATION (DINE-TRIAL)

Sophie Rodebjer Cairns[1]; Linda Nyström Hagfors[1]; José Caballero Corbalan[2]; Elisabeth Stoltz Sjöström[1]
[1]Department of Food, Nutrition and Culinary Science, Umeå University, Umeå, Sweden; [2]Department of Medical Science, Uppsala University, Uppsala, Sweden

BACKGROUND AND OBJECTIVES
Diet is an important part of reaching glycaemic targets in Type 1 Diabetes (T1D). However, evidence on the Nordic diet's impact on glucose is limited. In addition, it is unknown if person-centred diabetes education METHODSare used in Sweden due to the lack of a structured programme. The **DINE** trial is a randomised controlled trial which aims to evaluate the efficacy of a pre-assessed nutritional education intervention in comparison to standard care and short dietary advice in adults with T1D. The study will examine the intervention's impact on glucose levels, diet, lipids, blood pressure and BMI.
METHODS

The DINE trial is a non-blinded, randomised parallel group study conducted in Sweden. The primary hypothesis is that a person-centred, group-based nutritional education has an impact on glucose time in range for adults with T1D. A total of 54 adults, ≥18 years, diagnosed with T1D >12 months, with an HbA1c level >57 mmol/mol, and a BMI ≥ 25 kg/m2 will be enrolled. Data collection includes food diary and food frequency questionnaire, self-reported food enjoyment, physical activity level, glucose measured by continuous glucose monitoring, Hba1c, lipids, blood pressure, height, weight and BMI. All measured at baseline and at six months. The intervention will be conducted by a study dietitian and is underpinned by theories of adult learning and designed in co-creation with patients. The intervention is also supported by a model for person-centred care involving three routines:1) Initiating a partnership 2) Working in partnership 3) Safeguarding the partnership. Participants allocated to the intervention group will receive an individual pre-assessment followed by group-based nutritional education programme with a study dietitian.

RESULTS

Participant recruitment will commence in January 2025 and the nutritional education programme will run during 2025. Differences in dietary patterns and outcome variables from baseline to study endpoint at six months will be investigated between intervention and control group. The diet data will be analysed by measuring adherence to the EAT Lancet Planetary Diet and the Nordic Diet.

CONCLUSIONS

Through person-centred care, adults with T1D will not only gain essential knowledge about healthy eating but also achieve better blood glucose control and potentially reduce body weight. Furthermore, participants may enhance their understanding of lifestyle choices that can mitigate future diabetes-related complications.

SOAP09_10

MATERNAL IRON NUTRITION DURING PREGNANCY AND FETAL INTRAUTERINE GROWTH

Jiaomei Yang[1]; Qianqian Chang[1]; Qiancheng Du[1]; Xin Liu[1]; Shaonong Dang[1]; Xueye Tian[2]
[1]Epidemiology and Biostatistics, Xi'an Jiaotong University, Xi'an, China; [2]Department of Obstetrics and Gynaecology, The First Affiliated Hospital of Xi'an Jiaotong University, Xi'an, China

BACKGROUND AND OBJECTIVES

Iron is critical for maternal and fetal health; however, the effect of iron nutrition on fetal intrauterine growth remains unclear. This study aimed to investigate the associations of maternal iron nutrition during pregnancy, combining iron supplementation, dietary iron, and iron status, with fetal intrauterine growth parameters among the Chinese population.

METHODS

This retrospective birth cohort study included 482 pregnant women. Maternal diets during pregnancy were collected by a semi-quantitative food frequency questionnaire, and other information in pregnancy was obtained by standard questionnaires. Maternal concentrations of serum ferritin and hemoglobin were detected. Fetal ultrasound examinations in the second and third trimesters were conducted by professional physicians in the study hospital. Quantile regression or linear regression models were applied to assess the associations.

RESULTS

Participants took iron supplementation in early, mid, and late pregnancy accounted for 19.1%, 40.3%, and 37.8%, respectively. Iron supplementation in the first and second trimesters and total iron intake in pregnancy were positively associated with fetal intrauterine growth parameters at some percentiles. Compared with those without iron supplementation in the second trimester, women with iron supplementation in the second trimester had 0.37 (95%CI=0.24-0.49), 0.37 (95%CI=0.26-0.48), 0.15 (95%CI=0.04-0.26), and 0.52 (95%CI=0.42-0.61) higher z-scores in fetal biparietal diameter, femur length, abdominal circumference, and estimated fetal weight at the 50th percentile in the second trimester, respectively. Maternal serum ferritin and hemoglobin concentrations in the first and second trimesters were positively correlated with several fetal growth parameters.

CONCLUSIONS

Fetal intrauterine growth may benefit from maternal iron nutrition in the first and second trimesters.

TODAY'S MENU: ADHERENCE TO MEDITERRANEAN DIET IN CROATIA

Marko Gerić[1]; Katarina Matković[1]; Goran Gajski[1]; Ivana Rumbak[2]; Paula Štancl[3]; Rosa Karlić[3]; Martina Bituh[2]
[1]Division of Toxicology, Institute for Medical Research and Occupational Health, Zagreb, Croatia; [2]Department of Food Quality Control, Prehrambeno-biotehnološki fakultet, Zagreb, Croatia; [3]Division of Molecular Biology, University of Zagreb - Faculty of Science, Zagreb, Croatia

BACKGROUND AND OBJECTIVES

There is a strong relationship between lifestyle and human health. Over the past few decades a healthy lifestyle, particularly diet, has entered the spotlight of media and research. One of the most important links between diet and non-communicable diseases is obesity, which represents a major risk factor for different health conditions (e.g. diabetes, cardiovascular diseases, cancer, etc.). According to EUROSTAT, Croatia is the country with one of the highest overweight and obese ratios in Europe, yet it is a Mediterranean country as well. On the other hand, a balanced Mediterranean diet (MedD) is considered one of the best choices for maintaining human well-being and health. This paradoxical situation led us to assess the dietary habits of the Croatian population with a focus on MedD patterns.

METHODS

To achieve our aim, we adapted a validated 14-point *Mediterranean Diet Adherence Screener* for an online assessment, where most of the questions were accompanied by a few photographs of representative food items and portion sizes, defined according to the national food consumption data. Moreover, we created a 7-day dietary plan, following the Mediterranean Diet (MedD) pattern and compared the price with an average balanced dietary plan.

RESULTS

Based on the RESULTS of a validated questionnaire (N = 3326), we assessed the MedD adherence score to be 7.6±2.5. More detailed statistical analysis showed that women, residents of a coastal part of the country, older volunteers, those possessing a higher education degree, those with higher income, and those with lower BMI were associated with higher scores. The repeatability study had a 50.6% response rate among the participants who agreed to participate in an additional study (N=335) and showed good reliability of RESULTS. Based on the ordinal logistic regression, income was one of the major predictors of MedD score. Therefore, we saw an opportunity to target low-income citizens to refine their diet. We tailored a 7-day dietary plan with a daily average cost of 9.5 € compared to a traditional balanced plan (11.25 €). Moreover, by choosing cheaper ingredients, the menu cost could be decreased to slightly below 7 €.

CONCLUSIONS

In this study, we showed that the Croatian population moderately practised adherence to the MedD and detected the target groups for promoting MedD beneficial aspects. By turning to MedD and improving lifestyle, it is possible to save money, prevent diseases, and even navigate ageing, are not these enough to take action?

SOAP09_12

SUSTAINABILITY LOGOS AND CLAIMS ON FOOD PACKAGING AND LABELS: THE CASE OF TURKIYE

Nesli Ersoy[1]; Bensu Budak[1]
[1]Nutrition and dietetics, Hacettepe Üniversitesi Sıhhıye Kampüsü, Ankara, Türkiye

BACKGROUND AND OBJECTIVES

Sustainable food labelling takes into account the ecological footprint, which encompasses CO2 emissions and water usage throughout the food's production, processing, storage, packaging, and distribution phases. Sustainability logos or claims on food products can potentially boost their appeal to consumers. This study aims to examine the current status of such practices in Türkiye and to provide scientific insights for producers.

METHODS

Markets with branches across all 81 provinces in Türkiye were selected. At one store in a central district of Ankara's 1st Region, the sustainability-related logos or claims on food packages were analysed. A total of 3,085 food packages were reviewed to check for logos indicating sustainability features, such as Animal Welfare, Organic Certification, Recyclable Packaging, Green Dot, Rainforest Alliance Certification, Local Production, Geographically Indicated Products, Good Agricultural Practices, and Vegan/Vegetarian designations.

RESULTS

All supermarkets had recycling bins in-store, and signs promoting reusable shopping bags were displayed near checkout areas. The recycling logo was present on 87.4% of products; ÇEVKO green dot on 22.2%; Organic Production on 0.3%; Animal Welfare Certification on 0.13%; Local Production on 4.5%; Geographically Indicated Product on 0.3%; Rainforest Alliance on 1.0%; Vegan/vegetarian labelling on 0.4%; and the Good Agriculture Logo on 0.7% of products.

CONCLUSIONS

This study predicts that sustainability logos on products will increasingly contribute to sustainable development by raising awareness among consumers. However, the current number of sustainability-related labels on food products is limited, highlighting the need for more widespread and visible labelling. Encouraging the food industry to create environmentally friendly products with sustainable packaging is essential. Although no specific evidence was found on how to enhance the visibility of sustainability labels, this study underscores the importance of making these labels clear and comprehensible for consumers. Future research should focus on identifying ways to increase consumer response to sustainability labels.

PROMOTION OF EXCLUSIVE BREAST FEEDING IN LEBANON THROUGH A SALUTOGENIC INTERVENTION

Nabiha Ramadan[1]; Anna Bonmati-Tomas,[2]; Dolors Juvinya-Canal,[2]; Ali Ghaddar,[3]
[1]Nutrition, Lebanese International University, Beirut, Lebanon; [2]Nursing, University of Girona, Girona, Spain; [3]Biomedical Sciences, Lebanese Interational University, Beirut, Lebanon

BACKGROUND AND OBJECTIVES

Breastfeeding is a crucial public health priority due to its positive impact on maternal and infants' health and well-being. The WHO recommends breastfeeding initiation within the first hour after birth and exclusive breastfeeding (EBF) for 6 months. Despite widespread efforts and programs designed to reinforce exclusive breastfeeding, rates lag behind targets. A peer support, salutogenic approach was introduced to assist women in perceiving the challenging breastfeeding journey as comprehensible, manageable and meaningful hence, fostering a higher sense of coherence (SOC). This study aims to assess the impact of a salutogenic intervention on maternal SOC, on the initiation and duration of exclusive breastfeeding.

METHODS

A randomized controlled trial was implemented where 101 women residing in Lebanon, were randomly assigned to either an intervention (n=52) or a control group (n=49). Both groups received standard breastfeeding education at the maternity ward. In addition to the standard antenatal care, the intervention was facilitated by 4 infant feeding helpers (IFH), who created WhatsApp groups and delivered four informative and supportive videos at different time intervals. In the WhatsApp groups, IFHs encouraged mothers to self-identify "General Resistance Resources" (GRR)s, to describe coping mechanisms, and to express the role of BF in their life. Videos were designed to enhance manageability by giving relevant information and helpful coping techniques. Measured outcomes included breastfeeding initiation, duration, the evolution of SOC and its dimensions (Comprehensibility, manageability and meaningfulness). The change in pre-post SOC and SOC parameters scores between control and intervention groups was analyzed with Quade non parametric.

RESULTS

Rates of EBF at 6 months was higher among the intervention group's participants as compared to standard care (36.5% vs. 10.2%, p=0.00). SOC increased from baseline to six months postpartum in both groups, with a more significant change observed in the intervention group (F=11.358, p=0.001).

CONCLUSIONS

The salutogenic intervention demonstrated significant improvements in SOC and led to an increase in EBF rates. This study underscores the importance of comprehensive support systems to enhance maternal well- being, breastfeeding initiation and duration.

SOAP09_14

THE EFFECT OF BETAINE SUPPLEMENTATION ON SEX HORMONES IN OVERWEIGHT/OBESE PRE-MENOPAUSAL FEMALES

Emilia Zawieja[1]; Agata Chmurzynska[1]
[1]Department of Human Nutrition and Dietetics, Poznan University of Life Sciences, Poznań, Poland

BACKGROUND AND OBJECTIVES

Betaine supplementation may increase total testosterone concentrations in young athletic males. However, no studies have evaluated the effects of betaine supplementation on sex hormones in females. This study therefore aimed to evaluate the effects of betaine supplementation on sex hormone concentrations in overweight and obese premenopausal females.

METHODS

The participants (n = 35) were premenopausal females aged 18–35 with BMI > 25 kg/m2. The study was a randomized double-blind placebo-controlled trial with a parallel-group design. The participants were randomly allocated to the betaine group (3 g/day) or the placebo group (maltodextrin) for eight weeks. Blood samples and saliva were collected before and after the intervention for sex hormone analysis. Hormone concentrations were determined with commercial ELISA kits. The data were analyzed using repeated-measures ANOVA.

RESULTS

The baseline characteristics of the participants were: body mass 87.7 ± 14.0 kg; body fat percentage: 45.0 ± 6.5%; and body mass index (BMI): 31.5 ± 4.2 kg/m². There were no significant differences in sex hormone concentrations after betaine supplementation (Table 1).

Table 1. Sex hormone concentration changes with betaine and placebo.

	BETpre	BETpost	PLpre	PLpost	p-value
Salivary testosterone (pmol/L)	191±29	210±29	171±27	194±26	0.930
Plasma testosterone (nmol/L)	1.76±0.19	2.16±0.16	1.81±0.17	2.09±0.14	0.567
DHEA-S (µmol/L)	3.92±0.45	3.93±0.51	4.61±0.40	4.61±0.45	0.983
SHBG (nmol/L)	49.1±8.5	59.9±16.7	34.1±7.5	32.6±14.7	0.640
Estradiol (pmol/L)	494±111	573±133	326±98	287±117	0.408

DHEA-S, dehydroepiandrosterone sulfate; SHBG, sex hormone-binding globulin

CONCLUSIONS

In conclusion, betaine supplementation has no effect on sex hormone concentrations in overweight and obese premenopausal females.

HOUSEHOLD SOCIODEMOGRAPHIC CHARACTERISTICS AND FOOD AWAY FROM HOME TRENDS IN MALAYSIA: AN ANALYSIS OF THE HOUSEHOLD EXPENDITURE SURVEY

Ai Ni Teoh[1]
[1]Research, Khazanah Research Institute, Kuala Lumpur, Malaysia

BACKGROUND AND OBJECTIVES

Post-pandemic, households significantly changed the way they purchase and obtain food, necessitating further examination to understand the shifts in food spending behaviours. This study aimed to examine food expenditure patterns at the national level and across households of different sociodemographic characteristics.

METHODS

Descriptive analyses were carried out using data from the Household Expenditure Survey (HES), a national survey carried out by the Department of Statistics Malaysia, to examine household food expenditure trends from 1993 to 2022. Food at home and food away from home expenditure were expressed as a share of total household food expenditure and in nominal and real terms to adjust for the effect of inflation. Base-year analysis and compound annual growth rate were used to measure the growth in food at home and food away from home consumption. Food expenditure trends were further analysed at the household level by strata, size, income level and age group of the head of household.

RESULTS

The RESULTS show that Malaysian households have been gradually shifting from food at home to increased spending on food away from home, and this shift is particularly evident post-pandemic. In 2022, Malaysian households spent 48.4% of their total food expenditure on food away from home—the highest share recorded compared to previous years. Between 2019 and 2022, food away from home expenditure grew at a compound annual growth rate (CAGR) of 9.4%, about four times higher than food at home (2.4%). Despite the constant rise in nominal spending on food at home, its real spending has remained stagnant. In contrast, food away from home spending has been increasing in both nominal and real terms, suggesting that households either consume more outside meals or opt for more costly options but maintain the consumption quantity of food at home. At the household level, bigger, middle-aged and higher income households exhibited a more rapid shift towards increased food away from home consumption. Both urban and rural households experienced similarly rapid growth in food away from home consumption.

CONCLUSIONS

Although the shift towards eating out is progressing at different rates across households, this change in food preference is pronounced among all groups, highlighting the growing significance of food away from home in the Malaysian diet. Considering these trends when designing and evaluating health and nutrition policies is imperative in addressing the potential challenges posed by the increased consumption of food away from home.

Effects of the Red Apron Project: a Case Analysis of Shimokajiro Danchi, Fukushima Prefecture through Mixed METHODSResearch

Yuri Kinoshita[1]; Toshiya Kuchii[2]; Kanako Sato[3]; Ai Kuroda[4]; Natsumi Ishii[5]; Naomi Ito[6]; Yuji Masuda[7]; Yuko Kurokawa[7]; Hiroki Hara[8]; Mikio Yamada[8]; Yuka Miura[8]; Yoshiharu Fukuda[4]
[1]Department of Health and Nutritional Sciences, Faculty of Health Sciences, Aichi Gakuin University, Aichi, Japan; [2]Evaluation team, Red Apron Project, Tokyo, Japan; [3]Junior College, Chukyo Gakuin University, Mizunami, Japan; [4]Graduate School of Public Health, Teikyo University, Tokyo, Japan; [5]Nutrition, Kashinoki Internal Medicine, Fukushima, Japan; [6]Department of Radiation Health Management, Fukushima Medical University School of Medicine, Fukushima, Japan; [7]Department of Life and Culture, Tohoku Seikatsu Bunka Junior College, Sendai, Japan; [8]Disaster Prevention Support and Reconstruction Support Project through the Power of Food, The Ajinomoto Foundation, Tokyo, Japan

BACKGROUND AND OBJECTIVES

The Red Apron Project is a reconstruction initiative designed to improve the dietary habits of disaster victims and revitalize communities. Following the Great East Japan Earthquake of 2011, The Ajinomoto Foundation (TAF) collaborated with residents in affected areas to conduct 3,771 cooking classes over eight and a half years. According to third-party evaluations, the project contributed to the physical and mental recovery of disaster victims and enhanced their quality of life (1). Particularly, it helped strengthen social cohesion among the evacuees in Fukushima Prefecture who could not return to their hometowns. This study examines the effects of the Red Apron Project, focusing on a community association in Fukushima Prefecture that has organized self-run cooking classes over the past four years.

METHODS

This study employed a convergent mixed METHODSdesign. A focus group interview was conducted from March to April 2024 with 14 volunteer residents from a disaster public housing complex in Fukushima Prefecture. Subsequently, an anonymous questionnaire survey was conducted with 120 individuals who had been evacuated after the nuclear power plant accident. The survey asked about participants' experiences with cooking classes and their food dietary variety scores (DVS), which were measured on a scale of 0–10 (2).

RESULTS

Shimokajiro Danchi was developed in 2015 (3). TAF conducted 13 cooking classes with 228 participants to encourage residents to leave their houses and engage in cooperative activities. Currently, the community association holds cooking classes every three months. The survey achieved a response rate of 85.8 %. Respondents had a mean age of 70.3 ± 16.5 years. Of all the respondents, 17.5% attended regular cooking classes.The mean DVS was 2.8 ± 2.4 points, with participants of the cooking classes scoring a higher mean DVS of 4.1 ± 2.1 points compared to non-participantspoints ($p<0.01$). Participants reported that cooking classes provided valuable opportunities to socialize, strengthen community cohesion, prevent isolation, and foster personal growth. The participants appreciated the simplicity, originality, and nutritional balance of the recipes. Non-participants cited health issues and busy schedules as reasons for not attending. Overall, the cooking classes promoted self- and mutual help among residents, encouraging them to support each other.

CONCLUSIONS

Participation in cooking classes resulted in reduced isolation, improved dietary habits, and better overall quality of life. At the community level, the project strengthened social cohesion and fostered self- and mutual help among the residents.

SOAP12_04

ASSOCIATION BETWEEN FOOD CONSUMPTION OF BRAZILIAN SCHOOLCHILDREN AND THE INTERSECTION OF RACE/SKIN COLOR AND GENDER

Thays Rosa[1]; Daniela Canella[2]
[1]Programa de Pós-Graduação em Alimentação, Nutrição e Saúde, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil; [2]Nutrição Aplicada, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil

BACKGROUND AND OBJECTIVES

The food consumption of adolescents is characterized as inadequate. Gender, race/skin color, income, and their intersection can influence this consumption. The objective of this study was to analyze the relationship between food consumption and intersections of race/skin color and gender among Brazilian adolescents.

METHODS

Data from Brazil's National Student Health Survey 2019 was used. A total of 10 analytical categories (exposure) were designed, based on the intersection of binary gender (man and woman) and race/skin color (white, black, brown, Asian, and Indigenous), to represent social identities. As outcomes, the regular intake (5 or more times a week) of three subgroups of fresh or minimally processed food (beans, fruits, and vegetables) and two subgroups of ultra-processed foods (sweet treats and soft drinks) were assessed. Crude and adjusted (for a score of goods and services, age group, administrative dependency, and region) Poisson regression models were used to estimate prevalence ratios (PR).

RESULTS

There was a difference in food intake among the analytical categories in both crude and adjusted models. In adjusted analysis, regular intake of fruit and vegetables was higher among white men compared with other groups. In three of the five food subgroups analyzed (beans, vegetables, and sweets), black (PR 0.94, 0.79, and 1.48, respectively), brown (PR 0.91, 0.89, and 1.42, respectively) and Indigenous women (PR 0.85, 0.82 and 1.38, respectively) exhibited a statistically significant disadvantage when compared with white men (reference category), with a lower frequency of healthy food and higher of unhealthy food. Brown, Asian, and Indigenous men presented higher PR of regular intake of beans in comparison to the reference category. Brown women had lower PR for regular intake of soft drinks (PR 0.87).

CONCLUSIONS

The study identified racial and gender inequalities in food consumption among the analytical categories, with a worse scenario for women, especially those black, and Indigenous.

SOAP12_05

ANTENATAL CARE SEEKING AND MATERNAL SUPPLEMENT USE IN BANGLADESH: PRACTICES AND PREFERENCES OF PREGNANT WOMEN

Muttaquina Hossain[1]; Md. Ahshanul Haque[1]; Sudipta Das Gupta[1]; Kazi Istiaque Sanin,[1]; Kerri Wazny[2]; Tahmeed Ahmed[1]
[1]Nutrition Research Division, icddr,b, Dhaka, Bangladesh; [2]EME, CIFF, London, United Kingdom

BACKGROUND AND OBJECTIVES

In Bangladesh, differences between public and private antenatal care (ANC) services influence pregnant women's (PW) knowledge, perceptions, attitudes, and practices (KPAP) regarding ANC and maternal supplements, including iron-folic acid (IFA), calcium, multivitamins, and multiple micronutrient supplements (MMS). This study examines PW's KPAP about ANC services and their impact on supplement purchase and consumption.

METHODS

This mixed-METHODSstudy enrolled 3,486 PW (2,338 in intervention and 1,148 in control sub-districts) from five divisions in Bangladesh over 15 months (August 23–November 24). Roughly 30% of PW were excluded because they do not plan to purchase supplements during pregnancy. The primary outcome was KPAP related to ANC services; secondary outcomes included supplement purchase and consumption (IFA, MMS, or multivitamins). Qualitative interviews captured perceptions and attitudes toward ANC and supplementation. Quantitative data were analyzed using descriptive statistics.

RESULTS

Most PW (80%) received ANC information from family and friends, and doctors (76%). Nearly all PW (98%) had at least one ANC visit, averaging four visits per pregnancy. 69% of PW preferred private facilities due to perceived better care and access to medications, 4% preferred public facilities, 24% used both, and 3% did not seek ANC. Supplement purchases were high: 93% among private and 87% among public facility users. Among private facility users (n = 2,127) in MMS available areas, 42.7% purchased IFA, 16.7% MMS, 0.14% multivitamins, 33.3% all three supplements, and 7% none. Among public facility users in MMS available areas (n = 621), 32.5% purchased IFA, 24% MMS, 0.32% multivitamins, 32.7% all three supplements, and 10.5% none. Calcium purchases were higher among public facility users (76%) than private (61%). Qualitative data indicated PW preferred MMS over IFA due to better availability, no unpleasant odor, and fewer side effects.

CONCLUSIONS

Bangladeshi PW preferred private facilities for ANC due to perceived superior care, which influences KPAP and supplement consumption. Despite high ANC utilization and supplement purchase, disparities between public and private sectors persisted. MMS was preferred over IFA due to its advantages. Study findings are generalizable to 68% of PW planning to purchase supplements in this study; they underscore the need to engage the private sector alongside improving public services, enhancing communication, and promoting MMS to improve maternal and newborn health.

SOAP12_06

A FOLLOW-UP STUDY ON THE PUBLIC-PRIVATE PARTNERSHIP IN THE "GHANA NUTRITION IMPROVEMENT PROJECT" ANALYZED WITH MIT D-LAB'S P.ACT (PARTNERSHIP CO-DESIGN TOOLKIT)

Yasuhiko Toride[1]
[1]Institute for International Strategy, Tokyo International University, Tokyo, Japan

BACKGROUND AND OBJECTIVES

The "Ghana Nutrition Improvement Project" led by The Ajinomoto Foundation (TAF) aims to improve nutrition of children aged 6 months to 24 months by providing a nutrition supplement called "KOKO Plus", which is added to traditional complementary food, koko, corn-base porridge. TAF is engaged in a collaboration with Ghana Health Service (GHS), Ministry of Health to deliver effective nutrition education to mothers, which is considered to be a key factor for the success of the project

In 22nd IUNS-ICN the authors reported the result of the analysis on the partnership between GHS and TAF by using P.ACT Toolkit, which was developed by MIT D-lab. Through the workshops between GHS and TAF, it was confirmed that achieving the financial sustainability of the project was the common objective. Then they set up a roadmap toward financial sustainability, agreed on KPIs (Key Performance Indexes) The objective of this study is to evaluate the progress of the partnership using the agreed KPIs

METHODS

KPIs agreed in the previous P.ACT workshop were reviewed by conducting workshops with the participation of representatives from GHS and TAF members, which were facilitated by the author and the result was analyzed to evaluate the progress of the partnership.

RESULTS

As the key joint efforts to provide nutrition education to caregivers by GHS and TAF, the food demonstrations in the communities were conducted to disseminate knowledge on nutritionally balanced diets with the reference to "KOKO Pus". Peer to Peer education of health workers of GHS was effective in enhancing their capability and motivation. It turned out to be the cost effective method to achieve behavior changes of caregivers for better nutrition.

Through the effective collaboration between GHS and TAF as the public-private-partnership, there was steady progress in achieving financial sustainability of the project.

CONCLUSIONS

The public-private-partnership strengthened through P.ACT analysis has become the key success factor to make the nutrition improvement project more successful and sustainable.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

SOAP12_11

Post-weaning RESULTS from a Randomized Controlled Trial on Weight and Cardiometabolic Risk Factors - Effects of Breastfeeding Promotion Intervention and Dietary Treatment in Postpartum Women with Overweight and Obesity

Elisabeth Adolfsen Øhman[1]; Maria Fossli,[1, 2]; Kathleen Maher Rasmussen[3]; Anna Winkvist[4]; Beate Fossum Løland[5]; Kirsten Bjørklund Holven[1, 6]; Hilde Kristin Brekke[1]
[1]Department of Nutrition, University of Oslo Faculty of Medicine, Oslo, Norway; [2]Norwegian Research Centre for Women's Health, Oslo University Hospital, Oslo, Norway; [3]Division of Nutritional Sciences, Cornell University, Ithaca, United States of America; [4]Department of internal medicine and clinical nutrition, Institute of Medicine, University of Gothenburg, Gothenburg, Sweden; [5]Cluster for research and analysis of the health services, Norwegian Institute of Public Health, Oslo, Norway; [6]National advisory unit on FH, Department of Endocrinology,Morbid Obesity and Preventive Medicine, Oslo University hospital Ullevål, Oslo, Norway

BACKGROUND AND OBJECTIVES

Postpartum women face an elevated risk of weight gain, with prolonged potential consequences including increased risk of cardiometabolic disease. Breastfeeding has been proposed as a potential mitigating factor against this risk. We examined the effects of a breastfeeding promotion intervention (BPI) and a dietary treatment (Diet) for weight loss postpartum on body weight and cardiometabolic risk factors after lactation cessation.

METHODS

We used a 2 x 2 factorial design to assess the independent and combined effects of BPI and Diet. Pregnant women (n = 156) with a pre-pregnancy body BMI of 25 to 35 kg/m² were recruited and randomly assigned to four groups: BPI, Diet, both treatments, or no treatment. We measured body weight, body composition, waist and hip circumferences, markers of glucose and lipid metabolism, and blood pressure at 2 weeks postpartum (baseline), at 6 months postpartum, and after weaning (> 12 months postpartum). The data were analyzed using linear mixed models to investigate the effects of the treatments on weight and cardiometabolic risk factors post-weaning.

RESULTS

The post-weaning visit included 89 women and was performed at a median (25, 75 percentiles) of 15.8 (13.0, 21.1) months postpartum. Among all women, > 75% breastfed for 12 months or longer. Among women who received BPI, median (25, 75 percentile) duration of breastfeeding was 14.0 (11.0, 20.0) months, while women who did not receive BPI breastfed for 14.5 (12.5, 19.5) months ($P = 0.31$). There were no effects of BPI on breastfeeding duration, use of infant formula, or any of the cardiometabolic outcomes at 6 months postpartum or post weaning. Reductions in weight and percentage fat mass from Diet at 6 months postpartum ($P < 0.001$) were still statistically significant post weaning ($P < 0.05$). Favorable effects on waist and hip circumference, fasting glucose and insulin concentrations observed at 6 months postpartum ($P < 0.05$) were no longer evident post weaning and no effects were observed on blood lipids or blood pressure.

CONCLUSIONS

BPI as implemented among these long-breastfeeding Norwegian women did not affect breastfeeding duration, body weight, or cardiometabolic risk factors. Diet resulted in a reduction in body weight and percentage fat mass at both 6 months postpartum and post weaning.

SOAP12_12

EVALUATION OF THE YES TO VEG! PROGRAMME, A FOOD SYSTEMS APPROACH TO PROMOTE VEGETABLE ACCESS IN PRE-SCHOOL AGED CHILDREN ATTENDING NURSERIES IN SOCIOECONOMICALLY DEPRIVED AREAS OF GLASGOW, SCOTLAND

Ada L. Garcia[1]; Zabrina Zerr[1]; Irina Martin[2]; Alison Parrett[1]
[1]Human Nutrition, School of Medicine, Dentistry and Nursing, University of Glasgow, Glasgow, United Kingdom; [2]Senior Officer, Nourish Scotland, Edinburgh, United Kingdom

BACKGROUND AND OBJECTIVES

Vegetables are important sources of nutrients for optimal growth but pre-school age children in socioeconomically deprived households in the UK are less likely to consume them. Facilitating access to vegetables in children's nursery food environment could promote vegetable intake through increased exposure and by children gaining "vegetable" agency. We evaluated the immediate impact of Yes to Veg!, a 4-week nursery-based intervention targeting 3-5y children living in socioeconomically deprived areas of Glasgow, Scotland.

METHODS

A quasi-experimental study. Parents-child dyads were recruited from 11 nurseries (6 intervention/5 controls) and parents completed pre- and post-questionnaires. Yes to Veg! delivered 2 types of locally, organically grown fresh vegetables over 4 weeks (intervention). Nursery staff were provided with suggestions for using the vegetables [imaginative play (i.e. shopping, cooking); sensory activities]. Control nurseries were given general healthy eating recommendations. Outcomes in children were parental reported exposure (vegetables tried from a 27-item list), consumption frequency (1=once/week to 5=everyday) and variety consumed (0=none, 1=1-4, 2=5-9, 3=10+ kinds). Vegetable agency was children's vegetable-related engagement/activities at nursery and home reported by parents, nursery staff and from researcher observations.

RESULTS

Of 257 parent-child dyads recruited only 57 (n=34 intervention, n=23 control) completed both questionnaires. Child mean(SD) age was 50(8) months. There were no statistical differences [Mean(SD)] in vegetables tried between intervention [total score pre 16.7(4.5) vs 16.8(5.6) post, difference 0.19(0.6) p=0.765] and control group [total score pre 16.4(5.3) vs 16.0(5.6) post, difference -0.39(0.57), p=0.503]. Median pre- and post-consumption frequency in both groups was 4 (most days); the variety of vegetables consumed differed between intervention (5-9) and control (1-4) and these measurements didn't change between pre- and post. Vegetable agency increased in the intervention; parents said children talked more about vegetables at home (91% vs 65% control) and were willing to try vegetables at home (41% vs 34% control); qualitative comments were positive for children's engagement (preparation, sensory activities), and overall increased interest.

CONCLUSIONS

Yes to Veg! facilitated exposure to vegetables, engagement and familiarisation, it was well received by the parents and nursery staff, but this was not reflected in consumption. The intervention duration and limited recruitment might have hampered impact.

SOAP12_13

EFFECT OF EXERCISE AND ACUTE AND CHRONIC GALACTO-OLIGOSACCHARIDE SUPPLEMENTATION ON INFLAMMATION AND IRON ABSORPTION IN FEMALE ATHLETES

Mary A. Uyoga[1]; Zoleka Zuma[1]; Lize Havemann-Nel[1]; Lizelle Zandberg[1]; Arista Nienaber,[1]; Marlizé Louw[1]; Yolandi Willemse[2]; Jana Storm[2]; Lisanne du Plessis[3]; Jeannine Baumgartner[4]; Linda Malan[1]; Isabelle Herter-Aeberli[5]
[1]Centre of Excellence for Nutrition, North-West University, Potchefstroom, South Africa; [2]Centre for Health and Human Performance, North-West University, Potchefstroom, South Africa; [3]Medicine Usage in South Africa, North-West University, Potchefstroom, South Africa; [4]Department of Nutritional Sciences, King's College London, London, United Kingdom; [5]Laboratory of Nutrition and Metabolic Epigenetics, ETH Zurich, Zürich, Switzerland

BACKGROUND AND OBJECTIVES

Background: Iron depletion is particularly common in female athletes depending on the sports discipline. Endurance and resistance exercise can induce inflammation resulting in decreased dietary iron absorption. Galacto-oligosaccharides (GOS) are non-digestible fibres that selectively enhance the growth of beneficial gut bacteria. Although GOS improved iron absorption in young healthy women and infants, whether it has potential to improve iron absorption in athletes is uncertain.

Objective: To determine the effect of exercise and acute and chronic GOS intervention on inflammation and iron absorption in female athletes.

METHODS

In this single-arm stable iron isotope and intervention study, 22 female athletes aged 18 to 35 years with moderate or low iron status, each underwent 3 test conditions before and after a 5-week daily intervention with 10 g of GOS. Participants consumed a test drink containing labelled ferrous fumarate (fefum,54, 57, 58 Fe, 56 mg iron in total) 3 hours after: i) a period of rest, and ii)/iii) an acute resistance exercise bout at 70% 1 repetition maximum with and without co-administration of GOS. Iron status (Haemoglobin (Hb), ferritin, soluble transferrin receptor (sTfR)) was assessed at baseline and endpoint while inflammation markers (C-reactive protein (CRP) and alpha-1-acid glycoprotein) were measured on the morning of each test condition. Interleukin 6, hepcidin and serum isotope appearance were measured at several time points throughout each test day. Fractional iron absorption was determined 14 days after the last test drink in each phase. Sample analysis is ongoing, and RESULTS will be available at the conference.

RESULTS

Of the 89 screened participants, 27% had iron deficiency (ferritin<15 µg/L and/or sTfR>8.3 mg/L). Of the 22 that were enrolled, 20 completed the study. At baseline mean ± SD age was 21.2 ± 1.8 years and body fat % was 26.4 ± 6.0%. Median (IQR) body mass index was 22.0 (19.9 – 25.8). Estimated maximal oxygen uptake was 39.7 ± 5.9 mL/kg/min. Inflammation- and altitude-adjusted ferritin and Hb were 31.8 ± 12.4 µg/L and 12.2 ± 0.9 g/dL, respectively. Median high-sensitivity CRP was 0.86 (0.54 – 1.75) mg/L and 15% had low-grade inflammation (CRP>3 mg/L).

CONCLUSIONS

In young female athletes, iron deficiency may be compounded by exercise-induced inflammation. Strategies to enhance iron absorption are needed to maintain athletic performance and quality of life.

SOAP12_14

EXPLORING FOOD AUTONOMY: A STUDY ON JOHANNESBURG ADULTS' CONTROL OVER FOOD CHOICES AND ACCESS

Anike Pieters[1]; Xikombiso Mbhenyane[2]; Hema Kesa[3]
[1]Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa; [2]Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch university,, Cape Town, South Africa; [3]Hospitality Management & Food Evolution Research Laboratory, School of Tourism and Hospitality, University of Johannesburg, Johannesburg, South Africa

BACKGROUND AND OBJECTIVES

Individuals demonstrate autonomy by using their own judgment to make decisions, driven by self-determined goals. Food choices, in particular, are influenced by the specific context and environment at any given moment. By assessing the extent to which individuals exercise their autonomy, we can gain deeper insights into the factors driving food choices. This understanding can then be used to inform and shape effective public health campaigns. The aim of this study was to investigate how adults in Johannesburg, South Africa, perceive their autonomy in relation to food choices and access to food.

METHODS

A qualitative research design was used. Four focus groups, consisting of a total of 40 participants recruited using convenience sampling, were conducted. Two research assistants with a graduate qualification facilitated the focus groups using a discussion schedule, with pre-determined statements. The principal investigator and research assistants underwent training and were supervised by experience qualitative researchers to ensure rigor and trustworthiness. The study complied with the ethical principles of the Declaration of Helsinki, 2013. Thematic analysis was used to identify main themes from the discussions.

RESULTS

Four main themes, 1) Food choice, 2) Food availability, 3) Food purchasing and 4) Food access, were identified. Healthfulness and the cost of food were mentioned as determinants of food choice, with convenience, household size, variety and satiation as smaller themes. Food shortages and purchasing power was discussed with regards to food availability. Under food purchasing, food cost was again identified, the idea of buying basics against buying luxuries and planning were also mentioned. Sub-themes related to food access were the type of places and distances to places for food purchases, as well as affordability.

CONCLUSIONS

The participants view, and perception of autonomy was not expressed outright, but emerged throughout the discussions, and related to the right and ability to choose food that they would prefer to eat, and in relation to their own goals, such as being healthy. In the decision-making process to reduce food costs, participants might increase their autonomy by enabling themselves to choose foods that would otherwise be expensive. Conversely, their autonomy could decrease if their choices are limited to discounted options. Further studies can be conducted to compare the extent of which autonomy is exercised based on participants characteristics, socio-economic class or across different regions.

CONFLICTS OF INTERESTS

CORRELATES OF FOOD INSECURITY AMONG UNIVERSITY STUDENTS IN A DISADVANTAGED SOCIOECONOMIC AREA IN FRANCE

Henri Dehove[1]; Malo Mofakhami[2]; Julia Baudry[1]; Emmanuelle Kesse-Guyot[1]; Chantal Julia[3, 1]; Mathilde Touvier[1]; Sandrine Péneau[1]; Alice Bellicha[1]
[1]Centre of Research in Epidemiology and StatisticS, Nutritional Epidemiology Research Team (EREN), Université Sorbonne Paris Nord and Université Paris Cité, INSERM, INRAE, CNAM, Bobigny, France; [2]Institute for Interdisciplinary Research on Social Issues (IRIS), Center for employment and labor studies (CEET), Université Sorbonne Paris Nord, Villetaneuse, France; [3]Département de Santé Publique, Hôpitaux Universitaires Paris Seine-Saint-Denis, APHP, site Avicenne, Bobigny, France

BACKGROUND AND OBJECTIVES

The higher education student population is particularly concerned by food insecurity (FI), although data collected in France is limited and varies depending on socio-economic contexts. This cross-sectional study aims, 1) to assess the prevalence of FI among university students in a socioeconomically disadvantaged area, 2) to assess the association of FI with perceived school dropout, and 3) to describe the socioeconomic, demographic and academic factors, as well as the cooking and eating conditions associated with FI.

METHODS

An online survey was conducted (Nov 2022 to Jan 2023) among 5068 students (22% of the university population) enrolled at a university located in a low socioeconomic area. FI was assessed using a question with three response modalities: not having access to enough food (i.e. quantitative FI); not having access to the desired food (i.e. qualitative FI); having access to enough of the desired food (i.e. food security). Weighting was calculated (compared to the overall student population of the university) using gender, study level, field of study, country of high school diploma obtention, and training status. Multivariate multinomial logistic regression models were used to identify associations between i) FI and school drop-out; ii) socioeconomic and demographic data, academic-related data, cooking and eating conditions and FI.

RESULTS

Among respondents, 60% were women and 21% reported financial difficulties ≥4 (out of 5). After weighting, 11% and 35% reported quantitative and qualitative FI, respectively. In multivariable analyses, students reporting quantitative or qualitative FI were more likely to report school dropout than people reporting food security. Besides, reporting financial difficulties, living in a collective residence, not having cooking facilities at home, being an undergraduate, having obtained high school diploma abroad, not cooking frequently, relying on food aid and eating alone regularly were positively associated with both quantitative and qualitative FI. Being a man was associated only with quantitative FI. ($P<0.0001$)

CONCLUSIONS

This study reported a concerning prevalence of FI among students in a disadvantaged socioeconomic area. FI was associated with greater perceived school dropout, which may further increase socioeconomic inequalities. Both structural (e.g. socioeconomic status, accommodation type) and individual-level (e.g. cooking and eating conditions) factors were found to be associated with FI. These findings provide insight into the characteristics of students more likely to experience FI and to be the target of interventions.

CONFLICTS OF INTERESTS

POLICE MISTRUST AND DIET QUALITY: EXAMINING THE IMPORTANCE OF PSYCHOSOCIAL FACTORS IN PREDOMINANTLY BLACK COMMUNITIES

Andrea Richardson[1]; Rebecca Collins[2]; Rachel Burns[3]; Johnathan Cantor[4]; Sameer Siddiqi[5]; Tamara Dubowitz[6]
[1]Behavioral Policy Sciences, RAND Corporation, Pittsburgh, PA, United States of America; [2]Behavioral and Policy Sciences, RAND Corporation, Santa Monica, CA, United States of America; [3]Economics, Statistics, and Sociology, RAND Corp, Pittsburgh, PA, United States of America; [4]Economics, Statistics, and Sociology, RAND Corp, Santa Monica, CA, United States of America; [5]Behavioral and Policy Sciences, RAND Corp, Arlington, VA, United States of America; [6]Behavioral and Policy Sciences, RAND Corp, Pittsburgh, PA, United States of America

BACKGROUND AND OBJECTIVES

Policing practices in communities of color in the United States is an important public health issue. This study examined how police mistrust is associated with dietary quality.

METHODS

In this cross-sectional study, we analyzed 2021 data from 724 adults living in randomly selected households in two predominantly Black Pittsburgh, Pennsylvania communities; participants were mostly Black (90.6%), low-income (median household income $17,500), and women (79.3%). We quantified paths between police mistrust and dietary quality (measured by Healthy Eating Index [HEI]-2015) through perceived stress, community connectedness (i.e., how close respondents felt with their community), and subjective social status.

RESULTS

Dietary quality was poor (mean HEI-2015 score=50, out of possible range: 0-100) and mistrust of police was high: 78% of participants either agreed or strongly agreed that something they say might be interpreted as criminal by the police due to their race/ethnicity. Police mistrust was associated with lower perceived social status = - 0.03 (95% confidence interval [CI]: -0.05, -0.01) and lower community connectedness = - 0.03 (95% CI: -0.05, -0.01). Police mistrust was marginally associated with low dietary quality (β= - 0.14 (95% CI: -0.29, 0.02). Nineteen percent of the total association between police mistrust and lower dietary quality β=-0.16 (95% CI: -0.01, -0.31) was explained by an indirect association through lower community connectedness.

CONCLUSIONS

Police bias and mistrust may play a role in community connection, social status, and ultimately poor dietary quality for Black Americans. Addressing police mistrust continues to be an urgent public health issue.

SOAP15_03

ENABLERS AND BARRIERS OF FEEDING OF SMALL AND/OR SICK NEWBORNS IN GHANA

Habtamu Fekadu[1]; Lyndsey W Garg; Pearl Nanka-Bruce[2]
[1]Global Health, Nutrition, Save the Children US, MOMENTUM Country and Global Leadership, Washington, United States of America; [2]Country Director, Jhepiego,Ollenu Road, Accra, Ghana

BACKGROUND AND OBJECTIVES

Ghana's rising neonatal mortality rates (NMR) have prompted the government to prioritize improving the quality of newborn care, with a focus on specialized care for small and/or sick newborns (SSNBs), including creating an enabling environment for breastfeeding and appropriate feeding practices. This study explored the perspectives of health providers, mothers, families, and communities on current practices, barriers, and facilitators of quality, family-centered nutritional care for SSNBs during inpatient care and post-discharge.

METHODS

A descriptive cross-sectional design was employed to collect qualitative data through 56 individual interviews with health care providers and mothers/caregivers of inpatient and post-discharge SSNBs. Additionally, four focus group discussions were conducted with family members and key community influencers at six public hospitals in a large urban area in Ghana.

RESULTS

Almost all SSNBs were fed breastmilk both during inpatient care and after discharge. Organizational enablers for high breastmilk feeding (BMF) rates in SSNB care units included trained health workers providing respectful and quality counseling, accessible places for breastfeeding or expressing milk, and the availability of feeding supplies, such as feeding tubes, cups, and functional refrigerators for alternative feeding methods. However, health providers reported that staff shortages and heavy workloads negatively impacted the quality of feeding support provided.

Interpersonal and community-level enablers included caregivers' positive experiences with support, both from health care providers as well as emotional and social support from family members, especially fathers. Family level support was defined as help with meal preparation, baby care, and respecting mothers' decisions to feed breastmilk or use alternative feeding methods. Conversely, barriers included low attendance at postnatal care and SSNB follow-up visits, as well as a lack of home-based feeding support from community health workers.

CONCLUSIONS

Emotional and social support from family and community members, alongside acceptance of alternative feeding methods, facilitated BMF during inpatient care and post-discharge. Increased workloads among health care providers were identified as barriers to optimal counseling and support for mothers of SSNBs, particularly for BMF and alternative feeding methods. The limited availability of post-discharge follow-up emerged as a significant barrier requiring further investigation and intervention.

REFUGEE SETTLEMENT SERVICE WORKERS ROUTINELY USE PRINT INFORMATION RESOURCES TO ASSIST REFUGEE CLIENTS WITH FOOD SECURITY CHALLENGES

Julie Maree Wood[1]; Rebecca Lindberg,[1]; Alison Booth,[2]; Claire Margerison,[2]
[1]Institute of Physical Activity and Nutrition (IPAN), Deakin University Melbourne Burwood Campus, Burwood, Australia; [2]Institute for Physical Activity and Nutrition, Deakin University, Burwood, Australia

BACKGROUND AND OBJECTIVES

During resettlement, refugees are susceptible to food insecurity.[1,2] In high-income countries, settlement service workers provide expertise and information, including food security information, to refugee clients.[3] In Australia, between 12,500-17,500 refugees are resettled annually.[4] Australia has a large range of food security-related information resources but their use in settlement support work has not been systematically investigated. The objective was to explore perceptions of settlement workers regarding their use of food security-related resources with refugee clients and to identify opportunities for resources to better assist refugees with food and nutrition security in the new food environment.

METHODS

This descriptive, qualitative study adopted a subjective realism perceptive. One-on-one interviews with refugee resettlement workers were conducted between June-August 2024. The Technology Acceptance Model (TAM) constructs were used to frame the interview guide and analysis. NVivo was used for analysis.

RESULTS

Of the 14 workers interviewed, four had lived refugee experience, and all were health professionals, of which 64% were doctors, nurses or dietitians. All routinely used print food and nutrition security-related information resources with their clients as they were perceived to build capacity and scope of practice. Print, pictorial, translated, and co-designed resources were perceived to be the most useful. Less useful were resources with limited cultural tailoring, translation issues, limited topic range, and high literacy demand. There was limited use of digital resources due to perceived variations in digital access and digital literacy levels amongst refugee clients. There was widespread recurring use of the same food and nutrition resource range, as most workers' perception was that new resources were too difficult to find. Opportunities for improvement included streamlining access, addressing topics such as clinical deficiencies related to chronic food insecurity, and increasing culturally-nuanced translation. A need was identified for more resources for settlement workers regarding the food cultures and dietary patterns of refugee populations resettling in high-income countries.

CONCLUSIONS

Settlement workers perceive food security-related resources to be a valuable component of resettlement service but access issues and topic gaps limit their potential in-situ. Co-designed development of culturally-appropriate resources, streamlining resource access, and leveraging distributed food literacy may help better address some food security challenges faced by refugee populations in their new countries.

SOAP15_05

DETERMINANTS OF CHILDHOOD UNDERNUTRITION IN HO INDIGENOUS COMMUNITY OF JHARKHAND, INDIA

Ridhima Kapoor[1]; Manisha Sabharwal[2]; Suparna Ghosh-Jerath[1]
[1]Nutrition and Food Systems, The George Institute for Global Health India, New Delhi, India; [2]Department of Food & Nutrition and Food Technology, Lady Irwin College, New Delhi, India

BACKGROUND AND OBJECTIVES

Childhood undernutrition, a significant barrier to growth and development, is common among Indian tribal children. Jharkhand, a biodiverse-enriched state of India, is home to Ho indigenous community, that is known to access nutrient-dense indigenous foods (IFs) yet have poor nutrition. A study was conducted to assess dietary intake and nutritional status of under-five Ho indigenous children and examine role of different factors towards their nutritional status.

METHODS

We conducted cross-sectional study in nine randomly selected villages of West Singhbhum district in Jharkhand. Household surveys elicited information on sociodemographic and food access profile. 2-day non-consecutive 24-hour dietary recall (n=272) and anthropometric assessments (height and weight) (n=255) were conducted for diet and nutritional status assessments. Data analysis was conducted in R.

RESULTS

Diets of Ho children (6 months-5 years) were deficient in calories, essential vitamins (vitamins A, B1, B2, B3, C, folate), and minerals (iron, calcium, and zinc), in comparison to estimated average requirements for Indian children. Only 9.2% children consumed minimum adequate diet (≥5 food groups), with average diet diversity score of 3.1 ± 0.7. Many children (84.5%) reported IF consumption, mostly limited to local rice varieties. Less than half the children (39-43%) received hot cooked meals and take-home ration as part of government supplementary feeding programs. High prevalence of undernutrition was observed, with 24% children wasted, 34% stunted, and 40% underweight, partially concordant with state-level prevalence (wasting -25.2%, stunting-44.9%, and underweight-46.4%). Multivariate logistic regression revealed higher odds of wasting in younger children (<2 years) (OR: 0.5, $p<0.05$) than older children. In contrast, risk of stunting was 2.9 times higher in children aged 2-3 years, than younger children (<2 years) (OR: 2.9, $p<0.05$). Children with literate mothers had significantly ($p<0.05$) lesser odds of stunting (OR:0.4) and underweight (OR: 0.5), in comparison to children with illiterate mothers.

CONCLUSIONS

Sub-optimal dietary intake and high levels of undernutrition in Ho children, could be attributed to underutilization of nutrient-rich IFs, poor functioning of supplementary feeding programs, and limited literacy of caretakers. A multifaceted approach combining evidence-based targeted food-based interventions, nutrition literacy, and behaviour change strategies may address undernutrition in Ho children.

SOAP15_06

DEVELOPMENT AND EVALUATION OF A HEALTHY EATING INDEX FOR ZAMBIA

Elise Talsma[1]; Leanne Rozemeijer[1]; Taonga Chirwa-Moonga[2]; Kim Maasen[1]; Inge Brouwer[1]
[1]Division of Human Nutrition and Health, Wageningen University, Wageningen, Netherlands; [2]Department of Food Science and Nutrition, University of Lusaka, Lusaka, Zambia

BACKGROUND AND OBJECTIVES

Healthy diets play a crucial role in malnutrition and contribute to the reduction in burden of diet-related diseases. Zambia experiences a triple burden of malnutrition, which encompasses chronic undernutrition, micronutrient deficiencies, as well as overweight and obesity. To reduce these, the Zambian government established food-based dietary guidelines (FBDG's) in 2021 but adherence remains unclear. We aimed to develop and evaluate the Zambian Healthy Eating Index (Z-HEI) to assess adherence to the FBDG's.

METHODS

The 2021 Zambian FBDG's were translated into the Zambian Healthy Eating Index (Z-HEI). The Z-HEI comprises ten distinct food groups and seven food subgroups, which together form 17 components categorized into four specific categories: adequacy, optimum, moderation, and quality. Each category employs a unique scoring method, yielding a total score ranging from 0 (no adherence) to 130 (maximum adherence).

Z-HEI scores were calculated using an existing dietary intake dataset from 2022 which included data from 397 women of reproductive age from Choma and Mazabuka in Zambia. Six weighed dietary intake recalls were collected by multipass 24-recall method, and scored according to the Z-HEI score. Associations were examined between quartiles of the Z-HEI score and the mean probability of adequacy (MPA).

RESULTS

The mean Z-HEI score was 53.9 (SD = 5.8), with minimum and maximum scores of 34.7 and 75.6, respectively. High adherence was observed for saturated fat, unsaturated fat, eggs, red meat, and whole grains, while low adherence was noted for fruits, fruit variety, dairy, and legumes. MPA across participants was 0.7 (range: 0–1). PA for vitamin C, riboflavin, and calcium was 0.1. However PA's for zinc, iron, vitamin A, folate, and vitamin B6 exceeded 0.8. Associations across quartiles did not increase from Q1 to Q4 and no meaningful correlation between the Z-HEI score and MPA ($\tau = 0.07$, $p < 0.001$) was found.

CONCLUSIONS

Adherence to the food-based dietary guidelines was low. We found no meaningful correlation between Z-HEI score and the MPA, suggesting that Z-HEI may not reflect micronutrient status. However, the primary aim of FBDG's is to promote healthy diets and reduce the incidence of non-communicable diseases, which encompasses more than MPA. Future research should focus on evaluating the Z-HEI in conjunction with other healthy diet indicators and apply the Z-HEI in larger, nationally representative datasets from Zambia to capture greater variability in dietary intake in relation to Z-HEI scores.

SOAP15_07

A SYSTEMATIC REVIEW AND META-ANALYSIS ON DIETARY BEHAVIOURS AND THE DEVELOPMENT OF OBESITY: AN OBCT STUDY

Lucrezia Bertoni[1]; Jentske Wertwijn[1]; Joline Wj Beulens[1]; Josine M Stuber[1]
[1]Epidemiology and Data Science, Amsterdam UMC, locatie AMC, Amsterdam, Netherlands

BACKGROUND AND OBJECTIVES
Obesity prevalence has reached an epidemic proportion, which RESULTS from contextual and individual risk factors including dietary behaviours such as snacking habits or cooking skills. Young adults are particularly vulnerable to gaining excessive weight following changes in dietary behaviours or habits which can be partly explained by countering life transitions such as starting a new job, cohabitation, or starting a family. Systematically evaluated high quality evidence on the influence of various dietary behaviours on the development of obesity is, however, lacking. The objective of this systematic review and meta-analysis is thus to evaluate the available evidence on the longitudinal association between various actionable dietary behaviours and obesity development in (young) adults.
METHODS

The systematic review followed PRISMA 2020 guidelines and was registered in PROSPERO [ID:CRD42024611490]. A literature search in Medline, Embase and APA PsycInfo was performed up to November 20, 2024, in collaboration with a medical librarian. We will include prospective cohort studies and RCTs conducted in the general population aged 18–40 years at baseline. Included dietary behaviours are: meal frequency, timing or skipping; snacking; portion size; eating rate or speed; cooking skills; mindful eating; purchasing habits; social eating; and eating out. The primary outcome is defined as obesity development (BMI ≥30 kg/m²); secondary outcomes are overweight, morbid obesity, changes in BMI, weight and adiposity. Risk of bias will be assessed using the Cochrane Risk of Bias tool and the Newcastle-Ottawa Scale. ASReview and Covidence software will be used for screening and for data extraction and quality appraisal, respectively.

RESULTS
This systematic review is currently in progress. The search string yielded 44,469 unique hits, and we are now in the process of screening titles and abstracts. RESULTS will be available at the time of the conference.
CONCLUSIONS
The RESULTS will reveal knowledge gaps, inform future research priorities, and will inform dietary guidelines on actionable dietary behavior recommendations to prevent obesity in young adults, a population vulnerable to excessive weight gain and in which early obesity prevention is key in order to reduce chronic disease incidence later in life.
CONFLICTS OF INTERESTS

SOAP15_09

COMMERCIALLY PRODUCED FOOD FOR CHILDREN AGED 6-36 MONTHS AND POLICY GAPS IN CHINA

Junhua Han[1]; Mengjie Qiu[2]; Chao Gao[3]; Dongmei Yu[4]; Pengfeng Qu[5]; Feng Pan[5]
[1]Secretariat, Chinese Nutrition Society, Beijing, China; [2]Department of International Communication, Chinese Nutrition Society, Beijing, China; [3]Department of Food Nutrition Evaluation, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China; [4]Department of Nutrition Epidemiology, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China; [5]Food Safety Standards, China National Center for Food safety Risk Assessment, Beijing, China

BACKGROUND AND OBJECTIVES

Providing nutritious, safe, diverse, and affordable foods for children aged 6-36 months is critical. The market for commercially produced complementary foods (CPFC), such as instant cereals, purées, and snacks, has grown significantly in China, from $0.5 billion in 2008 to $7.5 billion in 2022[1]. This study evaluates the current state of CPFC in China and identifies policy gaps to inform future regulations.

METHODS

1. Analyzed national databases and literature to assess the dietary intake and nutrient status of Chinese children aged 6-36 months.

2. Conducted surveys with 368 caregivers to understand CPFC usage and purchase motivations.

3. Reviewed national CPFC standards and legislation for alignment with international guidelines.

4. Established a CPFC database and evaluated products using national and international standards for nutrient composition and labeling practices.

RESULTS

Dietary assessments revealed excessive protein intake and insufficient calcium, vitamin B1, and vitamin C consumption among children aged 24-36 months. While most caregivers (86.27%) prepare complementary foods at home, 85.97% also purchase packaged CPFC. A total of 1,017 CPFC samples from 21 brands were collected, representing 57% market coverage. Compliance with Chinese infant food standards varied by category: 100% for mixed purées, 77.2% for cereal products, 69.4% for fruit and vegetable products, 38.9% for meat products, and 24.3% for dairy products. Snacks, candies, and beverages universally failed to meet standards.

CONCLUSIONS

While China has implemented comprehensive laws, policies, and guidelines largely aligned with WHO recommendations and CODEX, but there still some gaps remain in CPFC quality and compliance. Strengthened regulatory frameworks and consumer education are needed to ensure CPFC support optimal child nutrition.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

SOAP15_11

APPETITE LOSS ACROSS THE LIFESPAN: INSIGHTS FROM BIOLOGICAL MARKERS

Annelie Turesson[1]; Philipe De Souto Barreto[2, 3, 4]; Margaretha Nydahl[1]; Afsaneh Koochek[1]
[1]Department of Food Studies, Nutrition and Dietetics, Uppsala University , Stockholm, Sweden; [2]Institute on Aging, Toulouse University Hospital, Toulouse, France; [3]CERPOP UMR, University of Toulouse III, Toulouse, France; [4]Department of Food Studies, Nutrition and Dietetics, Uppsala University, Stockholm, Sweden

BACKGROUND AND OBJECTIVES

Appetite loss affects 15–30% of older adults, leading to reduced energy intake, nutritional deficiencies, malnutrition, and increased mortality. Age-related changes in metabolism and digestion can worsen appetite loss and nutrient deficiencies, accelerating the aging process. Following that, knowledge regarding biological markers of aging such as epigenetic clocks (Horvath's, Hannum's, PhenoAge, GrimAge) might offer insights into these mechanisms. Therefore, the objectives are to compare biological markers of aging in older adults with and without appetite loss and to explore its association. Understanding the biological mechanisms behind appetite loss can help identify risks and develop targeted solutions to improve nutrition, health, and independence for healthy aging.

METHODS

This cross-sectional study utilized data from the INSPIRE T cohort in France, which aims to enhance healthy aging by identifying biomarkers associated with aging and age-related diseases. By 2024, 47 out of the included 1,099 participants reported appetite loss. A case-control design was implemented, matching these 47 cases with 94 controls based on sex, age, and body mass index (BMI). Descriptive statistics and logistic regression analyses were performed to compare biological markers, adjusting for psychological state, weight loss, medication use, and cognitive function.

RESULTS

The 141 matched participants had similar characteristics in terms of sex (68% women), age (mean 74 years), and BMI (mean 26 kg/m²) due to the matching design. However, participants with appetite loss (cases) reported taking more medications (6 vs. 3 per day), exhibited greater weight loss (17% vs. 2%), and showed more depressive symptoms (68% vs. 28%). Detailed RESULTS and tables will be presented at the conference.

CONCLUSIONS

This study found no significant associations between biological markers of aging and appetite loss. As a pioneering study investigating how aging biology relates to appetite loss, these RESULTS may have been influenced by the use of a single-question assessment, which did not capture the severity of appetite loss. Future investigations using the INSPIRE dataset will address this by using a measure of appetite severity. Additionally, a larger sample size and longitudinal design will be essential to better understand the mechanisms underlying appetite loss and to develop targeted interventions for promoting healthy aging.

SOAP15_12

DIABETES-RELATED DIETARY PATTERNS AND ENDOMETRIAL CANCER RISK AND SURVIVAL IN THE EPIC STUDY

Luisa Fernanda Torres Laiton[1]; Leila Luján-Barroso[1]; Carlota Castro-Espin[1]; Nuria Nadal-Zaragoza[1]; Paula Jakszyn[1]; Marta Crous-Bou[1]
[1]Unit of Nutrition and Cancer (UNAC), IDIBELL Institut d'Investigació Biomèdica de Bellvitge, L'Hospitalet de Llobregat, Spain

BACKGROUND AND OBJECTIVES

Endometrial cancer (EC) major risk factors include obesity and diabetes, both strongly related with lifestyle choices and dietary factors. (1) Our study aimed to evaluate the relationship between diabetes related dietary patterns (DP) and EC risk and survival in a population of middle-aged European women.

METHODS

A total of 285.418 female participants from the European Prospective Investigation into Cancer and Nutrition (EPIC) study were included in the present analysis. (2) In total 1.955 incident EC cases were registered, of those 380 women died, including 133 from EC.

The Empirical Dietary Index for Hyperinsulinemia *EDIH,* (3) the Empirical Dietary Index for Insulin Resistance *EDIR*, (3) and the Diabetes Risk Reduction Diet *DRRD,* (4) were estimated from dietary information collected at baseline from EPIC participants. (2) Cox proportional hazards regression models were used to evaluate the association between the diabetes-related DP and EC risk, using hazard ratios (HR) and 95% confidence intervals (CI), and adjusting for relevant confounders. Cox and Fine-Gray models were used to assess the association of DP with overall and EC-specific mortality respectively.

RESULTS

The mean BMI was 24.68 Kg/m² (SD 4.3), EC cases had a higher BMI 26.85 Kg/m² (SD 5.3), and a larger waist circumference 84.26 cm (SD 12.6). Higher adherence to EDIR and EDIH was associated with an increased risk of EC. Multivariable HR for the highest versus lowest tertile of adherence were 1.19 (95%CI = 1.06-1.34) for EDIR and 1.14 (95%CI = 1.01-1.27) for EDIH. However, when BMI was included in the models, these associations became weaker and no longer statistically significant for both EDIR 1.11 (95% CI = 0.99 to 1.25) and EDIH 1.07 (95% CI = 0.95-1.20). No associations were observed between EC risk and adherence to DRRD. Higher associations between adherence to EDIR and EC risk were observed among women with overweight and obesity HR 1.16 (95% CI = 1.00-1.35) as for the group of physically inactive women HR 1.24 (95% CI = 1.07-1.44). No relevant differences were observed among subgroups for the other DP. No associations were found in relation to the three diabetes-related DP and survival.

CONCLUSIONS

This study highlights the potential role of etiology-derived DP in disease prevention. The link between diets that promote hyperinsulinemia, insulin resistance and the increased risk of developing EC is mediated by BMI. Overweight, obese, and physically inactive women appear to be at a higher risk when adhering to dietary patterns such as EDIR.

SOAP 18 - PUBLIC HEALTH AND NUTRITION THROUGHOUT LIFE CYCLE

SOAP18_01

A COMMUNITY ASSET MAP OF CONTEXTUAL DETERMINANTS OF ENVIRONMENTAL FACTORS INFLUENCING NUTRITION, WELLBEING AND SOCIAL ENGAGEMENT OF OLDER ADULTS

Sophia Doyo Amenyah[1, 2]; Alison Benzimra[3]; Lee-Ann Fenge[4]; Jane Murphy[4]; Camila Devis-Rosental[5]
[1]Health and Life Sciences, Northumbria University, Newcastle upon Tyne, United Kingdom; [2]Faculty of Health and Life Sciences, Northumbria University, Newcastle upon Tyne, United Kingdom; [3]United St Saviour's Charity, United St Saviour's Charity, London, United Kingdom; [4]Faculty of Health and Social Sciences, Bournemouth university, Bournemouth, United Kingdom; [5]Office of the Vice-Chancellor, Bournemouth University, Bournemouth, United Kingdom

BACKGROUND AND OBJECTIVES

Older adults living in urban communities from low socioeconomic backgrounds are more likely to reside in deprived neighbourhoods and experience poorer health outcomes. Understanding the influence of neighbourhood environments on dietary choices, physical activity, and social engagement is crucial for developing targeted interventions. The objective of this research was to explore neighbourhood food, social and physical environment as contextual factors influencing nutrition, physical and social activity of older adults living in an inner-city community.

METHODS

A community asset mapping (CAM) exercise was conducted as part of the incLusivE coMmunity fOod model for health wellbeiNg and sociAl connectedness of olDer pEople (LEMONADE) project (https://www.bournemouth.ac.uk/research/projects/lemonade). CAM is a strength-based approach to community development that focuses on assets, resources and promotes community engagement. The CAM approach enabled sequential identification, ranking and documenting of resources and barriers to healthy food options, improved physical and social activity in Bermondsey, an inner-city area in London. The mapping exercise included a community walk followed by an insight session to gain in-depth understanding of the facilitators and barriers. Inductive thematic analysis was conducted to develop and refine emerging themes.

RESULTS

Participants (n 7) were 71 (65-78) years old, 57% female, 85.7% were married, had compulsory schooling (71.4%), with annual household income less than £20,000 (57.1%) and were all retired. Places identified as important in influencing nutrition, physical and social activity included local grocery shops, pharmacies, post offices, community green spaces and betting shops. Emerging themes on facilitators included availability of green spaces, friendliness of staff, opportunities for socialisation and costs. Barriers included limited access to local markets, nutritious and fresh produce, cost, safety concerns, lack of accessible transport and limited offers of diverse social engagement activities.

CONCLUSIONS

This research provides insights into the contextual determinants of dietary choices, social engagement and physical activity of older adults living in socially-deprived urban areas. Comprehensive assessments that consider the combined influence of food access, social networks, and physical infrastructure on the health and wellbeing of older adults are required to enable the co-design of environments suitable for improving quality of life in older adults.

SOAP18_02

FEEDING BEHAVIOUR AND SATIATION RESPONSES IN MALNOURISHED AND HEALTHY CHILDREN IN URBAN GHANA: IMPLICATIONS FOR CAREGIVER PRACTICES AND CHILD NUTRITION

Eunice Nortey[1]; Matilda Asante[1]; Freda Intiful[1]; ; Ada Lizbeth Garcia,[2]; Charlotte Magaret Wright,[2]
[1]Department of Dietetics, School of Biomedical and Allied Health Sciences, University of Ghana, Accra, Ghana; [2]Human Nutrition, School of Medicine, Dentistry and Nursing, University of Glasgow, Glasgow, United Kingdom

BACKGROUND AND OBJECTIVES

Infant malnutrition remains a significant concern in Ghana. Feeding behaviour, especially children's capacity to regulate energy intake, is essential to preventing malnutrition and energy regulation could play a key role in maintaining healthy weight and growth. This study evaluated feeding behaviour and satiation responses in undernourished children (moderate acute malnutrition (MAM) and/or stunting) compared to healthy peers in urban Ghana.

METHODS

The study had two phases. Phase one was a cross-sectional assessment (n=262) that used the International Complementary Feeding Evaluation Tool (ICFET) to examine feeding behaviours. Phase two was an experimental crossover preload study (n=41) conducted in the homes of participants. Healthy and malnourished children consumed a high (average 100kcal)- or low (9kcal/100ml)-energy drink before an ad libitum lunch (energy intake assessed using bomb calorimetry), assessing their compensation ability. Variation in food energy compensation was related to nutritional status, categorizing the children into three groups: less than 30% compensation (little to no regulation), 30-100% (normal compensation), and over 100% (overcompensation).

RESULTS

There were 41 children (17 MAM, 12 stunted and 12 healthy) involved in the study. MAM children demonstrated significantly lower appetite scores (-0.27 ± 1.1 vs 0.10 ± 0.9, p=0.01), higher food refusal (0.22 ± 1.1 vs -0.08 ± 0.9, p=0.032), and elevated caregiver feeding anxiety (0.49 ± 1.0 vs -0.18 ±1.0, p <0.001) compared to healthy children. In the preload study, the median compensation index (COMPX) was 24.6% (P25/75 =-10.5, 24.6), indicating limited energy compensation across groups. Notably, 41.2% of MAM and 66.7% of stunted children exhibited minimal or no compensation, while 35.3% of MAM children overcompensated. No stunted children overcompensated (p=0.023). Healthy controls demonstrated a median compensation of 35.2 % (P25/75= 11.1, 102.7).

CONCLUSIONS

The study highlights significant variations in eating behaviour and some possible differences in appetite regulation between malnourished and healthy children. MAM children have lower appetite and more food refusal and may reach satiety faster, whereas stunted children may eat beyond hunger. Interventions focusing on caregiver feeding practices and responsive feeding behaviors may enhance energy balance and reduce malnutrition risk in Ghanaian children.

ADDRESSING ACUTE MALNUTRITION USING A HOLISTIC MULTICRITERIA APPROACH BEYOND WEIGHT GAIN (IN A PRECLINICAL MODEL)

Aurelie Bechoff[1]; Peter Akomo,[2, 3]; Laura Utume,[4, 1]; Molly Muleya,[5]; Anastasios Tsaousis,[6]; Charoula Nikolaou,[1]; Jerome Janssen[7]; Kendra Byrd[1]; Andrew Westby[8]; Ram Reifen[7]; Efrat Monsonego-Ornan[7]
[1]Food and Market, Natural Resources Institute, Chatham Maritime, United Kingdom; [2]Department of Food Science, Nutrition and Technology, University Of Nairobi - Main Campus, Nairobi, Kenya; [3]Valid Nutrition, Valid International, Cork, Ireland; [4]Department of Biological Sciences, Benue State University, Makurdi, Nigeria, Federal Republic of; [5]School of Biosciences, Division of Food, Nutrition and Dietetics, University of Nottingham, Sutton Bonington Campus, Loughborough, United Kingdom; [6]School of Natural Sciences, University of Kent, Canterbury, United Kingdom; [7]Department of Biochemistry and Nutrition, Hebrew university, Rehovot, Israel; [8]Vice-Chancellor's Office, University of Greenwich, Greenwich, United Kingdom

BACKGROUND AND OBJECTIVES

A staggering one million children die every year of undernutrition. The primary treatment is a paste-like product called Ready-to-Use Therapeutic food (RUTF). Recovery is measured by weight gain, however, other parameters such as linear growth, micronutrient status, and functional outcomes i.e. cognitive development and microbiome diversity could provide important indicators concerning nutritional status and recovery state. Until recently, WHO stipulated that a minimum of 50% of the protein in RUTF should come from dairy products (1), limiting product development, especially in sub-Saharan Africa, where the dairy industry is not well developed. However, in 2022, the CXG 95-2022-UNICEF Codex Guideline (2) allowed the use of non-dairy alternative formulations, opening opportunities for new product development. We have used a preclinical model to predict malnutrition and its recovery with two-fold objectives: 1) optimise RUTF for parameters beyond weight gain and 2) promote the use of African-based ingredients for RUTF to support local economies.

METHODS

3-week-old-Sprague Dawley female rats were assigned to 6 groups in a 6-week experiment with 8 rats per group. Rats were split into healthy (control diet) or undernourished (diet limited in protein), and after 3 weeks, fed the same diets, the commercial RUTF (peanut-milk based,with 13% protein), or the novel RUTF (African plant-based modified SMS: Soybean Maize Sorghum,with 18% protein) (3). Beyond the standard anthropometric measurements (weight and length), we measured bone quality, the gut microbiome (using 16S rRNA sequencing), and NMR metabolomics on stool and serum samples (4).

RESULTS

The undernourished rats fed the novel RUTF demonstrated significantly greater catch-up weight and length gain with the compared to the undernourished rats on the commercial RUTF or control diet. Furthermore, the healthy rats fed the commercial RUTF experienced less weight gain than those fed the novel RUTF (3). The bone quality, gut microbiome, and metabolomes also significantly differed by treatment group.

CONCLUSIONS

Our findings demonstrate that the novel, plant-based RUTF was superior to the commercial RUTF. Locally sourced, culturally acceptable, dairy-free, cost-effective formulations could offer a suitable alternative for developing accessible and efficacious malnutrition treatments. These preliminary findings generated through this multidisciplinary approach will guide RUTF optimisation, strengthen novel RUTF's scientific foundation, and pave the way for evidence-based clinical trials to improve global malnutrition treatment strategies.

Multi-Trajectories of Macronutrient Intake and All-Cause Mortality, Hypertension among Chinese adults: RESULTS from the China Health and Nutrition Survey (1991–2015)

Ding Gangqiang[1]; Lina Huang[2]; Wang Zhihong[1]
[1]National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China;
[2]School of Nursing, Nanjing University of Chinese Medicine, Nanjing, China

BACKGROUND AND OBJECTIVES

Studies on the secular trend of the macronutrient intake, and its potential impact on the risk of all-cause mortality and hypertension have been inconclusive. The present study aimed to explore the long-term trajectories of macronutrient consumption and determine their association with all-cause mortality and hypertension risk among Chinese adults.

METHODS

We used the data from the China Health and Nutrition Survey, total of 9,661 participants were included in the analysis. Group-based multi-trajectory modeling was conducted to determine the multi-trajectory groups of macronutrient intake. And estimated their association with all-cause mortality and hypertension risk by Cox regression and binary logistics regression models, respectively. A restricted cubic spline was performed to determine the nonlinear relationships of mean macronutrient intake with mortality and hypertension.

RESULTS

Four trajectories groups were identified" moderate low protein, increasing high fat, decreasing low carbohydrate" (Group1), "moderate low protein, low fat, excessive carbohydrate" (Group2), "moderate increasing protein, moderate high fat, moderate low carbohydrate" (Group3)," moderate low protein, increasing fat, decreasing carbohydrate" (Group4). Compared with the Group3, both Group2 and Group4 were associated with higher risk of all-cause mortality (HR: 3.232, 95%CI: 2.155,4.845; HR: 1.601, 95%CI: 1.099,2.332, respectively), and showed a U-shaped relationship between mean energy intake proportion from protein, fat and carbohydrate with all-cause mortality(p for nonlinear < 0.001). Additionally, Group 1 and Group4 have positive association with risk of hypertension (OR: 1.201, 95%CI: 1.038,1.388; OR: 1.21, 95%CI: 1.026,1.426).

CONCLUSIONS

Relatively moderate increasing protein, moderate high fat, moderate low carbohydrate have a lower risk of all-cause mortality and hypertension. Considering the health effects can vary widely depending on the quality of macronutrient food sources. The causality of these connections is necessary to further determine and verification.

SOAP18_08

MAPPING THE EXTENT OF IMPLEMENTATION OF SCHOOL FOOD AND NUTRITION INTERVENTIONS AT POLICY AND SCHOOL LEVELS IN KENYA

Milka Wanjohi[1]; Mathilde Savy[2]; Housna Hassani[2]; Ursula Trübswasser[2]; Alice Ritho[1]; Dickson Amugsi[1]; Michelle Holdsworth[2]; Agnes Le Port[2]
[1]Nutrition and Food Systems Unit, African Population & Health Research Centre, Nairobi, Kenya; [2]UMR MoISA, Univ Montpellier, CIRAD, CIHEAM-IAMM, INRAE, Institut Agro, IRD, Montpellier, France

BACKGROUND AND OBJECTIVES

In Kenya, undernutrition among adolescents remains high while overweight/obesity are increasing, especially in urban contexts. Schools have become important settings for implementing nutrition programs targeting adolescents. The objective of this study was to map the extent of implementation of comprehensive school food and nutrition programs (SFNPs) at policy and school levels in Kenya.

METHODS

A scoping review identified good practices indicators for implementation of SFNPs, classified into 26 components, across 5 domains: school premises, school community, external school food environment (SFE), school policy environment, and cross cutting issues. We conducted a desk review of national policy documents, semi-structured interviews (SSI) with policy makers (n=2) and program implementers (n=2), and a survey in 30 schools in Nairobi (urban) and Kiambu (peri-urban) combining school observations (n=30), including school kitchens, meals services and playgrounds, and SSI with school heads (n=30) and caterers (n=27).

RESULTS

At policy level, 19 components were partially or fully addressed in Kenyan policy documents. At school level, only the *Nutrition education* component was fully implemented; 14 were partially and 4 not implemented at all. Policy actions were strong in areas of *Food safety, Water, Sanitation, and Hygiene, Health and Nutrition services*, within the school premises, but could be better implemented at school level to align with existing policies. Other components, such as *Food provision*, *School gardens*, *Community capacity*, *Community involvement and Farmers livelihood* need to be strengthened both at the policy and school level. No policy actions targeted the external SFE. Cross cutting issues like *Gender, Inclusion*, and *Environmental sustainability* were only partially addressed in policy documents.

CONCLUSIONS

Substantial policy guidance and implementation of SFNPs exists in Kenya but focuses almost exclusively on the internal SFE. Several recommendations to policy makers and implementers at national, county, school, and community level emerged to strengthen implementation of comprehensive SFNPs. These recommendations orientated subsequent participatory workshops with the school community to identify and reflect upon the challenges and solutions to SFNPs implementation in urban and peri-urban settings in Kenya.

SOAP18_09

THE ASSOCIATION BETWEEN TOTAL, ANIMAL-BASED, AND PLANT-BASED PROTEIN INTAKE AND COGNITIVE FUNCTION AND DECLINE IN COMMUNITY-DWELLING OLDER ADULTS

Hanneke Wijnhoven[1]; Maud Peperkamp[1]; Marjolein Visser[1]; Margreet Olthof[1]
[1]Health Sciences, Vrije Universiteit Amsterdam, Amsterdam, Netherlands

BACKGROUND AND OBJECTIVES

Higher protein intake may benefit cognitive function, but the evidence is inconclusive. This study examined associations of total, animal-, and plant-based protein intake and cognitive function and decline in older adults.

METHODS

Data were analysed from 1,339 community-dwelling adults aged 55+ participating in the Longitudinal Aging Study Amsterdam. Protein intake, measured via a Food Frequency Questionnaire (2014–2015), was expressed as energy percentage (%E) from total, animal-, and plant-based sources. Cognitive domains—global cognition (MMSE), information processing speed (Coding task), episodic memory (15WT), and executive function (Word Fluency)—were measured every three years (2011–2021) and converted to z-scores. Linear mixed models evaluated associations between cognitive function and decline (testing interaction by age), adjusting for confounders including diet quality. Sex interactions were tested.

RESULTS

Mean protein intake was 1.1 g/kg/d (SD: 0.3). Higher protein intake (%E) was associated with lower episodic memory (Q2–Q4 vs Q1, β_Q4=-0.18 (-0.30;-0.06)) and faster decline in global cognition (Q3 vs Q1, β=-0.02 (-0.03;-0.00)) and processing speed (Q3 vs Q1, β=-0.02 (-0.03;-0.01)). RESULTS were comparable for total protein intake in g/adjusted kg/d. Animal-based protein intake was associated with faster decline in processing speed (Q3,Q4 vs Q1, β_Q4=-0.01 (-0.02;-0.00)). Plant-based protein intake was associated with higher processing speed in females only (Q4 vs Q1, β=0.31 (0.09;0.53)) and lower episodic memory (Q4 vs Q1, β=-0.16 (-0.30;-0.02)). No associations were found for executive function.

CONCLUSIONS

These findings suggest protein intake does not benefit cognitive function in older adults. Negative associations may relate to protein food sources.

CONFLICTS OF INTERESTS

FOOD INSECURITY AND BODY MASS INDEX ARE ASSOCIATED WITH DEPRESSIVE SYMPTOMS AMONG ADOLESCENTS IN YOGYAKARTA PROVINCE, INDONESIA, DURING THE COVID-19 PANDEMIC: A ONE-YEAR LONGITUDINAL STUDY

Muhammad Asrullah[1]; Ahmad Watsiq Maula[2]; Shita Listya Dewi[3]; Siti Helmyati[4]; Alida Melse-Boonstra[1]
[1]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [2]Biostatistic, Epidemiology, and Population Health, Faculty of Medicine, Public Health, and Nursing, Universitas Gadjah Mada, Yogyakarta, Indonesia; [3]Centre for Health Policy and Management, Faculty of Medicine, Public Health, and Nursing, Universitas Gadjah Mada, Yogyakarta, Indonesia; [4]Department of Nutrition - Center for Health and Human Nutrition, Universitas Gadjah Mada, Yogyakarta, Indonesia

BACKGROUND AND OBJECTIVES

The COVID-19 pandemic has presented multifaceted challenges globally, impacting adolescent health. Among these, food security and nutrition are intertwined closely with mental health outcomes. In Indonesia, with its diverse socio-economic landscape, these interconnections may have been exacerbated by the pandemic. This study investigated the relationship between food security, nutrition, and adolescent mental health in Indonesia during COVID-19

METHODS

Longitudinal data were collected from 511 adolescent boys and girls in 2021-2022 in Gunungkidul district, Yogyakarta. Food security was measured using the Household Food Insecurity Access Scale, and the validated Kessler-10 Psychological Distress Scale was used to measure adolescent depression. Weight and height were measured to assess nutritional status. Anthropometric measurements were recorded twice, with an acceptable difference of 0.2 cm and 0.1 kg. Multivariate linear regression and linear mixed-effects regression were employed to explore associations between these variables while adjusting for sex, age, pubertal status, and household income

RESULTS

There was a large reduction in depression from 28.3% in 2021 to 6.9% in 2022. Reversely, anaemia was more prevalent at follow-up (32.1%) compared to baseline (23.4%), and was more prevalent among girls compared to boys (year 2021: 33.5 vs 12.7 and year 2022: 45.5 vs 18.7, respectively). Notably, there was an improvement in the prevalence of inadequate diet diversity (7.5% vs 1.6%), a reduction in the consumption of high-risk foods (73.1% vs 32.7%), and an increase in food security (59.9% vs 67.5%) after one year of follow-up. In the longitudinal analysis, food insecurity score was positively associated with depressive symptoms (β: 0·72, 95 % CI 0·52, 0·92), while BMI z-score was inversely associated (β: −0·31, 95 % CI 0·68, −0·03). We found an increase in strength of association between food insecurity and depressive symptoms over time (moderately food-insecure: β: 1·36 (95 % CI −0·10, 2·83) to 4·63 (95 % CI 2·17, 7·09); severely food-insecure: β: 1·89 (95 % CI 0·36, 3·41) to 3·30 (95 % CI 1·50, 5·10).

CONCLUSIONS

Depressive symptoms were positively associated with food insecurity scores and inversely associated with BMI. Enhancing food access, improving nutritional status, and providing mental health support are crucial components of adolescent health.

IODINE INTAKE IN TRANSITION: FROM TABLE SALT TO PROCESSED FOODS IN SENEGAL

Rita Wegmüller[1]; Maguette Fall Beye,[2]; Ndeye Fatou Ndiaye[3]; Volkan Cakir[2]; Ndèye Yaga Sy; Sitor Ndoure[2]; Maty Camara[4]; Malick Anne[4]; Nafissatou Lo[5]; Fabian Rohner[1]; Nicolai Petry[1]; Valeria Galetti[1]
[1]-, GroundWork, Fläsch, Switzerland; [2]-, Helen Keller INTL - Regional & Senegal, Dakar, Senegal; [3]-, ITA Food Technology Institute, Dakar, Senegal; [4]-, Ministry of Health and Social Action, Dakar, Senegal; [5]-, Conseil National de Développement de la Nutrition, Dakar, Senegal

BACKGROUND AND OBJECTIVES

Iodine is a vital micronutrient, essential for thyroid function and metabolic regulation. Universal Salt Iodization has been a global strategy to prevent iodine deficiency disorders. In Senegal, iodization of salt became mandatory in 2001. However, evidence shows declining household iodized salt coverage.This survey aimed to assess iodine status and household coverage of adequately iodized salt and to estimate the contribution of various dietary sources to iodine intake.

METHODS

This national cross-sectional survey, conducted in 2023, used stratified sampling across five geographic strata. Data were collected from 866 households and from 657 non-pregnant women aged 15-49 years. Household salt iodine concentration and urinary iodine concentration (UIC) were measured. Dietary iodine sources were apportioned to estimate intake from native sources, iodized salt in processed foods, and iodized household salt using statistical models integrating urinary sodium concentrations.

RESULTS

Coverage with adequately iodized salt was low (19%), with higher availability in urban areas (27% vs. 13%). Overall, median iodine concentration was low with 3.2 ppm. However, the median UIC of 252 µg/L indicated iodine sufficiency, yet regional disparities exist, with some areas showing more than adequate iodine levels. Women in urban areas showed higher UICs than those in rural areas, likely due to a higher contribution from adequately iodized salt. Household salt contributed modestly to iodine intake (9% in urban and 5% in rural areas), while processed foods, including bouillon, accounted for 49%, and native iodine sources for 44% of the dietary iodine intake.

CONCLUSIONS

Iodine sufficiency among Senegalese women, despite declining coverage of adequately iodized household salt, highlights the critical role of processed foods as a dietary iodine source. Strategies should focus on effective monitoring of iodized salt used in processed foods as well as on regular monitoring of iodine status to avoid excess intake while ensuring continued sufficiency in all population groups.

EFFECT OF SEX AND OBESITY INDICES ON CARDIOMETABOLIC RISK AMONG CHILDREN AGED 10–16 YEARS

Sayeeda Arshiya Farheen[1]; Deepa Puttaswamy,[1]; Sumithra Selvam[2]; Jini V Arvind[1]; Rebecca Kuriyan[1, 3]
[1]Nutrition, St. John's Research Institute, Bengaluru, India; [2]Epidemiology and Biostatistics, St. John's Research Institute, Bengaluru, India; [3]Physiology, St John's Medical College, Bengaluru, India

BACKGROUND AND OBJECTIVES

Sexual dimorphism influences body composition and metabolic health, yet its impact on cardiometabolic risk (CMR) in children remains underexplored. The objectives of the study were to investigate the sex-specific differences in CMR and to assess the sensitivity of three obesity indices (% fat mass (FM), body mass index (BMI) and waist to height ratio (WHtR), to identify CMR in children aged 10–16 years.

METHODS

Healthy children (n = 3,563), aged 10–16 years, were assessed cross-sectionally for anthropometry and body composition (BOD POD, Cosmed, Italy). BMI, BMI-for-age Z-scores (BAZ), and WHtR were calculated. Obesity categories were defined by BAZ (>+1 SD), %FM (>85th percentile), and WHtR (≥0.5). CMR markers included Total cholesterol (TC), Triglycerides (TG), Low density lipoprotein (LDL), High density lipoprotein (HDL), and Glycated hemoglobin (HbA1c), with abnormalities defined using NCEP guidelines. Regression analysis, adjusted for age, was used to evaluate sex-specific differences in CMR across obesity indices (interaction effect), and Receiver Operating Characteristic (ROC) curves was used to assess the sensitivity of these indices in identifying CMR.

RESULTS

Mean age was 13.4±1.8 years; 54.9% were females. Obesity prevalence by BMI, %FM, and WHtR, was 18.7%, 16.2%, and 44.8%, respectively, while abnormal HDL, TG, HbA1c, TC and LDL were 38.6%, 25.5%, 16.2%, 2.8%, and 1.8%, respectively. A significant interaction was observed between sex and %FM categories for TC (β= 0.057, 95% CI: 0.003, 0.068, p=0.034) and HDL (β= 0.064, 95% CI: 0.009, 0.099, p= 0.018). Similarly, significant interaction between sex and WHtR categories was noted for TC (β= 0.066, 95% CI: 0.007, 0.056, p= 0.011) and TG (β= 0.061, 95% CI: 0.013, 0.138, p= 0.018), indicating significant sex differences for the specified parameters within %FM and WHtR categories. These differences were only observed within normal %FM and WHtR categories, with females having higher TC, TG, and lower HDL values. Using ROC, the optimal cutoff for identifying abnormal TC, TG, LDL, and HDL categories was WHtR of 0.5 and the 75th percentile for %FM. No significant sex differences were observed for BMI categories.

CONCLUSIONS

Sex-specific differences were observed in specific markers of CMR, within the normal categories of WHtR and %FM, with females having higher lipid levels. Simple indices of WHtR of 0.5 and 75th percentile of %FM can be used as effective screening tools for early identification of CMR in children.

IMPACT ON FOOD INSECURITY AND WELL-BEING OF A "CASH PLUS" PROGRAM COMBINING CASH TRANSFERS, SOCIAL ORIENTATION AND WORKSHOP ON SUSTAINABLE DIETS: A RANDOMIZED CONTROLLED TRIAL AMONG VULNERABLE HOUSEHOLDS IN FRANCE

Marlène Perignon[1]; Sabrina Eymard-Duvernay[1]; Christophe Dubois[2]; Maria Somaraki[1]; Alejandra Giraldo[1]; Camille Calandre[1]; Pierre Berri[1]; Pascaline Rollet[1]; Sophie Lochet[3]; Radjaa Kebiri[3]; Nadia Berrambou[4]; Morgan Couppa[4]
[1]MoISA, Univ Montpellier, CIHEAM-IAMM, CIRAD, INRAE, Institut Agro, IRD, Montpellier, France; [2]ActAP, ActAP, Marseille, France; [3]Action Contre la Faim, Action Against Hunger, Montreuil, France; [4]Fondation de l'Armée du Salut, Fondation de l'Armée du Salut, Paris, France

BACKGROUND AND OBJECTIVES

At least 8 million people are food insecure in France. The current food aid system – mostly based on food distribution – suffers from various flaws (stigmatization, lack of choice, etc) resulting in high rates of non-use. Cash transfer (CT) interventions have proven their worth internationally but studies on CT in France are scarce and no study explored the impact of unrestricted CT on household (HH) food security. The objective is to evaluate the impact, implementation process and cost-effectiveness of the "Passerelle Plus" program, which aims to reduce food insecurity among vulnerable HH by combining three components: unrestricted CT, social orientation, and a workshop on sustainable diets.

METHODS

A randomized controlled trial was conducted in Montreuil, France. HH in vulnerable situations were enrolled and randomized into 2 groups: 1) intervention group received a CT (60€/month/HH member) distributed for 4 months through a payment card that can be used in any store and allows cash withdrawals, and was offered a meeting with a social worker for social orientation, and to take part in a group discussion workshop on sustainable diets; 2) control group received the full program after the evaluation phase. Indicators of food security (Household Food Security Survey Module, r-copying strategy index, diet diversity) and well-being (mental well-being scale, social isolation) were measured by questionnaire before program implementation (baseline) and after 3 and 6 months. Monthly HH food purchases were collected after 3 months to assess impact on diet quality and environmental impacts. Qualitative interviews were conducted to document HH use of and satisfaction with the program, and as factors that hindered or facilitated its implementation. Costs associated with program implementation were collected to measure program cost-effectiveness.

RESULTS

A total of 342 HH (1254 persons) participated in the program; 172 were in the intervention group and received the CT, 94 attended the workshop, 73 met with a social worker. A total of 342 participants completed the baseline questionnaire: 82% were food insecure, 68% did not use food aid, mean well-being score was 25. RESULTS on program effectiveness on food security, well-being and food purchase quality, as well as findings from qualitative survey are not available at the time of abstract submission but will be presented at the congress.

CONCLUSIONS

This study is the first large-scale trial of unrestricted CT-based programs in France. It will enrich the knowledge on feasibility and impact of CT programs and feed into the debate on policies to prevent food insecurity and fight social inequalities in health.

SOAP18_15

THE URBAN AND RURAL FOOD ENVIRONMENT IN ZAMBIA AND ITS ASSOCIATION WITH DIET QUALITY

Taonga Chirwa-Moonga[1]; Ming-Jie F Duan,[2]; Bas J. Zwaan,[3]; Sijmen E. Schoustra,[3, 1]; Elise Talsma[2]
[1]Department of Food Science and Nutrition, School of Agricultural Sciences, The University of Zambia, Lusaka, Zambia; [2]Division of Human Nutrition and Health, Chair Group Global Nutrition, Wageningen University & Research, Wageningen, Netherlands; [3]Laboratory of Genetics, Wageningen University & Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES

The food environment determines the food choices that people can make, yet evidence of the extent to which differences between urban and rural areas in low- and middle- income countries is limited. The nutrition transition is becoming more evident in Zambia with rising rates of non-communicable diseases (NCDs). This study aimed to assess the perceived food environment in relation to diet quality in a rural and urban area of Southern Province in Zambia.

METHODS

Data was collected from 411 women aged 18–49 in Choma and Mazabuka districts in Zambia with a general questionnaire for socio-demographic information, and an adapted Nutrition Environment Measures Survey–Perceived (NEMS-P) questionnaire for the food environment. Dietary intake was assessed using a quantitative multiple-pass 24-hour recall administered on six non-consecutive days for each participant over a 3-week period. Diet quality was determined using the Global Diet Quality Score total (GDQS), GDQS healthy, GDQS unhealthy and mean probability of adequacy (MPA). Anthropometric measures assessed body mass index (BMI) and waist-hip ratio (WHR). Linear mixed-effect models were applied to estimate associations between the perceived food environment and GDQS indicators.

RESULTS

Local markets, small grocery stores, and own food production were primary food sources in both areas. Participants had a moderate risk of nutrient inadequacy and NCDs-related outcomes (62%), with GDQS healthy scores of 8.8 ± 3.4 and unhealthy scores of 12.1 ± 1.7. Rural participants had higher unhealthy GDQS scores ($p<0.05$). The overall MPA was 0.7 (range 0–1), the PA for calcium, riboflavin, and vitamin C was low (range 0 - 0.1), while the PA for iron, zinc, vitamin A, folate, and vitamin B6 were higher (PA > 0.8). Overall, the perceived food environment showed limited association with diet quality. The availability of healthy food in the home was associated with lower unhealthy GDQS scores (5 – 6 healthy foods in the home: (β = -0.388 [95% CI -0.711, -0.065]); 8 – 10 healthy foods in the home: (β = -0.615 [95% CI -1.025, -0.206]). Conversely, the availability of 1 - 2 unhealthy foods in the home was positively associated with the overall GDQS score (β = 0.251 [95% CI 0.005, 0.497]) and GDQS healthy (β = 0.342 [95% CI 0.093, 0.590]).

CONCLUSIONS

The nutrition transition is still in its early stages in rural and urban Southern Zambia. This provides a unique opportunity for food environment interventions that should focus on promoting healthy foods while limiting unhealthy ones in the home and in the local markets.

SOAP 21 - PUBLIC HEALTH AND NUTRITION THROUGHOUT LIFE CYCLE

SOAP21_01

INTRODUCTION OF BALANCED ENERGY PROTEIN (BEP) SUPPLEMENTATION THROUGH ROUTINE ANTENATAL CARE (ANC): CHALLENGES AND OPPORTUNITIES FROM A GLOBAL LANDSCAPE ANALYSIS

Ruth Waithira[1]; Habtamu Fekadu[2]; Joseph Gaithuma[1]; Ward Delaney[2]; Justine Kavle[3]
[1]Public Health Nutrition, Kavle Consulting, Nairobi, Kenya; [2]Global Health, Nutrition, Save the Children US, MOMENTUM Country and Global Leadership, Washington D.C., United States of America; [3]Public Health Nutrition, Kavle Consulting, Washington, United States of America

BACKGROUND AND OBJECTIVES

Underweight pregnant women (BMI <18.5kg/m2) in nutritionally vulnerable populations remain at risk of delivering preterm, low birthweight, and small for gestational age (SGA) infants. Compiled evidence shows BEP supplementation in underweight pregnant women led to reduced risk of low birthweight, SGA, and preterm birth, and improved maternal outcomes (i.e. gestational weight gain). The World Health Organization (WHO) recommends balanced energy and protein (BEP) supplementation during pregnancy in contexts where prevalence of underweight among pregnant women is ≥ 20%. Yet, many countries have not operationalized this BEP recommendation as part of routine ANC service delivery. The objectives of this presentation are to 1) provide in-depth understanding of enabling factors and challenges in the implementation of BEP supplementation through routine ANC, and 2) discuss program recommendations to guide country programs.

METHODS
A landscape analysis was conducted, using a mixed METHODSapproach of 1) qualitative key informant interviews with 13 country and global stakeholders and 2) a literature review of previous studies on BEP supplementation. Interviews were recorded and transcribed. Themes and subthemes were analyzed using Dedoose software.
RESULTS

Our landscape analysis revealed low awareness of BEP recommendations within WHO ANC guidelines among country stakeholders, lack of inclusion of BEP in most country ANC guidelines, and lack of clarity and specificity in the recommendations for undernourished populations. Further, challenges identified include: BEP is often not part of ANC services, provider capacity for BEP provision is weak, and stock outs of BEP supplies. There is a need for cost-effectiveness data, and information on feasibility and country readiness for the introduction of BEP supplementation through ANC platforms.

CONCLUSIONS

Country program implementers should consider aspects of service delivery, product identification and supplies, consumer demand, acceptability and adherence to successfully integrate BEP into ANC platforms. Monitoring of BEP supplementation via routine health systems is also sorely needed. At a global level, development of implementation guidance, and standardizing the BEP definition and indicators can aid countries to monitor BEP implementation and outcomes.

SHARED DRIVERS OF THE DOUBLE BURDEN OF MALNUTRITION AMONGST CHILDREN, ADOLESCENTS AND WOMEN OF REPRODUCTIVE AGE IN LOW- AND MIDDLE-INCOME COUNTRIES: A SYSTEMATIC REVIEW

Rebecca Pradeilles[1, 2]; Chris Carroll[3]; Michelle Holdsworth[1]; Meron Worku[4]; Oonagh Markey[5]; Heather Ohly[6]; Kaleab Baye[4, 7]; Roos Verstraeten,[8]; Sabrina Eymard-Duvernay[1]; Tadesse Zerfu[9]; Marie Ruel[2]

BACKGROUND AND OBJECTIVES

The coexistence of multiple forms of malnutrition is a severe public health problem in low- and middle-income countries (LMICs), affecting millions of people. Shifting policies and programs to address multiple forms of malnutrition simultaneously requires a deep understanding of the problem and its drivers. This systematic review synthesizes the socio-economic and nutritional drivers of the double burden of malnutrition (DBM) within individuals, and mother/child dyads or households in LMICs.

METHODS

We conducted a comprehensive search of five databases from 2010 to 2025. Inclusion criteria were: 1) children under five (U5), older children and adolescents (5-19y), and women of reproductive age (WRA) with different forms of malnutrition in LMICs; 2) studies of association between drivers and individual, dyad/household DBM; and 3) cross-sectional studies; randomized controlled trials (RCTs); non-RCTs; and cohort studies. Risk of bias was assessed using the JBI critical appraisal tool. A narrative synthesis was then performed. The protocol was registered on PROSPERO as CRD42023421457.

RESULTS

Of 20,144 citations identified, 77 articles covering over 90 countries and 1 million participants were included. These predominantly cross-sectional studies provided mostly good-quality evidence. Regarding socio-economic drivers, at both individual (WRA/children U5) and dyad/household levels, there was substantial evidence in support of a positive association between maternal/paternal education, household income/wealth, urban residence, and DBM. At the dyad/household level only, food insecurity was also positively associated with DBM. In contrast, the presence or type of employment was not associated with DBM at any level. Regarding nutritional drivers (e.g. nutrition knowledge; dietary diversity; micronutrient supplementation), there was limited evidence supporting an association with DBM at any level, except for the presence of breastfeeding (vs. absence) which was negatively associated with dyad/household level DBM.

CONCLUSIONS

Our findings highlight the need for double-duty actions that address the socio-economic and nutritional drivers of DBM, such as improving education and income opportunities, reducing food insecurity, and promoting breastfeeding. Policymakers and practitioners should prioritize these interventions to reduce the burden of malnutrition in LMICs.

INFANT FEEDING PRACTICES IN MALI: A QUALITATIVE STUDY OF MOTHERS, GRANDMOTHERS, FATHERS AND ELDERS IN RURAL AND URBAN AREAS

Adams Rachel[1]; Evans Asamane Atiah[2]; Sidibe Cheick[3]; Sfeir Selina[4]; Bajaj Mitali[5]; Diarra Youssouf[3]; Poole Chloe[4]; Weber Katinka[4]; Toure Ousmane[3]; Semira Manaseki-Holland[4]; Gale Nicola[6]; Griffiths Paula[7]
[1]Health Services Management Centre, School of Social Policy, University of Birmingham, UK, University of Birmingham, Birmingham, United Kingdom; [2]Department of Applied Health Research, University of Birmigham, UK., Birmingham, United Kingdom; [3]Applied Health and Research, University of Science, Techniques and Technology Bamako, Bamako,, Mali; [4]Applied Health and Research, University of Birmingham, Birmingham United Kingdom; [5]Epsom and St Helier University Hospitals NHS Trust, Wrythe Ln, Sutton, Carshalton SM5 1AA,, Epsom and St Helier University Hospitals NHS Trust, Wrythe Ln, Sutton, Carshalton, United Kingdom; [6]Health Services Management Centre, School of Social Policy, University of Birmingham, Birmingham United Kingdom; [7]School of Sports, Exercise and Health Sciences, University of Loughborough, Loughborough, Leicestershire, United Kingdom

BACKGROUND AND OBJECTIVES

Sub-Saharan Africa, including Mali, continues to experience high under-five mortality rates. Exclusive breastfeeding and sufficient nutrition are critical for reducing mortality and improving health and developmental outcomes. The WHO global strategy for infant and young child nutrition (IYCN) recommends breastfeeding from birth to benefit from colostrum, continued exclusively for 6 months, then breastfeeding plus energy rich, complementary feeding with nutrient dense, locally available foods containing micronutrients for at least 2 years. We explored local practices, identifying barriers and facilitators to optimal breastfeeding and complementary feeding in Mali, and the influence of traditional beliefs.

METHODS

We conducted qualitative, semi-structured focus groups (FGs) in 4 urban and 3 rural areas in Mali. Separate FGs were conducted in each community with mothers, grandmothers, fathers and elders (4 groups per community) who had children or grandchildren aged 6–24 months. Data were recorded, transcribed, translated and analysed thematically.

RESULTS

Administration of colostrum was considered important; however, the practice of exclusive breastfeeding was variable. The practices of giving water, juices, and medications including herbal remedies to children under six months were common. Participants varied in when they introduced complementary foods and stopped breastfeeding. Underlying determinants influencing participants' decisions were the need to return to work, cost, availability and convenience of complementary foods, as well as traditional beliefs e.g., eggs causing malaria. There were mixed messages regarding sugary or sweet foods. Participants described practices they had discontinued in response to healthcare advice, including mixing dates in hot water for infants less than six months old.

CONCLUSIONS

Health education has positively influenced breastfeeding and complementary feeding practices. However, challenges still remain e.g. financial barriers, the need to return to work/ school, excess sugar intake and taboos inhibiting consumption of protein rich foods like eggs. Health campaigns should: 1. Encourage locally available low-cost, nutrient rich, complementary feeding from 6 months 2. Support mothers and communities to discuss ways of overcoming local beliefs acting as barriers to IYCN. 3. Emphasise the importance of family support from all to facilitate mothers' breastfeeding and prioritise diverse, frequent, small, hygienically prepared meals for IYC. 4. Promote longer, paid maternity leave, part-time work arrangements, on-site crèches, and breastfeeding friendly workplace policies.

SOAP21_04

FOUR-DAY DIARIES ADAPTED TO PRIMARY SCHOOL CHILDREN TO ASSESS USUAL BEVERAGE INTAKE

Lucille Desbouys[1]; Wassila Assakali[1]; Isabelle Thiébaut[2]; Katia Castetbon[1]
[1]Research Center in Epidemiology, Biostatistics and Clinical Research, School of Public Health, Université Libre De Bruxelles / Campus Érasme, Brussels, Belgium; [2]., Club Européen des Diététiciens de l'Enfance, Ath, Belgium

BACKGROUND AND OBJECTIVES

Belgian children are particularly exposed to the consumption of sweetened beverages (SB). Evaluating nutritional health initiatives requires a reliable estimate of beverage consumption in youth. The DRINK trial has been set up to investigate the effectiveness of two-year interventions aimed at reducing the consumption of SB and increasing the consumption of tap water among primary school children. At baseline, our aim was to describe the usual daily beverage intake according to individual characteristics among 8-to-11-year-old pupils.

METHODS

Forty-six primary schools participated in the baseline data collection in 2021. Children completed an age-appropriate 4-day diary to record beverage consumption and a questionnaire on socio-demographic characteristics and propensity to consume water and SB. Their parents completed a complementary questionnaire. Usual daily beverage intakes were estimated by correcting for within-person variation using the Statistical Program to Assess Dietary Exposure (SPADE v. 4.1.24). Differences in intake by subgroup were considered statistically significant if the bootstrapped 95% CIs did not overlap. Over-reporters (8%) were excluded based on the mean +2 SD of total water (i.e. > 2,060 ml/day) and total beverages (i.e. > 2,366 ml/day).

RESULTS

Of the 3,631 pupils included, 2,013 returned a valid diary, child questionnaire, and parent questionnaire. Children usually consumed 1,109 ml/day (95% CI: 1,092-1,132) of total beverages, including 677 ml/day (660-699) of water, 345 ml/day (331-359) of SB, and 60 ml/day (56-64) of unsweetened milk. A higher parental education level was associated with a higher usual intake of total beverages (secondary or lower level: 1,072 ml/day (1,034-1,111) *vs*. post-secondary long: 1,154 ml/day (1,119-1,199)), water (591 ml/day (556-622) *vs*. 774 ml/day (736-818)) and unsweetened milk (54 ml/day (47-60) *vs*. 73 ml/day (63-81)), and with a lower usual SB intake (404 ml/day (374-434) *vs*. 279 ml/day (253-300)). Other socio-economic disparities were observed, most notably for water intake.

CONCLUSIONS

Our estimates, consistent with previous observations, support the reliability of the 4-day diary for assessing usual beverage intake in children, and strengthen the future generalizability of the trial findings. The overall high consumption of SB and socio-economic disparities, especially in water consumption, emphasize the need to reinforce nutritional interventions among disadvantaged children.

SOAP21_06

WHAT DOES ‘GOOD COOKING’ MEAN TO YOU? A PHOTOVOICE STUDY OF GHANAIAN WOMEN LIVING IN GHANA AND THE UK

Hibbah Osei-Kwasi[1]; Sawudatu Zakariah-Akoto[2]; Robert Akparibo[3]; Mary Nicolaou[4]; Michelle Holdsworth[5]; Paula Griffiths[1]

[1]School of Sports Exercise and Health Sciences, Loughborough University, Loughborough, United Kingdom; [2]Noguchi Memorial Institute for Medical Research, University of Ghana, Accra, Ghana; [3]School of Medicine and Population Health, The University of Sheffield, Sheffield, United Kingdom; [4]Department of Public and Occupational Health, Amsterdam Public Health Research Institute, Amsterdam, Netherlands; [5]UMR MoISA (Montpellier Interdisciplinary Centre On Sustainable Agri-Food Systems), Univ Montpellier, CIRAD, CIHEAM-IAMM, INRAE, Institut Agro, IRD, Montpellier, France

BACKGROUND AND OBJECTIVES

Cooking practices may be strongly associated with improved dietary outcomes. Cooking is deeply rooted in culture and tradition and influenced by the food environment. However, the nuanced perceptions of ‘good’ cooking are not yet fully understood. This study explored perceptions of ‘good’ cooking practices and compared the drivers of these practices among Ghanaian women living in the UK and their compatriots in Ghana.

METHODS

Data were collected through participatory photography involving Ghanaian women living in Greater Manchester, UK (n=31) and Accra, Ghana (n=30). Participants documented their cooking experiences on one or more cooking occasions, capturing elements such as ingredients, tools, places, activities, cooked dishes. They responded to prompts exploring what ‘good cooking’ means and factors that make it easier or harder. Photographs served as prompts in follow-up interviews to allow participants to narrate the ‘stories’ of their cooking. Inductive thematic analysis of interview data and photographs was conducted using NVIVO.

RESULTS

Five themes emerged, capturing perceptions of 'good' cooking: traditional practices, health and nutrition, love and care, authenticity and heritage, and nostalgia. Participants in both settings viewed traditional cooking as distinct, highlighting preparation from scratch, the use of locally sourced ingredients, and specialised tools, despite its time and energy demands. In Greater Manchester, authenticity and heritage were particularly significant. Drivers of "good" cooking were influenced by individual (e.g., time constraints), physical (e.g., kitchen space), social (e.g., family preferences), and macro-level (e.g., seasonality) factors. In Ghana, clean water, sanitation, and hygiene (WASH) were critical, with food adulteration/contamination concerns shared across both locations.

CONCLUSIONS

For Ghanaian women, cooking has a range of dimensions, and perceptions of ‘good’ cooking were linked to health but also had social and emotional associations. Additionally in Ghana, WASH needs urgent attention by policy makers to facilitate healthy cooking. There is the need for nutrition interventions to emphasise social, cultural, and emotional connotations of ‘good’ cooking in addition to the usual emphasis on physical health, for recommendations to resonate with women’s realities.

SOAP21_07

DIETARY DIVERSITY AND ITS ASSOCIATION WITH CHANGES IN ANTHROPOMETRIC INDICES OF COMMUNITY-DWELLING OLDER ADULTS IN TEHRAN, IRAN: A LONGITUDINAL STUDY (2017-2021)

Arezoo Rezazadeh[1]; Kimia Forouzan[2]; Rezaei Mahshid[1]; Eini-Zinab Hassan[1]; Omidvar Nasrin[1]; Delaram Ghodsi[2]
[1]Community Nutrition, NAtional Nutrition and food Technology research institute, Tehran, Iran, Islamic Republic of; [2]Department of Community Nutrition, Shahid Beheshti University of Medical Sciences, Tehran, Iran, Islamic Republic of

BACKGROUND AND OBJECTIVES

Dietary diversity refers to the consumption of a variety of foods or food groups over a given reference period, which is crucial for improving nutrition and overall health. This longitudinal study aimed to investigate the association between dietary diversity and anthropometric indices in community-dwelling older adults living in Tehran city in 2017 and 2021.

METHODS

The current study was conducted on 368 older adults [204 (55.4%) women and 164 (44.6%) men] over 60 years of age living in Tehran, who were selected by a systematic cluster sampling method at two-time points, 2017 and 2021. Anthropometric measures (weight, height, hip circumference, and waist circumference) were assessed with standard methods. The participants' dietary intake was assessed by completing two non-consecutive 24-hour recalls, and the dietary diversity score (DDS) was calculated based on Kant's method. Statistical analysis was performed using R software by the mixed effect model method.

RESULTS

The mean age was 67.06±5.52 and 70.89±6.48 years in 2017 and 2021, respectively. Moreover, the mean DDS of the elderly in 2017 (5.07±1.20) was higher than that in 2021 (4.94±1.09) ($p<0.05$). DDS and dairy diversity score decreased significantly over time. After adjusting for confounders, there was an inverse relationship between the DDS and BMI (Body Mass Index) (SE=0.09; B= -0.22), but the interaction effect of year × DDS (SE= 0.10; B = 0.19) was not significant (p=0.06). However, there was a positive relationship between the DDS and ABSI (A Body Shape Index) (p= 0.022; B= 0.00). After adjusting for confounders, this relationship was no longer significant. Additionally, the interaction effect of year and DDS on the ABSI was not significant.

CONCLUSIONS

The dietary intake and dietary diversity of elderly residents of Tehran declined dramatically with age, and a higher DDS was associated with improved anthropometric indices. DDS had an inverse relationship with general obesity in the studied participants, and the passage of time did not affect this relationship. The DDS can be used as a predictive index and is a powerful tool for investigating changes in nutritional status in longitudinal studies of old age. However, longer-duration studies are needed to obtain more conclusive RESULTS.

SOAP21_08

TRUST IN THE GOVERNMENT AND FOOD INDUSTRY AS WELL AS CLEAR AND TRANSPARENT COMMUNICATION ON FOOD PRODUCTS COULD HELP CONSUMERS IN MAKING HEALTHY FOOD CHOICES IN THE SUPERMARKET

Sylvie Huybers[1]; Annet JC Roodenburg[1]
[1]Nutrition & Health, HAS University of Applied Sciences, 's-Hertogenbosch, Netherlands

BACKGROUND AND OBJECTIVES

Consumption of unhealthy food plays an important role in the increasing prevalence of overweight and obesity. Around 80% of products in Dutch supermarkets do not comply to Dutch Food-Based Dietary Guidelines. In addition, consumers are faced with a lot of product information in supermarkets which can make healthy food choices difficult. The aim of this study is to investigate which (sources of) information Dutch consumers use when making healthy food choices in the supermarket, and whether the use of and trust in information depends on specific consumer characteristics.

METHODS

A mixed METHODSapproach combined a survey (n=395) to quantify patterns and trends in consumer behaviour and semi-structured in-depth interviews (n=8) to obtain detailed insights into the decision-making processes among Dutch consumers aged 16-75 years.

RESULTS

Participants indicated to make most use of the ingredient list (67.6%), nutrition table (67.1%), Nutri-Score (39.0%), certification logo's (31.1%) and nutrition claims (24.1%) for choosing healthy products. When participants had to choose between identical products with different front-of-pack information (Nutri-Score, nutrition claims and organic logo) the Nutri-Score emerged as the most influential factor. Respondents with a positive attitude towards the Nutri-Score were more likely to choose a product with Nutri-Score A ($p<0.05$), whereas a product with organic logo was selected by those who have a more negative attitude towards the Nutri-Score, have a lower trust in the government or food industry and are relatively older ($p<0.05$). Attitude towards the Nutri-Score was more positive among consumers with a background in nutrition ($p=0.001$) and those with a higher trust in the government ($p=0.001$) and the food industry ($p=0.010$). The interviews revealed that available product information is currently inadequate, leading to confusion, skepticism and a desire for more transparent and clear information.

CONCLUSIONS

Consumers should be better informed about how to use product information to make healthy food choices. Especially consumers with a distrust in the government and food industry might benefit from transparent information from a trustful source to effectively use the provided nutritional information. It is recommended to confirm the observed RESULTS by studying effects on actual food purchases in supermarkets.

EFFECT OF NUTRIENT SUPPLEMENTATION IN PREGNANCY AND AFTER BIRTH ON ANTHROPOMETRIC STATUS AND THE DEVELOPMENTAL DELAY OF THE INFANTS: A COHORT STUDY IN TEHRAN CITY

Arezoo Rezazadeh[1]; Karimi Tahereh[1]; Eini-Zinab Hassan[1]
[1]Community Nutrition, NAtional Nutrition and food Technology research institute, Tehran, Iran, Islamic Republic of

BACKGROUND AND OBJECTIVES

Maternal dietary intake during pregnancy plays an important role in fetal development and birth outcomes (1-2). The aim of the present study was to determine maternal dietary diversity and Nutritional adequacy in relation with anthropometric measurements of newborn at birth as a cohort study in Tehran city.

METHODS

This prospective cohort study, was conducted by participation of 585 pregnant women referred to public health centers and hospitals selected by systematic cluster sampling from all geographical zones of Tehran City. Pre-pregnancy nutrient supplement intake [NSI] was assessed by a questionnaire in mothers` first visit, and NSI was followed in each monthly appointment recorded in the health records (the Sib electrical system). Neonatal anthropometric indices and the NSI were also collected from neonates' health records in the Sib electrical system. Developmental delay at 12th month of life was assessed by validated Persian second version of Ages and Stages Questionnaire (ASQII). The ASQII consisted of 5 domains. To explore the relation of NSI and the chance of developmental delay and anthropometric status, binary logistic analysis and linear regression analysis, respectively. Infants' anthropometric data was inputted in AnthroPlus software (version 1.0.4) for calculating weight for age z-score (WAZ), Height for age z-score (HAZ) and body mass index (BMI) for age z-score (BAZ).

RESULTS

Mean ± standard deviation of BAZ at birth of infants was-0.61±1.48. The prevalence of DD in the studied infants was 9.6%. Maternal Iron supplement intake during pregnancy was directly associated with HCZ at birth and 12thmonth. Folate supplement intake during pregnancy was only directly associated with HCZ at birth ($p<0.05$). NSI during pregnancy was not associated with the possibility of DD. However, Iron supplement intake of infants was associated with lower possibility of DD at 12thmonth of life (OR=0.73, 95% CI: 0.41-0.94).

CONCLUSIONS

The findings emphasized that NSI in pregnancy and in the first year of life positively associated with infant`s developmental progress.

PATTERNS AND DETERMINANTS OF POSTNATAL WEIGHT RETENTION AMONG WOMEN IN GHANA, KENYA, INDIA, PAKISTAN, AND ZAMBIA

Caleb Sagam[1]; Precious Williams[2]; Victor Akelo[1]; Joyce Akinyi Were[1]; Emily Smith[2]; Arun Singh Jadaun[3]; Azqa Mahar[4]; Anne George Cherian[5]; M. Bridget Spelke[6]; Charlotte Taiwah[7]; Winnie M. Karwirwa[1]; Prisma Research Working Group: Participating Investigators Of Mnh Study[2]
[1]Center for Global Health Research, Kenya Medical Research Institute, Kisumu, Kenya; [2]Global Health, The George Washington University, Washington, DC, United States of America; [3]Centre for Health Research and Development, Society for Applied Studies, New Delhi, India; [4]Paediatrics and Child Health, Aga Khan University, Karachi, Pakistan; [5]Obstetrics and Gynecology, Christian Medical College Vellore, Vellore, India; [6]Global Projects Zambia, University of North Carolina at Chapel Hill, Lusaka, Zambia; [7]Research and Development Division, Kintampo Health Research Centre, Kintampo, Ghana

BACKGROUND AND OBJECTIVES

High postnatal weight retention (PNWR), is a growing public health concern exacerbated by rapid urbanization and socioeconomic factors. Globally, 25-30% of women retain excessive weight post-delivery, with rates reaching 40-60% in LMICs. Despite its severe health and economic impacts, research on PNWR in LMICs remains limited; thus, we analyzed multi-site cohort data to evaluate the patterns and risk factors of PNWR in five LMICs.

METHODS

We analyzed PNWR data, defined as difference between maternal postpartum and pre-pregnancy weight, from the ongoing Pregnancy Risk, Infant Surveillance, and Measurement Alliance (PRISMA) open cohort study in Ghana, India, Kenya, Pakistan, and Zambia. Pre-pregnancy weight was measured at or before nine weeks of gestation or imputed using measures between 10 and 20 weeks. Maternal weight was then measured during pregnancy (at 20, 28, 32, and 36 weeks) and postpartum (6 weeks and 6 months). Descriptive analyses were conducted to evaluate patterns of PNWR as a continuous variable across sites. A two-stage meta-analysis was conducted to identify pooled determinants and risk factors of high weight retention, defined as PNWR >5 kg over the first six months postpartum.

RESULTS

Among 3,281 participants, women retained an average of 1.1 kg at six weeks and 1.0 kg at six months postpartum, with variability across sites. India and Ghana sites reported highest PNWR, with a mean of 1.8 kg and 1.9 kg at six months, respectively. The Zambia site reported both the highest prevalence of overweight and obesity prepregnancy and the lowest PNWR (-0.2kg at 6 months). Excessive gestational weight gain (GWG) strongly predicted higher PNWR (RR: 2.10, 95% CI: 1.33–3.31), while inadequate GWG predicted lower PNWR (RR: 0.63, 95% CI: 0.53-0.75). Each unit of total GWG increased weight retention by 12% (RR: 1.12, 95% CI: 1.07–1.17). The meta-analysis model revealed moderate heterogeneity (I^2 = 61.4%, p<0.001), indicating variation in effect sizes across sites.

CONCLUSIONS

Balanced weight gain during and after pregnancy is essential for maternal health, as both excessive GWG with high postpartum retention and inadequate GWG with postpartum loss pose risks. Findings underscore the importance of this balance for optimizing health outcomes. Site-specific variability in weight retention across BMI groups and differences in effect sizes highlight the need for tailored interventions that account for local sociocultural and nutritional factors. These RESULTS further emphasize the need to address contextual differences to optimize maternal weight trajectories and reduce long-term health risks.

SOAP21_11

THE NUTRITION-SENSITIVE FOOD ENVIRONMENT INDEX: A COMPREHENSIVE APPROACH TO ASSESSING FOOD ENVIRONMENTS IN ASSOCIATION WITH HEALTH RISKS FOR POLICY DECISION-MAKING

Tosin Akingbemisilu[1]; Nicanor Odongo[1, 2]; Sam Bodjrenou[3, 4]; Robert Assimwe[2]; Céline Termote[1]; Irmgard Jordan,[1]
[1]Food environment and consumer behaviour, Alliance of Bioversity International and CIAT, Nairobi, Kenya; [2]Institute of Agricultural Policy and Market Research, Justus-Liebig-Universität Giessen, Giessen, Germany; [3]Food Environment and Consumer Behavior Department, Alliance of Bioversity international and CIAT, Cotonou Benin; [4]Food sciences and Human nutrition, University of Abomey-Calavi, Abomey Calavi, Benin

BACKGROUND AND OBJECTIVES

Food environment (FE) is defined as the physical, economic, political and socio-cultural contexts in which people engage with the food system to make their decisions regarding their diet. Existing FE indices often focus on food affordability, overlooking public health aspects. This study introduces a robust, scalable, nutrition-sensitive food-environment index (N-FEI) that quantifies and describes the interplay between food diversity, accessibility, as well as water and sanitation facilities linked to malnutrition risks.

METHODS

Data from 17,294 food vendors collected between 2020 and 2023 in six low- and middle-income countries were used to develop the index based on 9 purposively selected Food Environment (FE) and nutrition-related indicators. The machine learning algorithm XGBoost was used to predict health risks from DHS data, integrated into FE data through geospatial techniques, with interpretations provided by SHAP.

RESULTS

The N-FEI-malnutrition model exhibited high accuracy, indicating that the FE indicators explain e.g. approx. 89.3% (standard R^2) and 87.1% (cross-validated R^2) of the variation in risk for stunting (children), or 93.4% and 94.8% in anemia (women) among population living in the area of the indexed FE. Coupled with low RMSE values (0.028 & 0.030 for stunting, 0.118 & 0.103 for anemia), this underlines the strong correlation between FE and stunting and anemia. The interaction for all predictions showed that, the main interacting pair are 'Vendor availability' and 'Vendor per km^2', suggesting that the combination of overall vendor availability and the density of vendors have a significant synergistic effect on the model's output, particularly in predicting BMI and anaemia-related outcomes. The interaction between 'Vendor availability' and other indicators, such as 'healthy food diversity within a 50m radius' and 'inverted unhealthy food availability', further highlights the critical role of vendor accessibility in shaping health outcomes within the population.

CONCLUSIONS

The N-FEI links poor food diversity, poor hygiene, and poor vendor availability with different malnutrition risks. The result for each indicator can be used (e.g. by policy decision makers) to identify measures to improve the assessed food environment and measure its transformation. In terms of policy implications, the overall RESULTS advocate for interventions that do not merely increase food vendor numbers, but also focus on enhancing the diversity of foods available, especially in areas identified as high-risk.

SOAP21_12

MATERNAL AND HOUSEHOLD-LEVEL DETERMINANTS OF THE GLOBAL DIET QUALITY SCORE DURING PREGNANCY IN INDIA

Shivani Kachwaha[1]; Parul Christian[1]; Andrew Thorne-Lyman[1]; Phuong Nguyen[2]
[1]Department of International Health, Program in Human Nutrition, Johns Hopkins Bloomberg School of Public Health, Baltimore MD, United States of America; [2]Nutrition, Diets, and Health Unit, International Food Policy Research Institute, Washington DC, United States of America

BACKGROUND AND OBJECTIVES

Adequate nutrition during pregnancy is critical for the health and nutritional outcomes of mothers and their newborns, but evidence on maternal diets is limited. The Global Diet Quality Score (GDQS) is a new metric to evaluate diet quality of populations in low-and-middle income countries (LMICs). This study aimed to examine GDQS during pregnancy and factors influencing it in rural Uttar Pradesh, India.

METHODS

These data are derived from the Alive & Thrive (A&T) impact evaluation study using a cluster-randomized design, which aimed to strengthen the provision of maternal nutrition interventions focused on behavior change communication within the government antenatal care (ANC) platform in India. We analyzed quantitative multi-pass 24-hour dietary recalls from two cross-sectional surveys, one at baseline (2017) prior to start of intervention and one at the endline (2019). The GDQS was constructed based on the amount (grams/day) of 25 food groups consumed (range 0-49); for 16 healthy food groups higher scores indicated higher consumption (GDQS+) whereas for 9 unhealthy food groups scoring was negative such that lower consumption of unhealthy foods resulted in a higher score (GDQS-). Maternal and household factors influencing GDQS examined in a multivariable linear regression model included age, education, parity, nutrition knowledge, ANC exposure, household size, religion, caste, socio-economic status (SES), and food insecurity, adjusted for pregnancy duration, survey time, and A&T intervention.

RESULTS

The mean (SD) scores at baseline and endline were low at 18.3 (3.4) and 18.7 (3.4) (out of 49) for overall GDQS, 7.1 (3.2) and 7.7 (3.1) (out of 32) for GDQS+ (healthy food consumption), and 11.3 (1.6) and 11.1 (1.7) (out of 17) for GDQS- (low consumption of unhealthy foods). In the multivariable model, 4+ ANC visits (β=0.83 and β=0.78), nutrition knowledge (β=0.12 and β=0.13), and SES (β=0.82 and β=0.96) were positively associated ($p<0.05$) with both overall GDQS and GDQS+, respectively. Maternal education (β=0.66) and caste (β= -0.66) were also significantly associated with GDQS+.

CONCLUSIONS

This study highlights poor diet quality during pregnancy in this context, characterized by low consumption of healthy and unhealthy food groups. The findings emphasize that significant inequities persist in accessing a healthy diet in rural LMIC contexts and identifies vulnerable sub-groups based on SES, knowledge, education, and ANC exposure. Future research is recommended to validate the GDQS among pregnant women across diverse settings.

SOAP21_13

STUDY ON NUTRITIONAL COGNITION, ATTITUDES AND DIETARY BEHAVIOR OF MIDDLE-AGED AND ELDERLY PEOPLE TOWARDS SARCOPENIA AT THE METABOLISM OUTPATIENT DEPARTMENT OF A REGIONAL HOSPITAL

Wen Hsin Tsui[1]
[1]nutrition, Taipei City Hospital Renai Branch, Taipei, Taiwan

BACKGROUND AND OBJECTIVES

The prevalence of sarcopenia is increasingly rising. Traditionally viewed as a common symptom among the elderly, sarcopenia has shown a trend of affecting younger individuals in recent years. Besides age, nutrition and chronic diseases such as hypertension, hyperlipidemia, and hyperglycemia have also been important factors frequently discussed in recent studies. This research focuses on the nutritional cognition, nutritional attitudes, and dietary behaviors related to sarcopenia among middle-aged and elderly people over 40 years old with chronic diseases (hypertension, hyperlipidemia, or hyperglycemia).

METHODS

Using the cognitive-attitude-behavior model as the research framework, a structured questionnaire was self-developed for data collection. The questionnaire consisted of four parts: personal background, nutritional cognition of sarcopenia, nutritional attitudes towards sarcopenia, and dietary behaviors. A purposive sampling method was used to select patients from the outpatient metabolic department. A total of 140 valid questionnaires were collected, and the data were analyzed using descriptive statistics, independent samples T-test, one-way ANOVA, Spearman rank correlation analysis, multiple regression analysis, and logistic regression analysis.

RESULTS

Among the personal background variables, age, education level, physical activity level, grip strength, and limb skeletal muscle mass are significantly correlated with nutritional cognition related to sarcopenia; age, education level, the number of chronic diseases, and grip strength are significantly correlated with nutritional attitudes towards sarcopenia; family income and expenditure status, the number of chronic diseases, and physical activity level are significantly correlated with dietary behavior. Grip strength, calf circumference, and limb skeletal muscle mass all show a significant positive correlation. Nutritional cognition related to sarcopenia is significantly positively correlated with nutritional attitudes towards sarcopenia, and nutritional attitudes towards sarcopenia are significantly positively correlated with dietary behavior.

CONCLUSIONS

"Education level" is the main predictive variable for nutritional cognition related to sarcopenia, with the greatest explanatory power; "the number of three chronic diseases" is the main predictive variable for nutritional attitudes and dietary behavior, with the greatest explanatory power. "Physical activity level" and "calf circumference" can effectively predict the occurrence of sarcopenia.

CONFLICTS OF INTERESTS

NATIONAL DIET AND NUTRITION SURVEY (NDNS): INFORMING PROGRESS TOWARDS DIETARY GOALS IN THE UK

Caireen Roberts[1]; David Collins[1]; Polly Page[1]
[1]MRC Epidemiology Unit, Cambridge University, Cambridge, United Kingdom

BACKGROUND AND OBJECTIVES
The NDNS was set up in 2008 as a cross-sectional survey with a continuous programme of fieldwork. It provides the only source of nationally representative data on the diet and nutritional status of the UK population aged ≥ 1.5 years. RESULTS are published for foods, nutrients and biomarkers by age and gender sub-groups and are used to monitor progress towards the nutrition objectives of UK Health Departments and develop policy interventions. The most recent RESULTS are for 2019 to 2023 and include comparison of intakes and nutritional status by income and other indicators of deprivation.
METHODS

Data collection was carried out between October 2019 and July 2023 apart from a full suspension of fieldwork between March and October 2020 due to the COVID-19 global pandemic. There were four waves of fieldwork, each aimed to collect data from a UK representative core sample of 500 adults (aged ≥ 19 years) and 500 children (aged 1.5 to 18 years). Participants were interviewed in their home (or over the telephone during COVID-19 restrictions) and asked to self-complete four 24-hour dietary recalls on non-consecutive days using the online tool Intake24 (https://intake24.org/). Telephone assistance was available to those who could not complete independently or who had internet/technical issues. A doubly labelled water (DLW) sub-study for assessment of misreporting by measurement of Total Energy Expenditure (TEE) took place between 2020 and 2022. NDNS is one of the few national large-scale population nutrition surveys to regularly include a DLW assessment.

RESULTS
A total of 4,089 individuals completed at least one dietary recall: 2,146 adults and 1,943 children. The majority of these participants went on to complete all four dietary recalls (3,107, 76%). Drawing on the latest RESULTS (publication due spring 2025), we will present the state of the UK nation in relation to consumption of foods such as fruit and vegetables and intakes of energy, fats, sugar and fibre by age and socioeconomic indicators.
CONCLUSIONS

The UK NDNS is a valuable resource providing ongoing assessment on progress towards public health nutrition objectives.

CONFLICTS OF INTERESTS
The authors have no conflict of interest.

SOAP23_03

SHORT- AND MEDIUM-TERM IMPACT OF AN IN-COMPANY INTERVENTION ON PLANT-BASED FOOD CONSUMPTION AT HOME AND ON REPRESENTATIONS OF VEGETARIAN MEALS

Mathilde Vandenberghe Descamps[1]; Luc Fontaine[1]; Amélie Escoulan[1]; Eloïse Remy Castagna[1]
[1]Research & Development, Bonduelle, Villeneuve-d'Ascq, France

BACKGROUND AND OBJECTIVES

The study is aimed at measuring the impact of an intervention delivered in the workplace on consumption of plant-based foods at home and on the way vegetarian meals are perceived.

METHODS

The study involved 77 adults divided into a Control group (n=25) and an Intervention group (n=42). The intervention lasted 6 weeks and consisted of two informational and motivational sessions in the workplace, a culinary workshop by videoconference from home and a team challenge to stimulate the implementation of practices at home. The control group did not benefit from any action. The frequency of consumption of vegetables, pulses and vegetarian meals, and perceptions of vegetarian dishes (source of pleasure, easy to digest, easy to prepare, economical'), were assessed by a self-administered questionnaire before (T0), then 1 month (T1) and 3 months (T2) after the intervention, by both groups.

RESULTS

At T0, an ANOVA between the control and intervention groups enabled us to consider them comparable because the consumption of plant-based foods and perceptions associated with vegetarian meals were not significantly different. For the Control group, no significant changes were observed in terms of consumption of vegetables, pulses, or vegetarian dishes nor in terms of perceptions associated with vegetarian meals between T0, T1 and T2. For the Intervention group, there was a significant increase in the consumption of pulses (T0= 5.2 ± 5.1; T1= 8.5 ± 5.3; T2= 9.9 ± 6.7 pulses per month, $p<0.0001$) and vegetarian meals (T0= 14.9 ± 9.6; T1= 18.8 ± 10.2; T2= 20.2 ± 10.5 vegetarian meals per month, $p<0.001$) was observed between each time point. The frequency of vegetable consumption, already high, remained stable (T0= 29.7 ± 11.6; T1= 30.8 ± 11.8; T2= 31.3 ± 9.6 vegetables per month, $p=0.61$). Perceptions associated with vegetarian meals also changed positively between T0 and T1 and remained stable between T1 and T2 (Vegetarian meals are 'a source of pleasure' (T0= 4.0 ± 0.8; T1= 4.3 ± 0.6; T2= 4.4 ± 0.5, $p=0.001$), economical (T0= 3.8 ± 0.8; T1= 4.2 ± 0.7; T2= 4,3 ± 0,7, $p<0,0001$), 'pleasant in the home' (T0= 2,8 ± 1,0; T1= 3,5 ± 0,9; T2= 3,5 ± 0,9, $p<0,0001$), 'easy to digest'(T0= 4,0 ± 0,7; T1= 4.3 ± 0.6; T2= 4.3 ± 0.5, $p=0.023$), 'easy to prepare'(T0= 2.9 ±1.0; T1= 3.8 ± 0.8; T2= 4.1 ± 0.8, $p<0.0001$)).

CONCLUSIONS

We conclude that for voluntary employees, a free, workplace-based programme combining knowledge, motivational strategies and culinary support helps them to make the transition to a flexitarian diet at home for at least 3 months after the programme.

SOAP23_05

PREVALENCE OF LOW BLOOD AMINO ACID CONCENTRATION OF STUNTED NON WASTED CHILDREN

Nia Wirawan,[1]; Ina Timan[2]; Badriul Hegar[3]; Umi Fahmida[4]; Aria Kekalih[5]; Ratna Chrismiari Purwestri[6]
[1]Department of Nutrition, Faculty of Health Science, Universitas Brawijaya,, Malang, Indonesia; [2]Clinical Pathology, Fakultas Kedokteran Universitas Indonesia, Central Jakarta, Indonesia; [3]Pediatric, Fakultas Kedokteran Universitas Indonesia, Central Jakarta, Indonesia; [4]Nutrition, SEAMEO RECFON, Central Jakarta, Indonesia; [5]Community Medicine, Fakultas Kedokteran Universitas Indonesia, Jakarta, Indonesia; [6]Forestry and Wood Sciences, Czech University of Life Sciences Prague, Prague, Czechia

BACKGROUND AND OBJECTIVES

The re-emerging concern on amino acids that plays a role for mammalian target of rapamycin (mTor) signalling pathways was triggered by the fact that protein intake is considerably adequate but globally, the prevalence of stunting is remained high. However, limited studies on the blood amino acid were found.

METHODS

A comparative cross-sectional study aimed to compare blood amino acid between stunted non-wasted (SNW) and non-stunted non-wasted (NSNW) children aged 12-23 months living in an agricultural area. Capillary blood was drawn from 151 children and drops onto filter paper (Whatman 903) as dried blood spots (DBs) for 2-3 drops. Analysis of amino acid using LC-MS/MS was performed with Waters Acquity TQ-S, using MassLynx 4.1 and NeoLynx 4.1 (Waters, Milford, MA, USA). Since no cut-off to define the sufficiency of the amino acid blood level, the value of 25th percentile or -2SD of amino acid level from previous study was used as the cut-off.

RESULTS

The finding showed that the prevalence of low blood amino acid concentration for methionine, arginine and citrulline was high (>60%, >90% and >50%, respectively). In contrast, none of the children in this current study have blood amino acids concentration lower than the cut-off for phenylalanine, aspartic acid, glutamic acid, glycine, tyrosine, proline, and ornithine. Different profile on the prevalence of low blood amino acids concentration when a study from Thailand was used as cut-off. From this comparison, the prevalence of low methionine was only 1%, whereas for arginine and citrulline showed similar pattern with previous comparison. In addition, the low glutamic acid level was 100% in this second comparison. However, no significant different between SNW and NSNW group.

CONCLUSIONS

The RESULTS suggest the careful examination and interpretation of amino acid blood level as this nutrient is the type II nutrient in which in the condition of deficiency the growth will be impaired whilst the concentration in blood was maintained.

VITAMIN D AND RISK OF SPORT RELATED INJURIES IN THE SUN PROJECT: A PROSPECTIVE COHORT STUDY

Adriana M Sayon[1]; Ana Valer-Martinez[2]; Maira Bes-Rastrollo[3]; Ligia J Dominguez[4]; Miguel A. Martínez-González[3]; Carmen Sayon-Orea[3]
[1]Physical therapy and rehabilitation, Marista University Valladolid, Morelia, Mexico; [2]Family Medicine, Aragon Health Service, Zaragoza, Spain; [3]Dpt. Preventive Medicine and Public Health, University of Navarra, Pamplona, Spain; [4]Faculty of Medicine and Surgery, University of Enna, Enna, Italy

BACKGROUND AND OBJECTIVES

Vitamin D deficiency has been associated with multiple chronic diseases, including those related with bone health. We analyzed the association between validated predicted serum vitamin D status and the risk of sport-related injuries in a large prospective cohort based on a Mediterranean population.

METHODS

The SUN project is a prospective cohort of Spanish university graduates. A validated 136-item food-frequency questionnaire was used as the dietary assessment tool. Vitamin D serum levels were predicted using a previously validated equation. The association between predicted serum vitamin D and the risk of sport-related injuries was assessed through Cox regression models according to quartiles of predicted vitamin D at baseline, after adjusting for different potential confounders. Sensitivity analyses were performed to assess the robustness of our findings.

RESULTS

We included 19,504 participants. After a follow-up of 235,293 person-years (median follow-up of 12.2 years), 4,088 participants had a sport-related injury. A significant inverse association between predicted serum levels of vitamin D at baseline and the risk of sport-related injury in multivariable-adjusted models was found. Individuals in the highest serum vitamin D quartile showed 12% relatively lower risk of having a sport-related injury as compared to the lowest quartile (hazard ratio= 0.88; 95% confidence interval (CI): 0.79-0.99, *p*-trend <0.039). The RESULTS remained significant after performing sensitivity analyses.

CONCLUSIONS

The RESULTS suggested that higher levels of vitamin D at baseline might be associated with a reduced risk of having a sport-related injury.

COPING STRATEGIES OF VENEZUELAN MIGRANTS IN COLOMBIA: ADDRESSING FOOD INSECURITY AND CULTURAL RESILIENCE

Jennifer Bernal-Rivas[1]; Alba Rocio Pico-Jaramillo[1]; Adelina Olga Restrepo-Betancor[1]; Diana Vanessa Delgado-Delgado[1]; Elizabeth Valoyes-Bejarano[1]; Sara Eloisa Del-Castillo-Matamoros[1]
[1]Maestria Soberania y Seguridad Alimentaria y Nutricional, National University of Colombia, Bogotá, Colombia

BACKGROUND AND OBJECTIVES

Migration profoundly affects all dimensions of human life—health, cultural, social, and economic. Over the past decade, 7.89 million people have emigrated from Venezuela, marking the largest exodus in the region's history. Colombia, a primary destination, hosts over 2.8 million Venezuelan migrants, nearly half facing food insecurity. Migration disrupts access to essential resources such as food, employment, and human security, creating complex challenges for individuals and communities. This study synthesizes three investigations to explore coping strategies employed by Venezuelan migrants in Colombia, emphasizing food insecurity, cultural resilience, and adaptation challenges.

METHODS

Three qualitative studies were synthesized, incorporating semi-structured interviews and sociodemographic data collection. Populations included migrant families, adolescents, and women migrants in Colombia. Data were analyzed using thematic coding and software tools to identify trends in coping mechanisms, culinary practices, and vulnerabilities. All studies received ethical approval from a recognized academic institution in Colombia.

RESULTS

Migrants reported improvements in food availability and physical access but faced barriers to nutritional quality and economic affordability. Culinary traditions fostered resilience and identity preservation despite economic instability. Adolescents and mothers expressed pride in sharing traditional meals but noted that job precarity limited food adequacy and cultural continuity. Women migrants, predominantly young (48% aged 20–30) and single (84%), struggled with informal employment (76%) and low education levels (74%). Households, typically medium-sized (54% led by single mothers), faced food insecurity, with 94% affected, including 84% severely. Health access was constrained despite 74% insurance coverage. Risks included crime (60.5%), discrimination (23.7%), and poor housing conditions (98% rented, 12% without sanitation). Migration facilitated culinary tradition preservation, enabling resilience despite significant socioeconomic challenges.

CONCLUSIONS

Venezuelan migrants in Colombia face vulnerabilities in food security, employment, and access to education and health. Coping strategies like culinary resilience aid adaptation and cultural identity preservation. Policies must address systemic barriers to enhance food security, legal protections, and socioeconomic inclusion while supporting cultural integration.

BACKGROUND AND OBJECTIVES

Many LMICs are transitioning from Iron and Folic Acid (IFA) to Multiple Micronutrient Supplements (MMS) as the new standard of care for preventive maternal supplementation. Following the WHO context-specific recommendation, and the Government of Pakistan's (GoP) commitment to scale MMS, a multi-year implementation research (IR) project was conducted to better understand implementation realities of introducing a new intervention through the antenatal care (ANC) platform in Pakistan (PK). As part of the broader IR project, this study explored the perspectives and experiences of healthcare providers (HCPs) and pregnant women (PW) with ANC and MMS in the context of this transition.

METHODS

This descriptive qualitative research took place in Swabi district, Khyber Pakhtunkhwa, PK. In-depth interviews were conducted with government facility and community-based HCPs providing ANC (n=7) and focus group discussions were conducted with PW (n=37) to collect information on perspectives and experiences with MMS. Journey Mapping was also conducted with PW (n=6) to collect information on care-seeking. All interviews were conducted in Urdu or Pashto, digitally recorded, transcribed verbatim, and then translated into English for thematic analysis using Excel.

RESULTS

Several key themes relating to MMS and ANC were identified. Within one pregnancy, women seek care from different HCP across public/private and facility/community settings. Factors influencing care-seeking include reputation of the HCP or facility, availability/accessibility of services, and influence of family members. Acceptability of MMS among PW depends on various factors including ease of access and perceived benefits and side effects of MMS. Facilitators to HCP provision of MMS include proximity of ANC to women's homes and open communication and a trusting relationship with PW. Barriers to MMS provision by HCP include high HCP workload, lack of coordination and communication among different ANC providers, and challenges tracking women throughout pregnancy. Facilitators to PW's MMS adherence include perceived benefits, use of daily reminder techniques, use of strategies to mitigate side effects, and support from HCPs and family. Barriers to MMS adherence include perceived side effects, limited agency to make health-related decisions, and interrupted access.

CONCLUSIONS

https://doi.org/10.1017/jns.2026.10126 Published online by Cambridge University Press

This study provides actionable insights from HCPs and PW in PK to inform the scale of MMS across the public ANC platform. Findings are also being used to inform broader decision-making on the transition to MMS as part of comprehensive maternal nutrition in other LMICs.

SOAP23_11

New guidelines on complementary feeding in France: evolutions of knowledge, acceptability and good practices among parents, and factors associated with knowledge: RESULTS from the French Complementary feeding Survey

Philippine Fassier[1]; Pauline Ducrot[2]; Julie Boudet-Berquier[3]; Corinne Delamaire[4]
[1]Diet and physical activity unit, Santé publique France, Saint-Maurice, France; [2]Health prevention and promotion department - Nutrition & physical activity unit, Santé publique France, Saint-Maurice, France; [3]Direction des Maladies Non Transmissibles et des Traumatismes, Santé publique France, Saint-Maurice, France; [4]Direction de la Prévention et de la Promotion de la Santé, Santé publique France, Saint-Maurice, France

BACKGROUND AND OBJECTIVES

Parental educational practices contribute to the child's acceptance of new foods during the complementary feeding (CoF) period and will have an influence on the child's eating habits in the long term. In 2020, Santé publique France spread the new dietary guidelines for parents of children aged 0-3 years. To disseminate these advices, a communication campaign was launched in September 2021 and rebroadcasted in May 2022.

Aims of this study were to investigate variations of knowledge, acceptability and practices of new guidelines among parents and to identify factors associated with knowledge.

METHODS

This study is based on a cross-sectional repeated web-survey: the CoF Survey. The first measure was in March 2022, and second in October 2023, on 2,750 representative French parents of children 0-3 years who already began CoF, recruited via quota method. To investigate variations the different outcomes as well as factors associated with guidelines' knowledge, multivariate logistic regressions were used.

RESULTS

In 2023, parents know more frequently they have to add fats in the meal of their child, compared to 2022 (67% vs 64%, p=0.01), and were more confident in their knowledge (p=0.007). Parents increased knowledge to introduce all food groups early (40% vs 35%), were more confident on their knowledge (p=0.01), and were more likely to consider this practice as acceptable (63% vs 55%, p<0.0001). Similar trends were observed for the introduction of allergenic foods early, with also higher percentage of parents who have put it into practice (p<0.05 for allergens asked). Mothers were more likely to know the guidelines on trusting the child's appetite, adding fats and introducing allergenic foods, while fathers were more likely to report properly the guideline on early introduction of all food groups (p<0.05). Parents with higher socio professional status were more likely to know they need to add fat or to introduce major allergenic foods (p=0.02 and p=0.0006 respectively). Feeling well informed increase the knowledge to introduce fats and other food groups (p=0.0007 and p=0.002 respectively). Educational level, financial status, being primiparous or having read the brochure on CoF were not associated with guidelines' knowledge.

CONCLUSIONS

The present RESULTS highlighted an increasing trend of the knowledge of the new guidelines on CoF, with higher level of confidence, and higher level of acceptability. Nonetheless, some guidelines appeared less well known, confirming the need for future campaigns targeting people who were less likely to report good level of knowledge.

CONFLICTS OF INTERESTS

Nutrition-sensitive social protection program coverage: Using mixed METHODSto develop new measures for household surveys

Swetha Manohar[1]; Sumanta Neupane[2]; Emily Myers[3]; Hanna Berhane[4]; Firehiwot Workneh[5]; Sk. Masum Billah[6]; Sharif Lotus[7]; Niharika Pandya,[2]; Sunny Kim[1]
[1]Nutrition, Diets, and Health Unit, International Food Policy Research Institute, Washington D.C., United States of America; [2]Nutrition, Diets, and Health Unit, International Food Policy Research Institute, New Delhi, India; [3]Poverty, Gender, and Inclusion Unit, International Food Policy Research Institute, Washington D.C., United States of America; [4]Public Health Sciences, Addis Continental Institute of Public Health, Addis Ababa, Ethiopia; [5]Department of Epidemiology and Biostatistics, Addis Cont, Addis Ababa, Ethiopia; [6]Maternal and Child Health Division, Icddr,b, Dhaka, Bangladesh; [7]Maternal and Child Health Division, Icddr,b, Dhaka Bangladesh

BACKGROUND AND OBJECTIVES

Nutrition-sensitive social protection (NSSP) programs combine food, monetary or in-kind transfers with health and nutrition interventions. They are a critical intervention to equitably address underlying determinants of malnutrition, but no standard approach to measure NSSP coverage exists. Formative research was conducted to examine how program beneficiaries understand social protection programs and to assess cognitive error in survey questions in Bangladesh and Ethiopia for development of new NSSP coverage measures.

METHODS

Following recommendations from technical consultations held in 2023-2024, a minimum set of survey questions were developed to capture the essential components of NSSP coverage – transfer type, target beneficiary, and linked health and nutrition intervention. In 2024, key informant interviews (KIIs) with program officers (n=27) and women program beneficiaries (n=30) were conducted in two districts in Bangladesh and in Ethiopia to understand what and how NSSP programs operate. Two rounds of cognitive interviews (CIs) were conducted with both women (n=57) and male household heads (n=44) to test the proposed survey questions and to identify cognitive errors. Survey items were revised between CI rounds after rapid debriefs. Thematic analyses were applied to field notes and transcripts from KIIs and CIs using deductive and inductive codes, respectively.

RESULTS

Three transfer types were considered – cash/food/in-kind transfers, targeted to nutritionally vulnerable household members and bundled with health and nutrition interventions. In Ethiopia, KII RESULTS indicated elements that may produce measurement error, e.g., women did not differentiate between NSSP and other programs. In CIs, most cognitive errors stemmed from poor understanding of technical terminology or survey items being too lengthy. In Bangladesh, a single program was referred to by many names. Household heads (typically male) could identify programs that provide free food but not programs that provide subsidized food or in-kind transfers. Both women and household heads readily identified programs that provide cash. Beneficiaries in both countries did not recognize the linkage between transfers and health and nutrition interventions, which is a key component of NSSP programs and critical for measurement.

CONCLUSIONS

We propose an alternative measure of NSSP coverage, involving co-coverage of bundled interventions and targeted transfer receipt, that may be useful for tracking progress of NSSP programs across diverse contexts.

CONFLICTS OF INTERESTS

SOAP23_13

PROSPECTIVE ASSOCIATIONS BETWEEN SUCRALOSE INTAKE AND METABOLIC OUTCOMES IN CHILEAN CHILDREN

Natalia Rebolledo,[1]; Camila Zancheta[1]; Marcela Reyes[1]; Camila Corvalán[1]
[1]CIAPEC, Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile

BACKGROUND AND OBJECTIVES

Sucralose, a non-nutritive sweetener (NNS), has been associated with decreased insulin sensitivity and altered glucose and insulin responses in adults (1-3), yet there is limited data on children (4, 5). This is relevant in Chile, where sucralose is the most consumed NNS, with prevalences ranging between 44.4% to 66.0% (6-8). This study evaluates the association between sucralose intake at age 4 and fasting glucose metabolism and lipid profiles at age 6 in a cohort of Chilean children.

METHODS

We conducted prospective analyses on 618 children from the Food and Environment Chilean Cohort (FECHIC). In 2016, at age 4 years, dietary data were collected with 24-hour diet recalls. All packaged foods and beverages were linked to their nutrition facts panels, which provided data on sucralose content and other nutrients. In 2018, after two years of follow-up, metabolic outcomes (fasting glucose, insulin, HOMA-IR, triglycerides, total cholesterol, LDL, and HDL cholesterol) were measured. The usual intake of sucralose was estimated using the Multiple Source Method. We used linear regression models, adjusted for stabilized inverse probability weights to address lost-to-follow-up and baseline covariables (sex, age, maternal education level, and total sugars intake) to examine the association between sucralose intake and metabolic outcomes. We constructed different models to compare sucralose consumers and non-consumers and to verify the association of the amount of sucralose consumed in mg/day among consumers.

RESULTS

At baseline, 62.1% of the children consumed sucralose, with a mean intake of 24.4 mg/day (SD= 7.2). Adjusted models showed a small but significant association between sucralose consumption and HDL cholesterol levels (b = 1.9 [95% CI 0.1, 3.6]). Further analysis of the quantity of sucralose consumed also showed a positive association with fasting triglyceride levels; for every 10 mg/day increase in sucralose intake, triglycerides increased by 7.5 mg/dL (95% CI 1.2, 13.8). No associations were found with other metabolic outcomes.

CONCLUSIONS

In Chilean preschool children, we found a positive association between sucralose consumption and fasting HDL cholesterol and triglyceride levels, while there were no associations with other metabolic outcomes. Our RESULTS suggest a complex relationship between sucralose intake and lipid profiles in Chilean children, indicating potentially beneficial and adverse associations. These findings highlight the importance of considering the potential net health impact of sucralose consumption over time.

CHILD HEALTH PROMOTERS PROGRAM MODEL IN MEXICO

Daniela Gonzalez-Valencia[1]; Alma Delia Contreras-Paniagua,[2]; Gloria Elena Portillo-Abril[2]; Karla Alejandra Bon-Padilla,[2]; Adriana Caballero-Roque[3]; Gabriela Nallely Trejo-Diaz[3]; María Isabel Ortega-Velez,[2]
[1]Facultad de Medicina Mexicali , Autonomous University of Baja California, Mexicali, Mexico; [2]Nutrición publica y salud, CIAD, Hermosillo, Mexico; [3]Nutrición, Universidad de Ciencias y, Tuxtla, Mexico

BACKGROUND AND OBJECTIVES
BACKGROUND AND OBJECTIVES: childhood obesity is a public health challenge that requires a holistic and contextual approach; school health promotion including parents and children have shown promising RESULTS, and children have proven to be agents of change regarding health. The aim of this study was to develop and evaluate a model of child health promoters (CHP) as a community strategy to improve feeding practices, food environment and physical activity in school-age children.
METHODS

Through a community-based participatory research the study developed in three Mexican cities, included 36 elementary schools (18 CHP and 18 reference schools), located in medium, high and very high poverty areas. We measured weight, height, waist circumference, and body fat as well as a 24-hour dietary recall, physical activity, socioeconomic and eating habits questionnaires, and parameters of metabolic syndrome. With the research team as facilitators, CHP developed and implemented healthy eating and physical activity actions during a full school year. Focus groups and interviews were conducted with key stakeholders. Realistic Evaluation Theory guided our analysis and model development.

RESULTS

Nutritional risk analysis showed that children in the CHP program had significantly lower body fat compared to the reference group ($p = .001$), a decrease in total cholesterol, and glucose levels, and higher HDL ($p \leq .041$). The context related to changes or intention to change in prevention variables were the teacher-student and parent-student conjunction of actions, and the families socioeconomic level within the most vulnerable areas.

CONCLUSIONS

School-age children can act as health promoters among their peers, resulting in a better communication channel, compared with a traditional researcher - community approach to health and nutrition promotion.

SOAP23_15

METHODOLOGICAL FRAMEWORK FOR THE CREATION AND CONSOLIDATION OF THE OBSERVATORIO MATERNO INFANTIL: ADVANCING MATERNAL AND CHILD HEALTH MONITORING AND POLICY IN MEXICO

Monica Ancira Moreno[1, 2]; Maternal And Child Observatory Consortium[2]
[1]Health Department, Universidad Iberoamericana Ciudad de México, Ciudad de México, Mexico; [2]Maternal and Child Observatory (OMI), Universidad Iberoamericana Ciudad de México, Ciudad de México, Mexico

BACKGROUND AND OBJECTIVES

The Observatorio Materno Infantil (OMI) was created in response to persistent maternal and child health challenges in Mexico, particularly regarding malnutrition and healthcare disparities, which have hindered the achievement of global nutrition targets (1,2). In alignment with the World Health Organization's definition (3) of an observatory, OMI aims to generate evidence that drives healthcare improvements for vulnerable populations. This study focuses on outlining the methodology employed in developing a comprehensive methodological framework for creating and consolidating the Observatorio Materno Infantil (OMI). The framework emphasizes generating evidence-based recommendations aimed at informing policy and improving healthcare delivery.

METHODS

The creation of the OMI involved four key phases: 1) Planning: A needs assessment was conducted to analyze national health data. Stakeholder mapping engaged key actors from government, academia, healthcare, and community organizations to align with national health priorities. 2) Co-creation workshops: Design Thinking(4) workshops were held to develop innovative solutions, with experts in maternal and child health and nutrition, and data science focusing on systematizing health information collection and monitoring. 3) Data collection: Data from national health surveys were integrated into the OMI platform to track health trends across Mexico. 4) Data analysis and visualization: Advanced analytics and tools were used to identify disparities and generate insights to inform policy decisions.

RESULTS

The OMI (https://omi.ibero.mx/en/) has successfully established a comprehensive system for monitoring maternal and child health and nutrition in Mexico. The integration of diverse data sources has provided actionable insights that have influenced public health strategies and policies. The platform’s visual dashboards allow policymakers to easily access and interpret data, fostering informed decision-making. The OMI’s capacity-building efforts have strengthened its impact, including training healthcare professionals and engaging vulnerable communities.

CONCLUSIONS

The OMI has significantly improved maternal and child health monitoring in Mexico, offering a model for similar health observatories in other countries. Despite challenges in data standardization and sustainability, the OMI has helped bridge gaps in service delivery and increased the visibility of key health issues.

FLOURISHING AND DIET QUALITY DURING PREGNANCY: A SOCIAL INEQUALITY APPROACH

Yanick Brunette[1]; Aida Barhamian[2]; Alex Dumas[2]; Bénédicte Fontaine-Bisson[3]
[1]Interdisciplinary School of Health Sciences, University of Ottawa, Ottawa, Canada; [2]School of Human Kinetics, University of Ottawa, Ottawa, Canada; [3]School of Nutrition Sciences, University of Ottawa, Ottawa, Canada

BACKGROUND AND OBJECTIVES

Flourishing broadly refers to a state of overall well-being and satisfaction across various life domains, including happiness and life satisfaction, physical and mental health, meaning and purpose, character and virtue and close social relationships. A balanced and nutritious diet can positively influence many of these domains, while a suboptimal flourishing state can also contribute to poor diet quality. During pregnancy, adequate nutrition and maternal flourishing play crucial roles in nurturing both the significant personal transformation and the deepened sense of purpose that define this unique period. Adverse social circumstances can impede both nutrition and flourishing by limiting access to nutritious food, safe living conditions, supportive environments, and healthcare services. This study on social inequality examined the influence of income, education, and social support on diet quality and flourishing, and the relationship between them.

METHODS

This cross-sectional study included 94 pregnant women from diverse socioeconomic, linguistic and cultural backgrounds. Diet quality was assessed with the Healthy Eating Food Index (HEFI) score derived from three 24-hour recalls, and flourishing was measured using the Flourishing Measure Tool from Harvard. Pearson correlation was used to assess the relationship between the HEFI score and the flourishing index and ANOVA tests were conducted to assess differences in HEFI score and flourishing index across psychosocial categories (income, education and social support).

RESULTS

No significant correlation was observed with the HEFI score and the total flourishing index ($r=0.19$, $p=0.07$), however, a significant correlation was observed with the physical and mental health flourishing subdomain ($r=0.30$, $p=0.003$). The HEFI score and the flourishing index both significantly differed between categories of income ($p=0.02$ and $p<0.0001$, respectively), and educational attainment ($p=0,03$ and $p=0.0002$), but did not significantly differ according to social support ($p=0,21$ and $p=0.84$).

CONCLUSIONS

These findings highlight the associations between diet quality and the physical / mental health domain of flourishing among pregnant women and underscore the impact of social inequality early in life. More research is necessary to understand how social determinants of health affect both diet quality and flourishing during pregnancy to inform interventions aimed at supporting pregnant women living in precarious conditions to reduce disparities in health and well-being during the perinatal period.

ENERGY INTAKE, NUTRIENT CONTRIBUTION AND SOCIOECONOMIC DETERMINANTS OF ULTRA PROCESSED AND LESS PROCESSED FOODS CONSUMED IN ETHIOPIA: EVIDENCE FROM NATIONAL FOOD CONSUMPTION SURVEY

Kifle Balcha[1, 2]; Stefanie Vandevijvere,[3]; Masresha Tessema[4]; Annette Onselen[5]; Siwela Muthulisi[2]; Tibebu Moges,[4]; Nqobile Monate Mkolo[6]; Edith Feskens[7]; Dejen Tesfaw[8]; Inge Brouwer[7]
[1]Nutrition, Environmental Health and Non-communicable Disease Research Directorate, Ethiopian Public Health Institute, Addis Ababa, Ethiopia, Ethiopia; [2]Dietetics and Human Nutrition, University of KwaZulu-Natal, Pietermaritzburg, South Africa; [3]Epidemiology and Public Health, Sciensano, Brussels, Belgium; [4]Nutrition, Environmental Health and Non-communicable Disease Research Directorate, Ethiopia Public Health Institute, Addis Ababa, Ethiopia; [5]Life and Consumer Sciences, UNISA, Pretoria, South Africa; [6]Biology, Sefako Makgatho Health Sciences Univesity, Pretoria, South Africa; [7]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [8]Statistics, Addis Ababa University, Addis Ababa, Ethiopia

BACKGROUND AND OBJECTIVES

NOVA classification is one of frequently used food category into four groups according to processing level. Consistently reported that higher consumption of ultra-processed (UPF) or NOVA 4 foods are associated with poorer diet quality and have epidemiological risk for non-communicable diseases (NCDs). Studies reports on consumption, share of energy and contribution for daily micronutrients of each NOVA foods in Ethiopia are limited. This study aims to determine the level of energy consumed and various micronutrients contributed from each NOVA foods

METHODS

This study used Ethiopian National Food Consumption Survey (NFCS). The survey used a random sampling of the population using a two-stage stratified cluster sampling design. It covered 8254 households, 8254 women of reproductive ages (15-45 years), and 7272 children (6-45 months old). Consumption of UPF and less processed foods were taken as response variables to find any association with explanatory variable in the population. Analysis was conducted in Multilevel mixed-effects GLM (meglm).

RESULTS

The most consumed UPF in children were biscuits, cookies, soft drinks, and semi-solid palm oil; while fresh cow milk, human milk, whole wheat bread, and other ranges of homemade cereals and cereal-based foods as minimally processed foods. In both children and women, the largest dietary energy share was from minimally processed foods: 75%% and 79%, from processed culinary ingredients: 18% and 14%, from processed foods: 1.9% and 3.3%, from UPF: 5.1% and 3.5% respectively. NOVA1 foods took large share of energy, also mainly provided the daily micronutrient and macronutrient requirement of the population compared to all other NOVA foods. But, near 66.0% of WRA and 94% of children did not consume fruits in the last 24 Hr. Higher consumption of UPF was found in wealthier households, urban residence and women with higher education.

CONCLUSIONS

NOVA1 foods were the major provider of daily energy, macronutrients also micronutrients. They were dominantly consumed in rural areas than urban, but the reverse had happened for UPF. However, as part of NOVA1 food groups, consumption of fruits and vegetables were low, which could have contributed much for vitamin C and calcium particularly but also for other essential vitamins and minerals

A NEEDS ASSESSMENT: FOOD SECURITY, NUTRITION, AND MENTAL HEALTH OF ADOLESCENTS DURING THE COVID-19 PANDEMIC IN INDONESIA

Muhammad Asrullah[1]; Nida Adzilah Auliani[1]; Ken Dwiba Amarakamini[1]; Ahmad Watsiq Maula[2]; Shita Listya Dewi[3]; Siti Helmyati[4]; Alida Melse-Boonstra[1]
[1]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [2]Biostatistic, Epidemiology, and Population Health, Faculty of Medicine, Public Health, and Nursing, Universitas Gadjah Mada, Yogyakarta, Indonesia; [3]Centre for Health Policy and Management, Faculty of Medicine, Public Health, and Nursing, Universitas Gadjah Mada, Yogyakarta, Indonesia; [4]Department of Nutrition - Center for Health and Human Nutrition, Universitas Gadjah Mada, Yogyakarta, Indonesia

BACKGROUND AND OBJECTIVES

The COVID-19 pandemic has profoundly impacted food security, nutrition, and mental health worldwide, but research in Indonesia, especially among adolescents, remains scarce. This study examines shifts in food security, nutritional status, and mental health among Indonesian adolescents during and after the pandemic.

METHODS

A needs assessment (Jan–May 2024) built on prior research (2021–2022) involving 576 adolescents in Gunungkidul district, Yogyakarta province, Indonesia. The needs assessment involved 61 stakeholders in eight World Café sessions and Focus Group Discussions (FGDs) to explore perceptions of adolescents' food security, nutrition, and mental health. Additionally, 50 adolescents (26 girls, 24 boys) aged 10–19 years participated in Participatory Learning and Action (PLA) using photovoice (400 photographs) to capture their lived experiences. Data analysis employed Atlas.ti.

RESULTS

Adolescents showed limited awareness of mental health and misconceptions about healthy eating, with diets often lacking nutritional quality. Parents demonstrated inadequate knowledge of nutrition and anaemia prevention, compounded by economic challenges and limited emotional support. Teachers and health workers were underprepared to address these issues, and school health programs faced budget and monitoring constraints. Weak intersectoral coordination and fragmented efforts hindered sustainable solutions for adolescent health.

CONCLUSIONS

Integrated, cross-sectoral efforts are crucial to improving adolescent food security, nutrition, and mental health in Indonesia. Recommendations include establishing cross-sectoral data systems, integrating mental health and nutrition into school curricula, fostering school-community collaborations, and reducing stigma through campaigns and capacity-building initiatives.

MIND THE GAP - OPTIMISING DIETS OF OLDER ADULTS TO IMPROVE NUTRIENT INTAKE USING THE SMALLEST FEASIBLE DIETARY CHANGE

Barbara Bray[1]; Romane Poinsot,[2]; Florent Vieux[2]; Miriam Clegg,[3]; Julie Lovegrove[4]; Vikki O'neill,[1]; Kaur Asha[5]; Jayne Woodside[6]; Claire T Mcevoy,[1]
[1]Centre for Public Health, Queen's University Belfast, Belfast, United Kingdom; [2]Bouches-du-Rhône, MS-Nutrition, Marseille, France; [3]School of Food and Nutritional Sciences, University C, Cork, Ireland; [4]Hugh Sinclair Unit of Human Nutrition, University of Reading, Reading, United Kingdom; [5]Nuffield Department of Primary Care Health Sciences, University of Oxford, Oxford, United Kingdom; [6]School of Medicine, Dentistry and Biomedical Sciences, Queen's University Belfast, Belfast, United Kingdom

BACKGROUND AND OBJECTIVES

Energy intake and diet quality decrease with age, (Van Dijk et al., 2021) as nutrient requirements rise. Supporting older adults in maintaining healthy dietary patterns as their food consumption declines is paramount. Evidence is needed to inform this cohort of potential dietary gaps that need to be managed. A literature review identified higher nutrient (HNut) dietary recommendations for older adults including current fibre recommendations and proposed higher protein, vitamin B12, calcium, folate, and fluids requirements compared to the current government guidelines (Dorrington et al., 2020). The objective of this study was to determine the smallest divergence to the UK current average diet that would be needed to meet specific nutrient requirements based on i) ‘Eatwell’ the UK’s Food-Based Dietary guidelines and government age*gender specific recommendations (Public Health England, 2016) and ii) HNut (Dorrington et al., 2020).

METHODS

The objective of this study was to analyse the consumption patterns of UK older adults to determine the smallest divergence to their current average diet that would be needed to meet specific nutrient requirements based on i) ‘Eatwell’ (the UK’s Food-Based Dietary guidelines) and government age*gender specific recommendations (Public Health England, 2016) and ii) HNut (Dorrington et al., 2020).

RESULTS

The population comprised men (n=781) and women (1082) over-64 years of age. The HNut diet increased daily fruit and vegetable intake by +175g (men), +241g (women), dairy by +67g (men), +225g (women), beans +14g (men), +18g (women), and for women failed to match observed energy intake (+458kcal). In the Eatwell diet, daily intakes increased for fruit and vegetables by +144g (men), +231 g (women), beans +10g (men), +8.5g (women), and red and processed meat +13.4g (women). There were reductions in red and processed meat by -57g (men), and dairy -139g (women).

CONCLUSIONS

Although this study aimed to minimise the changes required to meet optimised guidelines, in some instances large changes in the diet (e.g. adding two or more portions of fruit and vegetables, minimising red and processed meat (Eatwell diet - men) and halving dairy (Eatwell diet - women) would be required. A main conclusion is that 30g of fibre is not achievable for women consuming 1560kcal daily without large dietary change. Strategies to optimise diet in this population requires further examination.

SOAP24_04

PREVALENCE AND DETERMINANTS OF WASTING, STUNTING, UNDERWEIGHT AND OVERWEIGHT AMONG CHILDREN UNDER 5 YEARS OLD IN MONGOLIA: FINDINGS FROM MONGOLIA'S VI NATIONAL NUTRITION SURVEY, 2023

Amarsanaa Byambadorj[1]; Bolormaa Norov,[1]; Oyundelger Dechinjamts[1]; Batjargal Jamiyan,[1]; Bayasgalan Jambaldorj,[1]; Unursaikhan Surenjav,[2]
[1]Department of Nutrition and Food Safety, National Center for Public Health, Ulaanbaatar, Mongolia; [2]Director, National Center for Public Health, Ulaanbaatar, Mongolia

BACKGROUND AND OBJECTIVES
Malnutrition among under-five children in low- and middle-income countries is a global health concern. United Nations Sustainable Development goals 2030 and The World Health Organization Global Target 2025 include the reduction of malnutrition especially among children (1,2). In Mongolia, the National Nutrition Survey has been conducted since 1993, generating guidelines for infant feeding since 1997 and most recently enacting Law on Infant and Young Child Feeding in 2017. Our team conducted the VI National Nutrition Survey in 2023 to update previous findings and policies. The survey RESULTS will be launched in January 2025, and the data will be made public. The goal of this study is to estimate the prevalence and identify the determinants of under-five wasting, stunting, underweight and overweight in Mongolia.
METHODS

Cross-sectional study design and cluster sampling method were used. A total of 2786 randomly selected under-five children from all five regions of the country participated in the survey. Descriptive statistics and logistic regression models with univariate and multivariable analysis were implemented.

RESULTS

The prevalence of wasting in this population was 1.5%, stunting was 8.4%, underweight was 1.3% and overweight was 11.3%. While overweight prevalence was higher than most LMICs the prevalence of wasting, stunting and underweight were significantly lower. Low-birth weight (<2500g) increased the risk of stunting (AOR 4.411) and underweight (AOR 7.561), as did mothers' lack of education (primary only AOR 1.920; no education AOR 4.887) respectively. Low income increased the likelihood of stunting (AOR 2.330) and severe food insecurity was implicated in underweight (AOR 2.734) and stunting (AOR 2.331) respectively. Kazakh ethnic children had a higher risk of wasting (AOR 2.803) and stunting (AOR 1.441). Overweight children were more likely to be of male gender (AOR 1.456), and those 0-5 months old were more likely to be overweight compared to children >36 months (AOR 3.672). High birth weight (>4500g) babies were more likely to be overweight (AOR 1.740) compared to normal and low birth weight children.

CONCLUSIONS

Current nutritional interventions should be strengthened in quantity and quality, notably nutrition education for mothers. In-depth studies of the Kazakh ethnic population are vital for designing culturally appropriate interventions.

SOAP24_06

PERIODIC REVISIONS OF THE CHOICES INTERNATIONAL 5-LEVEL NUTRIENT PROFILING MODEL

Annet JC Roodenburg[1]; Pulkit Mathur[2]; Bruce Hamaker,[3]; Lauren Lissner,[4]; Ngozi Mercy Nnam[5]; Mario Maróstica,[6]; Hidemi Takimoto[7]; Herbert Smorenburg,[8]

BACKGROUND AND OBJECTIVES

Poor dietary habits are a major contributor to non-communicable diseases (NCDs), the leading global cause of mortality. To promote healthier eating, nutrition policies such as front-of-pack nutrition labeling (FOPNL) have been implemented worldwide. The Choices Program, including the International Choices criteria, supports these efforts by providing a standardized framework for nutrient profiling. Originally designed for a positive front-of-pack logo, the Choices criteria were expanded in 2021 to a 5-level nutrient profiling model encompassing 23 basic and 10 non-basic food groups (Tognon et al). The criteria address key nutrients including industrially-produced trans-fatty acids, saturated fat, sodium, sugar, fiber and energy.

METHODS

To maintain relevance and scientific rigor, the Choices criteria undergo periodic evaluation and revision by an independent international scientific committee. This paper outlines the development of the 2025 version of the International Choices criteria, addressing challenges identified in the 2021 version. Stakeholders highlighted several issues, including misalignment with international trans-fatty acid guidelines, the absence of criteria for plant-based alternatives to meat, the classification of dairy alternatives as non-basic food group, and the need to consider whole grains, non-nutritive sweeteners (NNS), and micronutrients. Revisions were guided by national and international dietary recommendations, literature reviews, food composition data, and stakeholder input.

RESULTS

While whole grain and micronutrient criteria were reviewed, they were not included in the final framework. NNS were introduced as a disqualifying factor, reducing the product's classification by one level and excluding such foods from positive FOPNL eligibility. Criteria for industrially-produced trans-fatty acids were aligned with international standards, and equivalence criteria for protein and micronutrients were established for plant-based alternatives to meat and dairy. Validation involved comparing the revised criteria with indicator foods from food composition databases.

CONCLUSIONS

The updated 5-level nutrient profiling model serves as an international standard for assessing product healthiness and provides a robust framework to guide nutrition policies globally.

SOAP24_09

THE INFLUENCE OF A MANDATORY VITAMIN D FORTIFICATION POLICY IN DENMARK ON NEONATAL 25(OH)D CONCENTRATIONS

Fanney Thorsteinsdottir[1]; Ramune Jacobsen[2]; Mina Nicole Händel[3, 1]; Ina Specht[1]; Berit Heitmann,[1]
[1]The Parker Institute, Frederiksberg Hospital, Frederiksberg, Denmark; [2]Department of Pharmacy, Copenhagen University, København, Denmark; [3]Unit for Dietary Studies, Parker Institute, Frederiksberg Hospital, Copenhagen, Denmark

BACKGROUND AND OBJECTIVES

Vitamin D deficiency is a widespread public health issue, even in industrialized countries. Fortifying commonly consumed foods with vitamin D has been proposed as a strategy to improve vitamin D status at the population level. In Denmark, from the 1930s until June 1, 1985, margarine was mandatorily fortified with a small dose of vitamin D (1.25 µg/100 g). However, this fortification policy was discontinued after that date. This study aimed to evaluate the impact of this low-dose vitamin D fortification policy on neonatal 25-hydroxyvitamin D [25(OH)D] concentrations.

METHODS

In an ecological study design, we compared neonatal 25(OH)D concentrations in the exposed group consisting of individuals born from June 1st 1983 to May 31st 1985 and the unexposed group consisting of individuals born from September 1st 1986 to August 31st 1988. We used cosinor modeling to describe the overall mean concentration and seasonal variation in 25(OH)D before and after the termination of the fortification policy.

RESULTS

Considering seasonal variation, the mean concentration of neonatal 25(OH)D3 was lower among exposed than among unexposed (-2.2 nmol/L; 95%CI: -4.5, 0.2). We observed an overall increase in neonatal 25(OH)D concentration over time.

CONCLUSIONS

Our analyses show that margarine fortification with small-dose vitamin D in Denmark before 1985 did not influence newborns' serum 25(OH)D concentrations. The vitamin D dose added to margarine was too small to prevent seasonal vitamin D deficiency in pregnant women and their offspring.

SOAP24_11

TRANSITIONING FROM IRON-FOLIC ACID TO MULTIPLE MICRONUTRIENT SUPPLEMENTATION: HEALTH SYSTEM PERSPECTIVES IN NEPAL

Mai-Anh Hoang[1]; Sasmita Poudel[2]; Lila Bikram Thapa[3]; Rolf Klemm,[1, 4]; Kenda Cunningham[5]
[1]Nutrition, Helen Keller Intl, New York, United States of America; [2]Health, Helen Keller Intl Nepal, Lalitpur, Nepal; [3]Family Welfare Division, Department of Health Services, Kathmandu, Nepal; [4]Global Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [5]Monitoring, Evaluation and Learning, Helen Keller Intl, New York, United States of America

BACKGROUND AND OBJECTIVES

The Government of Nepal is exploring the transition from Iron Folic Acid (IFA) to Multiple Micronutrient Supplementation (MMS) to improve maternal and child health outcomes. This study aims to assess the operational feasibility of this transition, focusing on critical health system components, including health provider training requirements, supply chain readiness, and storage challenges. By capturing insights from health facility workers, female community health volunteers, and policy makers, the study seeks to identify actionable strategies that support a successful, sustainable transition to MMS.

METHODS

This qualitative study will be conducted across all seven provinces of Nepal. Data collection METHODSinclude 28 semi-structured focus group discussions with health facility workers, female community health volunteers, and 30 key informant interviews with policymakers and logistics/supply chain specialists. Participatory techniques, such as free-listing, prioritization ranking, and pile sorting, will be employed during data collection. Thematic analysis using NVivo software will identify patterns and themes related to the health system readiness for scaling, operational feasibility, and potential enablers and barriers to successful MMS rollout.

RESULTS

This study's analysis will provide comprehensive and detailed findings on domains of scalability, readiness of the health system infrastructure, and enablers and barriers to Nepal’s transition from IFA to MMS, focusing on training, logistics, and resource allocation. The findings, available in April 2025, will provide crucial insights into the health system’s readiness for this transition to MMS. The findings also aim to inform sustainable policy and programmatic approaches to enhance maternal and child health outcomes in Nepal by engaging key stakeholders throughout the research process.

CONCLUSIONS

These findings will complement learnings from a large-scale randomized controlled trial on MMS adherence and acceptability, a qualitative supply readiness assessment, and other ongoing studies, all supporting evidence-based decision-making to optimize Nepal’s health system readiness for MMS implementation. Together, these studies will offer practical recommendations for addressing challenges and generate evidence to support Nepal’s transition from IFA to MMS across all seven provinces.

DIETARY CADMIUM EXPOSURE AND HEALTH RISKS: INSIGHTS FROM A BULGARIAN STUDY

Ivelina Ruseva[1]; Vanya Birdanova[1]; Tsvetelina Vitkova[1]; Zdravka Radionova[2]
[1]Department of Hygiene, medical ecology and occupational diseases and DM, Medical University - Pleven, Плевен, Bulgaria; [2]Department of Social Medicine and Health Management, Medical University - Pleven, Плевен, Bulgaria

BACKGROUND AND OBJECTIVES

Cadmium is a metal primarily known for its toxic effects on the kidneys. Beyond renal toxicity, cadmium exposure has been statistically linked to an increased risk of cancers in the lung, endometrium, bladder, and breast. The primary routes of sources of cadmium exposure are food and drinking water, with dietary intake accounting for over 75.8% of the total daily cadmium intake. This study aimed to evaluate dietary cadmium exposure in a young population and assess the associated health risks.

METHODS

Cadmium concentrations in 2979 food samples categorized according to the FoodEx2 system were studied. The food samples were analyzed for cadmium content using an accredited inductively coupled plasma mass spectrometry (ICP-MS) method. Handling Left-Censored Data method was applied for analytical RESULTS below the limit of quantification (LOQ). Dietary consumption data for 60 healthy participants (aged 19–29 years) were collected using the 24-Hour Dietary Recall Method. The consumption data covered 1220 food products. The cadmium exposure levels were expressed as mean, median, and 95th percentile values.

RESULTS

The dietary exposure to cadmium in the studied group ranged from 0.21 μg/kg body weight (bw)/week to 0.38 μg/kg bw/week. The median chronic exposure ranged from 0.2 to 0.32 μg/kg bw/week, and the 95th percentile for high consumers ranged from 0.41 μg/kg bw/week to 0.73 μg/kg bw/week. These values did not exceed the toxicological reference value established by EFSA of 2.5 μg/kg bw/week. Women in the study exhibited higher chronic exposure levels compared to men, suggesting that women might be at greater risk for chronic exposure to cadmium. However, no adverse health effects are expected in the studied group based on the calculated dietary exposure levels.

CONCLUSIONS

The dietary cadmium exposure levels in the study group did not exceed EFSA’s tolerable weekly intake. Women in the study appear to be a potentially higher-risk group for dietary cadmium exposure. Further research is recommended to confirm these findings and explore gender-specific factors contributing to cadmium exposure.

ENHANCING MATERNAL AND CHILD HEALTH: A CROSS-NATIONAL ANALYSIS OF NUTRITION SERVICE READINESS IN SUB-SAHARAN AFRICA

Romance Dissieka[1]; Djeinam Toure[2]; Akriti Singh[3]; Mansour Ndiath[4]; Rolf Klemm,[3]
[1]Vitamin A Supplementation, Helen Keller International - Côte d'Ivoire, Abidjan, Ivory Coast; [2]Africa region, Helen Keller Intl, Dakar, Senegal; [3]Nutrition, Helen Keller Intl, New York, United States of America; [4]Africa region, Helen Keller INTL - Regional & Senegal, Dakar, Senegal

BACKGROUND AND OBJECTIVES

Sub-Saharan Africa is off track in achieving the 2025 World Health Assembly nutrition targets. A robust health system is essential to deliver critical interventions that protect the nutrition of pregnant women and children under five years of age.

This study aimed to examine health and nutrition service readiness, provision, and training in Côte d'Ivoire, the Democratic Republic of Congo, Guinea, Kenya, Mali, Niger, and Nigeria.

METHODS

Two distinct data collection streams were employed: national-level commodity data and health facility data. Interviews were conducted with Ministry of Health officials to gather information on the procurement of nutrition commodities. Health facility data were collected in a survey using a two-stage random cluster design. This integrated approach assessed the availability of essential nutrition commodities, service provision, and training of health personnel.

RESULTS

Findings revealed significant variations in health system readiness and service provision across the seven countries. For pregnant women, the availability of Iron-Folic Acid at health facilities ranged from 73% in Guinea to 98% in Mali, with similar variability in service provision and health worker training. Multiple Micronutrient and calcium supplements showed gaps in availability and provision. For children under five, Oral Rehydration Solution availability ranged from 32% in Côte d'Ivoire to 89% in Niger, with corresponding differences in service provision and training. Newer interventions like Micronutrient Powders and Small-Quantity Lipid-Based Nutrient Supplements showed low service provision.

CONCLUSIONS

This study highlights the need for targeted interventions to address supply chain challenges, enhance health worker training, and ensure consistent service provision.

SOAP24_15

BRIDGING THE GAP BETWEEN POLICY AND PRACTICE: COMMUNITY HEALTH WORKERS' CONTRIBUTIONS TO NUTRITION SERVICES IN SUB-SAHARAN AFRICA

Akriti Singh[1]; Mansour Ndiath[2]; Djeinam Toure[3]; Romance Dissieka[4]; Kyomuhangi Bazira Lennie[5]; Carolyne Wanyonyi[6]; Rolf Klemm,[1]
[1]Nutrition, Helen Keller Intl, New York, United States of America; [2]Africa region, Helen Keller INTL - Regional & Senegal, Dakar, Senegal; [3]MER , Helen Keller Intl, Dakar, Senegal; [4]Vitamin A Supplementation, Helen Keller International - Côte d'Ivoire, Abidjan, Ivory Coast; [5]Policy, Community Health Impact Coalition, Clarksville, United States of America; [6]Community Health Worker Engagement, Community Health Impact Coalition, Nairobi, Kenya

BACKGROUND AND OBJECTIVES

Community health workers (CHWs) are the backbone of healthcare service provision in Africa, particularly in delivering critical health and nutrition services. Despite their pivotal role, there is limited understanding of the alignment between CHW responsibilities as defined in national policies and the actual nutrition services they provide. This study aimed to compare the nutrition-related responsibilities assigned to CHWs in national policies with the nutrition services CHWs report delivering to women and children in six Sub-Saharan African countries: Guinea, Mali, Niger, Côte d'Ivoire, Democratic Republic of Congo (DRC), and Kenya.

METHODS

Data were collected from a cross-sectional survey conducted with CHWs as part of post-event coverage surveys for Vitamin A supplementation. Structured interviews were conducted with 735 CHWs across the six countries. National community health policies and training manuals were also reviewed to extract CHW responsibilities.

RESULTS

The policy documents revealed notable differences in the CHW scope of responsibilities across the six countries. Training for CHWs was inconsistently documented across countries. Financial compensation for CHWs was mentioned in policy documents from five out of six countries, though the nature and amount of compensation varied significantly. Among the CHWs surveyed, a high percentage (68%-84%) reported receiving financial compensation. Most CHWs provided promotional services but were more likely to dispense preventive and curative commodities for children (e.g., Vitamin A, deworming, oral rehydration solution, and Zinc) than women (iron-folic acid, intermittent preventive treatment for Malaria). Service provision was closely linked to the training received. Discrepancies were noted between policy-defined responsibilities and reported service delivery, particularly in growth monitoring and promotion and management of wasting.

CONCLUSIONS

These findings highlight the critical need for stronger alignment between policy directives and CHW training and service provision. Governments must invest in adequately training and compensating CHWs to effectively deliver lifesaving nutrition services.

SOAP 27 - PUBLIC HEALTH AND NUTRITION THROUGHOUT LIFE CYCLE

SOAP27_01

ENHANCING THE VISIBILITY AND INTEGRATION OF SUSTAINABILITY IN THE NUTRITION AND DIETETICS EDUCATION PROGRAM

Ellen Martens[1]; Erika Vanhauwaert[1]; Ilse Scroyen[1]
[1]Health, University College Leuven Limburg (UCLL), Leuven, Belgium

BACKGROUND AND OBJECTIVES

Integrating sustainability into higher education is essential to equip students with tools they need, to create a more sustainable future. However, its visibility and integration in modern curricula often remain unclear. Indeed, in our Nutrition and Dietetics program, a recent student survey revealed a perceived lack of focus on sustainability. Further analysis indicated that students tended to interpret sustainability narrowly, associating it almost exclusively with environmental and climate-related issues (Planet), while overlooking the other dimensions of the 5P model being People, Prosperity, Partnership and Peace.

METHODS

To address these findings, a multi-faceted approach was adopted. Although, it is the responsibility of every educational program to contribute to SDG4 (Quality of Education) other SDGs can be aligned to professional competences of a specific program. For a Nutrition and Dietetics program these are SDG 2 (Zero Hunger), SDG 3 (Good Health and Well-being), and SDG 12 (Responsible Consumption and Production). A focus group involving students confirmed that attention is given to these SDGs throughout the curriculum, with continuous alignment to SDG 4. Additionally, interviews with faculty members provided a comprehensive inventory of course modules that integrate sustainability (with focus to SDG2, 3 and 12) in their content and pedagogy.

RESULTS

To enhance visibility, sustainability's role was explicitly highlighted in two ways: by updating the ECTS course descriptions to reflect relevant sustainability themes and by emphasizing its importance during course introductions. Furthermore, sustainability was formally embedded into the program's policy and vision statements, underscoring its critical role in shaping future nutrition and dietetics professionals. In addition, an Impact Team Health Promotion was established to further link SDG 3 and SDG 12 to healthy lifestyle promotion on campus. This team, comprising Nutrition and Dietetics students and faculty members, organizes monthly themed activities that spotlight various aspects of health promotion. This initiative fosters a campus culture that integrates sustainability with practical, health-oriented actions, empowering students to apply these principles in real-world contexts.

CONCLUSIONS

This structured approach not only improves the visibility of sustainability within the curriculum but also broadens students' understanding of its multifaceted nature, fostering a holistic perspective on sustainability that aligns with the United Nations' SDGs.

SOAP27_03

COST-EFFICIENCY ANALYSIS OF MULTISECTORAL INTERVENTIONS TO PREVENT STUNTING IN ANGOLA: LESSONS LEARNT FROM THE MUCCUA TRIAL

Rocio Martin-Cañavate[1, 2]; Elena Trigo[3]; Mª De Lourdes Faria[4]; Ana Silva-Gerardo[5]; Eva Iráizoz[6]; Amaia Navarro-Erro[7, 1]; Chloe Puett[8]; Estefania Custodio[1, 9]
[1]National Centre of Tropical Medicine, Carlos III Health Institute, Madrid, Spain; [2]Escuela Internacional de Doctorado, UNED - Universidad Nacional de Educación a Distancia, Madrid, Spain; [3]Tropical Medicine Unit Vall d'Hebron-Drassanes, Vall d'Hebron University Hospital, Barcelona, Spain; [4]Fundo de Apoio Social, Fundo de Apoio Social - Local Development Institute, Lubango, Angola; [5]Faculdade de Medicina, Universidade Mandume Ya Ndemufayo, Lubango, Angola; [6]Nutrition and Health, Action Against Hunger, Madrid, Spain; [7]Servicio de Medicina Preventiva, Hospital Universitario Rey Juan Carlos, Madrid, Spain; [8]Public Health, Stony Brook University, New York, United States of America; [9]CIBERINFEC, Carlos III Health Institute, Madrid, Spain

BACKGROUND AND OBJECTIVES

In order to progress in stunting reduction, it is essential to expand the limited existing evidence on the costs and benefits of multisectoral interventions to prevent it. Assessing cost-efficiency is crucial for optimizing resources and minimizing expenditures to achieve desired outcomes. Stunting remains a significant problem in Southern Angola, where the Crescer project is implementing the MuCCUA trial-a community-based randomised controlled trial with three intervention arms combining standard of care, nutritional supplementation and cash transfers.

METHODS

We are conducting a cost-efficiency analysis of the interventions nested within the MuCCUA trial using the Strengthening Economic Evaluation for Multisectoral Strategies for Nutrition (SEEMS-Nutrition) framework and a societal perspective. A mixed-METHODSapproach (combining financial and economic costs) is used to measure and allocate costs for program activities and inputs. Financial costs are estimated using the activity-based costing method, using project's accounting records and staff time allocation. The ingredient approach uses costs not included in accounting records and both direct and indirect costs incurred by beneficiaries during program participation. Cost-efficiency of each intervention will be calculated by dividing the total estimated cost of each intervention by the respective number of participants reached.

RESULTS

Several challenges emerged during the analysis, including reconciling diverse data sources, selecting appropriate costing methodologies, and accurately determining the number of beneficiaries for community-based interventions. Triangulating input costs required balancing purchase invoices, which often cover multiple deliveries, against beneficiary distribution lists; while sensitivity around salary disclosures from government and non-project-funded staff complicated data collection. However, early engagement with project staff and key stakeholders enhanced the process, offering critical insights into expenditure rationales.

CONCLUSIONS

While cost-efficiency RESULTS are forthcoming, this study highlights key methodological insights and practical lessons learned. Early integration of economic evaluations during project implementation proved instrumental in addressing challenges and refining cost measurement strategies. Accurate cost and cost-driver analyses will contribute to optimizing interventions aimed at reducing stunting in resource-constrained settings, and to inform policy, programming, and future research efforts in multisectoral nutrition strategies.

SOAP27_04

SERUM VITAMIN B12 LEVELS AND DIETARY INTAKE IN YOUNG ADULTS: A STUDY ON VITAMIN B12 STATUS AND ITS ASSOCIATION WITH BODY WEIGHT

Vanya Birdanova[1]; Tc Vitkova[2]; Ivelina Ruseva[1]; Zdravka Radionova[3]
[1]Department of Hygiene, medical ecology and occupational diseases and DM, Medical University - Pleven, Плевен, Bulgaria; [2]Department of Hygiene, Medical Ecology, Occupational Diseases and DM, Medical University - Pleven, Плевен, Bulgaria; [3]Department of Social Medicine and Health Management, Medical University - Pleven, Плевен, Bulgaria

BACKGROUND AND OBJECTIVES

Vitamin B12, or cobalamin, is a vital water-soluble vitamin involved in DNA synthesis, red blood cell production, and brain function. Observational and intervention studies have demonstrated that individuals ranging from underweight to severely obese, often exhibit low levels of vitamin B12. The aim of this study was to evaluate the vitamin B12 status in young adults, examining its dietary intake, biochemical levels, and their association with body weight.

METHODS

The study included 90 healthy subjects aged 23.8±1.8 years (68 women) randomly selected from general practitioners' practices in the Pleven region, Bulgaria. Dietary intake was evaluated using a three-day 24-hour dietary recall method. Serum cobalamin levels were measured with a COBAS c411 immunoassay analyzer. Anthropometric measurements, including body mass index (BMI), were recorded using a Tanita MC-780MA analyzer. Data were analyzed using IBM SPSS Statistics, v. 25.

RESULTS

The average dietary intake of vitamin B12 was 4.06 ± 4.7 μg/day for men, while women had lower intake of 3.14 ± 4.2 μg/day, falling short of the Dietary Reference Values (DRVs) of 4 μg. The mean serum vitamin B12 level across participants was 432.5 ± 136.2 pg/mL, with no significant difference between men and women. Vitamin B12 deficiency (<148 pg/mL) was identified in 2.4% of participants, exclusively women. Suboptimal serum B12 levels were observed in 12% of men and 18% of women. Among women with inadequate vitamin B12 status, 31% were overweight - double the proportion of those with a normal BMI (17%). Additionally, a moderate negative correlation (r = -0.58, p = 0.03) was observed between serum B12 levels below 300 pg/mL and BMI.

CONCLUSIONS

Lower levels of vitamin B12 are associated with overweight in healthy young women.These findings highlight the importance of targeted nutritional interventions to address potential deficiencies and their effects on metabolic health.

SOAP27_05

THE NUTRITIONAL QUALITY OF THE FIVE-YEAR INVENTORY OF AN AUSTRALIAN FOOD RELIEF ORGANISATION

Tjing Shaeny Dian Chandra[1]; Scott Hanson-Easey[2]; Olena Kravchuk[3, 1]; Helen Morris[1]
[1]School of Agriculture, Food and Wine, The University of Adelaide, Adelaide, Australia; [2]The University of Adelaide, School of Public Health, Adelaide, Australia; [3]The Biometry Hub, The University of Adelaide, Adelaide, Australia

BACKGROUND AND OBJECTIVES

In Australia, although food insecurity is addressed through food relief from organisations such as food banks, there is limited information regarding the nutritional quality of food distributed by this sector. A better understanding is warranted, particularly given that food insecure households, reliant on food relief, face higher risk of suboptimal diets and diet-related diseases. Objective: to examine the complete five-year inventory (2019–2023) of an Australian food relief organisation, encompassing over 50,000 distinct lines (more than 19 million kilograms) using three food classification systems, and comparing the alignment between these tools.

METHODS

A quantitative retrospective analysis of the inventory was conducted, with main measures as mean % of each food group/colour category over time and per supply channel, while Cohen's Kappa was used to assess for alignment, agreement and discordance. For the food classification tools, two were nutrition-based underpinned by dietary guidelines and the third was the NOVA system.

RESULTS

Analysis of the included inventory (just over 17 million kilograms) revealed that the sector, on average, supplied 66% of dietary guidelines recommended foods (most nutritious, healthiest), followed by 17% discretionary items (least healthy), and 13% amber foods (nutritious, less healthy). Supply of dairy foods, animal protein and alternatives was variable and low, whilst, 69% of beverages were sugar-sweetened beverages. Under the NOVA system, the inventory was composed of 34% ultra-processed foods (UPF), which are generally perceived as unhealthy foods but were spread across green (52%), amber (9%) and red (39%) nutrition-based categories, resulting in a confusion matrix analysis, indicating low agreement between nutrition-based tools and NOVA, with high confusion for UPF.

CONCLUSIONS

Continuous inventory monitoring using nutritional metrics will improve understanding of the quality of food provided through food relief, and better inform policy decisions and funding support, enabling food insecurity to be more effectively addressed. The NOVA system may stigmatise some nutrient-rich foods in Western diets and rushed policy decisions could result in unintended consequences for an already resource-strapped sector, and individuals with limited cooking facilities.

CONFLICTS OF INTERESTS

SOAP27_07

Opportunity cost estimation of participating in three maternal and child interventions in South Angola: RESULTS from the MuCCUA trial

Carmen Rojas-Chicote[1]; Rocio Martin-Cañavate[2, 3]; Elena Trigo[4]; Mª De Lourdes Faria,[5]; Jose Carlos Lima[6]; Eva Iráizoz[7]; Estefania Custodio[2, 8]
[1]Servicio de Medicina Preventiva y Gestión de Calidad, Gregorio Marañón General University Hospital, Madrid, Spain; [2]National Centre of Tropical Medicine, Carlos III Health Institute, Madrid, Spain; [3]Escuela Internacional de Doctorado, UNED - Universidad Nacional de Educación a Distancia, Madrid, Spain; [4]Tropical Medicine Unit Vall d'Hebron-Drassanes, Vall d'Hebron University Hospital, Barcelona, Spain; [5]Fundo Apoio Social, Fundo Apoio Social - Local Development Institute, Lubango, Angola; [6]Faculdade de Medicina, Universidade Mandume Ya Ndemufayo, Lubango, Angola; [7]Nutrition and Health, Action Against Hunger, Madrid, Spain; [8]CIBERINFEC, Carlos III Health Institute, Madrid, Spain

BACKGROUND AND OBJECTIVES

Stunting is a public health concern in Southern Angola. The MuCCUA trial evaluates the cost-effectiveness of a combination of three interventions to prevent it: standard of care (SOC), nutritional supplementation (NS), and cash transfers (CT) during the first 1000 days. Participation entails an opportunity cost, which should be considered to better understand indirect costs and improve future interventions design. This study aims to estimate the opportunity cost for the women participating in it.

METHODS

The MuCCUA trial is a community-based, cluster randomized controlled trial that recruited pregnant women and conducts periodic follow-up interviews with mother-child pairs until the child reaches two years of age. At twelve months postpartum, data was collected on travel time, waiting time, transportation expenses, and activities foregone due to traveling to and waiting at health posts (SOC) or distribution points (NS and CT). Descriptive analyses were presented median transportation costs and proportions according to transport and waiting time categories as well as to type of activities missed due to their intervention participation.

RESULTS

Of 1,006 women surveyed, all participated in the standard of care (SOC) intervention and some of them received combined interventions: 352 also received nutritional supplementation (NS), and 351 also received cash transfers (CT). Over 50% of women reported spending more than 1 hour traveling to health posts for SOC or to distribution points for NS and CT, with 30% spending over 2 hours. Waiting times were also significant, with 25% of women waiting more than 1 hour at health posts for SOC, and 10% of NS and 32% of CT participants waiting over 1 hour at distribution points. Between 30 and 40% of women reported transportation expenses, with median costs of 1500 AOA ($1.6) for SOC and 2000 AOA ($2.2) for NS and CT. Additionally, around 70% of participants reported ceasing daily activities to participate in the interventions, primarily agricultural work (50%), domestic tasks (30%), and paid work (20%).

CONCLUSIONS

A significant majority of participants reported sacrificing economically valuable activities due to long travel and waiting times, which will be accounted for as indirect costs in the final analysis. Additionally, over one-third incurred transportation expenses, with higher costs linked to trips to distribution points. Incorporating a societal perspective and opportunity costs in economic evaluations is essential to identify unintended participant costs and inform the design of more efficient and accessible interventions.

SOAP27_08

Was the increase in breastfeeding initiation and duration in France between 2012 and 2021 observed whatever the level of maternal education? RESULTS from the EPIFANE 2012 and 2021 cohorts

Julie Boudet-Berquier[1]; Elodie Lebreton[1]; Virginie Demiguel[1]; Charlotte Verdot[1]; Corinne Delamaire[2]; Arielle Le Masne[2]; Christine Cesar[2]; Aude Mondeilh[3]; Nolwenn Regnault[1]; valerie deschamps[1]; Katia Castetbon[4]; Benoit Salanave[1]

[1]Direction des Maladies Non Transmissibles et des Traumatismes, Santé publique France, Saint-Maurice, France; [2]Direction de la Prévention et de la Promotion de la Santé, Santé publique France, Saint-Maurice, France; [3]Direction Appui Traitement et Analyses de données, Santé publique, Saint-Maurice, France; [4]Research Center in Epidemiology, Biostatistics and Clinical Research, School of Public Health, Université Libre De Bruxelles / Campus Érasme, Brussels, Belgium

BACKGROUND AND OBJECTIVES

Since 2001, France has included the promotion and support of breastfeeding as a public health objective in its National Nutrition and Health Programme (PNNS). To guide public policy, the national repeated cohorts EPIFANE, an epidemiological surveillance system of trends in breastfeeding, were set up. We aimed to assess changes in breastfeeding initiation and duration in France between 2012 and 2021, and whether these changes differed according to mothers' level of education.

METHODS

EPIFANE 2012 and 2021 were two prospective cohorts including a nationally representative sample of neonates born after 33 AW in mainland France. in 2012, 3368 neonates from 136 maternity wards randomly selected, were included and interviewed at birth, 1, 4, 8 and 12 months. In 2021, we included 3 543 dyads, drawn at random from women included in the 2021 National Perinatal Survey and who agreed to take part in its 2-month follow-up. Mothers were interviewed at birth, 2 ,6 and 12 months. Kaplan Meier curves were used to determine breastfeeding duration. For maternal education, we distinguished a level of education below high school, high school level, 1 or 2 year after baccalaureate(high school) degree, 3 years or more after baccalaureate Sample designs were taken into account in all statistical analyses and the data were weighted.

RESULTS

In France, in 2012, 74% of mothers initiated breastfeeding versus 77 % in 2021. Median duration of breastfeeding increased of 5 weeks between 2012 and 2021, to 15 from 20 weeks. In 2012 and 2021, maternal education was a determinant of breastfeeding initiation and duration, with higher rates and duration observed among women with an education level equal to 3 years or more after baccalaureate. However, while the proportion of breastfeeding initiation did not change between 2012 and 2021 for women with a baccalaureate +1 or 2 (74%) and women with a baccalaureate +3 or more (83%) it almost increased of five points for women with a high school level (69% vs. 74%) and women with an education level below high school (65% vs. 69%). On the other hand, we observed increases in the median duration of breastfeeding between 2012 and 2021 for all levels of education, with an increase of 47 days for women with an education level below high school, and equal to 30 days for other categories

CONCLUSIONS

Analyses are underway to understand whether these trends, more significant for women with lower level of education, stay the same when maternal place of birth is taken into account.

SOAP27_10

ADVANCING MATERNAL NUTRITION: EVALUATING MULTIPLE MICRONUTRIENT SUPPLEMENT ACCEPTABILITY IN SIERRA LEONE'S ANC SERVICES

Djeinam Toure[1]; Umu Jalloh[2]; Francis Moses[3]; Aminata Shamit Koroma[4]; Sugandh Juneja[2]; Mohamed Bangura[2]; Mansour Ndiath[5]; Garn Kristine[6]
[1]Africa region, Helen Keller Intl, Dakar, Senegal; [2]Sierra Leone, Helen Keller International, Freetown, Sierra Leone; [3]Reproductive Health and Family planning, Ministry of Health and Sanitation, Sierra Leone, Freetown, Sierra Leone; [4]Director of Food and Nutrition, Ministry of Health and Sanitation, Sierra Leone, Freetown, Sierra Leone; [5]MER, Helen Keller INTL - Regional & Senegal, Dakar, Senegal; [6]Helen Keller Intl, Helen Keller INTL - Regional & Senegal, Dakar, Senegal

BACKGROUND AND OBJECTIVES

There is significant evidence of the benefit of multiple micronutrient supplements (MMS) during pregnancy over iron folic acid (IFA) on maternal and infant health and nutrition. In view of this, the Ministry of Health (MoH) of Sierra Leone decided to switch from IFA to MMS in 2023 with the support of its partners Helen Keller International and CARE International. The MMS is distributed in bottles containing 180 tablets to address the problem of inconsistent supplementation among pregnant women, but the impact this may have on ANC attendance and the general acceptability of the product in Sierra Leone is unclear. To address these implementation questions, a formative study was carried out in three districts where Helen Keller Intl supported the government to transition from IFA.

METHODS

A survey was conducted with 533 women in Kenema, Bombala, and Western Area districts in Sierra Leone. Women were enrolled at ANC and administered a survey questionnaire assessing their perceptions of MMS organoleptic, packaging, ease of use, social and time resources for supplement use and perceived impact on health. Women were also asked about how they valued ANC and their trust of ANC service providers.

RESULTS

The study has four key findings: first, most women who attended ANC reported receiving MMS (88%) and counseling for MMS. Second, women value ANC beyond MMS receipt and did not perceive that a 180-pill ration would limit ANC attendance. This was evidenced by the high trust and value of the counseling offered at ANC. Third, women found the MMS supplement to be acceptable. Women liked the pill size and color, found packaging attractive, and found the product easy to use. Taste, smell and ease of swallow were slightly less accepted. Finally, social support and education can be strengthened. A quarter of women did not feel that their family supported them to take MMS. Though women generally were aware of MMS health benefits to themselves and their babies, some women were unaware of the need to continue taking the supplement even if their diet was adequate and others noted double dosing in case of a missed dose.

CONCLUSIONS

The study found MMS in a 180-pill bottle to be acceptable among women who attend ANC in Sierra Leone. Women trust and value their ANC providers and experience, beyond the receipt of supplements. Future efforts should proceed with the administration of the 180 pill bottle of MMS and invest in strategies to improve knowledge and social dynamics that constrain supplementation.

Improving Growth and Feeding Practices of Children Under Two (U-2) Years through Animal Source Food, Multiple Micronutrient Powder and Psychosocial Stimulation in a Resource-Poor Setting: Preliminary RESULTS from a Randomized Controlled Trial

Gulshan Ara[1, 2]; Samira Dilruba Ali[1]; Rafid Hassan[1]; Md. Ahshanul Haque[1]; Zhahirul Islam[3]; Md. Shafiqul Alam Sarker[1]; Tahmeed Ahmed[1]
[1]Nutrition Research Division, International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b), Dhaka, Bangladesh; [2]Dept. of Nutrition, Sports and Exercise (NEXS), University of Copenhagen, Copenhagen, Denmark; [3]Infectious Disease Division, International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b), Dhaka, Bangladesh

BACKGROUND AND OBJECTIVES

The first two years of life are critical for growth and development. Poor complementary feeding, poor home environments, and high infection rates hinder progress, contributing to stunting and micronutrient deficiencies affecting nearly one-third of children under five in developing countries. Previous interventions implemented in Bangladesh showed that comprehensive intervention improved growth and dietary diversity of children under two (U-2) years. This study explores the impact of combining Animal Source Food (ASF), Multiple Micronutrient Powder (MNP), psychosocial stimulation, and nutrition education (NE) on enhancing growth and feeding practices in U-2 children in low-resource settings.

METHODS

A community-based, cluster-randomized, controlled, three-arm trial was conducted in 30 clusters in Atpara Upazila, Netrokona district, Bangladesh. A total of 627 mother-infant pairs were equally assigned to Group-I, receiving daily eggs, MNP, psychosocial stimulation, and nutrition education (NE); Group-II, receiving eggs, MNP, and NE; and Group-III (Control), receiving NE only. The 12-month intervention was delivered by trained Nutrition Workers. Egg consumption and morbidities were measured monthly, while anthropometric measurements and feeding histories were collected quarterly. Dietary intake was assessed using a 24-hour recall. The primary outcomes included differences in growth and feeding practices among groups, analyzed using linear regression.

RESULTS

Baseline characteristics were similar across the three groups, including child age, gender distribution, parity, breastfeeding rates (94%–97.6%), dietary diversity scores (2.8–2.9), and delivery type (~64% normal). Nutritional status indicators, such as mean length-for-age z-scores (LAZ) and weight-for-age z-scores (WAZ), were comparable. After 12 months, Group -I achieved the highest mean length (81 cm at endline), followed by Group-II (80 cm) and the control group (79 cm). Group-I had a significant effect on length (coefficient: 2.311, 95% CI: 1.53–3.10) compared to Group-II (coefficient: 1.586, 95% CI: 0.81–2.37). For LAZ, Group-I showed a higher effect (coefficient: 0.551, 95% CI: 0.36–0.75) than Group-II (coefficient: 0.375, 95% CI: 0.18–0.57). Dietary diversity scores improved significantly, reaching 89% and 88% in intervention groups, compared to 71% in the control group.

CONCLUSIONS

The study showed that the combined intervention including ASF, MNP and NE significantly improves growth and dietary diversity among children under two.

INFLUENCE OF FOOD INSECURITY AND ACCULTURATION ON DIETARY CHANGES AMONG STUDENTS FROM FRENCH OVERSEAS REGIONS AFTER RELOCATION TO MAINLAND FRANCE

Mélanie Antoine[1]; Caroline Méjean[2]; Sabrina Eymard-Duvernay[3]; Génica Lawrence[4]; Pascaline Rollet[1]; Célia Basurko[5]; Laurence Tibère[3]; Hélène Charreire[1]
[1]UMR MoISA, Inrae Centre Occitanie-Montpellier, Montpellier, France; [2]MoISA, Univ Montpellier, CIHEAM-IAMM, CIRAD, INRAE, Institut Agro, IRD, Montpellier, France; [3]UMR MoISA, Research and Development Institute IRD Montpellier, Montpellier, France; [4]COVACHIM-M2E, Université des Antilles, Guadeloupe, Saint-Claude, France; [5]Pôle Guyane, Centre d'Investigation Clinique Antilles-Guyane, Cayenne, French Guiana

BACKGROUND AND OBJECTIVES

The influence of changes in the food environment on behaviors remains rarely studied. Individuals from French overseas regions (FOR), particularly students, experience profound and sudden changes in their food, socio-cultural and economic environments that can affect their diet when they move to mainland France (MF) to their studies. The aim of this work is to assess associations between dietary changes among students from the FOR after relocating and food insecurity (FI) and acculturation.

METHODS

In 2024, a cross-sectional survey (n=306) was conducted among students born in one of the five FOR and were studying in the MF, using a quota sampling method. An online questionnaire captured food purchasing and consumption practices, including reported dietary changes for 17 food groups. FI was measured using the 6-items US. Household Food Security Survey Module and acculturation by length of residence and age at arrival in MF. Multinomial logistic regression models adjusted on individual-level covariates were used to evaluate associations between dietary changes and FI and acculturation.

RESULTS

More than half of students were food insecure. Students who reported consuming fewer vegetables (OR=2.2, 95% CI: 1.0-4.5), dairy foods (OR=2.6, 95% CI: 1.0-6.5), whole starchy foods (OR=2.7, 95% CI: 1.1-6.2) and more sugary drinks (OR=2.6, 95% CI: 1.3-5.3) since they are in MF were more likely to be food insecure. Those who reported eating more eggs (OR=3.6, 95% CI: 1.9-6.9) and poultry (OR=3.0, 95% CI: 1.5-6.2) after relocation were also more likely to experience FI. The probability of FI was significantly higher among students who consumed less fast-food (OR=2.8, 95% CI: 1.2-6.6) and alcohol. Students who reported changes in their red meat consumption after relocation, either eating more (OR=5.5, 95% CI: 2.1-14.4) or less (OR=3.4, 95% CI: 1.8-6.4) were more likely to be food insecure. Acculturation variables had weak associations with changes in consumption of food groups, except for a higher consumption of eggs and a lower consumption of sugary products.

CONCLUSIONS

Although some changes were converging towards healthier diets, FI also leads to unfavorable modifications. Further research is needed to assess the effect of relocation to MF on food consumption and the influence of acculturation considering additional variables such as cultural proximity to the FOR, as well as exploring the potential interaction between FI and acculturation.

SOAP27_14

IMPACT OF SUPPLEMENTATION WITH FORTIFIED BALANCED ENERGY–PROTEIN DURING PREGNANCY ON BIRTH OUTCOMES: A COMMUNITY-BASED RANDOMIZED TRIAL AMONG PREGNANT WOMEN IN SOUTHERN NEPAL

Daniel Erchick; Tsering Lama,[1]; Subarna Khatry,[1]; Joanne Katz,[2]; Luke Mullany,[3]; Eleonor Zavala,[2]; Steven Leclerq,[2]; Parul Christian[2]; James Tielsch,[4]
[1]NNIPS, Nepal Nutrition Intervention Project, Sarlahi, Kathmandu, Nepal; [2]Center for Human Nutrition and Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, United States of America; [3]Research and Exploratory Development Department, Johns Hopkins University Applied Physics Laboratory, Laurel, MD, United States of America; [4]Department of Global Health, George Washington University Milken Institute School of Public Health, Washington, DC, United States of America

BACKGROUND AND OBJECTIVES

Undernourished pregnant women are at increased risk of adverse birth outcomes, including small-for-gestational-age (SGA) and preterm birth. The World Health Organization (WHO) recommends balanced energy-protein supplementation (BEP) in pregnancy to reduce risk of stillbirth and SGA birth in undernourished populations, yet variations in supplement composition and format and limited evidence on impact in lactation warrants further study. The Maternal Infant Nutrition Trial (MINT) aimed to assess the impact of a fortified BEP supplement in pregnancy and lactation on birth outcomes and infant growth in rural Nepal.

METHODS

MINT was a 2X2 factorial, unblinded, household randomized efficacy trial. Married women (15–30 years) who became pregnant were randomized to daily fortified BEP (~400 kcal, ~14 g protein, and multiple micronutrients) or no BEP from 14 weeks' gestation to delivery; participants in both arms also received iron-folic acid as standard of care. This analysis presents RESULTS for the primary outcome of the pregnancy period, incidence of SGA among live-born infants, and secondary outcomes, including preterm birth (<37 wks) and low birth weight (<2.5 kg). SGA was defined as infants with birth weight <10th centile of the INTERGROWTH-21st reference by gestational age and sex for those measured <72 hours after delivery. The analysis used an intent-to-treat approach to compare the proportion of SGA infants in intervention vs. control using log-binomial regression to estimate a relative risk and 95% confidence interval. A similar approach was used for secondary outcomes.

RESULTS

The trial enrolled 1,944 pregnant women, randomized as 985 supplement and 959 no supplement, in Sarlahi District, Nepal, from November 2021 to August 2023. Of 1,566 pregnancies with ≥1 live birth, 1,197 singleton infants had data on gestational age at birth and anthropometry within <72 hours of delivery. Trial groups were balanced across participant factors. At baseline, participant mean (SD) age was 24.5 (3.5), 10.8% (n=210) were nulliparous, 40.2% (n=781) had short stature (<150cm), 29.6% (n=576) were underweight (<18.5 kg/m2), and 45.1% (n=876) had no formal education. The incidence of SGA was 40.1% (n=479), preterm birth was 5.1% (n=79/1,550), and low birth weight was 20.1% (n=240). Data on treatment effects will be presented.

CONCLUSIONS

MINT RESULTS will contribute to global efforts to refine and implement the WHO context-specific recommendation for BEP supplementation in pregnancy for undernourished settings across low- and middle-income countries.

BACKGROUND AND OBJECTIVES

Food biodiversity, representing the diversity of plant and animal species consumed, may be a key determinant of diet quality, and positively influence the resilience of food production systems. Dietary species richness (DSR), a core marker of food biodiversity, has been positively associated with micronutrient adequacy and inversely associated with mortality and digestive cancer risks. However, the relationship between DSR and weight variation, including the risk of overweight and obesity, has not yet been explored. This study aimed to investigate these associations in a large French cohort.

METHODS

A total of 87,246 participants (78.2% were women, age = 43.8 (±14.7) years old) were included. They reported their weight and height at baseline and every six months. Each participant's DSR (the average number of different species consumed daily) was calculated based on repeated 24-hour dietary records collected during the first two years of follow-up. Proportional hazards Cox models were used to examine the associations between DSR and the risk of developing overweight (among participants with baseline BMI ≤ 25 kg/m²) and obesity (among those with BMI ≤ 30 kg/m²), adjusting for potential confounders and baseline BMI. The relationship between DSR and BMI variation was analyzed using mixed models for repeated measures.

RESULTS

The mean DSR was 32.4 ± 6.7 species per day. Higher DSR was inversely associated with the risk of developing overweight (2009–2023; median = 8 years): hazard ratio (HR) for a 10-species increase = 0.88 (0.85–0.91); $p < 0.001$. Participants in the highest DSR quartile (Q4) had a lower risk of overweight compared to those in the lowest quartile (Q1): HR = 0.81 (0.76–0.86); $p < 0.001$. Similarly, higher DSR was inversely associated with obesity risk: HR for a 10-species increase = 0.85 (0.81–0.90); $p < 0.001$, and HR (Q4 vs. Q1) = 0.76 (0.69–0.83); $p < 0.001$. Mixed models revealed that higher DSR was associated with a decrease in BMI over time ($\beta = -0.00834$; $p < 0.001$). These findings remained robust after additional adjustments for food groups associated with weight gain.

CONCLUSIONS

These RESULTS suggest an association between food biodiversity, measured by the number of different species consumed daily, and a lower risk of weight gain, overweight and obesity. If confirmed by further studies, these associations could help explain previous findings linking food biodiversity to reduced mortality and cancer risks, where overweight is a known risk factor. More research is needed to understand the underlying mechanisms.

MICROPLASTICS IN FOOD AS A POTENTIAL HEALTH RISK: MECHANISMS OF IMPACT AND MITIGATION STRATEGIES

Akmaral Baspakova[1]; Amin Tamadon[2]
[1]Epidemiology, West Kazakstan Marat Ospanov medical university, Aktobe, Kazakhstan; [2]Natural Sciences, West Kazakhstan Marat Ospanov medical university, Aktobe, Kazakhstan

BACKGROUND AND OBJECTIVES

Owing to the presence of microplastics (MPs) in a variety of food sources such as water, seafood, salt, and packaged products, it has emerged as a major environmental and health threat over the past few years. Though their environmental impact is well studied, their potential effects on human health are uncertain. Here, we report an evaluation of dietary microplastic exposure risks, investigation of their biocompatibility, and elucidation of strategies to attenuate their impact.

METHODS

The investigations performed use spectroscopic and microscopic approaches to analyze microplastic contamination in several dietary foods. MP uptake, oxidative stress, and inflammatory responses are assessed using intestinal epithelial cells (Caco-2) and immune cells (macrophages) under in vitro conditions. Phagocytosis and cellular damage are quantified by flow cytometry and fluorescence imaging.

RESULTS

Initial RESULTS support that MPs are actively taken up by intestinal and immune cells, contributing to oxidative stress and inflammatory signaling. Long-term exposure to MPs can alter gut barrier function, the microbiome, and is thought to be involved in the development of metabolic and inflammatory diseases. Differences in the constituent and size of the MPs can modify their cellular uptake and toxicity.

CONCLUSIONS

MPs in dietary exposure pose a potential health risk by triggering cellular stress and inflammation. In the face of this reality, strict implementing regulations on food contamination, reducing plastic packaging, and using alternative biodegradable materials are vital for risk mitigation. More research is required to understand longitudinal health effects and the best detoxification approaches related to microplastics.

FROM THEORY TO ACTION: IMPACT OF A BREASTFEEDING EDUCATION INTERVENTION ON KNOWLEDGE, SKILLS, AND CONSTRUCTS OF THE THEORY OF PLANNED BEHAVIOUR OF MEXICAN NUTRITION STUDENTS

Cecilia Alejandra Cortés Flores[1]; Ana Soledad Sandoval Rodríguez[2]; Gabriela Alejandra Grover Baltazar[3]; Ana Laura De La Garza[4]; Ulises De La Cruz Mosso[5]; Bárbara Vizmanos Lamotte[1]
[1]Departamento de Reproducción Humana, Crecimiento y Desarrollo Infantil, Centro Universitario de Ciencias de la Salud, Guadalajara, Mexico; [2]Instituto de Biología Molecular en Medicina, Centro Universitario de Ciencias de la Salud, Guadalajara, Mexico; [3]Coordinación de Investigación, Health Secretary, Guadalajara, Mexico; [4]Centro de Investigación en Nutrición y Salud Pública, School of Public Health and Nutrition, Monterrey, Mexico; [5]Instituto de Neurociencias, Centro Universitario de Ciencias de la Salud, Guadalajara, Mexico

BACKGROUND AND OBJECTIVES

Breastfeeding (BF) is recognized as a fundamental component of public health (WHO, 2018). However, the lack of adequate training among nutritionists affects its effective promotion of BF (Becker, 2021; Grover, 2022). Innovative educational tools, as Massive Open Online Courses-*MOOC*, are key to closing these gaps and enhance the competencies of professionals in this domain (Sandhi, 2023). The aim of this study is to evaluate the impact of a BF-MOOC on knowledge, skills, and constructs of the Theory of Planned Behaviour about BF in Mexican nutrition students.

METHODS

A quasi-experimental pre/post-intervention study was conducted with nutrition students from three public universities in northern/western Mexico (approved by Ethical Committe). The students were invited by each Nutrition Degree Coordinator. Participants completed five 100-point online questionnaires (*LACTAMEX*) before and after a 40-hour BF-MOOC. Differences in scores (final-first test), were analysed with Student's t-test for related samples, with RESULTS expressed as mean±SD, p-value, size effect (Cohen’s d), and the percentage of subjects who improved in each construct.

RESULTS

Out of 235 participants who took the initial survey, only 64 students returned after four weeks, having completed the course. We excluded the only two men who answered the final survey. The scores obtained improved significantly in knowledge (8.04±15.0, $p<0.05$, d=0.5), attitudes (3.85±9.2, $p=0.002$, d=0.4), beliefs (3.03±9.1, $p=0.013$, d=0.3) and intention to promote BF (9.61±14.7, $p<0.05$, d=0.7). There were no significant differences in skills (1.15±15.3, $p=0.562$, d=0.1). Most of the students improved in knowledge (73.3%), skills (36.7%), attitudes (66.7%), beliefs (53.3%) and intention to promote BF (75%).

CONCLUSIONS

The efficacy of a BF-MOOC for nutrition students has been demonstrated, except for BF skills. This finding underscores the significance of incorporating BF contents into health undergraduate degrees, to which clinical or population-based experiences should be added.

ONE NUTRITION COVERAGE SURVEY - LEARNINGS FROM A METHODS-DRIVEN HOUSEHOLD SURVEY TO ESTIMATE CO-COVERAGE AND EQUITY OF MULTI-SECTORAL NUTRITION INTERVENTIONS

Swetha Manohar[1]; Phuong Nguyen[1]; Sumanta Neupane[2]; Archis Banerjee[3]; Niharika Pandya,[2]; Gulshan Ara[4]; Melinda Munos[5]; Rebecca Heidkamp[6]; Sunny Kim[1]
[1]Nutrition, Diets, and Health Unit, International Food Policy Research Institute, Washington D.C., United States of America; [2]Nutrition, Diets, and Health Unit, International Food Policy Research Institute, New Delhi, India; [3]Nutrition, Diets, and Health Unit, International Food Policy Research Institute, Dhaka, Bangladesh; [4]Nutrition and Clinical Services Division, Icddr,b, Dhaka, Bangladesh; [5]Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [6]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America

BACKGROUND AND OBJECTIVES

Global efforts to eliminate malnutrition face persistent challenges, and governments in low- and middle-income countries (LMICs) have developed multi-sectoral nutrition policies and strategies to combat these issues. However, measuring coverage of multi-sectoral nutrition interventions remains complex with data gaps that hinder effective policy implementation. The One Nutrition Coverage Survey (ONCS) aims to improve nutrition intervention coverage data by piloting new and standard metrics for assessing individual and household coverage of multi-sectoral interventions, targeted to vulnerable populations.

METHODS

The methods-focused ONCS will be implemented in 4 districts in Bangladesh (N=3280 households) in early 2025 as a proof of concept, using district-representative household survey to collect data on coverage of nutrition interventions aligned with national policies. The survey will test both new and standard measurement tools across sectors, including maternal, infant, and young child nutrition (MIYCN), nutrition-sensitive social protection (NSSP), and large-scale food fortification (LSFF). Coverage and co-coverage estimates will be generated and compared with existing data sources. The survey will also assess equity through disaggregation by residence type (urban vs. rural), education, and vulnerability segmentations based on socio-economic factors.

RESULTS

The ONCS will provide comprehensive coverage data on a wide range of nutrition interventions across health, WASH, agriculture, and social protection sectors. The analysis will estimate both individual and household-level coverage of individual interventions (percentages) and co-coverage of combined interventions for different life stages and across sectors (percentages and mean index values). Socio-demographic factors such as education, wealth quintile, and urban-rural residence will be analyzed to assess equity in intervention reach as well as by multi-dimensional vulnerabilities identified by segmentation of population groups. We will also develop guidance on how these data were collected and analyzed and provide measurement considerations.

CONCLUSIONS

Our findings will contribute to the monitoring and improvement of multi-sectoral nutrition programs in Bangladesh. The ONCS will also contribute to the global nutrition data landscape by refining coverage measurement methodologies and providing actionable insights to guide policy improvements. Learnings from the survey will support evidence-based decision-making in LMICs by addressing the complexities of multi-sectoral intervention measurement.

MONITORING CHANGES IN IODINE STATUS IN THE UK

Kerry Jones[1]; David Collins[1]; Albert Koulman[1]; Polly Page[1]
[1]MRC Epidemiology Unit, Cambridge University, Cambridge, United Kingdom

BACKGROUND AND OBJECTIVES

Dietary iodine is essential for the production of thyroid hormones. Deficiency is associated with impaired neuro-cognitive development. Children and women of childbearing age are at particular risk in relation to the impact of deficiency. Over the past decade, concern has been raised about the possible decline in iodine status in some groups of the UK population due to declining dairy milk intake and changes in farming practices. We present population urinary iodine concentration (UIC) data from the UK National Diet and Nutrition Survey (NDNS).

METHODS

The NDNS is a continuous cross-sectional survey of diet and nutritional status of the UK population aged ≥1.5 y. Since 2013, spot urine specimens have been collected in participants aged ≥4 y. UIC is measured by inductively coupled plasma mass spectrometry (ICP-MS) and compared against WHO population cut-offs.

RESULTS

In the previous NDNS assessment between 2016 and 2019, median UIC was 149 and 135 µg/L in children aged 4 to 10 y (n 525) and 11 to 18 y (n 524) respectively, and in adult women (19 to 64 y) was 104 µg/L (n 688). The average percent change (95% CI) in UIC per year between 2013 and 2019 was -2.1% (-5.3, 1.3), 0.6% (-2.6, 4.0) and -2.6% (-5.3, 2.5) for children aged 4 to 10 y, 11 to 18 y and adult women, respectively. We will present up-to-date estimates of UIC in children and adults from the most recent NDNS assessment between 2019 and 2023 (RESULTS due for publication in Spring 2025) and examine change in UIC over 10 years to 2023.

CONCLUSIONS

NDNS data between 2016 and 2019 indicated evidence of declining iodine status in the UK. Whilst UIC in children was adequate, in adult women median UIC was relatively close to the WHO population threshold of <100 µg/L for mild deficiency. This may have implications for women in the UK and their offspring. These data suggest continued surveillance of at risk population groups is warranted in NDNS to inform on potential future public health programmes.

EVALUATING THE NUTRITIONAL QUALITY AND LABELLING OF CANADIAN FOOD PRODUCTS FOR INFANTS AND YOUNG CHILDREN USING THE WHO NUTRIENT AND PROMOTION PROFILE MODEL

Mary L'abbe[1]; Jessica Muha[1]; Christine Mulligan[1]; Jennifer Lee[2]; Laura Vergeer[1]
[1]Nutritional Sciences, University of Toronto, Toronto, Canada; [2]School of Nutrition, Toronto Metro, Toronto, Canada

BACKGROUND AND OBJECTIVES

Unhealthy foods can contribute to poor dietary habits early in life. However, there has been little research or regulation regarding the nutritional composition and labelling of food products for infants and young children (FIYC) in Canada. Given the WHO's 2022 publication of a nutrient and promotion profile model (NPPM) to guide the appropriate nutritional composition, labelling, and promotion practices of FIYC, the objective was to evaluate Canadian FIYC using the WHO NPPM.

METHODS

Data for 228 toddler foods were extracted from the University of Toronto 2017 pre-packaged food database (Food Label Information and Price) and evaluated using the WHO NPPM. The number and proportion of FIYC that did not meet each nutrient content and labelling, and promotion criteria were evaluated.

RESULTS

None of the Canadian pre-packaged FIYC met all the WHO NPPM standards. Specifically, 71.9% (n=164) failed to meet ≥1 nutrient content and labelling criteria, with 48.3% (n=112) lacking a 'high in sugar' front-of-pack label despite exceeding the sugar thresholds. All FIYC failed to meet the promotion standards with all of them having no proportional content for ingredient list, 94.4% (n=219) displaying ≥1 promotional claims, and 99.1% (n=230) not displaying any content to promote and protect breastfeeding.

CONCLUSIONS

RESULTS suggest that most FIYC in Canada do not meet the nutrient standards and/or labelling of the WHO NPPPM with widespread inappropriate promotion practices. Regulatory action addressing the composition, labelling, and promotion of FIYC are needed to support the nutritional health of infants and young children in Canada.

REAL WORLD INTERVENTIONS TO INCREASE DIETARY FIBRE INTAKE IN CHILDREN, ADOLESCENTS AND LOW INCOME CONSUMERS

Dye Louise[1]; Fiona Croden[2]; Eloise Tann[3]; Nicholas Wilkinson[4]; Neil Boyle[5]
[1]Institute of Sustainable Food, The University of Sheffield, Sheffield, United Kingdom; [2]School of Psychology, The University of Leeds, Leeds, United Kingdom; [3]School of Psychology , University of Sheffield, Sheffield, United Kingdom; [4]Food Science and Nutrition, University of Leeds, Leeds, United Kingdom; [5]Psychology, The University of Sheffield, Sheffield, United Kingdom

BACKGROUND AND OBJECTIVES

Intake of dietary fibre in all age groups fails to meet national recommendations across Europe, despite public health campaigns. People from low SES groups tend to have the lowest fibre intakes and poorest diet quality. They are also most vulnerable to diet related disease. Health by stealth strategies and increasing exposure to dietary fibre via interventions such as in schools could be effective means to increase fibre intake.

METHODS

This presentation considers interventions developed in the "Healthy Soil, Healthy Food, Healthy People" (www.h3.ac.uk) programme grant which aim to increase fibre intake in children, adolescents and adults on low incomes in the UK. Reformulation of foods for school breakfast programmes, meals using high fibre ingredients available in food pantries and foodbanks were developed, trialled and evaluated in real world studies.

RESULTS

RESULTS of school based tasting studies demonstrate the acceptance of breads which are high in fibre or a source of fibre by children and adolescents and provide insight into the design if such products for school breakfast programmes. Evaluation of a large long term school breakfast programme which provided high fibre bread for 1 year showed acceptance of the food and also increased attendance, improved punctuality and narrowed the gap between free school meal eligible children and their food secure peers. Incorporating high fibre ingredients into familiar meals in interventions such as cooking classes for children and their carers, providing tasting sessions in food pantries and evaluating uptake of recipes developed demonstrated effective METHODSto increase fibre in low income consumers.

CONCLUSIONS

Taken together this range of interventions highlights the need to tailor nutritional interventions for low SES groups as a method to increase fibre intake, increase acceptability of higher fibre foods and ultimately to reduce health inequalities.

ASSESSING THE SCHOOL FOOD ENVIRONMENT TO IMPROVE ADOLESCENT NUTRITION IN URBAN COMOROS: FROM POLICY AMBITIONS TO COMMUNITY REALITIES

Housna Hassani[1]; Moussa Mohamed Ahmed[2]; Agnes Le Port[3]; Mathilde Savy[3]
[1]UMR MoISA, Univ Montpellier, CIRAD, CIHEAM-IAMM, INRAE, Institut Agro, IRD, Montpellier, France, IRD, Montpellier, France; [2]Santé Publique, Ecole de Medecine - Université des Comores, Moroni, Comoros; [3]UMR MoISA, Univ Montpellier, CIRAD, CIHEAM-IAMM, INRAE, Institut Agro, IRD, Montpellier, France

BACKGROUND AND OBJECTIVES

In Comoros, undernutrition among adolescents persists while overweight and obesity rates are rising, particularly in urban contexts. While nutrition education and physical activity are part of national school programs, we examined whether key stakeholders prioritized these areas for developing comprehensive school food and nutrition programs (SFNPs) and assessed their current implementation in schools.

METHODS

We consulted key stakeholders from international, national, and local levels - 8 multi-sectorial policy makers, 4 development program implementers and 1 nutrition researcher - using semi-structured interviews (SSI). Additionally, we conducted a survey in a random sample of 32 secondary public and private schools in Moroni-Bambao (urban) and Itsandra-Hamanvou (peri-urban). SSI were conducted with school heads (n=32), food vendors inside schools (n=9) and food vendors outside schools (n=15). The type of food sold by vendors were also collected on the day of the survey through direct observations (n=32).

RESULTS

All national stakeholders acknowledged the double burden of malnutrition as an urgency to tackle in their country and prioritized 3 domains to be improved in schools: food provision inside schools, food provision around schools and school community involvement into SFNPs for an effective and sustainable impact. All school heads declared promoting healthy eating and physical activity, with 29 schools offering classes on food or nutrition as part of the national program. Half of the schools also had extra-curriculum activities to encourage healthy behaviors. None of the sampled schools provided meals to pupils (no canteen); we observed 12 schools with cafeterias, primarily in urban areas, and 16 schools had external vendors at school gates. On the survey day, fried snacks, sweet cakes, and sugary drinks were the most commonly sold items across all schools, while fruits were offered in only two out of 32 schools. Snacks sold by food vendors inside schools were mainly processed snacks. External food vendors offered more homemade snacks but may raise food safety concerns. Few schools have attempted to ban unhealthy snacks in their premises, but school heads acknowledged that healthy and local alternatives were scarce, costly or unavailable.

CONCLUSIONS

Bridging the gap between evidence, policies, and practices is crucial to improving school food environments and ensuring healthy choices are accessible and affordable for all pupils. The next step of this study will be to conduct participatory workshops with the school community to develop solutions for healthier nutrition in schools, considering local resources.

LINEAR GROWTH VELOCITY VARIES BY SEVERITY OF THINNESS IN NEPALI PRESCHOOLERS

Angela KC[1]; Andrew Thorne-Lyman[1]; Swetha Manohar[2]; Binod Shrestha[3]; Abhigyna Bhattarai[3]; Ramesh Kant Adhikari[4]; Scott Zeger[5]; Rolf Klemm[6, 1]; Keith West[1]
[1]Center for Human Nutrition, Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [2]Nutrition, Diets, and Health Unit, International Food Policy Research Institute, Washington D.C., United States of America; [3]Innovation Lab for Nutrition, Feed the Future, Kathmandu, Nepal; [4]Academician, Nepal Academy of Science and Technology, Lalitpur, Nepal; [5]Department of Biostatistics, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [6]Nutrition, Helen Keller International, New York, United States of America

BACKGROUND AND OBJECTIVES

Wasting and stunting malnutrition often coexist in impoverished regions of the world, including Nepal. However, the influence of the degrees of antecedent wasting [weight (wt)-for-height (ht) z-score (WHZ) < -2] on preschool child linear growth velocity, and risk of becoming stunted [height-for-age z-score (HAZ) < -2] remains poorly understood.

METHODS

We analyzed longitudinal data on 5,930 children ≤60 mo of age with ≥ 1 pair of ht and wt measurements from the PoSHAN community studies (2013–2016). WHZ at the first measurement was stratified into decrements of ≥ 0, 0 to -1, -1 to -2, and <-2. Annualized linear growth velocities (LGV) were calculated as paired differences in ht, expressed in cm/yr, and as a LGV Z-score (Z) derived from a concatenated WHO-Tanner preschool annual LGV referent (Manohar et al. Publ Health Nutr 2023). Primary outcomes were differences between observed LGV and the age-sex-specific median referent LGV (ΔLGV), and relative odds (95% CI) of a LGVZ <-2, we define as growth faltering (GF). Baseline variables included child sex, age as natural splines, household socioeconomic and food security status, season and region (*Terai*, hills, mountains). Mixed effects models with random intercepts for child and cluster were used to explore associations between baseline thinness and subsequent LGV, ΔLGV, and odds of GF, controlling for above variables. Additional models were also run allowing for the interaction between WHZ strata and child age spline terms.

RESULTS

Initial WHZ was ≥ 0, 0 to -1, -1.01 to -2, and <-2 for 14.2%, 33.1%, 34.1% and 18.5% of children, respectively. Compared to children with WHZ ≥ 0, those with 0 to -1 had a significantly lower LGV of -0.47 cm/yr (95% CI: -0.59, -0.34) and higher odds for GF of 1.54 (1.27, 1.88). Children with -1 > WHZ ≥ -2 had a lower LGV of -0.69 cm/yr (-0.82, -0.56) and odds of GF of 2.19 (1.80, 2.67). Those with WHZ < -2 exhibited the greatest LGV deficit of -1.11 cm/yr (-1.25, -0.96), and relative odds GF, of 3.24 (2.63, 4.00).

CONCLUSIONS

Among Nepali preschool-aged children, compared to having a WHZ at/above the WHO median, linear growth velocity in progressively thinner children decreased, and risk of growth faltering increased, in a dose-responsive manner. In this undernourished population of South Asian children growing, on average, below a recently derived composite Tanner-WHO velocity reference, our findings reveal the importance of a normal weight-for-height to sustain adequate growth.

STUDY ON THE PERCEPTION OF THE NUTRI-SCORE AND ITS IMPACT ON PURCHASING BEHAVIORS AMONG RETAIL MANAGERS AND CONSUMERS IN THE HAUTS-DE-FRANCE REGION

Lucie Lebrun[1]; Claire Boutonnet[2]; Pauline Ducrot[3]; Nancy Hallal[4]; Maxime Perrot[4]; Carine Delayre-Orthez[4]; Mégane Tchouye[2]; Hinde Tizaghti[5]; Eva Moukahal[2]; Virginie Floquet[2]; Anne-Kathrin Illner[4]
[1]IDEALISS,URL 7519, UniLaSalle Beauvais, Beauvais, France; [2]Nord, CLUBSTER NSL - Nutrition Santé Longévité, Loos, France; [3]Health prevention and promotion department - Nutrition & physical activity unit, Santé publique France, Saint-Maurice, France; [4]IDEALISS,URL 7519, Institut Polytechnique UniLaSalle, Beauvais, France; [5]Health prevention and promotion department - Nutrition & physical activity unit, ARS Hauts de France, Lille, France

BACKGROUND AND OBJECTIVES

The Hauts-de-France (HDF) region is facing a rise in chronic diseases linked to diet. Obesity and overweight are particularly prevalent. To address this issue, the Nutri-Score, a simple and clear nutritional labeling system, has been implemented. This color-coded system aims to help consumers make healthier food choices. In this context, the Nutricourses HDF project aims to evaluate the effectiveness of the Nutri-Score in the region, specifically by studying how it is perceived by retailers and its impact on consumer purchases.

METHODS

This observational study, conducted over 12 months (October 2023 - July 2024), is divided into two phases. The first qualitative phase involved seven individual interviews with managers of partner retailers to gather their perceptions of the Nutri-Score and its impact on consumer purchasing behaviors. The verbal data collected were transcribed, coded, and analyzed. The second quantitative phase was based on an online questionnaire distributed by partner retailers to their customers. This 25-item questionnaire, adapted from one developed by Santé Publique France, was used to collect data on purchasing habits and perceptions of the Nutri-Score. The data were analyzed using statistical software (SPSS and SPAD).

RESULTS

The RESULTS of the qualitative phase reveal differing opinions about the Nutri-Score: half see it as a clear tool with a stronger impact on online purchases and organic products. Conversely, half of consumers, according to the managers, perceive it as overly simplistic and difficult to understand. No local communication or marketing strategies have been implemented. In the quantitative phase, 1,762 responses were collected, of which 1,674 met the inclusion criteria. Respondents were predominantly women (74%), aged 50 to 64 years (39%), residing in the northern part of the region (74%), with a high school diploma or higher (67%), and either overweight (33%) or obese (19%). Three distinct profiles emerged: the advocate, the uninterested, and the uninformed. The non-classifiable participants (n=671) form a heterogeneous group with no clear stance on the nutritional label.

CONCLUSIONS

This first study on the Nutri-Score at a regional level reveals a mixed perception of the logo among consumers in the HDF region. While some distribution professionals view the Nutriscore as a valuable tool for consumers, others believe it is perceived as complex or overly simplistic, underpinning the neccesity to targeted communication strategies.

SOAP29_11

BALANCING BUSINESS AND PUBLIC HEALTH: RETAILER PERSPECTIVES AND ECONOMIC IMPACT OF VOLUNTARY ENERGY DRINK SALES RESTRICTIONS

Gina Trapp[1]; Elizabeth Cook,[1]; Matt Cooper,[2]; Sally Brinkman,[3]; Adrian Cameron,[4]; Claire Pulker,[1]; Francis Mitrou,[5]; Jacinta Francis,[1]; Frith Klug[1]; Catrina Mcstay,[1]
[1]School of Medical and Health Sciences, Edith Cowan University, Joondalup, Australia; [2]Biostatistics, The Kids Research Institute Australia, Nedlands, Australia; [3]Education Futures, University of South Australia City East Campus, Adelaide, Australia; [4]Faculty of Health, Deakin University Melbourne Burwood Campus, Burwood, Australia; [5]Public Health, The Kids Research Institute Australia, Nedlands, Australia

BACKGROUND AND OBJECTIVES

Energy drinks (EDs) are highly caffeinated beverages associated with significant health risks for children and adolescents, including insomnia, anxiety and cardiovascular issues. Despite the evidence of harm, these beverages are readily available to young individuals in some regions. While numerous countries have implemented restrictions on selling these beverages to minors, they remain accessible in certain areas. This research investigated the feasibility, acceptability, and economic implications of voluntary restrictions on selling energy drinks to individuals under 18 at all retail outlets in a regional town. The study aimed to understand the role of retailers in supporting public health initiatives and the commercial outcomes of these voluntary restrictions.

METHODS

Using a matched prospective controlled design, we combined Interrupted Time Series analysis of sales data with qualitative interviews of retailers (n=19) conducted before and during the implementation of a 4-month voluntary sales restriction of energy drinks to children under 18 years.

RESULTS

RESULTS indicated the four-month restriction did not adversely affect overall beverage sales, with retailers reporting shifts toward alternative products that offset potential losses. Qualitative findings demonstrated strong retailer support driven by youth wellbeing concerns and positive community reception of the voluntary sales restriction, which facilitated smooth implementation.

CONCLUSIONS

Our findings suggest voluntary ED sales restrictions can be feasibly implemented without compromising business viability, while protecting youth health. This community-driven initiative offers valuable insights for policymakers and retailers considering similar public health measures.

BACKGROUND AND OBJECTIVES

The causes of undernutrition are multifactorial, with the condition mostly influenced by several factors, (Mogaji, et al 2022). Nutrition Intervention (NI) is essential to reduce malnutrition prevalence in Nigeria.

METHODS

A quasi-experimental study was conducted among 5,040 School Age Children (SAC) in South West Nigeria. A validated semi-structured interviewer-administered questionnaire was developed to obtain information on respondents' demographic characteristics at baseline. Anthropometric measurements were taken, 24-hour dietary recall questionnaire administered and Nutrient Dense Biscuit (NDB) was developed. SAC with mild/moderate thinness were randomly divided into four groups at midline: group I, 28g NDB was consumed, II, 56g NDB, III: 33g conventional biscuit and IV (no biscuit consumed). Endline evaluation was conducted by re-assessing respondents' nutritional status. WHO-Anthro plus and adapted Food Processor Softwares were used to determine SAC's nutritional status. NDB's efficacy was deduced by change in z scores before and after intervention of 10 weeks and 5 measurements.

RESULTS

SAC's mean age was 8.91 ± 2.08years. At baseline, prevalence of severe stunting (4.2%) thinness (16.8%) and underweight (5.8%) were statistically significantly different across Nigeria **(**p=0.000**),** likewise **e**nergy/protein intakes. Conventional biscuit was most efficacious compared to 56g NDB, 28g NDB was the least efficacious. Factors responsible could be composition of NDB, and nutrient requirements of participants.

CONCLUSIONS

This study's NDB did not significantly reduce mild/moderate malnutrition among vulnerable SAC in South West Nigeria. This must have been influenced by several confounding factors, such as cashless policy and economic meltdown. Further grouping into intervention should factor requirements, age, wealth status and mean nutrient intake.

Monitoring micronutrient status in the UK - recent RESULTS from the UK National Diet and Nutrient Survey

Kerry Jones[1]; David Collins[1]; Sarah Meadows[1]; Damon Parkington[1]; Caireen Roberts[1]; Albert Koulman[1]; Polly Page[1]
[1]MRC Epidemiology Unit, Cambridge University, Cambridge, United Kingdom

BACKGROUND AND OBJECTIVES

Since 2008, the UK National Diet and Nutrition Survey (NDNS) has provided nationally representative cross-sectional data on the diet and nutritional status of the UK population aged ≥1.5 years. Here we present objectively measured data from the most recent round of NDNS for folate status prior to the introduction of folic acid fortification in the UK, and the status of other B-vitamins.

METHODS

Data collection was performed between October 2019 and July 2023 bar a suspension of fieldwork during 2020 due to the COVID-19 global pandemic. Blood specimens were collected by trained biomedical fieldworkers in participants' homes and specimens were mailed overnight, cooled, to a central laboratory for processing. Specimens were subsequently measured for a range of micronutrient biomarkers including the following B-vitamins: vitamin B1 (erythrocyte transketolase activity coefficient [ETKac]), vitamin B2 (erythrocyte glutathione reductase activity coefficient [EGRac]), vitamin B6 (high performance liquid chromatography), serum folate (liquid chromatography tandem mass spectrometry), whole blood folate (microbiological assay) and vitamin B12 (and holotranscobalamin).

RESULTS

Between 2019 and 2023, blood specimens were collected from 292 children and 791 adults. Using these data (publication due in Spring 2025), we will provide the most recent estimates of micronutrient status in the UK, including for folate status prior to the introduction of folic acid fortification of non-wholemeal wheat flour scheduled for introduction at the end of 2026.

CONCLUSIONS

Objectively measured micronutrient status data are essential to determine the burden of micronutrient deficiencies in populations and to monitor the effectiveness of public health programmes. In the UK, the NDNS provides high quality, population representative data on micronutrient status that are used to inform and monitor the impact of public health policy, e.g. introduction of folic acid fortification, and that can contribute to knowledge on micronutrient status globally.

SOAP29_15

MOBILITY AND EXPOSURE TO MULTIPLE FOOD ENVIRONMENTS IN CHILDREN AGED 10-14 YEARS

Jenny Peña[1]; Janeth Mosquera[2]
[1]salud , Universidad del Valle Sede San Fernando, Cali, Colombia; [2]Salud pública, Universidad del Valle Sede San Fernando, Cali, Colombia

BACKGROUND AND OBJECTIVES

Physical environments influence the availability and consumption of food. Every day people are exposed to different food environments according to the daily activities they carry out, the means of transport and the design of the cities.

Objetive: explore the spatio-temporal dynamics of the mobility of children aged 10 to 14 years living in different socioeconomic strata and its relationship with food availability.

METHODS

Case study involving children between 10 and 14 years old who live in areas with socioeconomic strata between 1 and 5. The travel diary, photography and drift were used as data collection techniques.

RESULTS

The RESULTS showed that the mobility of the participants exposes them to multiple food environments, so food exposure is not fixed, since, depending on the means of transport and the time at which they move, the offer varies. Children who reside in the lower socioeconomic strata and who also walk are more exposed to ultra-processed foods than those who travel by motorized means of transport. Thus, mobility dynamics facilitate exposure to multiple food environments, which is a threat to health.

CONCLUSIONS

The spatial and temporal mobility dynamics of children facilitate exposure to multiple environments where processed and ultraprocessed foods predominate, which is a threat to health.

END USERS, REGULATORS, IMPLEMENTERS AND HEALTHCARE PROFESSIONALS' AWARENESS, IMPLEMENTATION AND USE OF THE 2007 WHO GUIDELINES ON THE SAFE PREPARATION, STORAGE AND HANDLING OF POWDERED INFANT FORMULA: QUALITATIVE FINDINGS FROM GHANA, ENGLAND AND WALES

Evans Asamane Atiah[1]; Zakariah-Akoto Sawudatu[2]; ; Millie Manning[3]; Semira Manaseki-Holland[1]
[1]Department of Applied Health Sciences, University of Birmingham, Birmingham, United Kingdom; [2]Noguchi Memorial Institute for Medical Research, University of Ghana, Legon, Ghana, University of Ghana, Legon, Ghana, Legon, Ghana; [3]Medical School, University of Birmingham, Birmingham, United Kingdom

BACKGROUND AND OBJECTIVES

The 2007 WHO guidelines for safe Powdered Infant Formula (PIF) Preparation, Handling and Storage were developed following PIF-linked C.Sakazakii, S.Enterica and S.Agona infection outbreaks causing diarrhoea and deaths. We investigated the awareness, usage, and barriers to using of the guidelines among implementers/regulators and end-users (healthcare and nursery workers, care providers) in Ghana, Wales and England.

METHODS

We conducted semi-structured interviews (SSI) with purposively selected participants. The recordings were transcribed and analysed thematically using *a priori* and emerging themes.

RESULTS

44 participants were interviewed (23 Ghana, 8 England, 13 Wales; of 23 mothers/non-professional caregivers, 12 nursery teachers/professional caregivers, 7 healthcare professionals, and 2 implementers/regulators). In all settings, knowledge on PIF preparation was acquired mainly from producers' manuals/label information. Training/education for all was reported to be very low, mainly in Wales. Practices by end-users were largely unregulated and subject to diverse influences including personal choice and producers' information. Generic precautions for food safety were common but not related to reducing pathogens. Awareness of 2007 WHO PIF Guidelines was low in all 3 countries. The awareness was lowest in Ghana (5/23-) followed by England (2/8) but in Wales (5/13). Participants encountered the PIF Guidelines through various information sources, including electronic media, training workshops, and interactions with professional colleagues. Dissemination and implementation among end-users appeared to be uncoordinated in all settings. National policy favouring breastfeeding and the resulting 'taboo' around the use of PIF were identified as barriers to guideline dissemination and implementation across the 3 countries.

CONCLUSIONS

The 2007 WHO PIF Guidelines are largely unknown and not used in our high- and low-income countries, posing an infection risk. PIF is a child nutrition supplement inevitably used in all countries. There is a need for training on safe PIF practices for all end-users, without compromising exclusive breastfeeding promotion.

SOAP 30 - PUBLIC HEALTH AND NUTRITION THROUGHOUT LIFE CYCLE

SOAP30_01

ESTIMATING THE POTENTIAL HEALTH IMPACTS OF THE UK SALT REDUCTION PROGRAMME ON CARDIOVASCULAR DISEASE: FINDINGS FROM A MODELLING STUDY

Lauren Bandy[1]; Ben Amies-Cull,[1]; Madison Luick[1]; Linda Cobiac[2]; Susan Jebb[1]; Peter Scarborough[1]
[1]Nuffield Department of Primary Care Health Sciences, University of Oxford, Oxford, United Kingdom; [2]School of Medicine, Griffiths University, Brisbane, Australia

BACKGROUND AND OBJECTIVES

Excessive dietary sodium contributes to approximately 3 million deaths globally each year. The UK is among 64 countries with a salt reduction programme. It has set voluntary salt content targets for 84 grocery categories and 24 out-of-home categories to be achieved by 2024. This study aimed to estimate the potential impact of these salt reduction targets on cardiovascular outcomes and healthcare costs for UK adults.

METHODS

This was a simulation modelling study using dietary data from 586 individuals to estimate the potential impact of changes in salt intake among adults aged 18 and over in England. The 2020 population data for adults in England was used, with intake changes modelled based on the National Diet and Nutrition Survey (2017/18). The effects on ischaemic heart disease (IHD) and stroke were assessed over 20 years using PRIMEtime, a multistate lifetable model. Healthcare costs and Quality-Adjusted Life-Years (QALYs) were calculated for the population's remaining lifetime.

RESULTS

If the UK salt reduction targets for 2024 were fully achieved, average daily salt intake is estimated to decrease from 7.06g to 5.75g (17.5% reduction). This would result in 114,000 fewer cases of IHD and 27,000 fewer cases of ischaemic stroke over 20 years. We predict a saving of 537,000 QALYs and a net cost reduction of £1.10 billion to the NHS over the lifetime of the adult population.

CONCLUSIONS

Industry reformulation to meet salt reduction targets could substantially lower cardiovascular disease burden without requiring changes in consumer behaviour. Policymakers should consider enhancing salt reduction policies, including better monitoring and implementation.

SOAP30_02

NUTRISHED: A FRAMEWORK TO ASSESS THE RESILIENCE OF KEY NUTRIENT FLOWS IN URBAN FOOD SYSTEMS

; Robert Akparibo[1]; Fidelia Dake[2]; Gregory Cooper,[3]; Seth Afagbedzi,[4]; Bernard Opoku-Ofosu,[4]; Ebenezer Yamoah,[4]; Claudia Ewa,[4]; Bhavani Shankar,[3]
[1]School of Medicine and Population Health, The University of Sheffield, Sheffield, United Kingdom; [2]Regional Institute for Population Studies, University of Ghana, Accra, Ghana; [3]School of Geography and Planning, University of Sheffield, Sheffield, United Kingdom; [4]School of Public Health, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES

The resilience of food supplies into cities in LMICs face multidimensional threats: climate change, shock events, and shifting consumer demands. However, quantities, sources, and seasonality of food flows into and within cities remain scant, leaving decision-makers with limited capacity to improve access to healthy diets. Building on 'foodshed' approaches, we develop the NutriShed methodology to map urban-bound flows of key limiting nutrients, identify spatiotemporal vulnerabilities, and develop solution space of prospective interventions and food system policies.

METHODS

The NutriShed methodology was deployed in 2 urban settings in Ghana:Takoradi and Asesewa. First, indicative dietary surveys (n=616) with mothers, adolescents and young children identified limiting nutrients in both communities, to inform a shortlist of nutrient-dense foods of interest in local markets. Then at 1047 checkpoints on selected roads into markets, traders completed a 5-minute survey about origins and quantities of food shipment. This data supplemented market (n=181), consumer backtracking (n=50) and food systems infrastructure surveys (n =169), and qualitative key informant interviews on issues associated with food safety, transportation, and retailing (n=15). Finally, geospatial techniques were integrated with systems thinking principles to identify chokepoints in food distribution pathways, existing infrastructure landscape and market environments.

RESULTS

Diets were limited in Ca, Fe, FA and vitamin B2, leading to identification of 15-20 nutrient-dense foods commonly consumed in the two citiess. Food flow mapping identified various catchment areas, seasonal quantities, and common transportation forms distributing these foods towards the study communities. In both sites, existing food systems infrastructure were spatially-clustered around markets. However, a mismatch was found between current facilities use and need to store highly perishable nutrient-dense foods, indicating vulnerability to accessing critical nutrients.

CONCLUSIONS

Local decision-makers require reliable and timely information on the types (i.e., what?), sources (i.e., where?) and seasonality (i.e., when?) of nutrient-dense food supplies. As standalone approaches, the METHODSenable local planners and decision-makers to identify seasonal sources, destinations and quantities of nutrient-dense foods traded. Integrated into a holistic methodology, the NutriShed approach highlights the critical vulnerabilities affecting flow of nutrient-dense foods across space and time.

Impact of targeting strategies for balanced energy protein supplementation in pregnancy on adverse birth outcomes: RESULTS of a cluster randomized controlled trial in rural Bangladesh

Towfida Siddiqua[1]; Hasmot Ali[1]; Eleonor Zavala[2]; Andrew Thorne-Lyman[2]; Rezwanul Haque[1]; Kaniz Ayesha[1]; Lee Shu Fune Wu[2]; Hasan Mahmud[1]; Diwakar Mohan[2]; Daniel Erchick[2]; Kaosar Afsana[3]; Parul Christian[2]
[1]JiVitA, Maternal and Child Health & Nutrition Research Project, Rangpur, Bangladesh; [2]Center for Human Nutrition and Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore MD, United States of America; [3]James P Grant School of Public Health, BRAC University, Dhaka, Bangladesh

BACKGROUND AND OBJECTIVES

Balanced energy-protein (BEP) supplementation is a WHO recommended intervention to reduce the risk of adverse birth outcomes such as small-for-gestational-age (SGA) and low birth weight (LBW) in undernourished settings. However, there is limited evidence that targeting individual undernourished women is more effective than untargeted supplementation. We aimed to assess both a targeted and an untargeted approach to daily fortified BEP supplementation (containing 15 nutrients at an RDA for pregnancy and 500 mg calcium) during pregnancy on the primary outcomes of birth weight, LBW and SGA, compared to the control of daily multiple micronutrient supplements (MMS) using the UNIMMAP formulation.

METHODS

A four-arm, cluster-randomized controlled trial is ongoing in rural Bangladesh. From 12 weeks of gestation until pregnancy outcome, participants aged 15–35 years old in the study area comprising 240 predefined sectors were randomly assigned to one of four intervention arms: (1) MMS (control), (2) BEP, (3) BEP for those with pre-pregnancy body mass index (BMI) <18.5 kg/m2, while those with a pre-pregnancy BMI ≥18.5 kg/m2 received daily MMS or (4) BEP for those with pre-pregnancy BMI <18.5 kg/m2, MMS for others, with a switch to BEP if inadequate gestational weight gain was identified. Birth outcomes were assessed within 72 hours. Continuous outcomes at birth will be analyzed using linear regression with generalized estimating equations (GEE) to account for cluster design. For binary outcomes, relative risk ratios (RRRs) and absolute risk differences will be calculated using log-binomial regression with GEE. The impact of targeted and untargeted BEP compared to MMS will be assessed (Arm 1 vs: Arm 2; Arm 3; Arm 4).

RESULTS

In total 3390 pregnant women were enrolled in the trial between October 2022 and August 2024. At enrollment mean ± SD gestational age was 9.9±3.6 weeks, age was 23.6±5.4 years, hemoglobin was 116.0±11.7 g/L, BMI was 21.8 ± 3.7 kg/m2 (18.9% BMI<18.5) and MUAC was 26.2 ± 3.3 cm (16.7% MUAC<23.0 cm), and comparable across groups. Birth outcome follow up and assessment will conclude in March 2025. The effects of targeted and untargeted BEP supplementation versus MMS on adverse birth outcomes will be presented.

CONCLUSIONS

The findings will provide evidence for targeted BEP supplementation to identify beneficiaries and improve birth outcomes, hence strengthening the WHO's contextual recommendation for BEP supplementation in pregnancy.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

SOAP30_04

SHOULD POPULAR WEIGHT-LOSS SUPPLEMENTS BE CONSIDERED SAFE? A SYSTEMATIC REVIEW OF CASE REPORTS OF GARCINIA CAMBOGIA SUPPLEMENTS

Thibault Fiolet[1]; Nena Karavasiloglou[1]; Lucia Fabiani[1]; Leonard Matijević[1]; Ariane Titz[1]
[1]Nutrition and Food Innovation Unit, European Food Safety Authority, Parma, Italy

BACKGROUND AND OBJECTIVES

Hydroxycitric acid (HCA), derived from the plant Garcinia cambogia, has been widely promoted as a weight-loss supplement. However, increasing reports of adverse events associated with its use have raised concerns about its safety. This study aimed to review case reports and series to assess the clinical outcomes and causality of adverse events linked to HCA and Garcinia cambogia intake.

METHODS

Pubmed, Embase and the Cochrane library databases were searched up to May 22, 2023 for eligible publications. We systematically reviewed published case reports and series where Garcinia cambogia or HCA was implicated as a causative agent. Data on demographics, clinical presentation, dosing, duration of use, co-medications, medical history, recovery, and causality assessment scales were extracted.

RESULTS

Among 28 publications reviewed, 32 cases (75% women, median age 44 years (16y-82y)) reported adverse events linked to consumption of Garcinia cambogia extracts as the exclusive suspected agent. Daily doses ranged from 250 mg to 2000 mg (in 75% of cases not reported), with durations of use ranging from 2 days to 1 year. Hepatic injury (56%, 18 cases) with elevated liver enzymes was the most prevalent adverse event, followed by mania, pancreatitis, and cardiac injury. Specifically on hepatotoxicity, causality assessments (including Roussel Uclaf Causality Assessment Method scores) categorised 28% of cases as very probable, 28% as probable and 11% as possible. Four cases required liver transplantation. Recovery was documented in all the cases except one, which was fatal. Additionally, 73 cases reported adverse events (including 81% liver injury and 8% neurotoxic effects) to Garcinia cambogia extracts in combination with other ingredients. Regarding hepatotoxicity, in 47% of cases, Garcinia cambogia extracts were assessed as definitive or highly likely causative.

CONCLUSIONS

The temporal relationship between Garcinia cambogia use and adverse events highlights potential toxicity. While hepatotoxicity remains the primary concern, cardiac and neuropsychiatric effects warrant attention. The findings emphasize the need for public awareness of the potential risks associated with Garcinia cambogia and HCA supplementation. Future studies should explore the mechanisms underlying these adverse effects.

SOAP30_06

CREATING A GLOBAL CALCIUM DASHBOARD TO HIGHLIGHT COUNTRY-SPECIFIC DATA ON CALCIUM INTAKES, POLICIES, AND RELATED HEALTH OUTCOMES

Ziaul Rana[1]; Filomena Gomes[1]; Megan Bourassa[1]; Keith Lividini[2]; Gabriela Cormick[3]
[1]Nutrition Science, The New York Academy of Sciences, New York, United States of America; [2]Research Delivery & Impact Division, International Food Policy Research Institute, Washington DC, United States of America; [3]Instituto de Efectividad Clínica y Sanitaria, Universidad Nacional de La Matanza, Buenos Aires, Argentina

BACKGROUND AND OBJECTIVES

Low calcium intake is a pervasive global health problem that can profoundly impact maternal health, neonatal survival, and the development of chronic health problems such as osteoporosis. Despite its important health implications, fragmented data on calcium intakes and related health outcomes have hindered strategic responses. The aim of this project is to develop a centralized, interactive platform that visualizes calcium intakes, associated health outcomes and policies across countries. This tool seeks to give stakeholders useful insights to promote fair resource distribution, shape public health policies, and boost the impact of efforts to address inadequate calcium intake.

METHODS

The Global Calcium Dashboard integrates datasets that include calcium availability, calcium intake, as well as calcium supplementation, and fortification programs and legislation from over 150 countries. Epidemiological data on preterm births, maternal hypertensive disorders, and other calcium related health outcomes were also incorporated to highlight areas with the greatest potential need for improved calcium intake. These data were sourced from national surveys, international health organizations, scientific literature searches through multiple systematic reviews, and published modeled estimates. These data can be visualized in a series of online maps and country profiles that describe the available information for each country and enable the identification of health disparities, and critical data gaps related to calcium as well as opportunities to design tailored strategies.

RESULTS

The Global Calcium Dashboard reveals that data coverage is comprehensive for high- and middle-income countries, with detailed records on daily calcium intake and related health outcomes. However, low-income countries often lack granular data, creating challenges for targeted interventions. Analysis of the data shows significant variation in calcium intake globally, with over 60% of countries not meeting the requirements. Furthermore, supplementation initiatives are documented in less than 40% of the countries surveyed, highlighting the need for an increased emphasis on these efforts.

CONCLUSIONS

The Global Calcium Dashboard is a data repository, serving as a transformative framework for addressing calcium-related global health challenges. By bringing together diverse datasets, the maps of the Global Calcium Dashboard offer country-specific information on calcium intake, health outcomes, and current policies, enabling targeted interventions. It also serves as an instrumental tool for advocacy and education, and driving policy changes.

RISK FACTORS FOR MENTAL DISORDERS IN PREGNANT WOMEN: A COMPARISON BETWEEN THE JUNDIAÍ AND ARARAQUARA COHORTS IN BRAZIL

Audêncio Victor[1]; Perla Pizzi Argentato[2]; Maria Paula De Carvalho Leitão[2]; Lívia Patrícia Rodrigues Batista[3]; Liania A. Luzia[4]; Rinaldo Artes[5]; Patrícia H.C. Rondó[2]
[1]DEPARTAMENT OF PUBLIC HEALTH, SÃO PAULO UNIVERSITRY, São Paulo, Brazil; [2]School of Public Health, Universidade de São Paulo, São Paulo, Brazil; [3]School of Public Health, Universidade de São Paulo, São Paulo, Brazil, Brazil; [4]School of Public Health, University of São Paulo (USP), São Paulo, Brazil, Brazil; [5]Institute of Education and Research, Institute of Education, São Paulo, Brazil

BACKGROUND AND OBJECTIVES

Mental disorders during pregnancy are a significant public health problem due to the substantial physiological and psychological changes that occur during this period. This study aims to investigate the risk factors for mental disorders in pregnant women by comparing data from two distinct cohorts in Jundiaí and Araraquara, Brazil.

METHODS

This is a prospective cohort study that included pregnant women from two Brazilian cohorts. The Jundiaí cohort (1997-2000) included 865 pregnant women, while the Araraquara cohort (2017-2023) included 755 pregnant women. Socioeconomic, demographic, obstetric history, and mental health data were collected and analyzed. Mental health was assessed using standardized questionnaires, including the General Health Questionnaire (GHQ), the State-Trait Anxiety Inventory (STAI), and the Perceived Stress Scale (PSS). Statistical analysis included bivariate tests and univariate and multivariate random-effects models for panel data.

RESULTS

The RESULTS indicated higher levels of anxiety, depression, and perceived stress in the Araraquara cohort compared to the Jundiaí cohort study. Socioeconomic factors such as being single, separated or widowed, lower per capita income, lower educational levels, higher household density, and morbidity during pregnancy such as urinary infection, pyelonephritis, gestational hypertension, tuberculosis, cervicitis, and vaginitis were the risk fators identified.

CONCLUSIONS

The findings of this study highlight the need for targeted interventions for pregnant women in vulnerable situations, including socioeconomic support, improvements in living conditions, and access to adequate health care. Additionally, it is essential to integrate mental health services into prenatal care to monitor and treat health complications that may affect the mental health of pregnant women.

SOAP30_08

A 'VALUE FOR INVESTMENT' ANALYSIS OF FREE, HEALTHY SCHOOL LUNCHES IN NEW ZEALAND

Boyd Swinburn[1, 2]; Carolina Mejia Toro,[1]; Julian King,[3]; Sally Mackay,[1]; David Tipene-Leach,[2]
[1]School of Population Health, University of Auckland, Auckland, New Zealand; [2]Te Kura i Awarua Rangahau Māori Research Centre, Eastern Institute of Technology, Napier, New Zealand; [3]Principal, Julian King and Associates, Auckland, New Zealand

BACKGROUND AND OBJECTIVES
Free, healthy school lunch programs are both costly and beneficial and New Zealand's new program (Ka Ora, Ka Ako) is highly politically contested. However, assessing the return on investment using standard METHODSis fraught because important, non-monetizable benefits are usually omitted. The objective of this study was to use the interdisciplinary, participatory method called Value for Investment (VfI) analysis to provide a comprehensive, evidence-based, stakeholder-defined assessment of the value of Ka Ora, Ka Ako.
METHODS

Three workshops were conducted with key stakeholders from schools, the community, lunch providers, and government agencies to define the value proposition of the program and the value criteria, standards, and evidence indicators for rating the levels of value created by the program. The evaluation team collated the evidence which was presented at the fourth workshop where stakeholders made evaluative judgements about the program's performance in achieving each of the values determined in the value proposition.

RESULTS

Over 3 workshops, 91 stakeholders co-created the value proposition statement: "A healthy, tasty, sustainable, equitable, free school lunch system that contributes to improving food security, nutritional health and wellbeing, learning outcomes, environmental sustainability, and local economies and communities" and 21 criteria upon which they would judge the program's performance and value. In economic terms there were 10 criteria for effectiveness, 5 for efficiency, 3 for equity, 2 for economy (money stewardship), and 1 for cost-effectiveness. Evidence from 44 sources were collated and summarised and presented to the fourth workshop (19 stakeholders). They rated the program's performance as Excellent for 8 criteria, Good for 11, Adequate for 2, and Poor for none. In particular, the 6 criteria relating to the government's initial justification for the program scored Excellent (Improved healthy eating: Reduced financial burden on disadvantaged households) or Good (Alleviating hunger at schools; Improved diet-related outcomes; Strengthened local economies; Reduced barriers to education and improved long-term educational outcomes).

CONCLUSIONS
The participatory VfI approach enabled stakeholders to define the wide range of the program's expected values and create evidence-based ratings for each value. The program rated very well but despite these very positive RESULTS, it has since suffered major budget cuts. This study also demonstrates how the VfI approach provides transparent, evidence-based assessments of value for money in contexts that often resist economic analysis.

BACKGROUND AND OBJECTIVES

Human milk feeding supports infant development and protects against diseases, potentially through human milk oligosaccharides (HMOs) and milk-associated bacteria. However, the dynamics of milk microbiome and HMO composition, and their impact on infant gut microbiota in low- and middle-income countries remain underexplored, especially in the context of maternal nutritional challenges.

METHODS

We analyzed fecal and milk samples from 152 mother-infant pairs in Burkina Faso participating in a maternal nutrition intervention. Maternal gut microbiota were analyzed using metagenomic sequencing during pregnancy (second and third trimester) and lactation (1-2 and 5-6 months postpartum), and infant gut microbiota were profiled at 1-2 and 5-6 months. Milk microbiome and HMO composition were analyzed with 16S rRNA sequencing and HPLC, respectively, at 14-21 days, 1-2, and 3-4 months postpartum.

RESULTS

Infant gut microbiomes at 1-2 months clustered into three patterns: Bifidobacterium-dominated, Escherichia-dominated, and a diverse group. These patterns converged by 5-6 months due to exclusive breastfeeding. Maternal gut microbiota at trimester 3 strongly correlated with infant gut microbiota, but postnatal maternal samples did not. Milk microbiome diversity mirrored infant gut clusters at 3-4 months, with temporal correlations evident only at matching time points. Infant gut Bifidobacterium species correlated with fucosylated HMOs, such as 2'Fucosyllactose (2′FL) at early time point, and correleated with sialylated HMOs later. Redundancy analysis revealed that HMOs were significant drivers of infant gut microbiota variance, surpassing milk microbiome contributions.

CONCLUSIONS

Optimizing maternal nutrition to enhance HMO profiles may foster healthier infant gut microbiota development in resource-limited settings.

SOAP30_11

Impact of Cash Transfers and Digital Nutrition Counselling on Maternal Nutrition Knowledge: RESULTS from the Shonjibon Trial

Huda Tanvir[1]; Hossain Sazzad[1]; Mohammad Mehedi Hasan[2]; Afrin Iqbal[2]; Michael Dibley[1]
[1]Faculty of Medicine and Health, School of Public Health, The University of Sydney, Camperdown, Australia; [2]Maternal and Child Health Division, International Centre for Diarrhoral Disease Research, Bangladesh, Dhaka, Bangladesh

BACKGROUND AND OBJECTIVES

The Shonjibon Trial (ACTRN12618001975280), a cluster randomised controlled trial, assessed the effectiveness of a multifaceted intervention combining unconditional cash transfers, a mobile app, and phone-based nutrition counselling in reducing child stunting in Bangladesh. This study presents the impact of the intervention on participants' nutrition knowledge, a critical determinant of improved maternal and child health outcomes.

METHODS

The trial was designed as a two-armed cluster randomised controlled trial. Participants in the intervention arm received unconditional cash transfers along with access to the "Soi Barta" mHealth app and the "Soi Pushti Sheba" counselling service. The app provided stage-specific multimedia nutrition advice tailored to pregnancy and early childhood, while trained counsellors delivered empathetic, personalized guidance to address beliefs, barriers, and motivations. Nutrition knowledge was assessed at enrolment (during the first trimester of pregnancy) and at the study endpoint (18 months postpartum) using a 24-item questionnaire. The questionnaire was tailored for pregnant women from rural communities, focusing on practical and culturally relevant nutrition concepts. The impact of the intervention on knowledge scores was analyzed using ANOVA, with pairwise comparisons to identify differences between groups.

RESULTS

A total of 2,243 participants were included in the analysis. The mean score in the intervention arm increased from 11.0 (SD 2.8) at baseline to 14.9 (SD 3.4) at endline. Similarly, in the control group, the mean score increased from 10.2 (SD 2.6) at baseline to 12.3 (SD 3.8) at endline. The mean score improvement in the intervention arm was 3.9 (SD 4.0), compared to 2.1 (SD 4.4) in the control arm. ANOVA revealed a statistically significant effect of the intervention on changes in nutrition knowledge scores ($p < 0.001$). Participants in the intervention arm experienced a significantly greater mean improvement in knowledge scores compared to the control arm (mean difference 1.80, 95% CI: 1.45–2.15, $p < 0.001$).

CONCLUSIONS

The Shonjibon Trial demonstrated that mobile app and phone-based nutrition education can enhance maternal nutrition knowledge in a low-resource setting. The integration of digital tools with personalized counselling showed considerable promise in addressing maternal and child nutrition challenges in vulnerable populations across South Asia. While improved knowledge is a critical precursor to behavior change, its translation into improved nutrition practices and health outcomes requires further investigation.

SOAP30_13

EVOLUTION OF LEGUMES CONSUMPTION AND ASSOCIATED FACTORS IN THREE WEST AFRICA COUNTRIES

Fifali Sam Ulrich Bodjrenou[1, 2]; Youna Hemery[3]; Papa Mamadou Dit Doudou SYLLA[4]; Fatoumata Hama Ba[5]; Waliou Amoussa Hounkpatin[2]; Claire Mouquet-Rivier[6]
[1]Food Environment and Consumer Behaviour, Alliance of Bioversity International and Ciat, Cotonou, Benin; [2]Human nutrition and Food sciences, FSA/UAC, Abomey Calavi, Benin; [3]UMR QualiSud, Institut de Recherche pour le Développement (IRD), Cotonou, Benin; [4]Departement de Technologies Agro-alimentaires, Université Gaston Berger, Saint-Louis, Senegal; [5]Food Technology Department, IRSAT, Ouagadougou, Burkina Faso; [6]UMR QualiSud, Equipe 6 - Aliments, Nutrition et Santé, Institut de Recherche pour le Développement (IRD), Montpellier, France

BACKGROUND AND OBJECTIVES

The importance of legumes in traditional West African diets is well established. However, their consumption has evolved over the years. This study analysed the changes in their consumption and associated factors in Benin, Burkina Faso and Senegal, as well as options for promotion.

METHODS

In each country, focus group discussions (FGD) were held in various regions in both rural and urban areas (n=32). In each study site, two FGD were held: one with young women (18-35 years) and the second with older women (50-65 years). We investigated changes over time in the levels and forms of consumption of legumes, factors associated and strategies for promotion. Discussions were recorded, transcribed and then, organized a thematic analysis.

RESULTS

There is a diversity of 14 legumes consumed across the three countries, with slight differences. Pulses such as cowpea, bambara pea, Kersting's groundnut, lentil, lima bean and pigeon pea have been consumed for a long time. Consumption of 'traditional' legumes has declined over time, due to falling production, rising prices, replacement by 'new' species, and existence of prohibition/negative perception. They are generally not much appreciated by the young generation; youth preferring easy-to-cook modern foods. However, legumes such as soybean, mung beans and split peas, are relatively recent and seeing increasing uptake. Soya consumption has risen sharply over the last twenty years in both urban and rural areas of Benin and Burkina Faso. Soya is consumed in several forms. In Benin, soya cheese (i.e. tofu) is the main form consumed. It is available, cheap and used in sauces. It replaces fish and meat: '200 XOF francs worth of [soy]cheese is enough to make a sauce for my whole family, and everyone will be happy! It's very economical. It would be impossible with fish'. In addition, traditional legume-based recipes with high nutritional potential are being abandoned. Promotion strategies identified included access to quality seeds and inputs to improve productivity, raising awareness among the nutritional benefits of pulses, and developing new processing technologies. Marketing strategies such as quest for new markets, price reduction, etc. can be important levers for encouraging their consumption.

CONCLUSIONS

There is a diversity of legumes with many forms of consumption in Benin, Burkina Faso and Senegal. However, some species and forms of consumption are disappearing or are tending to be abandoned. It is, therefore, important to work on improving the image of legumes, in order to maintain their high existing consumption level within the population.

SOAP30_14

LONGITUDINAL CHANGES OF HUMAN MILK LACTOFERRIN DURING THE FIRST YEAR: A PROSPECTIVE COHORT STUDY

Zhenyu Yang[1]; Yang Zhou[1]; Yifan Duan[1]; Shan Jiang[1]; Rulan Jiang[2]; Jianqiang Lai[1]
[1]Department of Maternal and Child Nutrition, National Institute for Nutrition and Health, China CDC, Beijing, China; [2]Department of Nutrition, University of California Davis, Davis, United States of America

BACKGROUND AND OBJECTIVES

Lactoferrin (Lf) is an important bioactive protein in human milk involved in diverse biological functions. Concentrations of milk Lf are tightly regulated during lactation. This study aims to explore longitudinal changes of human milk Lf concentrations during the first year postpartum and to identify the associated factors.

METHODS

This prospective cohort study recruited 160 dyads of healthy mothers and their newly delivered full-term newborns in Wuqiang, Hebei province, China. Characteristics of mothers and infants were collected using a structured questionnaire. Concentrations of milk Lf were measured by using an Enzyme-linked Immunosorbent Assay kit. Linear mixed model was used to examine its longitudinal changes and associated factors.

RESULTS

The mean concentrations of milk Lf were 7.17 g/L, 4.02 g/L, 2.95 g/L, 2.19 g/L, and 2.43 g/L at 0-7 days, 30 days, 3 months, 6 months, and 12 months postpartum, respectively. The frequency of breastfeeding in the prior 24 hours was negatively associated with Lf concentrations (P = 0.017). Prenatal mean corpuscular volume (MCV) status may influence the longitudinal changes of milk Lf (PMCV*time = 0.011).

CONCLUSIONS

The concentration of milk Lf decreases during the first 6 months and increases from 6 to 12 months, with its change possibly being associated with feed frequency and prenatal MCV status.

ENHANCING ADHERENCE TO BALANCED ENERGY PROTEIN SUPPLEMENTS THROUGH COMMUNITY HEALTH RESEARCH WORKERS IN RURAL BANGLADESH

Atiya Rahman[1]; Mary De Boer[2]; Nazrana Khaled[1]; Pragna Mondal[1]; Hasmot Ali[3]; Rezwanul Haque[3]; Eleonor Zavala[2]; Anna Kalbarczyk[2]; Towfida Siddiqua[3]; Kaosar Afsana[1]; Parul Christian[2]; Andrew Thorne-Lyman[2]
[1]BRAC James P Grant School of Public Health, BRAC University, Dhaka, Bangladesh; [2]Center for Human Nutrition and Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [3]JiVitA, Maternal and Child Health & Nutrition Research Project, Rangpur, Bangladesh

BACKGROUND AND OBJECTIVES

Balanced energy protein (BEP) supplements improve maternal and newborn health, but limited program examples make it crucial to identify strategies for enhancing adherence, especially as cultural and practical barriers persist.This study explores how community health research workers (CHRWs) motivate pregnant women to improve BEP adherence in a community-based trial in northern Bangladesh.

METHODS

Six focus group discussions were held with 35 CHRWs (n≅6 per group), selected for the research study and responsible for delivering BEP supplements and supporting adherence through the JiVitA Project in Gaibandha, Bangladesh. Data were collected using field guides and analyzed thematically.

RESULTS

CHRWs explained their roles in promoting adherence through culturally sensitive communication and consistent follow-up to integrate BEP supplementation into the maternal and child health-related beliefs of trial participants and their families. By delivering appropriate messages on BEP consumption and health awareness, community health research workers emphasized the importance of regular BEP supplementation in improving maternal and child health, supporting healthier pregnancies, and achieving adequate weight gain. Their trusted status enabled them to address cultural beliefs and misconceptions, making the intervention more acceptable. CHRWs also enhanced access and adherence by delivering supplements directly to households, encouraging the integration of supplements into traditional dietary practices, and offering consistent and frequent follow-ups outside their regular hours. CHRWs described challenges such as traveling on bicycles to reach women’s homes and sometimes not finding them at home, some refusals due to perceived side effects, and disapproval from some husbands and mothers-in-law. CHRWs actively involved husbands, mothers-in-law, and female neighbors to foster a collective understanding of the benefits of BEP. CHRWs believed the community's trust in the JiVitA Project had created a supportive environment for women to adopt and adhere to BEP.

CONCLUSIONS

CHRWs helped to ensure adherence to BEP supplementation by building trust, delivering tailored health messages, and ensuring consistent follow-up with the women. Policies should consider adequate support to nutrition programs through workload management, transport, financial incentives, and addressing field challenges faced by CHRWs. Funding: This work was supported by the Bill and Melinda Gates Foundation grant number INV-033381.

EVALUATION OF THE FOOD ENVIRONMENT AT THE PARIS 2024 OLYMPIC AND PARALYMPIC GAMES

Fiona Pelly[1]; Angela Dufour[2]
[1]School of Health, UniSC University of the Sunshine Coast, Sippy Downs, Australia; [2]Lead Performance Dietitian, Canadian Olympic Committee, Toronto, Canada

BACKGROUND AND OBJECTIVES

Recent global focus on sustainability of the Olympic and Paralympic Games (OPG) by the International Olympic Committee (1) was a key feature of the Paris 2024 OPG. This included a food vision that aimed to reduce environmental impact through specific strategies such as providing plant-based food, locally sourced suppliers and no plastics (2). Despite this, the food environment at the OPG must be suitable for the performance, health and cultural needs of athletes from over 200 countries (3). The aim of this study was to investigate the safety and suitability of the Paris 2024 OPG food provision for athletes in the context of the food vision focused on environmental sustainability.

METHODS

A mixed METHODSstudy design was employed using a previously developed survey instrument specific for this environment (4) that was implemented with experienced sports nutrition experts in advance (n=13) and during the event (n=11); and a series of focus group discussion with 17 sports nutrition experts affiliated with national Olympic and Paralympic teams who had attended the Paris 2024 OPG and experienced the food provision for athletes. Focus group discussions were recorded, transcribed and thematically analysed, while survey RESULTS were descriptively analysed and RESULTS used to further inform emerging themes.

RESULTS

Experts' overall ratings of the food provision for athletes during the Paris 2024 OPG was 5.0 / 10, in comparison to 7.7 /10 for the proposed menu reviewed 12 months prior to the event. Emerging themes from focus group discussions included issues with food safety, cross contamination, insufficiency of animal protein, accessibility to water and lack of specific cultural items, although this was noted as improving over time. Experts recommended the development of a framework to guide caterers appointed to provide food, improved early engagement by caterer and organisers with team dietitians and inclusion of food service nutrition experts during the planning phase.

CONCLUSIONS

While the food vision that aimed to reduce environmental impact was recognised as important by all experts, RESULTS of this study suggest that a more balanced approach that equally meets the performance and health needs of athletes is necessary. The development of a framework of standards for food provision at the OPG would benefit organisers and caterers in the future.

EGCG IMPROVE THE SKIN AGING OF C57BL/6J MICE BY MODULATING SIRT1/FOXO1 PATHWAY

Rui Fan[1, 2]; Yuxin Ma[1]; Meng Sun[1]; Yaxin Han[1]; Haohao Zhang[1]; Jiajing Tian[1]; Wenli Zhu[1, 2]; Zhaofeng Zhang[1, 2]

[1]Department of Nutrition and Food Hygiene, School of Public Health, Peking University, Beijing, China; [2]Food Safety Toxicology Research and Evaluation, Beijing's Key Laboratory, Beijing, China

BACKGROUND AND OBJECTIVES

The skin is integral to the maintenance of body homeostasis. Addressing the issue of skin aging, which is partly induced by glycosylation, is becoming increasingly imperative. The aim of this study is to examine the potential of EGCG in decelerating skin aging and to elucidate its underlying mechanisms.

METHODS

Eight-month-old C57BL/6J mice were randomly allocated into four experimental groups: Normal, EGCG-low (50 mg/kg/d), EGCG-high (50 mg/kg/d), and an aging model group. The aging model group was provided with a diet enriched in advanced glycosylated end products. Additionally, six-week-old C57BL/6J mice were utilized as the young control group. Following a four-month intervention with EGCG, dorsal skin samples were collected for pathological analysis and assessment of substances associated with the aging process.

RESULTS

The RESULTS demonstrated that high-dose EGCG treatment resulted in a statistically significant reduction in N-ε-Carboxymethyllysine content ($p < 0.05$). When compared to the aging model groups, EGCG treatment was associated with an 0.8-fold increase in Hyp content and a 4.85-fold increase in COL1A1 expression, while MMP-3 expression decreased by 0.93-fold. Furthermore, the study observed that high-dose EGCG intervention led to enhanced aging outcomes, as demonstrated by a significant reduction in the senescence-associated secretory phenotype (SASP) such as IL-1β, IL-6, MMP-1 ($p<0.05$), and p16 expression. Notably, the administration of high doses of EGCG resulted in significant improvements in SOD levels, increasing from 88.19±15.07 U/mg to 108.69±19.49 U/mg, GSH levels from 15.84±6.15 U/mg to 45.10±14.40 U/mg, and CAT levels from 0.62±0.26 U/mg to 1.78±0.48 U/mg. These improvements can be partially ascribed to the upregulation of NRF2 expression, as well as the phosphorylation of Sirt1 and Foxo1.

CONCLUSIONS

The potential anti-aging effects of EGCG may be attributed to its antioxidative benefits, which are mediated through the activation of the Sirt1/Foxo1 pathway.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

SOAP33_05

THE IMPLEMENTATION OF PILOT PROGRAM OF MULTIPLE MICRONUTRIENTS SUPPLEMENTATION IN SIDOARJO DISTRICT OF EAST JAVA, INDONESIA

Sri Sumarmi[1]; Lailatul Muniroh,[2]; Maya Sari Dewi,[3]; Annas Buanasita,[4]; Otte Santika,[5]; Markus Puthut Harmiko,[5]; Kristen Hurley[6]
[1]Department Nutrition, Faculty of Public Health, Airlangga University - Campus MERR (C), Surabaya, Indonesia; [2]Nutrition, Faculty of Public Health, Airlangga University - Campus MERR (C), Surabaya, Indonesia; [3]Faculty of Public Health, Airlangga University - Campus MERR (C), Surabaya, Indonesia; [4]Doctorate Program, Faculty of Public Health, Airlangga University - Campus MERR (C), Surabaya, Indonesia; [5]Jakarta, Vitamin Angels Indonesia, Jakarta, Indonesia; [6]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America

BACKGROUND AND OBJECTIVES

Multiple Micronutrients Supplement (MMS) currently has been widely used in Asian and African countries. In Indonesia, the use of MMS is still in context of implementation research to prepare in transitioning from IFA to MMS. The objective of this study aims to evaluate the implementation of the pilot program of MMS among pregnant women.

METHODS

This is a formative evaluation study, was conducted using explanatory sequential QUAL→QUAN mix method. Qualitative approach was provided the information about the implementation of MMS program including input, process and output (the coverage and adherence of MMS), and quantitative approach was to provided the data of acceptance and adherence of MMS consumption among pregnant women. This research was conducted in Sidoarjo Districts, East Java Province, Indonesia. There were 3 samples consist of staff of district health office, sub-districts level, and pregnant women in village level. This difference of targets was intended to explore the role of each level in MMS program implementation. Qualitative data were gathered by FGD among staff of district health office, sub districts level, while the survey was done among pregnant women in village level. Qualitative data form FGD was analysed using content analysis, narrative analysis. Data survey was performed as cross table and percentage.

RESULTS

The implementation of MMS pilot program in Sidoarjo District was conducted since 2017 under initiation of District Health Office (DHO) following with strong commitment by the head of DHO and Head of Public Health Division, strengthened by local regulation on maternal and child health. Budget support was quite good, to provide MMS supply. MMS supply only cover about 65.8% of population of pregnant women. Supply of IFA remain consistent, and MMS distribution did not interfere the IFA distribution, because DHO extent the IFA target on adolescent girls. Recording and reporting of MMS distribution embedded in ANC services using “si cantik” application. However, the pilot program still lacks of promotion. Based on data survey, the MMS coverage is about 69.1%, because MMS supply only provide 25000 bottles, whereas the total population of pregnant women is about 38000. MMS was distributed either as a single supplement or combine with IFA.

CONCLUSIONS

The acceptance and adherence of MMS consumption among pregnant women was good, because of less side effect, and family support (husband), even their knowledge of MMS benefit remains poor. Most of respondent stated that MMS product was quite stable in odor

FACILITATORS AND BARRIERS TO HEALTHY MERCHANDISING INITIATIVES IN THE FOOD RELIEF SECTOR: A SOUTH AUSTRALIAN QUALITATIVE STUDY

Tjing Shaeny Dian Chandra[1]; Olena Kravchuk[2, 1]; Helen Morris[1]; Scott Hanson-Easey[3]
[1]School of Agriculture, Food and Wine, The University of Adelaide, Adelaide, Australia; [2]The Biometry Hub, The University of Adelaide, Adelaide, Australia; [3]The University of Adelaide, School of Public Health, Adelaide, Australia

BACKGROUND AND OBJECTIVES

In economically developed countries, food relief services are indispensable safety nets; however, concerns have grown regarding the nutritional adequacy of foods supplied by third-sector organisations. Evidence-informed behavioural strategies and pricing manipulations have been shown to improve unplanned impulse purchases for healthy food selection. In 2021, researchers successfully adopted a place-based approach by collaborating with Foodbank South Australia and Northern Territory to implement the 3P Pantry Reform Study as part of the Healthy Merchandising Project in two food relief pantries. Understanding the perceptions and experiences of key stakeholders involved in 3P Pantry Reform Study is important in policymaking. However, their perceptions of the implementation challenges remain unknown. Objective: This study sought to explore the facilitators and barriers to implementing healthy merchandising in the food relief pantries of a leading South Australian food relief provider.

METHODS

Purposive sampling identified 13 informants who were deemed integral and familiar with the study. One-to-one, semi-structured interviews were conducted with key stakeholders, including managers (n = 4), frontline pantry employees (n = 4), and volunteers (n = 5). The interview schedule was informed by Kurt Lewin's three-stage model. Interview transcripts were reported using Braun and Clarke's thematic analysis, using inductively coded data from a critical realist ontology.

RESULTS

Facilitators (N =11) and barriers (N = 11) were identified across the four main themes structured as stratified layers of realities: 1) individuals, engagement with pantry operations and intervention; 2) organisational, within the contraints of distribution facilities and capacities; 3) structural, deviating away yet dependent on food rescue; and 4) governance, a food insecure organisation tackling food insecurity.

CONCLUSIONS

Insights from key informants revealed that existing forces and dynamics within and external to the food relief sector must be considered as essential components in the pathways towards nutritious food banking, particularly when considering the viability and uptake of public health strategies.

CONFLICTS OF INTERESTS
The authors have no conflict of interest.

BREAST MILK SUBSTITUTES MARKETING ON SOCIAL MEDIA: A SYSTEMATIC SCOPING REVIEW

Heilok Cheng[1]; Eve House[2]; Sarah Taki[3]; Isabelle Raisin[4]; Elizabeth Denney-Wilson[1]; Li Ming Wen[3]; Mu Li[2]
[1]Faculty of Medicine and Health, The University of Sydney, Sydney, Australia; [2]School of Public Health, The University of Sydney, Sydney, Australia; [3]Population Health Research & Evaluation Hub, Sydney Local Health District, Sydney, Australia; [4]University Library, The University of Sydney, Sydney, Australia

BACKGROUND AND OBJECTIVES

Infant feeding decisions significantly impact child health and development. These decisions should be guided by evidence and accurate information rather than influenced by commercial marketing. Digital media has rapidly superseded traditional media for persuasive marketing, and social media marketing may exploit a loophole in the International Code of Marketing of Breast-milk Substitutes. This scoping review aimed to identify and analyse the strategies of breast-milk substitutes (BMS) marketing on social media platforms

METHODS

Six databases were searched: CINAHL, Embase, Medline, Scopus, and two Cochrane databases. Backward and forward citation hand-searching was undertaken. Grey literature that may have been excluded from other reviews was included in this analysis. The search was limited to English language articles published from January 2003 to April 2024.

RESULTS

20,425 and 91 articles were identified through database and hand searches, respectively. After removing duplicates and screening abstracts, 497 full-text articles were reviewed, with 70 included in the analysis. The study revealed extensive BMS marketing strategies, specifically for social media platforms. The most prominent strategies identified on social media included: user engagement features, promotion by social media influencers and bloggers, peer influence, digital marketing tracking, and live streaming or live interaction. Facebook and Instagram were the most popular social media platforms for BMS marketing. The top three companies marketing their BMS brands on social media were Danone, Nestle, and Mead Johnson.

CONCLUSIONS

Several transnational companies control the global milk formula market and actively promote BMS on social media. This study highlights the urgent need for coordinated global monitoring and regulatory measures to restrict BMS marketing on social media in order to protect breastfeeding and child health.

NUDGING FOOD CHOICES IN DUTCH FOOD BANKS: AN INTERVIEW STUDY

Anastasia Vugts[1, 2]; Remco Havermans,[2]; Emmy Van Den Heuvel[2]
[1]Nutrition & Health, HAS university of applied sciences, 's-Hertogenbosch, Netherlands; [2]Laboratory of Behavioural Gastronomy, Maastricht University Campus Venlo, Venlo, Netherlands

BACKGROUND AND OBJECTIVES

This study explored the acceptance of healthy food choice nudges at food banks. The primary aim was to assess how nudges promoting healthier food choices among food bank clients are considered acceptable and feesable through the perspectives of both clients and volunteers.

METHODS

Interviews were conducted with 13 clients and 18 volunteers of two different food banks to gather insights into the feasibility and acceptability of implementing healthy food choice nudges at food banks. All interviews were analyzed using thematic analysis, which identified various themes in both groups (clients and volunteers). The acceptance of nudges was examined across both groups.

RESULTS

Feasibility of nudging was considered moot, due to limited: offer of food items, need for healthy food choices, and language ability among clients. The need for autonomy was stressed, with nudges intended to raise awareness of healthy food choices being viewed as most acceptable.

CONCLUSIONS

Despite the expressed value of healthy nutrition by both volunteers and clients, we conclude that the narrow and inconsistent range of healthy foods on offer make food banks the wrong place for promoting healthy nutrition through nudging.

EXPOSURE TO FOOD ADDITIVE MIXTURES AND TYPE 2 DIABETES RISK IN THE NUTRINET-SANTÉ COHORT

Marie Payen de la Garanderie[1]; Nicolas Deschamp[1]; Anaïs Hasenböhler[1]; Guillaume Javaux[1]; Fabien Szabo De Edelenyi[1]; Cédric Agaësse[1]; Alexandre De Sa[1]; Raphaël Porcher[2]; Emmanuel Cosson[3]; Mélanie Deschasaux-Tanguy[1]; Bernard Srour[1]; Mathilde Touvier[1]
[1]Centre of Research in Epidemiology and StatisticS, Nutritional Epidemiology Research Team (EREN), Université Sorbonne Paris Nord and Université Paris Cité, INSERM, INRAE, CNAM, Bobigny, France; [2]Centre d'Epidémiologie Clinique, AP-HP Hôtel-Dieu, Paris, France; [3]Diabetology, endocrinology and nutrition Department, Avicenne Hospital, AP-HP, Bobigny, France

BACKGROUND AND OBJECTIVES

The safety assessment of food additives has traditionally focused on individual substances. However, in reality, people are exposed to mixtures of food additives daily. Preliminary experimental data suggest that some of these chemicals, alone and/or in synergy, impact metabolic health. The objective of this study was to investigate for the first time the associations between exposure to mixtures of food additives and type 2 diabetes (T2D) risk in a large French adult cohort.

METHODS

Participants (n=108,643, mean follow-up=7.7y, SD= 4.6, age=42.5y, SD=14.6, 79.2% women) were adults from the French NutriNet-Santé cohort (2009-2023). Dietary intakes were assessed using repeated 24h-dietary records, including industrial food brands. Exposure to food additives was evaluated through multiple food composition databases and laboratory assays. Mixtures were identified through non-negative matrix factorisation, and associations with type 2 diabetes risk were assessed using multi-adjusted Cox models.

RESULTS

1,131 participants were identified with T2D during follow-up. Two out of the five identified food additive mixtures were associated with increased type 2 diabetes risk : the first included modified starches E14XX, pectin E440, guar gum E412, carrageenan E407, polyphosphates E452, potassium sorbate E202, curcumin E100, and xanthan gum E415 (HR =1.08 [1.02-1.15], p=0.006), and the second mixture included citric acid E330, sodium citrates E331, phosphoric acid E338, sulphite ammonia caramel E150d, acesulfame-K E950, aspartame E951, sucralose E955, arabic gum E414, malic acid E296, carnauba wax E903, paprika extract E160c, anthocyanins E163, guar gum E412, and pectin E440 (HR=1.13 [1.08-1.18], p<0.001). Food groups most likely to contain the mixtures associated with type 2 diabetes risk were broth, dairy desserts, fats and sauces, as well as artificially sweetened beverages and sugary drinks, respectively. These associations were not driven by a specific food additive, and several interactions between additives of a same mixture were detected.

CONCLUSIONS

This study revealed positive associations between exposure to two widely consumed food additive mixtures and increased type 2 diabetes risk. Further experimental research is need to depict underlying mechanisms. These findings suggest that potential interaction/synergistic effects of food additives should be considered in safety assessments and they support public health recommendations to limit non-essential additives.

SOAP33_10

CHILD FEEDING PRACTICES AND NUTRITIONAL OUTCOMES OF TWO GEOGRAPHICALLY DIVERSE INDIGENOUS COMMUNITIES OF INDIA

Suparna Ghosh-Jerath[1]; Ridhima Kapoor[1]; Akshita Rathore[1]; Soli Padi[1]; Rashi Saini[2]; Quisa Terokchi D. Shira[1]; Swati C Nair[1]
[1]Nutrition and Food Systems, The George Institute for Global Health India, New Delhi, India; [2]Department of Food and Nutrition, Institute of Home Economics, New Delhi, India

BACKGROUND AND OBJECTIVES

Role of agroecology in improving nutrition outcomes is well documented [1]. Research is crucial to explore differences in child feeding practices of population groups from different agroecological zones, having access to distinct traditional foods. We conducted a study among children from two indigenous communities, from geographically diverse and different agroecological zones of India, to examine their infant and young child feeding (IYCF) practices, dietary intake and nutritional status. The communities included Gond tribe residing in forest-surrounded villages of Madhya Pradesh (MP) and Garo tribe, residing in Meghalaya, a biodiversity hotspot of India.

METHODS

Study sites included 21 randomly selected villages from Mandla district, MP, and 14 randomly selected villages from West Garo Hills district, Meghalaya. Household surveys elicited information on IYCF practices (n=232 in Gond tribe, n=205 in Garo tribe). Additionally,2-day non-consecutive 24-hour dietary recall and anthropometric assessments (height and weight measurements) were conducted for diet and nutritional status assessment. Data analysis was done in MS Excel and R.

RESULTS

Overall better IYCF practices were demonstrated in Garo children, for early initiation of breastfeeding (95.4% Garo vs 59.4% Gond), colostrum feeding (67.3% Garo vs 44.3% Gond) and pre-lacteal feeding (2.4% Garo vs 6.8% Gond). Exclusive breastfeeding till 6 months was reported in 53.4% and 47.4% Garo and Gond children. Similar to national estimates (23%), 25.6% Garo and 21.1% Gond children consumed minimum diverse diet (≥5 food groups). Less than one-fourth reported minimum adequate diet (18.5% Garo, 12.9% Gond), although higher than national estimate (11%). Most children consumed high fat, salt and sugar foods (83.4% Garo, 73.2% Gond) with one-fifth Garo children (21.6%) consuming sugar-sweetened beverages. Animal-source foods like egg and flesh foods was reported more in Garos than Gonds (42.7% vs 16.3%). In comparison to national estimates (32.1% underweight, 35.5% stunting and 19.3% wasting), lower prevalence of underweight (28.9%), stunting (23.6%) and higher wasting prevalence (28.6%) was observed in Gond children, attributed to consumption of nutritionally inadequate diets.

CONCLUSIONS

This study provides insights into suboptimal diet and nutrition of young indigenous children from diverse agroecological zones of India. Strengthening nutritional outcomes through community-specific foods, grown and accessed as part of rich agro-diversity, is warranted.

SOAP33_12

A GLOBAL ACTION-ORIENTED FRAMEWORK FOR ADOLESCENT NUTRITION

Sara Estecha Querol; Catharine AK Fleming[1]; Stephanie V Wrottesley[2]; Amir A Samnani[2]; Natasha Lelijveld[2]
[1]School of Health Science, Western Sydney University , Sydney, Australia; [2]Global Adolescent Nutrition Network, Emergency Nutrition Network, London, United Kingdom

BACKGROUND AND OBJECTIVES

Optimal nutrition during adolescence is fundamental to growth and development. Yet globally, adolescents experience a triple burden of undernutrition, micronutrient deficiencies and overweight/obesity. Currently, we lack a comprehensive reference framework to improve adolescent nutrition. The aim of this collaborative project between the Global Adolescent Nutrition Network (GANN) and youth partners from Act4Food, was to develop a framework to guide actions and investments to improve global adolescent nutrition.

METHODS

The framework was developed using a multi-step methodology including (1) a review to identify and summarise existing frameworks relevant to adolescent nutrition (10-19 years); (2) Nominal Group Technique (NGT) methodology to achieve consensus on strengths and limitations of available frameworks, and key characteristics of an ideal new framework for adolescent nutrition; (3) stakeholder workshops to co-create the framework; and (4) stakeholder survey to assess the use and applicability of the final framework.

RESULTS

We present a framework that recommends actions to improve adolescent nutrition across four levels: adolescents themselves; households, peers, schools and communities; national systems; and global systems and planetary health. These actions can be tailored to different contexts and are directed at actors, including youth, working on research, programming, policy, and advocacy. Key to this process was the contribution of young people to enable agency and empower change.

CONCLUSIONS

Through a novel youth co-design process, we developed a new framework to guide actions and investments to improve global adolescent nutrition.

CHALLENGES IN MONITORING PRENATAL SUPPLEMENTATION WITHIN THE CONTEXT OF ROUTINE ANTENATAL CARE IN INDONESIA

Nancy Kosasih[1]; Tika Rianty[1]; Akhir Riyanti[1]; Fitri Nandiaty[1]; Monica Fox[2, 3]; Budi Utomo[4]; Endang Achadi[1]; Otte Santika[5]; Kristen Hurley[2, 6]; Trisari Anggondowati[7, 1]
[1]Center for Family Welfare, Faculty of Public Health, Universitas Indonesia, Depok, Indonesia; [2]International Health, Johns Hopkins University, Bloomberg School of Public Health, Baltimore, United States of America; [3]Program Quality and Impact (PQI) Team, Vitamin Angel Alliance, Goleta, United States of America; [4]Department of Population Studies and Biostatistics, Faculty of Public Health, Universitas Indonesia, Depok, Indonesia; [5]Senior Country Program Advisor for Indonesia, Vitamin Angel Alliance, Bogor, Indonesia; [6]Chief Nutrition Officer, Vitamin Angel Alliance, Goleta, United States of America; [7]Department of Epidemiology, Faculty of Public Health, Universitas Indonesia, Depok, Indonesia

BACKGROUND AND OBJECTIVES

A key indicator of the prenatal supplementation program in Indonesia has been the percentage of pregnant women (PW) who receive at least 90 tablets of Iron & Folic Acid (IFA). Given low IFA adherence, as shown in national surveys, the Ministry of Health, in 2020 started assessing adherence to prenatal supplements via a supplement consumption card (or consumption calendar) that was given to women upon their receipt of their supplements. The objective of this study is to examine the feasibility and use of the consumption card within the context of exploring the introduction of multiple micronutrient supplementation (MMS).

METHODS

Implementation research is being conducted to examine the feasibility of introducing MMS in 25 districts in Indonesia, utilizing a mixed METHODSlongitudinal design. The survey with 1941 PW was conducted in eight out of 25 districts. Focus group discussions (FGDs) were conducted in a subset of three districts representing Western, Central, and Eastern regions of the country. In three districts, nine FGDs were conducted in health centers involving 75 midwives and included questions related to the feasibility and use of the consumption control card. Thematic analysis was conducted.

RESULTS

From the PW survey, only 57.6% of women always/often filled out the control card after taking MMS. Nearly 10% of PW had never filled out the control card. This result is in line with the qualitative findings. From the FGDs, midwives informed that only some PW use the control cards to document their MMS consumption. Overall, midwives reported that not all PW use or bring the consumption card to their ANC visits. Key themes for not using or bringing the card included: 1) midwives not instructing PW to bring the card to ANC visits; 2) PW forgetting to bring the card to their ANC visits; and 3) the card was lost/damaged. In addition, midwives varied across districts in their responses, reporting regular use and sharing of the card, inconsistent use or sharing of cards, or inappropriate use or sharing (i.e., perceptions that women falsely reported taking tablets on their cards). Concerning the latter, some midwives felt that the supplement packaging (e.g., use of bottle) hindered their ability to count remaining tablets and validate PW's recording on the consumption card.

CONCLUSIONS

Monitoring prenatal supplementation by midwives remains challenging and continued efforts are needed to strengthen ANC monitoring of prenatal supplement adherence, including strengthening the use and sharing of MMS consumption records by PW.

LOW OR HIGH DIETARY SWEET TASTE EXPOSURE DO NOT AFFECT SWEET TASTE LIKING OR BODY WEIGHT

Eva ČAd[1]; Monica Mars[1]; Leoné Pretorius[2]; Claudia Tang[2]; Merel Van Der Kruijssen[1]; Hanne De Jong[1]; Michiel Balvers,[1]; Katherine Appleton[2]; Kees De Graaf[1]
[1]Human Nutrition and Health, Wageningen University and Research, Wageningen, Netherlands;
[2]Psychology, Bournemouth University, Bournemouth, United Kingdom

BACKGROUND AND OBJECTIVES
Humans love sweet taste (1). Intuition suggests we may love it too much, and that it RESULTS in excessive consumption and high energy intake (2). Authoritative public health agencies, such as the WHO, follow the reasoning: more frequent exposure to sweet taste increases preference for sweetness, which leads to greater sugar and calorie intake and, eventually, leads to higher body weight (3). However, none of these steps have been confirmed with experimental data (4,5,6).
METHODS

A large-scale 6 months, Randomized, Clinical Trial with 180 adults and 3 experimental groups: higher, regular and lower dietary sweetness exposure. Primary outcome was sweet taste preferences; sweet taste perception, energy intake, body weight and several biomarkers for diabetes and cardiovascular disease were secondairy outcomes.

The full design of the trial has been pubslished previously (7), preregistered at clinicaltrials.gov NCT04497974: Sweet Tooth: Nature or Nurture? and had medical ethical approval: NL72134.081.19.

RESULTS

A higher/lower dietary exposure to sweet taste did not lead to higher/lower sweet taste preferences, changes in perception, energy intakes, body weight or biomarkers for diabetes and cardiovascular disease. Subjects also spontaneously returned to baseline levels of sweet food intake at 1 and 4 months follow up.

CONCLUSIONS

Our findings directly contradict the assumptions made by many public health agencies, and suggest that, while overweight remains a global public health concern, excess energy intake is unlikely to be affected by advice to reduce our exposure to, or intakes of, sweet taste. Dietary recommendations to avoid energy overconsumption should instead focus on effective evidence-based strategies, such as, reducing the energy density of food and drinks, limiting portion sizes, and avoiding foods with a high energy intake rate such as sugar-sweetened beverages.

SOAP 36 - PUBLIC HEALTH AND NUTRITION THROUGHOUT LIFE CYCLE

SOAP36_01

WHY DO WOMEN CHOOSE TO USE COMMERCIAL MILK FORMULA? A WHO MULTI-COUNTRY MARKET RESEARCH STUDY OF WOMEN'S EXPOSURE TO COMMERCIAL MILK FORMULA MARKETING

Christiane Horwood[1]; Sphindile Mapumulo,[1]; Lyn Haskins,[1]; Tanya Doherty,[2]; Gillian Kingston,[3]; Nigel Rollins[4]
[1]Centre for Rural Health, University of KwaZulu-Natal - Howard College, Durban, South Africa; [2]Health systems research unit, South Africa Medical research Council, Cape Town South Africa; [3]Kings Business School, Kings College, London, United Kingdom; [4]Department of Maternal, Newborn, Child and Adolescent Health and Ageing, World Health Organization, Geneva, Switzerland

BACKGROUND AND OBJECTIVES

Marketing of commercial milk formula (CMF) is a well-resourced strategic effort by CMF companies to shape societal attitudes and practices towards infant feeding to promote CMF and, as a consequence, undermines breastfeeding. CMF marketing continues despite legislation in many countries partially aligned with the provisions of the International Code of Marketing of Breast-milk Substitutes (the Code).

METHODS

A cross-sectional survey was conducted across seven countries: Bangladesh; Mexico; Morocco; Nigeria; South Africa; the United Kingdom (UK); and Viet Nam; to explore the extent and nature of CMF marketing. A market-research methodology used convenience sampling of women stratified by infant feeding practices and child age. Participants were recruited from hospitals, clinics, markets and shopping malls. In each country, the sample included 300 pregnant women, and 750 mothers of children aged < 18 months (150 mothers breastfeeding, never feeding CMF; 600 women feeding CMF with or without breastmilk). Questionnaires were administered on tablets by trained field workers.

RESULTS

Interviews were conducted with 8,528 women between October 2019 and March 2021. Among them, 3,095 of 7,480 respondents (41.3%) reported exposure to CMF marketing, with rates ranging from 3% in Morocco to 92% in Viet Nam. The commonest marketing site in all countries was television, with in-store advertising and print media also common. Social media marketing was uncommon in all countries except the UK.

Health professionals were reported to be the most important influencers among women, both in their choice of CMF feeding and which CMF brand to use. Friends and family were also influential. In addition, although most women agreed with the statement that 'breastfeeding is best for babies' many women perceived CMF as being similar to breastmilk, ranging from 12.9% in Bangladesh to 48.9% in South Africa. Practical considerations such as the belief that CMF feeding is easier than breastfeeding and a better choice for mothers who are returning to work were also important in decisions to feed with CMF.

CONCLUSIONS

The findings underscore how CMF marketing strategically positions products as equivalent to breastmilk and as solutions to normal newborn behaviour, normalizing formula feeding through strategic messaging and promotional activities. Effective legislation to strengthen the Code and public health strategies are urgently needed to protect breastfeeding and empower women with accurate information about infant feeding.

SOAP36_02

STATE OF RESEARCH ON NUTRITION AND FOOD SYSTEM POLICIES AND ACTION PLANS IN SECONDARY CITIES IN LOW- AND MIDDLE-INCOME COUNTRIES: A NARRATIVE REVIEW

Daniel Salunga[1]
[1]Swiss Centre for International Health / Faculty of Medicine, Swiss Tropical and Public Health Institute / University of Basel, Basel, Switzerland

BACKGROUND AND OBJECTIVES

Secondary cities (SC) in low- and middle-income countries (LMICs) are rapidly urbanizing, presenting unique challenges and opportunities for addressing malnutrition and improving food systems. However, research and policy focus have predominantly centered on primary cities, leaving a knowledge gap about the status and impact of nutrition and food system (FSs) policies in SC. This review aims to synthesize the existing literature on this topic, identifying key trends, challenges, and opportunities to inform policy, program development and research gaps.

METHODS

A narrative review was conducted to explore the state of research on nutrition and FSs policies and action plans in SCs in LMICs. Literature published between 2010 and second quarter of 2024 was purposively searched using databases such as PubMed, Scopus, and Web of Science, alongside gray literature from international organizations, including the FAO, WHO, and UNICEF. Studies were included if they focused on nutrition outcomes, FSs, or policy frameworks and action plans specific to SCs. Key themes and evidence were extracted and synthesized to identify research gaps and emerging practices.

RESULTS

The review identified 54 relevant studies and policy reports, majority published after 2015. The findings highlighted significant themes on nutrition and FSs challenges in SCs, SCs as central to FSs transformation, evidence gaps on policy elaboration on nutrition and FS, and knowledge, interventions and recommendations available on how to shape better nutrition, FSs and environment. Malnutrition both under and over remains a major public health concern specifically in SC in LMICs aggravated by rapid urbanization, climate crisis and FSs disturbances. Policies and plans are pivotal in creating a healthier urban FSs. However, policy research related to this were conducted most in high-income countries of the global north with concentration in capital cities, and very limited for SCs. Nutrition and FSs policies and action plans at the city level might be present however quality of implementation is questionable and research gaps on this were identified in several literature.

CONCLUSIONS

The review underscores the urgent need for more research and tailored policy interventions focused on SCs in LMICs. SCs are pivotal to achieving equitable and sustainable FSs, yet remain underrepresented in current research and policy discussions. Utilizing multisectoral collaboration is a first step toward FSs transformation and tackling malnutrition issues through effective governance of urban FSs.

SOAP36_03

NUTRI-SCORE IN THE NETHERLANDS: HOW TO ALIGN WITH NATIONAL FOOD-BASED DIETARY GUIDELINES AND TARGETS FOR PRODUCT IMPROVEMENT

Sylvie Huybers[1]; Herbert Smorenburg[2]; Annet JC Roodenburg[1]
[1]Nutrition & Health, HAS University of Applied Sciences, 's-Hertogenbosch, Netherlands; [2]Choices International Foundation, Choices International Foundation, Breedenbroek, Netherlands

BACKGROUND AND OBJECTIVES

Since 2024, Nutri-Score is the official front-of-pack nutrition label (FOPNL) in the Netherlands. Despite improvements to its nutrient profiling model (NPM), criticism persists. The Nutri-Score NPM is not fully aligned with Dutch Food-Based Dietary Guidelines (Wheel of Five, WoF) and allows for excessive additions of salt or sugar in processed vegetables and fruits. This study aims to develop an alternative NPM for the Nutri-Score FOPNL that is more consistent with National Dietary Guidelines.

METHODS

A product-category-specific NPM was developed to replace the across-the-board Nutri-Score NPM. Criteria from the WoF and the Dutch Targets for Product Improvement were integrated with the Choices 5-level criteria to create an alternative NPM. To evaluate the alternative and Nutri-Score NPM with Dutch food composition data, the percentage of products labeled A/B (i.e. healthier options) and the percentage of products that align with WoF were calculated.

RESULTS

Compared to Nutri-Score NPM, the alternative NPM assigned fewer products to label A/B (table 1). The alternative NPM showed better alignment with WoF than Nutri-Score NPM for processed vegetables (2-fold improvement) and fruits (1.4-fold improvement). Products labeled A/B under the alternative NPM had 45% lower salt levels in processed vegetables and 33% reduced sugar content in processed fruits compared to Nutri-Score NPM.

Table 1. Percentage of products compliant with WoF, percentage of products with label A/B and percentage alignment with WoF for alternative and Nutri-Score NPM.

Product group	WoF	Alternative NPM		Nutri-Score NPM	
	compliant (%)	label A/B (%)	alignment WoF (%)	label A/B (%)	alignment WoF (%)
Processed vegetables (n=52)	19	42	61	88	31
Processed fruit (n=48)	52	17	60	69	42
Processed beans & legumes (n=25)	92	96	88	100	92

CONCLUSIONS

This preliminary analysis illustrates that it is possible to support the Nutri-Score FOPNL with an alternative product-category-specific NPM that is stricter and better aligned with Dutch Food-Based Dietary guidelines. This analysis will be expanded to other product groups.

SOAP36_08

IMPACT OF A COMPLEMENTARY FEEDING PROGRAM ON THE QUALITY OF LIFE OF OLDER PEOPLE

Carlos Márquez[1]; Ana Valeria Peña-Lozano[2]
[1]Department of Internal Medicine, University of La Frontera, Temuco, Chile; [2]Department of Psychology, University of La Frontera, Temuco, Chile

BACKGROUND AND OBJECTIVES

Background: The world's population is aging rapidly, this is happening due to the combination of different factors: health policies, changes in mortality and birth rates, and migration processes. Aging is a natural process in which a series of changes occur, depending on the speed at which these changes occur, they can even affect people's quality of life (QoL). The WHO defines QoL as the individual sees perception of life, goals, expectations, standards, and concerns. The Complementary Food Program for the Elderly is a set of activities for the distribution of fortified foods to older people in Primary Health Care establishments, this plays an important role in the health of the elderly people. **Objective:** To analyze the impact of a complementary food program on the quality of life of older people.

METHODS

A cross-sectional study was conducted in community dwelling eldery people using non-probabilistic sampling. We evaluated self-perception of QoL and adherence to the complementary feeding program. The RESULTS are presented as n(%) and the Chi-square test was performed to establish the association between the variables. The analyses were performed using STATA 15.1 software.

RESULTS

444 elderly people participated in the study, 73.87% are women with an average age of 77±3 years. 51.35% self-perceive their health as good. 40.54% of the sample withdrew from the program, of them 50% would change something about the products and 100% would recommend the products. The QoL RESULTS are as follows: 77.03% consider their QoL to be good, 20.05% consider it to be average and 2.93% to be poor. When asked if they consider that the complementary feeding program has improved their quality of life, 60.65% of the sample answered yes, with statistical differences between women and men 54.6% vs 79.25% respectively $p<0.001$.

CONCLUSIONS

We can conclude that there is low adherence to the complementary feeding program. However, a greater proportion of men who consume the foods of the program consider that it has a positive impact on their quality of life. It is necessary to explore the reasons for the low adherence to the complementary feeding program.

RESOURCES FOR CARE IN CAREGIVER AND CHILD NUTRITION RESEARCH, PROGRAMS, AND POLICY: ANALYZING AND REFLECTING ON 25 YEARS OF EVIDENCE AND APPLICATION

Paige Harrigan[1]; Doreen Alumaya,[2]; Scott Ickes[3]; Lisa Sherburne,[4]; Amanda Zongrone,[5]; Stephanie Martin[2]
[1]Human Nutrition Foods and Exercise, Virginia Tech, Blacksburg, United States of America; [2]Gillings School of Global Public Health, University of North Carolina at Chapel Hill, Chapel Hill, United States of America; [3]Department of Kinesiology, William & Mary, Williamsburg, United States of America; [4]Social and Behavior Change; Integrated Nutrition Activity, Helen Keller Intl, Kathmandu, Nepal; [5]Global Nutrition, Independent Consultant, Washington, United States of America

BACKGROUND AND OBJECTIVES

Adequate care was first highlighted as an underlying determinant of infant and child growth, development, and survival in the 1990 UNICEF conceptual framework for malnutrition. Care refers to behaviors that affect child nutrition, health, and development.

In 1999, Engle, Menon, and Haddad published the seminal "Care and Nutrition: Concepts and Measurement" (Engle et al.) article, adding Resources for Care as another determinant to the UNICEF framework. Resources for Care are resources that caregivers need to draw upon that are linked to their own physical and psychological well-being and sense of self to practice nurturing care and participate in nutrition activities. Engle et al. identified six categories of Resources for Care: 1) caregiver education, knowledge, and beliefs; 2) physical health and nutritional status; 3) mental health and self-confidence; 4) autonomy and control over resources; 5) reasonable workloads and sufficient time; and 6) social support. In the 25 years since publication, the concept of Resources for Care has been widely recognized and used globally, but a systematic investigation of its application and impact was needed.

METHODS

A citation analysis was conducted to 1) understand how Engle et al. and the concept of Resources for Care have been applied to nutrition and related research and programs, and 2) examine how the article has influenced scholarship across disciplines.

RESULTS

From a total of 696 citations identified, 264 peer-reviewed articles, books, reports, and theses from researchers across multiple geographic regions and disciplines (e.g., agriculture, anthropology, child development, economics, education, gender, nutrition, political science, public health) met inclusion criteria and were analyzed. The most frequent nutrition topics were growth and nutritional status, followed by breastfeeding and complementary feeding. Thirty-three (12.5%) of the publications reported on interventions and 33 (12.5%) included the Engle et al. figure. How the concept of Resources for Care was used to guide the research and/or inform a framework or theory was summarized. For publications conceptually grounded in Resources for Care, adaptations to the original framework, which Resources for Care were included, and related measures and outcomes were documented.

CONCLUSIONS

"Care and Nutrition: Concepts and Measurement" continues to be cited in the global nutrition literature. Use and measurement of Resources for Care advanced in some contexts. Research and program recommendations, including improving standardization and measurement of caregiver resource constructs for comparison across contexts, will be presented.

CONFLICTS OF INTERESTS

SOAP36_10

NUTRITION EDUCATION IMPROVES THE DIET QUALITY OF ADOLESCENTS IN FOOD-INSECURE HOUSEHOLDS (STUDY IN POST-DISASTER AREAS OF INDONESIA)

Nikmah Utami Dewi[1]; Ali Khomsan[2]; Cesilia Meti Dwiriani[2]; Hadi Riyadi[2]; Ikeu Ekayanti[2]; Diah Ayu Hartini[3]
[1]Nutrition Department, Tadulako University, Palu, Indonesia; [2]Community Nutrition, IPB, Bogor, Indonesia; [3]Nutrition, Poltekkes Kemenkes Palu, Palu, Indonesia

BACKGROUND AND OBJECTIVES

Adolescents' diets can be worse in post-disaster areas due to food insecurity. Nutrition education is a method often used to change eating behaviors, but its effectiveness in improving the diet quality of food-insecure adolescents has not been extensively researched. This study aims to analyze the impact of nutrition education on improving eating behaviors and its effects on the diet quality of adolescents in post-disaster areas.

METHODS

The research was conducted in disaster-affected areas in Indonesia from August 2021 to August 2022. The Cluster Randomized Controlled Trial (CRCT) design was used, with random allocation based on schools. There were 52 and 53 adolescents in the intervention and control groups, respectively. The intervention group received a combination of nutrition education at school and home visits for three months. Each group received food coupons that could be exchanged for groceries. Follow-up measurements were conducted three months after the intervention was completed.

RESULTS

The combination of nutrition education in schools and home visits had a significant positive impact on behavioral mediators such as attitudes, behavioral control, intentions, and vegetable eating habits among adolescents ($p<0.05$). Also, it resulted in an improvement in the diet quality ($p<0.05$). This condition persisted three months after the intervention, except for the scores of behavioral control and diet quality, which decreased although their values remained above the pre-intervention scores.

CONCLUSIONS

Nutrition education interventions designed based on behavior change theory, multi-strategy, and multi-component approaches can improve the diet quality of adolescents in vulnerable households in post-disaster areas.

MICRONUTRIENT DEFICIENCIES AND RISK FACTORS AMONG SCHOOL-AGED CHILDREN: A REPRESENTATIVE CROSS-SECTIONAL STUDY

Modibo Drame[1]; Sassi Sonia[1]; Houda Ben Gharbia[1]; Khammassi Marwa[1]; Trabelsi Tarek[1]; Traissac Pierre[2]; Ghattas Hala[3, 4]; Jalila El Ati[1]; Research Group Scale[1, 4]
[1]SURVEN (Nutrition Surveillance and Epidemiology in Tunisia) Research Laboratory, INNTA (National Institute of Nutrition and Food Technology), Tunis, Tunisia; [2]CIRAD, CIHEAM-IAMM, INRAE, Institut Agro, IRD, MoISA – University of Montpellier, Montpellier, France; [3]Arnold School of Public Health, University of South Carolina, Columbia, United States of America; [4]Center for Research on Population and Health, American University of Beirut, Beirut, Lebanon

BACKGROUND AND OBJECTIVES

In the context of nutritional transition and significant shifts in lifestyle and diet, the Middle East and North Africa are experiencing a notable rise in overnutrition, while micronutrient deficiencies persist. These micronutrient deficiencies, particularly vitamin A (VAD) and iron deficiencies (ID), remain significant public health concerns among school-aged children. This study aims to analyze the extent, severity, and socio-demographic factors influencing VAD and ID among school-aged children in Greater Tunis.

METHODS

A stratified random sample of 50 primary schools (public and private) in urban Tunisia was selected, with 50 children randomly chosen from grades 4–6 in each school. Between January 2020 and June 2021, a cross-sectional study was conducted among 2465 children aged 8–11 years (50.3% girls, 49.7% boys) and their parents (n = 2256). Data were collected through surveys, dietary recalls, and measurements of anthropometric and biological parameters, including hemoglobin (Hb), ferritin (FER), retinol-binding protein (RBP), C-reactive protein (CRP), and alpha-1-acid glycoprotein (AGP) using a combined sandwich ELISA method. Adjustments for inflammation using Thurnham's method provided corrected estimates of ferritin and RBP levels. Multivariate logistic regression explored associations between socioeconomic and demographic factors and anemia, ID, and VAD.

RESULTS

The proportions of schoolchildren with anemia (based on WHO criteria), ID (serum ferritin < 15.0 µg/l), and iron-deficiency anemia (concurrent ID and anemia) were 5.9%, 22.4%, and 1.9%, respectively, with ID being more prevalent among girls (25.3%) compared to boys (19.5%). The mean RBP level was 1.02±0.007 µmol/l, and 6.7% of children exhibited levels below 0.70 µmol/l, the threshold for VAD, with a higher prevalence in boys (7.8%) than girls (5.6%). Mother's education level significantly influences micronutrient deficiencies in children, especially girls. Children of mothers with secondary education had a lower risk of iron deficiency (OR = 0.6, 95% CI [0.43-0.91]) but a higher likelihood of vitamin A deficiency (OR = 1.5, 95% CI [0.86-2.53]) compared to those with university-educated mothers. Socioeconomic factors significantly influenced deficiencies, with children from lower wealth tertiles having a higher adjusted prevalence of ID (21.8%) and VAD (7.1%).

CONCLUSIONS

This study reveals that in a context with documented increases in overweight, micronutrient deficiencies still persist among schoolchildren in urban Tunis, with disparities by sex, maternal education, and socioeconomic status.

VILLAGE LEVEL TREATMENT OF ACUTE MALNUTRITION IN SOMALILAND USING ICCM PLUS: THE SETIPLUS TRIAL

Gael Cronin[1]; Mohamed Jelle[1]; Schofield Lilly[2]; S Yuusuf Yuusuf[3, 4]; Shukri Mohamed[4]; Paola Vargas[5]; Adan Mahdi[6]; Meftuh Omer,[6]; Nimo Gulied[4]; Halimo Abdillahi[7]; Said Mohamoud[6]; Andrew Seal[1]

BACKGROUND AND OBJECTIVES

In Somaliland, a 2019 analysis of SAM treatment coverage found that that less than 1 in 5 children with SAM was enrolled in treatment. Physical access to healthcare facilities is one of the biggest issues families face when seeking care. We hypothesised that integrating simplified combined approach for treatment of acute malnutrition into existing community case management platforms (iCCM+) would lead to greater access to effective acute malnutrition treatment compared to facility-based treatment.

METHODS

We conducted a cluster randomised controlled trial in 37 villages. We collected baseline and endline data and followed a cohort of active cases over 12 months (March 2024-February 2025). The trial intervention was the provision of treatment at village-level for uncomplicated acute malnutrition, for children 6-59 months of age, by community health workers, known locally as Family Health Workers (FHW). Treatment followed a simplified treatment package. Data was collected from households using Open Data Kit on Android mobiles, and records from FHW and health facilities were photographed and data manually entered into Excel. We used STATA to perform data analysis and hypotheses were tested using multi-level linear and logistic regression models.

RESULTS

We conducted a cluster randomised controlled trial in 37 villages. We collected baseline and endline data and followed a cohort of active cases over 12 months (March 2024-February 2025). The trial intervention was the provision of treatment at village-level for uncomplicated acute malnutrition, for children 6-59 months of age, by community health workers, known locally as Family Health Workers (FHW). Treatment followed a simplified treatment package. Data was collected from households using Open Data Kit on Android mobiles, and records from FHW and health facilities were photographed and data manually entered into Excel. We used STATA to perform data analysis and hypotheses were tested using multi-level linear and logistic regression models.

CONCLUSIONS

RESULTS from the SETiPlus trial will provide important insights into the challenges facing the scale up child malnutrition treatment using the iCCM platform in this setting. The findings will provide evidence to help inform the ongoing development of WHO operational guidelines.

INFLUENCE OF SOCIO-ECONOMIC DETERMINANTS AND FOOD INSECURITY ON FREQUENCY OF AWAY FROM HOME CONSUMPTION AMONG STUDENTS FROM FRENCH OVERSEAS REGIONS AFTER RELOCATION TO MAINLAND FRANCE

Mélanie Antoine[1]; Caroline Méjean[2]; Sabrina Eymard-Duvernay[3]; Célia Basurko[4]; Pascaline Rollet[1]; Laurence Tibère[3]; Génica Lawrence[5]; Hélène Charreire[1]
[1]UMR MoISA, Inrae Centre Occitanie-Montpellier, Montpellier, France; [2]MoISA, Univ Montpellier, CIHEAM-IAMM, CIRAD, INRAE, Institut Agro, IRD, Montpellier, France; [3]UMR MoISA, Research and Development Institute IRD Montpellier, Montpellier, France; [4]Pôle Guyane, Centre d'Investigation Clinique Antilles-Guyane, Cayenne, French Guiana; [5]COVACHIM-M2E, Université des Antilles, Guadeloupe, Saint-Claude, France

BACKGROUND AND OBJECTIVES

Given their vulnerability, understanding students' eating habits is essential. Students from the French overseas regions (FOR) who have relocated to mainland France (MF) for their studies experience a sudden change in their food environment that may lead to unhealthy food behaviors. The aim of this work is to evaluate the associations between the frequency of food away from home consumption (FAHC) including on-campus university cafeteria, and the socio-economic determinants and food insecurity (FI).

METHODS

In 2024, a cross-sectional survey (n=306) was conducted among students born in one of the five FOR and were studying in the MF, using a quota sampling method. Participants were asked to complete an online questionnaire about their food consumption and food purchasing practices. FCAH was assessed with the frequency of use of university cafeteria (UC) that provide more affordable food services, and fast-food (FF) or traditional (TR) restaurants. FI was measured using the 6-items US. Household Food Security Survey Module. Multinomial logistic regression models adjusted on individual-level covariates were used to evaluate associations between FAHC and socio-economic determinants and FI.

RESULTS

More than half of students never eating at UC. Students who reported visiting the UC several times a week were more likely to be men (OR=2.3, 95% IC: 1.1-4.9), to have a scholarship (OR=3.7, 95% IC: 1.9-7.5) and to live in university accommodation (OR=3.0, 95% IC: 1.5-5.9). 55% of students reported going to FF at least once a week. Those who visited FF at least one a week were less likely to live in university accommodation (OR=0.4, 95% IC: 0.2-0.9) and to be food insecure (OR=0.4, 95% IC: 0.2-0.9). More than half of students reported eating in a TR at least once a week. Those who declared going several times a week were more likely to be men (OR=2.8, 95% IC: 1.1-7.5). Age, level of education and income did not seem to be associated with the use of UC, FF and TR.

CONCLUSIONS

Sex and housing and study conditions appear to significantly influence away from home consumption, suggesting the role of food preparation practices, equipment and food environment as mediating factors in these relationships. Further research is needed to better understand the role of food environment and the affordability on the frequency of food consumed away from home, especially regarding UC an FF.

DIETARY DIVERSITY, HOUSEHOLD FOOD INSECURITY AND CHILD- AND CAREGIVER ALCOHOL CONSUMPTION ON SCHOOL-AGED CHILDREN'S NUTRITIONAL STATUS IN UGANDA: A CROSS-SECTIONAL STUDY

Ingunn M S Engebretsen[1]; Theogene Habumugisha[1]; Majorie Mukisa,[2]; Harriet Aber-Odonga[2]; Jutta Dierkes[3]; Joyce Nalugya[4]; Vilde Skylstad[1]; Melf-J. Kuhl[1]; Ane-Marthe Solheim Skar[5]; Norbert Skokauskas[6]; Juliet Babirye[2]

[1]Centre for International Health, Department of Global Public Health and Primary Care, University of Bergen, Bergen, Norway; [2]School of Public Health, College of Health Sciences, Makerere University, Kampala, Uganda; [3]Department of Clinical Medicine, Centre for Nutrition, University of Bergen, Bergen, Norway; [4]Department of Psychiatry, School of Medicine, Makerere University, Kampala, Uganda; [5]Global Health Cluster, Norwegian Institute of Public Health, Oslo, Norway; [6]Faculty of Medicine and Health Sciences, Norwegian University of Science and Technology, Trondheim, Norway

BACKGROUND AND OBJECTIVES

The nutritional status of children in the primary school age period has received limited attention. This study, embedded in the "TREAT C-AUD - Child Alcohol Use Disorder in Eastern Uganda: screening, diagnostics, risk factors and handling of children drinking alcohol", investigated the relationship of child dietary diversity, household food insecurity and child- and caregiver alcohol consumption on the nutritional status of children aged 6 to 13 years in Mbale District, Uganda.

METHODS

A two-stage proportionate-to-size sampling procedure was carried out in Mbale District, including 20 sub-counties and 114 selected clusters (villages) where 1857 households were systematically sampled for caregiver-child interviews including all children 6-13 years. This study included a sub-set of children with anthropometric measurements. Dietary diversity scores (DDS) were computed based on self-reported consumption of nine food groups as defined by the Food- and Agriculture Organisation. A household food insecurity (HFI) scale was created based on a modified version of the Household Food Insecurity Access Scale including 6 items. Child and caregiver alcohol consumption included self-reported drinking during the past 30 days. The z-scores for BMI-for-age (BAZ) and height-for-age (HAZ) were employed to assess nutritional status according to WHO reference values. Linear regression adjusting for household clustering was done and the final model also adjusted for child age and sex.

RESULTS

A total of 1,566 children, 51.3% boys, were included in the analysis. The mean age was 9.5 years (95% CI 9.4-9.6). The prevalence of underweight (BAZ < -2) and stunting (HAZ < -2) were 8.3% (95% CI 7.0% to 9.8%) and 49% (95% CI 46% to 51%), respectively. The mean DDS was 4.2 (standard deviation 2.0). Alcohol consumption was reported by 21.1% (95% CI 19.2% to 23.2%) of children and 27.5% (95% CI 25.4% to 29.8%) of caregivers, both groups usually drinking 1 and 2 units each time. There was no association between DDS, HFI, and child- and caregiver alcohol consumption on HAZ, but a positive association was found between DDS and BAZ (Adj ß: 0.04; 95% CI 0.02 to 0.08). A negative association between child alcohol consumption and BAZ was only seen in the bivariable model (ß: -0.19, 95% CI -0.38 to -0.01). HFI and caregiver alcohol consumption were not found related to BAZ.

CONCLUSIONS

There were low dietary diversity and high alcohol consumption among 6-13 year old children in Mbale, Uganda, that affected children's nutrition status. Further research to explore the complex interplay of dietary patterns, substance use, and health determinants is needed in this age group.

WHEY PROTEIN SUPPLEMENTATION USE AMONG UK RECREATIONAL EXERCISERS: INSIGHTS INTO SUPPLEMENT TYPES, DOSE, EXERCISE HABITS AND DIETARY GOALS

Hannah Bell[1]; Kim Jackson[1, 2]; Les Crompton[3]; David Ian Givens[2, 3]; Julie Lovegrove[1, 2]
[1]Hugh Sinclair Unit of Human Nutrition, Department of Food and Nutritional Sciences, University of Reading, Reading, United Kingdom; [2]Institute for Food, Nutrition and Health, University of Reading, Reading, United Kingdom; [3]School of Agriculture, Policy and Development, University of Reading, Reading, United Kingdom

BACKGROUND AND OBJECTIVES

Whey protein (WP) supplements derived from cow's milk are rich in branched-chain amino acids (BCAA). Although a large body of evidence supports the positive health benefits of WP, some studies have reported diets high in BCAA are associated with type 2 diabetes risk. WP is marketed to people who exercise for muscle building, to improve recovery from exercise and aid with weight management. Despite increasing annual sales of WP, there is little evidence on how and why they are used by UK recreational exercisers. The objective of this research was to address this knowledge gap.

METHODS

An online survey, aimed at UK adults who exercise was developed. Participants who used WP were asked questions about the amount, frequency, timing, goals and perceived effects of WP use. The survey also collected demographic data including sex, age, occupation and income, as well dietary and exercise habits. The survey was open for 11 weeks and was shared primarily via online fitness groups and through gym networks. Data were analysed using regression (binary/multinomial logistic or linear as appropriate).

RESULTS

Of the 688 survey responses, 46% used WP. Sex (OR 0.551, 95% CI 0.389 - 0.781, $p<0.001$), age (OR 0.974, 95% CI 0.961-0.967, $p<0.001$), body mass index (OR 1.045, 95% CI 1.005-1.087, $p=0.026$), exercise type and duration (OR 1.002, 95% CI 1.001- 1.002, $p<0.001$) were significantly associated with higher odds of using WP. The most common supplement type was WP powder (57%), followed by WP bars (26%) and ready-to-drink shakes (13%). The primary goal for WP use was muscle building (52%) and weight management (17%). Relative to females, a greater proportion of males used WP for muscle building, whereas use for weight management was lower. Most participants had used WP for more than 2 years (57%) and took WP after exercise (61%). Males consumed larger servings with more frequency (25-50 g, 4.5-10 times per week) than females (25-30 g, 3-7 times per week). Reported daily protein intake goals in both sexes far exceed current UK protein intake recommendations. Most WP users indicated they did not follow any specific diet (48%) with high-protein diet being the next most common response (12%).

CONCLUSIONS

These findings offer valuable insights into the demographics and behaviours of WP users in the UK, which will help inform future research into the impact of high dietary BCAA intake from WP on metabolic health.

SOAP39_02

EFFECTIVENESS OF MULTI-MICRONUTRIENT POWDERS AND HEALTH EDUCATION COMMUNICATION ON BODY COMPOSITION IN VIETNAMESE INFANTS AGED 6 - 11 MONTHS

Nga Thuy Tran[1]; Thi Minh Nguyet Tran[2]; Anh Hoa Le[3]; Thi Lan Phuong Nguyen[1]; Tran Khanh Van[1]; Tran Thanh Duong[4]
[1]Department of Micronutrients, National Institute of Nutrition, Hanoi, Vietnam; [2]Center of Nutrition Counseling, Rehabilitation and Obesity Control, National Nutrition of Nutrition, Hanoi, Vietnam; [3]Department of Nutrition Surveillance and Policy, National Institute of Nutrition, Hanoi, Vietnam; [4]Director, National Institute of Nutrition, Hanoi, Vietnam

BACKGROUND AND OBJECTIVES

Changes in the body composition of children help open up knowledge about nutritional needs as well as functional changes after nutritional intervention in children. This study was conducted to evaluate the effect of multiple micronutrient powders and health education communication on body composition in Vietnamese infants 6-11 months old.

METHODS

360 infants 6-11 months old participated in the intervention, divided into 2 groups according to anthropometric indicators, age in months and gender. The intervention group supplemented the multi-micronutrient package MNPs Bibomix, 1 package/1 day; 5 packages/1 week, consisting of 15 vitamins and minerals, combined with nutrition communication, the control group used a placebo package and nutrition communication, for 12 months. Assessment of body composition (n=138) using deuterium and analysed by Fourier transform infrared spectroscopy (FTIR). Comparison of the difference between the two study groups used generalized multiple regression analysis.

RESULTS

After controlling for pre-intervention confounding factors, the RESULTS show that the increase of average fat free mass (FFM) in the intervention group was 1.25 ± 0.10 kg (SE), the control group was 1.12 ± 0.09 kg, the difference between the two groups was 0.13 kg ($p > 0.05$). After 12 months, the intervention group gained 3.18 ± 0.18 kg (SE), the control group gained 2.86 ± 0.18 kg, the difference between the two groups was 0.32 kg ($p < 0.05$). There is no difference between the intervention and the control group on the average FM after 6 months of intervention. After 12 months, the intervention group increased by 0.72 ± 0.13 kg (SE), the control group increased by 0.79 ± 0.13 kg, the difference between the two groups was -0.07 kg ($p > 0.05$). After 12 months, the intervention group decreased by -0.02 ± 1.42 (%) (SE), the control group increased by 0.63 ± 1.29 (%) (SE), the difference between the 2 groups was -0.65% ($p < 0.05$).

CONCLUSIONS

Fortification of multi-micronutrient powders into complementary foods at households combined with counseling on child feeding and care have improved the body composition of children measured by the stable isotope method significant increase in the average FFM of children after 6 months and 12 months in the intervention group compared to the control group. These findings highlight the need for using stable isotope techniques to monitor situations and interventions for promoting infant and young child nutrition.

SOAP39_03

ADHERENCE TO PLANT-BASED DIETARY PATTERNS TOWARDS IMPROVEMENTS IN GLYCAEMIC CONTROL IN A UK PREDIABETIC COHORT ON THE NATIONAL DIABETES PREVENTION PROGRAMME

Peter Jeff[1]; Sumanto Haldar[1]
[1]Faculty of Health and Social Sciences, Bournemouth university, Bournemouth, United Kingdom

BACKGROUND AND OBJECTIVES

This study aimed to assess the impact of adherence to plant-based dietary patterns on glycaemic control among participants that completed the National Diabetes Prevention Programme (NDPP), a targeted behaviour change intervention in the UK. This study also evaluated the programme's effectiveness in altering body composition and its effects on glycaemic control as measured by HbA1c levels.

METHODS

A survey method was employed to collect data from individuals who completed the NDPP. Adherence to an overall plant-based diet index (PDI), healthy plant-based dietary index (hPDI), and unhealthy plant-based diet index (uPDI) were assessed. Correlation and regression models between these dietary index scores and glycaemic control (HbA1c), weight loss, and other body composition measures were analysed. The timeline for these measurements was from baseline (on referral to the NDPP), to at least 9 months (from completion of the NDPP), to 6 months after completion.

RESULTS

Adherence to the hPDI showed significant improvements in glycaemic control ($r=-0.237$, $p=0.042$), whereas the PDI and uPDI were not significant or predicted remission. Weight loss and baseline glucose control were significant predictors of changes in HbA1c ($B=0.206$, $p<0.001$, and $B=0.353$, $p=0.021$, respectively) and post-intervention HbA1c levels ($B=-0.206$, $p<0.001$, and $B = 0.647$, $p<0.001$, respectively). Significant reductions in body weight, waist circumference, and BMI were observed over the 9-month programme (-5.02kg, -5.85cm, and -1.74kg/m2, respectively). Post-intervention, 56.8% of 74 participants achieved remission from prediabetes, with a mean change in HbA1c levels of -2.4mmol/mol.

CONCLUSIONS

Preliminary findings suggest that adherence to a healthy plant-based diet is associated with improved glycaemic control, to a greater extent than adherence to PDI or uPDI indices. Weight loss remains a primary target for diabetes prevention, with an increased focus on consuming healthy plant foods as recommended for optimal prevention of type 2 diabetes. A follow-up survey will be conducted to further investigate and validate these preliminary findings.

SOAP39_06

ASSOCIATIONS BETWEEN NIGHT EATING SYNDROME, FOOD ADDICTION AND SLEEP QUALITY: A CROSS-SECTIONAL ANALYSIS

Mahmut Bodur[1]; Ecem Nur Sakar,[1]; Meral Cittir,[1]; Egera Kundakçı,[1]; Gül Duru Aydın,[1]
[1]Faculty of Health Science, Department of Nutrition and Dietetics, Ankara University, Ankara, Türkiye

BACKGROUND AND OBJECTIVES

Night Eating Syndrome (NES) and Food Addiction (FA) are emerging conditions with significant implications for metabolic, psychological and behavioural health. NES is characterized by compulsive nocturnal eating patterns and disrupted sleep cycles, while FA involves a critical inability to regulate food intake, similar to substance addiction. Sleep quality, a nocturnal but essential factor in overall well-being, may serve as a common pathway linking NES and FA and exacerbating their impact on health. Therefore, the aim of this study is to investigate the relationships between NES, FA and sleep quality in a cross-sectional population.

METHODS

This cross-sectional study was conducted with adults aged 18–65 years, recruited through face-to-face interviews. Participants with chronic diseases, pregnancy, or lactation were excluded. Data were collected using the Night Eating Questionnaire (NEQ) to assess NES, the Yale Food Addiction Scale (YFAS) for food addiction, and the Pittsburgh Sleep Quality Index (PSQI) for sleep quality. Demographic and lifestyle information were recorded. Analyses were performed using SPSS, with statistical significance set at $p < 0.05$.

RESULTS

The study was conducted with 600 participants aged 18–65 years, with a mean age of 31.7 ± 13.7 years. The study included 264 males (44.0%) and 336 females (56.0%), with 71.5% of participants never smoking, and 28.5% being current smokers. A multiple linear regression model was used to assess the effects of age, gender, BMI, smoking status, night eating syndrome, and sleep quality on food addiction. The RESULTS revealed that higher NES scores ($\beta = 0.027$, $p < 0.001$) and poorer sleep quality ($\beta = 0.046$, $p=0.010$) were significant predictors of increased food addiction scores. Specifically, a one-unit increase in NES scores and sleep quality scores increased food addiction scores by 0.046 and 0.027 points, respectively. Age ($p=0.460$), smoking status ($p = 0.491$), gender ($p = 0.665$), and BMI ($p = 0.667$) were not statistically significant predictors.

CONCLUSIONS

This study shows that NES, food addiction, and sleep quality are closely linked and may affect overall health. Addressing these issues together could help improve sleep and eating habits while reducing the risk of food addiction. Future research should explore these connections over time and in different groups to gain a deeper understanding of their impact and improve treatment strategies.

SOAP39_08

THE EFFECTS OF A WHOLE-DIET SWEET TASTE INTERVENTION FOR SIX DAYS ON SUBSEQUENT SWEET TASTE PERCEPTIONS AND SWEET FOOD INTAKE

Aleksandra Bielat[1]; Peter Rogers[2]; Katherine Appleton[1]
[1]Psychology, Bournemouth University, Bournemouth, United Kingdom; [2]School of Psychological Science, University of Bristol, Bristol, United Kingdom

BACKGROUND AND OBJECTIVES

Considering associations with the development and maintenance of poor health, the World Health Organisation currently recommends reducing free sugar intakes [1]. To aid with this reduction, one strategy that has been proposed is to reduce consumption of all sweet-tasting foods and beverages, based on a rationale that regular exposure to dietary sweet taste increases preferences for sweet-tasting foods and beverages, including those which contain free sugars [2]. This randomized controlled trial investigated the effects of a whole-diet, sweet taste intervention on subsequent sweet taste perceptions and intakes of other sweet-tasting foods and beverages.

METHODS

A total of 104 adults were randomized to: a) increase their sweet food intake (n = 40), b) decrease their sweet food intake (n = 43), or c) make no dietary change (n = 21), for six consecutive days. Sweet taste perceptions (pleasantness, desire to eat and taste intensity) and sweet food intake as a proportion of total food intake, were measured on day 0 and day 7.

RESULTS

In intention-to-treat analyses, no dietary exposure x time interactions were found for perceived pleasantness (F(2, 101) = 1.32, p = .27, $np2$ = .03), desire to eat (largest F(2, 101) = 2.22, p = .11, $np2$ = .04) or sweet food intakes (largest F = 2.53, p = .09, $np2$ = .05). A significant dietary exposure x time interaction was found for sweet taste intensity (F(2, 101) = 4.13, p = .02, np2 = .08), where participants in the decrease sweet food consumption group reported all foods to taste more sweet after the intervention compared to before ($Mdiff$ = 6mm / 100mm, SE = 2mm). Participants in this group also reported their intervention to be significantly more difficult to adhere to than participants in the other two groups (t(81) = 2.45, p = .02, $Mdiff$ = 14mm / 100mm, SE = 6mm).

CONCLUSIONS

Our findings suggest that dietary exposure to sweet-tasting foods and beverages does not affect the perceived pleasantness, desire to eat or intake of subsequent sweet-tasting foods. These findings contradict the predictions that reducing dietary sweet taste exposure will aid with reducing free sugar intakes.

SOAP39_09

A CROSS-SECTIONAL ANALYSIS OF THE NUTRITIONAL QUALITY AND PRICES OF INFANT AND TODDLER FOOD AND BEVERAGE PRODUCTS IN THE CANADIAN FOOD SUPPLY

Jennifer Lee[1, 2]; Caroline Middleton[2]; Christine Mulligan[2]; Laura Vergeer[2]; Leila Hammond[2]; Mary L'abbe[2]
[1]School of Nutrition, Toronto Metropolitan University, Toronto Canada; [2]Nutritional Sciences, University of Toronto, Toronto, Canada

BACKGROUND AND OBJECTIVES

Proper nutrition is essential for growth and development during infancy and early childhood; however, the healthfulness and cost of commercial infant and toddler food and beverage products (ITPs) have not been documented in Canada. The objective of the study assessed the nutritional quality and prices of ITPs in the Canadian food supply.

METHODS

Using the Food Label Information and Price 2020 database, ITPs intended for children <4-year-olds (n=423) were examined for their energy and nutrient content (per 100 g or mL), the prevalence of products exceeding 'High in' thresholds for nutrient(s)-of-concern (according to Canadian front-of-pack labelling thresholds), and their price (per 100 g or mL).

RESULTS

Median energy level of ITPs was 101 kcal/100 g or mL [IQR: 67, 400], derived primarily from carbohydrates (21.7 g [14.1, 71.4]). Although total and saturated fat (1.2 g [0, 7.1] and 0 g [0, 0], respectively) and sodium (16 mg [4, 100]) levels were low, ITPs were also low in protein (3.6 g [0.8, 10.0]) and iron (0.9 mg [0.4, 6.0]), and high in sugars (10.9 g [5.5, 17.6]). Based on Canadian front-of-pack labelling thresholds, 59% (n=248) of products were 'High in' one or more nutrients-of-concern, particularly sugars (55%, n=234). Prices varied significantly, ranging from $1.32 to $6.95/100 g or mL, with toddler products costing more than those for infants ($3.14 vs. $1.55).

CONCLUSIONS

Overall, the nutritional quality of commercial ITPs in Canada is poor, with many products 'High in' sugars, highlighting the need for healthier, affordable options and public health policies that can support healthier food environments for infants and toddlers.

BACKGROUND AND OBJECTIVES

Vitamin A is crucial for vision, growth, immunity, and reducing mortality from diarrhea and other causes. Despite its importance, vitamin A supplementation (VAS) uptake among children under five in Tanzania remains low, with limited understanding of determinants. This study analyzed Tanzania Demographic and Health Survey (TDHS) data from 2010 to 2022 to assess trends and factors influencing VAS uptake

METHODS

A secondary analysis of TDHS data was conducted on children aged 6–59 months with available VAS data and caregiver information. Logistic regression assessed associations between VAS uptake and sociodemographic factors using STATA 17 software

RESULTS

Data from 5,863 child-caregiver pairs showed that VAS coverage was 61.1% in 2010, declined to 41.3% in 2015/16, and increased to 53.2% in 2022. Factors significantly associated with higher VAS uptake included maternal primary education or higher, high wealth index, urban residence, first birth after 18 years of age, and marital union. Conversely, younger child age (<12 months), more than four under-fives in the household, lack of vitamin A-rich fruit consumption, and missing postnatal visits within the first two months were linked to lower uptake.

CONCLUSIONS

VAS coverage in Tanzania remains suboptimal and is influenced by child and caregiver characteristics. Targeted health education campaigns emphasizing the importance of VAS uptake and addressing barriers such as education, access, and postnatal care are recommended to improve coverage and reduce vitamin A deficiency-related complications

EFFECT OF BUFFALO MILK CONSUMPTION ON THE BIOCHEMICAL INDICES RELATED TO LINEAR GROWTH OF ADOLESCENT FILIPINO SCHOOLGIRLS

Marivic Samson[1]; LEILA SACDALAN AFRICA[2]; Corazon Barba,[3]; Juliet Sio-Aguilar,[4]; Thelma Saludes,[5]; Arnel Del Barrio[6]

[1]Department of Health, National Nutrition Council Central Office, Taguig, Philippines; [2]Institute of Human Nutrition and Food, University of the Philippines Los Baños (UPLB), Los Baños, Philippines; [3]Institute of Human Nutrition and Food, College of Human Ecology, University of the Philippines Los Baños (UPLB), Los Banos, Philippines; [4]College of Medicine, University of the Philippines, Manila, Philippines; [5]PCC, Philippine Carabao Center, University of the Philippines, Los Baños, Philippines; [6]Dairy Training and Research Institute, University of the Philippines Los Baños (UPLB), Los Banos, Philippines

BACKGROUND AND OBJECTIVES

Energy and nutrients in milk such as calcium, phosphorus, and high-quality protein are needed for biological processes including bone development, and for optimal nutrition to support rapid growth during adolescence. Deficiencies in these nutrients can disrupt the synthesis and secretion of insulin-like growth factor 1 (IGF-1), a hormone that promotes bone formation.The study investigated the effect of buffalo milk consumption on the total serum protein, inorganic phosphorus, total serum calcium, and IGF-1 concentrations among schoolgirls.

METHODS

A quasi-experimental study design was employed to evaluate the impact of buffalo milk consumption for 160 days on the biochemical indices of 57 schoolgirls ages 10-12 years old in selected public schools. The buffalo milk used in the study was analyzed in terms of its energy and nutrient content.

RESULTS

The overall mean total serum protein of the participants decreased after the feeding period while the overall mean inorganic phosphorus, total serum calcium, and IGF-1 concentrations increased. This is also true regardless of the linear growth status, except for phosphorus. Moreover, dairy consumption has been associated with increased serum IGF-1, which is a hormone that is important in skeletal growth. Milk-induced changes in IGF-1 contribute to accelerated linear growth. Therefore, the change in calcium and IGF-1 levels in the blood of the subjects in this study implies that milk consumption can improve their bone mass development and the rate of linear growth regardless of their nutritional status.

CONCLUSIONS

The study findings imply that milk consumption can improve the nutrition profile of adolescent schoolgirls, particularly on nutrients that can assist in improving bone mass development and consequently the rate of linear growth.

FOOD LITERACY CURRICULUM, STUDENT COMPETENCY, AND TEACHERS' CONFIDENCE IN SRI LANKAN SECONDARY SCHOOLS: GAPS AND RECOMMENDATIONS

Poornima Rathnayake[1]; Janandani Nanayakkara,[2]; Thushanthi Perera[1]; Anthony Worsley,[3]; Alison Booth,[2]; Renuka Silva[1]
[1]Department of Applied Nutrition, Faculty of Livestock, Fisheries & Nutrition, Wayamba University of Sri Lanka, Makandura, Gonawila, 60170, Sri Lanka; [2]Institute for Physical Activity and Nutrition, Deakin University, Geelong, Australia; [3]School of Exercise and Nutrition Sciences, Deakin University, Geelong, Australia

BACKGROUND AND OBJECTIVES

Food literacy is a critical skill that enables individuals to make informed food choices, promoting health and sustainability. This study examined the food literacy curriculum, stakeholder opinions, student competency, and teacher confidence in Sri Lankan secondary schools to identify gaps and recommend improvements.

METHODS
A mixed-METHODSapproach was used combining curriculum analysis, stakeholder interviews, and quantitative surveys. Curriculum analysis involved identifying essential components and conducting curriculum mapping. Stakeholders, including educators, policymakers, and parents, provided qualitative insights. A validated 25-item tool ($\alpha = 0.937$) was used to measure grade 9 and 10 students' food literacy level across knowledge, attitudes, and practices. Teachers' confidence in teaching food literacy was also assessed.
RESULTS
In curriculum analysis, 34 food literacy components identified as essential for school food literacy education. Of these, 31 components were included in the curricula, with an emphasis on knowledge over practical skill building. Stakeholders emphasized integrating practical skills and fostering collaboration among schools, families, and policymakers to drive behavioral changes through food literacy education. Survey RESULTS indicated that 56% of students demonstrated moderate level of food literacy, 26% low levels, and only 18% high levels. The truncated scores (out of 100) were highest in knowledge (78.9), followed by attitudes (75.7), and lowest in practices (57.1), highlighting a significant gap in applying knowledge. Teachers, particularly females, demonstrated high confidence in delivering food literacy, which is influenced by their educational level.
CONCLUSIONS

The current food literacy curriculum offers substantial knowledge but lacks emphasis on practical skills and sustainable behaviors. Students struggle to apply knowledge in practice, while teachers' confidence varies, highlighting the need for targeted interventions. Revising the curriculum to integrate food literacy into core subjects, prioritizing skill-based learning, and improving teacher training are recommended to enhance confidence and effectiveness, ensuring a balanced approach to knowledge, skills, and behavioral change in food literacy education.

PREVALENCE OF CHILD UNDER-NUTRITION IN RURAL COASTAL COMMUNITIES

Yasmin Ooi[1]; Hazriani Harris,[1]; Seih Teck Kew,[2]; Jau Shya Lee,[1]; Patricia Matanjun,[1]; Ramlah George,[1]; Constance Sat Lin Liew,[2]; Norliyana Aris,[1]
[1]Faculty of Food Science and Nutrition, University Malaysia Sabah, Kota Kinabalu, Malaysia; [2]Faculty of Medicine and Health Sciences, Universiti Malaysia Sabah, Kota Kinabalu, Malaysia

BACKGROUND AND OBJECTIVES

We report childhood stunting in communities which are surrounded by relatively cheap to almost free marine proteins. Two serial cross-sectional studies were conducted in 2015 in the east coast (n=244) and 2019 on an island off the west coast (n=106) of (location redacted for review). The objective was to determine the prevalence of undernutrition among children and determine adequacy of food intake.

METHODS

Anthropometric assessments were done using standard procedures. Weight-for-age and height-for-age were compared against WHO 2007 growth charts. WHO AnthroPlus was used to determine anthropometric nutritional status. Socio-economic information were gathered using interviewer administered questionnaires. In 2015, dietary intake was measured using 3-day 24-hour recall. In 2019, due to logistical constraints, food intake was measured as diet diversity score (DDS). Consent to participate were obtained from parent of children and children agreed to participate.

RESULTS

The children in both locations were of the same ethnic group and had almost similar food culture. In 2015, prevalence of underweight, i.e., weight-for-age (WFA) <-2SD was 51.0%. Mean WFA was -1.94 ± 0.97 (95%CI: -2.14 to -1.74). Stunting, i.e., height-for-age (HFA) <-2SD was 42.6%. Mean HFA was -1.91 ± 1.01 (95%CI: -2.11 to -1.70). In 2019, underweight was 51.7%. Mean WFA was -2.12 ± 1.13 (95%CI: -2.31 to -1.73). Stunting was 59.4%. Mean HFA was -2.35 ±1.34 (95%CI: -2.69 to -2.00). In comparison, the national survey (redacted for review) of 2019 reported that the national prevalence of underweight was 15.4% and stunting was 12.7%. In 2015, 99.7% of children met or exceeded the recommended protein intake levels. In 2019, 96.2% of children ate fish every day.

CONCLUSIONS

Such differences between national and local prevalence of under-nutrition formed the basis for an on-going qualitative study to elucidate the causes of severe under-nutrition in various rural coastal communities within (location redacted for review). Food intake data suggested dietary intakes were adequate albeit over-reporting is possible. These findings are of public health importance as stunting is irreversible.

EFFECTS OF A CLUSTER-RANDOMIZED, MULTI-SETTING INTERVENTION TO IMPROVE CHILDREN'S DIET, PHYSICAL ACTIVITY, SLEEP AND SCREEN TIME ON CARDIOMETABOLIC RISK MARKERS IN 6-11-YEAR-OLD CHILDREN: THE GENERATION HEALTHY KIDS STUDY

Frederik Holmegaard[1]; Anna G. Eilersen[1]; Lotte Lauritzen[1]; Malte N. Larsen[2]; Louise T. Thomsen[3]; Natascha H. Pedersen[2]; Peter Krustrup[2]; Nikolai Nordsborg[1]; Rikke Krølner[4]; Ulla Toft[3]; Christian Mølgaard[1]; Camilla T. Damsgaard[1]

[1]Department of Nutrition, Exercise and Sports, University of Copenhagen, Copenhagen, Denmark; [2]The Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark; [3]Department of Prevention, Health Promotion and Community Care, Steno Diabetes Center Copenhagen, Copenhagen, Denmark; [4]National Institute of Public Health, University of Southern Denmark, Copenhagen, Denmark

BACKGROUND AND OBJECTIVES

The prevalence of cardiometabolic risk markers such as elevated blood pressure, an adverse plasma lipid profile, and elevated insulin is increasing along with the increasing prevalence of overweight and obesity among children. Randomized trials have shown that the New Nordic Diet, intake of fish and wholegrains as well as physical activity can have beneficial effects on children's blood pressure, triacylglycerol, cholesterols, and insulin sensitivity. However, the effect of multicomponent interventions has only been investigated in a few studies with inconsistent RESULTS. The present study was a sub-study of the Generation Healthy Kids project; a 2-school-year multi-setting, multi-component intervention focusing on healthy diets, physical activity, sleep, and screen media habits with the aim of promoting healthy weight development among Danish children aged 6-11 years. The aim of the present study was to investigate the effects of the intervention on children's blood pressure and fasting cardiometabolic blood markers at midpoint by the end of the first school year of the intervention.

METHODS

23 schools were cluster-randomized to either the intervention or the control group and a total of 1351 children aged 6-9 years were included in the sample. The main intervention components were 1) a free-of-charge school lunch four days a week focusing on fruits and vegetables, wholegrains, and fish, 2) three weekly 40-minute sessions of organized vigorous physical activity, and 3) three 45-minute teaching sessions for children and a workshop for parents on sleep practices and screen media use. The control schools continued their usual practice. Children's height, weight, waist circumference, resting blood pressure, and resting heart rate were measured at baseline and after 7-8 months. A subset of children (n=399) also had a venous blood sample drawn which was analyzed for fasting triacylglycerol, cholesterols, insulin, and glucose.

RESULTS

Data analysis is ongoing, and the RESULTS will be presented at the IUNS-ICN 2025. We will use linear mixed effects models to test for differences between intervention and control in changes in blood pressure and cardiometabolic blood markers.

CONCLUSIONS

Our hypothesis is that the intervention will have beneficial effects on children's blood pressure (in particular systolic blood pressure), plasma lipid profile and potentially insulin sensitivity and glucose homeostasis.

SOAP42_03

IMPACT OF FOOD INSECURITY ON DIET QUALITY AND NUTRITION STATUS: A CROSS-SECTIONAL STUDY

Esma Asil[1]; Hatice Adam[2]; Mustafa Volkan Yılmaz[1]
[1]Nutrition and Dietetics, Ankara University, Faculty of Health Sciences, Ankara, Türkiye; [2]Nutrition and Dietetics, Ankara University, Graduate School of Health Sciences, Ankara, Türkiye

BACKGROUND AND OBJECTIVES

Food insecurity is a growing global issue that significantly affects individuals' access to nutritious food, leading to poor dietary habits and negative health outcomes. This study aimed to evaluate the impact of food insecurity on diet quality and nutrition status.

METHODS

The study was conducted with 385 adult individuals aged 18-65 years (mean age: 32.4±13.6 years; M: 31.9%, F: 68.1%) through face-to-face surveys. Food insecurity was assessed using the Household Food Insecurity Access Scale, and diet quality was calculated using the Healthy Eating Index-2020 (HEI-2020) from 24-hour dietary recall. The researcher measured participants' body weight, height, waist circumference, and neck circumference.

RESULTS

It was determined that 46.0% of the participants were married, 38.2% were employed, 52.2% had a university education or higher, and the mean body mass index (BMI) was 25.9±5.1 kg/m². The food insecurity rate among participants was 41.8%, with the majority experiencing mild food insecurity (88.8%). Food insecure individuals had significantly higher BMI, waist circumference, neck circumference, and waist-to-height ratio ($p<0.05$). Diet quality scores were calculated for participants based on their food consumption records, and it was found that only 10.6% had a good diet quality. Individuals with food insecurity had significantly higher dietary energy, carbohydrate (g), fat (g), and polyunsaturated fatty acid intake, but lower intake of animal protein, total protein, and fiber ($p<0.05$). Those with food security consumed significantly higher amounts of vitamin B1, vitamin B2, niacin, folic acid, vitamin B6, vitamin B12, vitamin C, and vitamin E ($p<0.05$). Food secure individuals also consumed significantly more iron, zinc, magnesium, phosphorus, and potassium ($p<0.01$), whereas sodium intake was not influenced by food security status. In the food insecure group, a higher number of individuals had poor diet quality, while in the food secure group, more individuals had good diet quality. A significant negative correlation between diet quality and food insecurity was also found (r:-0.480,$p<0.001$).

CONCLUSIONS

Food insecurity is associated with poorer diet quality, higher body mass index, and a higher risk of inadequate nutrient intake. Individuals facing food insecurity tend to consume lower quality diets, with specific deficiencies in essential vitamins and minerals. Addressing food insecurity could improve overall diet quality and nutrition in affected populations.

STUNTING AMONG CHILDREN HIV-EXPOSED AND HIV-FREE IN ESWATINI: A RETROSPECTIVE EVALUATION OF ASSOCIATIONS WITH BIRTH WEIGHT, FEEDING AND CAREGIVING PRACTICES

Maureen Black[1]; Barang A S Nonyone[2]; Letha Varughese,[3]; Jigna M Dharod,[4]; Xolisile Diamini,[5]; Andrea Ruff[6]
[1]International Development Group, RTI International, Severna Park, United States of America; [2]International Health, Johns, Baltimore, United States of America; [3]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA, United States of America; [4]Nutrition, UNCG, Greenboro, NC, USA, United States of America; [5]Health, Government of eSwatini, Mbabane, Eswatini; [6]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, United States of America

BACKGROUND AND OBJECTIVES

There is a need to understand how dietary practices and feeding patterns relate to stunting among children HIV-exposed and HIV-free, while also considering the socio-demographic environment and maternal characteristics. We investigated the associations between infant birth weight, household socio-demographic factors, and dietary and feeding practices with children's stunting at 9 and 18 months. We used secondary data from a study conducted in eSwatini to evaluate neurodevelopmental outcomes after a nurturing care intervention.

METHODS

We used generalized linear mixed models (GLM) with a logit link to characterize the association between stunting and exposures including infant birth weight quartiles, socio-demographics, maternal characteristics, and infant dietary diversity scores (<5,=5,>5). We further tested for moderating effects of dietary factors on the relationship between birthweight and stunting. Generalized structural equation models were used to characterize the direct and indirect associations between the exposures and stunting at 18 months, mediated through stunting at 9 months.

RESULTS

We included 367 children HIV-exposed and HIV-uninfected. Stunting at 9-months was associated with significantly reduced odds among infants in the 3rd and 4th birthweight quartiles [adjusted Odds Ratio (adj OR) 0.24 (0.11,0.55) p-value=0.0001, 0.10(0.03,0.33), p<0.001, respectively]. Evidence of a moderating effect of dietary diversity was limited to a relative decline in the second birthweight quartile. There was a significant increase in stunting prevalence from 9 months (21%) to 18 months (37%), mediated by stunting at 9 months with significant direct and indirect effects of birthweight and dietary diversity on stunting at 18 months.

CONCLUSIONS

In this population of children HIV-exposed and HIV-free, stunting risk increased dramatically from 9 to 18 months of age, reaching a prevalence rate consistent with that of young children throughout eSwatini. The association with birthweight was strong and not significantly moderated by caregiving practices or dietary factors. These findings, along with a suggestive finding of dietary diversity, illustrate the importance of incorporating the social determinants of health into investigations of children HIV-exposed. The findings warrant urgent attention because stunting among young children is associated with poor school performance, and reduced human capital across the life-course.

VITAMIN B12 SUPPLEMENTATION AND DOSE RESPONSE IN WOMEN OF REPRODUCTIVE AGE AND PREGNANT WOMEN IN TWO DOUBLE-BLIND, RANDOMIZED, CONTROLLED MICRONUTRIENT DOSE RESPONSE (MINDR) TRIALS IN RURAL BANGLADESH

Towfida Siddiqua[1]; Sulagna Bandyopadhyay[2]; S.m. Tafsir Hasan[3]; Khalid Bin Ahsan[1]; Eleonor Zavala[2]; Anjan Kumar Roy[3]; Hasmot Ali[1]; Lee Shu Fune Wu[2]; Brooke Langevin[4]; Mathangi Gopalakrishnan; Kerry J Schulze[2]; Parul Christian[2]
[1]JiVitA, Maternal and Child Health & Nutrition Research Project, Rangpur, Bangladesh; [2]Center for Human Nutrition and Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore MD, United States of America; [3]Nutrition Research division, International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b), Dhaka, Bangladesh; [4]Center for Translational Medicine, University of Maryland School of Pharmacy, Baltimore MD, United States of America

BACKGROUND AND OBJECTIVES

Antenatal multiple micronutrient supplements (MMS), providing approximately one recommended dietary allowance (RDA) of 15 nutrients, improve birth outcomes but may be insufficient to address deficiencies in micronutrients such as vitamin B12 in undernourished settings with inadequate dietary intake. We are conducting two parallel bioefficacy trials of increasing amounts of multiple micronutrients, including vitamin B12, in women of reproductive age (WRA) and pregnant women (PW) (18-35 years) in rural northern Bangladesh to ascertain the amounts of each nutrient that minimizes deficiency. Here we focus on vitamin B12.

METHODS

The trials are double-blind, placebo-controlled randomized to attain 240 (60 per arm) WRA and PWs each (NCT06081114). Daily doses of micronutrients are provided in a reconstituted powdered drink, including a placebo, along with a balanced energy-protein product containing ~1 RDA of 18 nutrients/serving. Vitamin B12 per arm is 2.6, 6, 12, and 18 µg/d, ~1-7.5x the RDA. Trial duration is 3 and ~6 months for WRA and PW (12-16 weeks gestation to birth), respectively, with biospecimens collected at baseline, midpoint, at/near the end of supplementation, and at 1 month postpartum for PW. Serum B12 is measured by autoanalyzer (Roche Diagnostics) and holo-transcobalamin (HoloTC) by immunoassay (Active B12-ELISA, IBL International). Pharmacokinetic (PK) and pharmacodynamic (PD) analytical approaches will be applied to determine the threshold of intake at which vitamin B12 sufficiency is achieved.

RESULTS

In total, 289 WRA and 354 PW were enrolled, with follow-up visits to conclude in December 2024 and April 2025, respectively. Study arms were balanced across baseline characteristics. Preliminary blinded data (WRA=280, PW=337) on baseline serum B12 show that 12.6% of WRA and 21.5% of PW were B12 insufficient (150 to <220 pmol/L), and 1.9% and 4.2% deficient (<150 pmol/L), respectively. Baseline HoloTC values (WRA=45, PW=133) indicated 8.8% of WRA, but no PW, were B12 deficient (<35 pmol/L). RESULTS of PK and PD models for the complete sample size will be presented at the conference.

CONCLUSIONS

The risk of vitamin B12 deficiency is high among WRA and during pregnancy in LMICs like Bangladesh. Findings from the dose-response trials will guide B12 dosing in MMS products in LMICs, where the risk of vitamin B12 deficiency is high.

SOAP42_06

CHOLINE ALLEVIATES COGNITIVE IMPAIRMENT IN SLEEP-DEPRIVED YOUNG MICE VIA REDUCING NEUROINFLAMMATION AND ALTERING PHOSPHOLIPIDOMIC PROFILE

Huang SiYu[1]; Huilian Zhu[1]; Qiuye Lan[2]
[1]Department of Nutrition, School of Public Health, Sun Yat-sen University, Guang Zhou Shi, China; [2]School of Public Health, Guangdong Pharmaceutical University, Guang Zhou Shi, China

BACKGROUND AND OBJECTIVES

Cognitive impairment caused by insufficient sleep is a significant public health concern, particularly in children. This study explores the protective effects of choline supplementation in alleviating sleep deprivation-induced cognitive deficits, with a focus on neuroinflammation, oxidative stress, and alterations in hippocampal phospholipidomic profiles.

METHODS

Chronic sleep deprivation was induced in young mice, followed by choline supplementation (11.36 g/kg). Cognitive function was assessed using Y-maze and novel object recognition tests. Functional connectivity was analyzed with rs-fMRI, and structural integrity was evaluated by DTI. Pathological injury and synaptic plasticity were assessed using electron microscopy and histological staining. Neuroinflammation was assessed through microglial activation and cytokine levels. Oxidative stress markers were measured with LC-MS/MS. Blood-brain barrier integrity was evaluated using Evans Blue dye extravasation and serum brain injury markers. Phospholipidomic profiles were determined by HILIC-MS/MS.

RESULTS

Choline supplementation significantly improves spatial learning ability. Functional MRI RESULTS reveal the hippocampus as a key region affected by sleep deprivation, where choline supplementation notably preserves hippocampal structural integrity and enhanced connectivity. Additionally, choline ameliorates hippocampal pathological injury, reduces blood-brain barrier permeability and serum brain injury biomarkers. Choline also reduces inflammation and oxidative stress biomarkers, and mitigates microglial activation in the hippocampus, which preserves synaptic plasticity. A key finding is the changes of hippocampal phospholipidomic profile along with cognitive function, and a total of 313 phospholipid molecules are identified. Choline increases the levels of total phospholipid and sub-classes (particularly PC), which are strongly correlated with reduced neuroinflammation and oxidative stress biomarkers, as well as improved cognitive outcomes. Furthermore, there are similar findings in some phospholipid molecules such as PC 36:1, PC O-33:0, PC p-38:3, PE 36:3, PE p-42:4 and PS 44:12.

CONCLUSIONS

These findings highlight that choline alleviates cognitive impairment in sleep deprivation via reducing neuroinflammation and oxidative stress as well as altering phospholipidomic profile. This study suggests that choline could develop into functional food or medicine ingredient to prevent and treat cognitive impairment by sleep disturbances, particularly children and adolescents.

SOAP42_09

PREVALENCE OF EXCLUSIVE BREASTFEEDING IN RURAL MOTHERS LIVING WITH AND WITHOUT HIV IN LESOTHO

Phumudzo Tshiambara[1]; Mothusi Nyofane[2]
[1]Human Nutrition, University of Pretoria, Pretoria, South Africa; [2]Nutrition, National University of Lesotho, Roma, Lesotho

BACKGROUND AND OBJECTIVES

Exclusive breastfeeding (EBF) rates are low in Lesotho, and lower in mothers living with HIV (MLWH). Breastfeeding is a life-saving intervention to prevent malnutrition (1-8). We compared the prevalence of EBF among MLHIV vs mothers not living with HIV (MnLWH) and further explored the relationship between breastfeeding and its associated factors.

METHODS

A quantitative retrospective, cross-sectional study design with a convenience sampling method was used. Semi-structured questionnaires were used to collect data on sociodemographic and breastfeeding feeding practices of mothers of children aged 6-12 months, attending regular visits at Maseru district clinics in May 2022 in 151 mother-child dyads (MLWH; n=73 and MnLWH: n=78).

RESULTS

All mothers had similar socio-demographic information, with the prevalence of EBF at 40.4%. The MLWH had lower rates of EBF than MnLWH (28.8% vs. 51.3%); p=0.005. Most MLWH introduced complementary feeding from as early as 1-3 months (19.2% vs 9.0%) and more than half of MLWH started giving solids foods from 4-5 months (52.1% vs 39.7); p=0.012. Above a quarter of mothers in this study received EBF support from the health facility, spouse, and other family members. Only 40.4% of the mothers were encouraged to EBF and 70.9% believed that breastmilk was only adequate for the first six months, and a strong positive correlation was found in EBF and mothers' belief MLWH: r=0.5; p<0.001 and MnLWH: r=0.4; p=0.001.

CONCLUSIONS

Despite significant efforts to promote breastfeeding among MLWH in Lesotho, the low EBF rate remains a persistent public health concern, necessitating increased breastfeeding rates through nutrition education, counseling, and support.

THE EAT-LANCET REFERENCE DIET: ASSOCIATION BETWEEN DIET QUALITY AND COGNITIVE FUNCTIONING AND DECLINE IN COMMUNITY-DWELLING OLDER ADULTS

Hanneke Wijnhoven[1]; Jin Bruins,[1]; Marjolein Visser[1]; Margreet Olthof[1]
[1]Health Sciences, Vrije Universiteit Amsterdam, Amsterdam, Netherlands

BACKGROUND AND OBJECTIVES

Adherence to higher-quality diets has been linked to better cognitive function in older adults, but limited research exists on the EAT-Lancet diet. This study examined the association between adherence to the EAT-Lancet diet and cognitive function and decline in community-dwelling older adults.

METHODS

Data from 1,371 participants aged 55–99 years from the Longitudinal Aging Study Amsterdam were analyzed. Adherence to the EAT-Lancet diet was assessed in 2014–2015 using a diet quality index based on a 238-item food frequency questionnaire. Cognitive domains—global cognition (MMSE), information processing speed (Coding task), episodic memory (15WT), and executive function (Word Fluency)—were measured every three years (2011–2021) and converted to z-scores. Linear mixed models assessed associations between quintiles of adherence and cognitive function and decline (testing interaction by age), adjusting for demographic and lifestyle factors. Interaction by sex and secondary analyses with the Mediterranean Diet Score and Dutch Healthy Diet index 2015 were also tested.

RESULTS

Higher adherence to the EAT-Lancet diet was associated with better episodic memory (Q5 vs. Q1, β=0.14 (0.01;0.28)) and executive function (Q5, Q2 vs. Q1, β_Q5=0.20 (0.09;0.32)), but not with information processing speed or global cognition. Higher adherence was linked to slower decline in information processing speed (Q5, Q3 vs. Q1, β=0.01 (0.00;0.02)), with no associations for other domains. Comparable findings were observed for the other diet indices.

CONCLUSIONS

Higher adherence to the EAT-Lancet diet is associated with better episodic memory and executive function and slower decline in information processing speed in Dutch older adults.

SOAP42_11

FOOD INSECURITY AND OVERCROWDING: THE CONCURRENCE BETWEEN TWO SOCIAL DETERMINANTS OF HEALTH IN URBAN CHILEAN HOUSEHOLDS

Gabriel Gonzalez-Medina[1]; Leslie Landaeta-Díaz[2]; Francisco Vergara Perucich[3]
[1]Departamento de Salud Pública, Pontificia Universidad Católica de Chile, Santiago, Chile; [2]Núcleo de Investigación en Nutrición y Ciencias Alimentarias, University of the Americas, Providencia, Chile; [3]Núcleo Centro Producción del Espacio, University of the Americas, Providencia, Chile

BACKGROUND AND OBJECTIVES

Food insecurity and inadequate housing are critical social determinants of health in cities, socioeconomic spatial segregation is related with health inequalities. While evidence suggests vulnerable households face elevated risks of both food insecurity and overcrowding, the spatial co-occurrence and sociodemographic patterns of these conditions remain poorly understood.

Objective: to determine the distribution and association of food insecurity and overcrowding prevalence in Chilean households according to social determinants and residence region.

METHODS

Cross-sectional design based on secondary data from the Chilean National Socioeconomic Survey CASEN, 2022. A sample of 72,056 households occupying 70,751 dwellings in 335 communes in the 16 regions of the country was completed, obtaining information on 202,231 people. Used the food insecurity experience scale. Overcrowding is measured as the ratio of people per bedroom (PPB) in a household Critical overcrowding when ≥2.5 (PPB).

RESULTS

Significant higher food insecurity in women (18%) than men (13%); $p < 0.001$. In the same way, overcrowding prevalence was higher in women (4.3%) than men (3.2%). The women, aged 25 -44 years, lowest socioeconomic level, and critical overcrowding have significantly more food insecurity (OR 1.34; OR 0.95; OR 0.75; OR 3.72 respectively). At a regional level, food insecurity prevalence is higher in the Tarapacá region with higher overcrowding prevalence, whereas the Magallanes region is the lowest in both.

https://drive.google.com/file/d/1S_7Jq-AAG_HF2k7W5CRthKHIm3m_AS5H/view?usp=drive_link

CONCLUSIONS

Food insecurity is a persistent public health problem linked to sex, age, socioeconomic status, and overcrowding. Food and housing indicate the necessity of structural changes in urban settings to improve health in more vulnerable populations.

SOAP42_13

HIGHER PREVALENCE OF INADEQUATE VITAMIN D INTAKE IN TODDLERS NOT CONSUMING A VITAMIN D SUPPLEMENT

Alejandra M Wiedeman[1]; Victoria M Lampkemeyer[1]; Constadina Panagiotopoulos[1]; Timothy J Green[2]; Rajavel Elango[1]; Angela M Devlin[1]
[1]Pediatrics, The University of British Columbia, Vancouver, Canada; [2]College of Nursing and Health Sciences, Flinders University, Adelaide, Australia

BACKGROUND AND OBJECTIVES

Vitamin D is required for growth and development, but little is known about its status during early childhood. This study aimed to determine vitamin D intake and status in toddlers.

METHODS

This is a secondary analysis of data from toddlers (n=133) enrolled in a double-blind randomized controlled trial of fatty acid supplementation between ages 1-2 y. Participants were recruited between 2010-2014 (latitude 49°N). Dietary information was collected using a 3-day food record, and supplement use was assessed by questionnaire. Vitamin D intakes (dietary plus supplemental) were compared to the North American Estimated Average Requirement (EAR; 400 IU [10 µg]) and European Adequate Intake (AI; 600 IU [15 µg]) recommendations. Plasma 25-hydroxyvitamin D3 (25OHD) concentrations were quantified by LC–tandem MS; low vitamin D status was defined as <50 nmol/L. Blood sampling was dichotomized by season defined as winter (Sep-Feb) and summer (Mar-Aug). Relationships were determined by adjusted general linear models and logistic regression.

RESULTS

At baseline 61% of the toddlers were male; 92% had normal weight-for-age z-score; 56% attended the study visit during the winter; and 61% were European ethnicity (parent-reported). At age 1 y (n=110) and 2 y (n=86), the top food sources of vitamin D were dairy (73-81%), fish (7-14%), and eggs (4-6%). Vitamin D supplements were consumed by 43% and 48% of the toddlers at age 1 y and 2 y, respectively. Daily median total vitamin D intakes were 317 IU (8 µg) at age 1 y and 288 IU (7 µg) at age 2 y. Intakes <EAR and ≥AI were 61% and 16% at age 1 y and 66% and 23% at 2 y, respectively. There was a higher prevalence of inadequate vitamin D intake (<EAR) in vitamin D supplement non-users compared with users (P≤0.001) at age 1 y (92% [n=63] vs 19% [n=47]) and age 2 y (96% [n=45] vs 34% [n=41]). Overall, mean (SD) plasma 25OHD levels were 60 (18) nmol/L at age 1 y (n=124) and 61 (14) nmol/L at 2 y (n=104). The prevalence of low vitamin D status was 27% at age 1 y and 22% at 2 y. Plasma 25OHD levels did not differ by sex, supplement use, ethnicity, or weight z-score. At age 1 y, there was a higher prevalence of low vitamin D status in the winter compared to summer (39% vs 12%; P<0.001) with greater odds of low vitamin D status in winter (OR=4.53; P=0.001). A positive relationship was found between plasma 25OHD and total vitamin D intakes at age 1 y (P<0.05; adjusted models).

CONCLUSIONS

These findings suggest a high prevalence of inadequate vitamin D intake in toddlers who do not consume a vitamin D supplement, placing them at higher risk for deficiency in winter.

SOAP42_14

IMPACT OF PORTION GUIDANCE ON COMMONLY CONSUMED PACKAGED FOOD TO REDUCE DISCRETIONARY CALORIES AND PUBLIC HEALTH SENSITIVE NUTRIENTS: EVIDENCE FROM THE UNITED KINGDOM AND FRANCE

Li-Tang Tsai[1]; Charlotte Debras[1]; Eric Scuccimarra[2]; Florent Vieux[3]; Matthieu Maillot[3]; Fabio Mainardi[2]; Alison Eldridge,[1]
[1]Department of Nutrition & Digestion, Société des Produits Nestlé SA - Nestlé Research, Lausanne, Switzerland; [2]Health Data and Labs, Nestlé Institute of Health Science, Lausanne, Switzerland; [3]Research, MS-Nutrition, Marseille, France

BACKGROUND AND OBJECTIVES

Excessive consumption of discretionary food is a global concern linked to obesity prevalence. Providing reference portion sizes and the possible subsequent reduction in portion size holds potential to tackle this issue. Our aim was to evaluate the impact of following newly established global portion values (GPV) (Eldrige et al., 2025) - without altering food choices - on discretionary calorie intake and nutrients of public health concern, using nationally representative datasets from the United Kingdom (NDNS) and France (INCA3).

METHODS

Diet modelling was applied to selected discretionary, energy-dense food categories; portions larger than GPV were substituted with GPV. Nutritional quality and adherence to WHO guidelines were compared before and after substitutions. Linear regressions were conducted to determine if reduction in daily total energy and daily added/free sugar was associated with participants' demographic and anthropometric characteristics.

RESULTS

After substitution, the proportion of daily energy from discretionary foods decreased 3.1% for NDNS (mean ± SD from 15.6 ± 9.8% to 12.5 ± 8.0%, $p<0.001$) and 3.6% for INCA3 (from 16.1 ± 10.7% to 12.5 ± 8.1 %, $p<0.001$) data. Following reference portion guidance for discretionary foods led to diet quality improvements, with a decrease in public health sensitive nutrients (e.g., saturated fat, added sugar, sodium) and a better adherence to WHO dietary guidelines. Older age was associated with a smaller reduction in discretionary calories and added/free sugar.

CONCLUSIONS

Modification of excessive portion sizes without altering food preferences holds promise for decreasing energy intakes and improving intakes of public health sensitive nutrients. Further research is needed to explore the applicability of these findings to other geographical regions and to investigate potential associations with health outcomes.

SOAP 45 - PUBLIC HEALTH AND NUTRITION THROUGHOUT LIFE CYCLE

SOAP45_02

EXPLORING THE USES AND PERCEPTIONS OF FOOD ENVIRONMENTS ACROSS SOCIOECONOMIC BACKGROUNDS

Patricia Gálvez Espinoza[1]; Maggiolo, Carolina Franch[2]; Lorena Rodríguez-Osiac,[3]; Daniel Egaña[4]
[1]Nutrition, University of Chile, Santiago, Chile; [2]Antropology, Universidad de Chile - Campus Juan Gómez Millas, Ñuñoa, Chile; [3]Public Health School Dr. Salvador Allende, University of Chile, Santiago, Chile; [4]Primary Care and Family Health, University of Chile, Santiago, Chile

BACKGROUND AND OBJECTIVES

Food environments (FEs) are crucial in shaping dietary patterns and the population's health. Evidence suggests significant disparities in food environments between low- and high-socioeconomic neighborhoods. This study compares how individuals from different socioeconomic backgrounds use and perceive their food environments, using the Chilean model of FE as the framework.

METHODS

This qualitative study involved 11 focus groups conducted in two neighborhoods in Santiago, Chile: five in a low socioeconomic status neighborhood (LSN) and six in a high socioeconomic status neighborhood (HSN). Each focus group included 4 to 10 participants over 18 years old. Discussions were audio-recorded, transcribed, and analyzed thematically, organized around the five FEs in the Chilean model: domestic, restaurant, supply, street, and organizational. Informed consent was obtained from all participants before data collection.

RESULTS

Uses and perceptions of the FEs differed according to socioeconomic status. Participants from the HSN approached food environments with a focus on self-care and pleasure, while those from LSNs prioritized economic constraints and basic needs. In the domestic FE, HSN participants shared responsibilities for food-related tasks, whereas in the LSN, these tasks were primarily managed by women. The HSN supply FE offered greater variety, purchasing options, and quality, whereas LSN participants highlighted farmers' markets as essential for accessing affordable and quality food. The restaurant FE in the HSN served as a space for relaxation and social enjoyment, with a wide range of options. In contrast, LSN participants reserved its use for special occasions due to economic limitations. Both groups associate the street FE with exceptional use and hygiene concerns. In the organizational FE, HSN participants prepare meals for work or choose healthy workplace options, while in LSNs, working conditions create more significant barriers to eating adequately. Digital FE (not included in the Chilean model) appeared more frequently in the HSE and younger participants.

CONCLUSIONS

This study reveals socioeconomic disparities in the use and perception of food environments. Therefore, the challenge is improving food environments, especially in low socioeconomic and vulnerable communities.

[1]Nutrition and Dietetics, University of Health and Allied Sciences, Ho, Ghana

BACKGROUND AND OBJECTIVES

Maternal exposures may have an impact on their offspring health in the immediate and long-term. We assessed the association between maternal prenatal factors and parameters of child health measured at birth.

METHODS

This cross sectional study collected data on previous pregnancies from 403 women at a Teaching Hospital. Data collected included socio demographics whilst pregnancy and child birth factors were extracted from the maternal health record book. Maternal factors were maternal age at child birth, BMI at first antenatal clinic (ANC) and gestational weight gain (GWG kg). Child health factors were birthweight, APGAR score measured at 1 and 5 minutes and head circumference. Associations between maternal and child factors were analysed using multivariable linear regression models in SPSS.

RESULTS

Mean maternal age was 30.4 ± 5.3, BMI was 27.4 ± 6.3kg/m2, gestational age was 39.0 ± 1.9 weeks whilst GWG was 12.0 ± 5.3kg. Maternal age was associated with birthweight, after adjustment for child's sex and gestational age, ß=0.089, P= 0.039. Maternal age was associated with child's APGAR score at 1 minute, ß=0 .100, P= 0.044 and with child's head circumference, ß=0.136, P =0.004. Maternal BMI was associated with birthweight, ß=0.203, P<0.001, but no association between GWG and birthweight. BMI and GWG were inversely associated with APGAR scores but not significant. No association was observed between BMI and child's head circumference P= 0.06.

CONCLUSIONS

Maternal age, BMI at first ANC and GWG may be relevant determinants of a child's birthweight, APGAR scores and head circumference at birth.

ASSOCIATION BETWEEN ADHERENCE TO LIFESTYLE RECOMMENDATIONS AND HEALTH OUTCOMES IN CHILDREN: IMPACT ON OBESITY, ABDOMINAL OBESITY, ATHEROGENIC INDEX, AND INSULIN RESISTANCE

María Dolores Salas-González[1, 2]; África Peral-Suárez[2, 1]; Esther Cuadrado-Soto[1, 2]; Elena Rodríguez-Rodríguez[2, 3]; Viviana Loria-Kohen[2, 1]; Adrián Cervera-Muñoz[1]; Sofía Perea-Tajuelo[1]; Ana Cecilia Maawad-Villavicencio[1]; Rosa María Ortega[1, 2, 4]; Ana María López-Sobaler[1, 2, 4]; Aranzazu Aparicio[1, 2, 4]
[1]Department of Nutrition and Food Science, Faculty of Pharmacy. Universidad Complutense de Madrid, Madrid, Spain; [2]Research Group VALORNUT-UCM (920030), Universidad Complutense de Madrid, Madrid, Spain; [3]Analytical Chemistry Unit, Department of Chemistry in Pharmaceutical Science, Faculty of Pharmacy. Universidad Complutense de Madrid, Madrid, Spain; [4]San Carlos Health Research Institute, (IdISSC), Madrid, Spain

BACKGROUND AND OBJECTIVES

Diet quality, physical activity, sedentary behaviour and sleep duration have been related to health status in adults and children, but most studies have investigated the relationship of these factors independently, so the aim of this study was to analyze whether a healthier lifestyle is related to better health status in children.

METHODS

A total of 819 Spanish children aged 8 to 13 years were studied. Dietary data (3-day food record), anthropometric data, biochemical parameters, sleep duration and physical activity were collected. The diet was analyzed using the DIAL software. The Healthy Eating Index (HEI-2020) was calculated as an indicator of diet quality. BMI (weight/height2) and z-score BMI were calculated and classified into normal weight and overweight/obesity according to WHO criteria. The waist-to-height ratio was calculated, and a cut-off point of 0.5 was established to determine abdominal obesity. Fasting blood samples were collected to determine serum cholesterol, HDL-c, glucose and insulin, and the atherogenic index (cholesterol/HDL-c) and HOMA-IR for insulin resistance (IR) were calculated with a cut-off point of 3.5 and 3.16, respectively. A physical activity questionnaire was used to collect the number of hours spent in different activities along the day. Children were classified based on the number of recommendations for a healthy lifestyle they complied with: moderate-to-vigorous physical activity (≥ 1 h/day), screen time (≤ 2 h/day), sleep (9-11 h/day) and HEI-2020 (> 60 points). Logistic regression models, adjusted for sex and age, were used for statistical analysis.

RESULTS

38.95% of the sample had a good lifestyle (meeting 3-4 recommendations) with no differences between the two sexes, and 5.74% did not achieve any recommendations. Having a worse lifestyle (< 3 recommendations) was significantly associated with a higher risk of abdominal obesity, atherogenicity and IR [OR (IC 95%): 1.42 (1.01-2.00), 1.57 (1.05-2.35) and 3.71 (1.54-8.97), $p < 0.05$, respectively) but was not associated with overweight/obesity. Analysis by sex showed an association with atherogenicity in boys and IR in girls.

CONCLUSIONS

A poorer lifestyle was related to poorer health status data such as abdominal obesity, atherogenicity or insulin resistance. Programs to improve health status should address lifestyle as a whole.

SOAP45_07

RELATION BETWEEN DIETARY QUALITY AND SERUM LPS IN PREGNANT WOMEN WITH OVERWEIGHT OR OBESITY

Kati Mokkala[1]; Kirsi Laitinen[2, 1, 3]
[1]Nutrition and Food Research Center, Faculty of Medicine, University of Turku, Turku, Finland; [2]Institute of Biomedicine, University of Turku, Turku, Finland; [3]Department of Obstetrics and Gynaecology, Turku University Hospital, Turku, Finland

BACKGROUND AND OBJECTIVES

Bacterial lipopolysaccharide (LPS) is a trigger for inflammatory response. Chronic exposure to low levels of LPS may induce systematic low-grade inflammation, which underlines several metabolic disorders, including obesity and type 2 diabetes. Maternal low-grade inflammation may impact intrauterine programming with likely impacts on child and even transgenerational health. High fat diet has been shown to increase serum LPS levels. Whether diet, as whole, during pregnancy have similar implication on serum LSP and further, beyond maternal metabolic health, is not characterized. The objective is to investigate the impact of overall dietary quality on serum LPS levels. Further, whether LPS is related to insulin levels in pregnant women with overweight or obesity was investigated.

METHODS

The study population comprised of 200 pregnant women with overweight/obesity (prepregnancy BMI≥25) at early pregnancy. Dietary quality was analysed by a validated index of diet quality (IDQ, score 1-15, <10 indicate poor (n=124) (1) and ≥ 10 good (n=75)) and by dietary patterns (healthy pattern and less-healthy pattern) (2). Nutrient intakes were analysed from three-day food diaries. LPS activity was measured by a Limulus amebocyte lysate assay coupled with a chromogenic substrate. Insulin was determined by an immunoelectrochemiluminometric assay.

RESULTS

IDQ correlated negatively with LPS when all the women (ρ=-0.141, p=0.047) and women with poor dietary quality (IDQ<10, n=124)(ρ= -0.274, p=0.002) were analysed, whilst no correlation was detected in women with good dietary quality. Instead, intake of carbohydrates (ρ=-0.232, p=0.047) and fibre in grams (ρ=-0.246, p=0.034) associated negatively with LPS in women with good dietary quality. In women with less-healthy dietary pattern (n=99), intake of total energy (ρ=-0.243, p=0.016), protein (ρ=-0.302, p=0.003) and fibre (ρ=-0.267, p=0.008) correlated negatively with LPS. No correlations were detected in women with healthier dietary patterns (n=96). Direct correlation between LPS and insulin was detected when all the women (ρ=0.24, p<0.001) and women with poor dietary quality were analysed (ρ =0.291, p=0.001). Direct correlation between LPS and insulin were also found in women with less-healthier dietary pattern (ρ=0.339, p<0.001).

CONCLUSIONS

Dietary intake and serum LPS show distinct relations according to dietary quality status in pregnant women with overweight or obesity. This may be reflected in aberrant glucose metabolism and insulin resistance in this study population.

SOAP45_08

COMMENSALITY - THE PRACTICE OF EATING TOGETHER IN OLDER AGE

Ida Synnøve Grini[1]; Laura Terragni,[2]; ØYdis Ueland,[3]
[1]Consumer, Sensory and Innovation, Nofima, Ås, Norway; [2]Nursing and Health Promotion, Oslo Metropolitan University, Oslo, Norway; [3]Food and Health, Nofima, Ås, Norway

BACKGROUND AND OBJECTIVES

Older adults are increasingly self-sufficient and have better physical function than before. Many older adults are satisfied with life, but in very old age loneliness increases. Participating in health-promoting activities with others, such as eating together, can contribute to better social interaction. Older adults who participate in social meals tend to feel less lonely and eat more nutritious meals. The aim of this study was to understand commensality among older adults and how it changes as years go by.

METHODS

This qualitative longitudinal study used a phenomenological research design to gain deeper insight into older adults' meal experiences. Data collection was carried out first in 2011/2012 and was followed up in 2020/21 using semi-structured interviews. We conducted a total of 24 interviews with 16 participants aged 67 to 94 years.

RESULTS

The first round of the study showed how commensality contributed to good life quality. In the follow-up, we found that changes in life situations, such as being alone, medical conditions, or decreasing physical activity, were factors that impacted their eating habits. We also observed that age played a significant role in their willingness to venture out and meet other older adults for social gatherings.

CONCLUSIONS

The study showed that commensality played an important part in the respondents' perception of a good life. Facilitating commensality also among the oldest old could be a good strategy for local communities to improve their quality of life. This can help to maintain good health and prevent nutrition-related diseases such as malnutrition in this group.

NUTRIENT PROFILE OF FOODS CONSUMED BY ADOLESCENTS IN SENEGAL, ACCORDING TO NOVA CLASSIFICATION

Olouwafemi Mistourath Mama[1]; Abdou Badiane[1]; Mame Aminata Thiam[1]; Saliou Diombo KEBE[1]; Mariame Sy[2]; Mane Hélène Faye[1]; Nicole Idohou-Dossou[1]; Adama Diouf[1]
[1]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Universite Cheikh Anta Diop (UCAD), Dakar, Senegal; [2]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Université Cheikh Anta Diop (UCAD), Dakar, Senegal

BACKGROUND AND OBJECTIVES

Adolescence is a period of intense growth that requires a balanced diet to prevent health problems in adulthood. However, the growing exposition to ultra-processed foods (UPF) increases the risk of non-communicable diseases (NCDs). This study aimed to determine the nutrient profile of foods consumed by adolescents in Senegal.

METHODS

A food consumption survey was carried out among 2 121 Senegalese adolescents aged 10-19 years, randomly selected from households using three-stage cluster sampling as part of a national cross-sectional study of anemia. The foods consumed by the adolescents were recorded using the individual 24-hour dietary recall and then grouped according to the NOVA classification system. The nutrient content of foods, including total fat (TF), saturated fat (SF), total sugars (TS) and sodium, was collected from product labels or food composition tables. The nutrient profile of the foods was assessed using the WHO's nutrient profile model for the African region.

RESULTS

The NOVA food groups most frequently consumed were unprocessed or minimally processed foods (52%), followed by processed culinary ingredients (24%), UPF (16%) and processed foods (8%). Among 381 unique foods analyzed, processed culinary ingredients had the highest median values for energy (898.5 kcal/100g; IQR [397.3-900]) and TF (99.9 g/100g; IQR [0.07-100]). Processed foods had the highest sodium content (0.17 g/100g; IQR [0.01-0,4]), while UPF had the highest TS content (30.05 g/100g; IQR [10.1-60.2]). Overall, 41.2%, 24.9% and 26.8% of the foods exceeded the recommended limits for TS, TF and energy, respectively. All groups, except for the minimally processed or unprocessed foods, had high rates of non-compliance with the thresholds for TS (over 98%) and energy (over 82%). In addition, 36.4% and 14.3% of the culinary ingredients exceeded the thresholds for SF and sodium, respectively. For processed foods, respectively 50% and 26.8% exceeded the limits for TF and sodium. More than half of the UPF were above the thresholds for TF (61.1%) and SF (57.1%).

CONCLUSIONS

Senegalese adolescents' diet is marked by a predominance of unprocessed or minimally processed foods. Half of the foods consumed exceeded the recommended thresholds for TS, while a quarter surpassed the limits for TF and energy. Most UPF were above the levels recommended for nutrients of concern. This highlights the need to implement strategies to restrict the promotion of unhealthy foods and prevent diet-related NCDs among adolescents.

SOAP45_11

AN OPEN-LABEL RANDOMIZED CONTROLLED TRIAL TO COMPARE THE EFFICACY OF DAILY SUPPLEMENTATION OF SMALL QUANTITY LIPID-BASED NUTRIENT SUPPLEMENTS (SQLNS) VS. IRON AND FOLIC ACID (IFA) SYRUP, FOR ANEMIA PROPHYLAXIS AMONG CHILDREN AGED 6 MONTHS TO 24 MONTHS

Aravind M[1]; Kapil Yadav[2]; Ravneet Kaur[2]; Mohan Bairwa[2]; Archana Singh[3]; Ganesh Kumar V[4]; Ragavendra Singh[5]

[1]Centre for community medicine , All India Institute Of Medical Sciences Delhi, New Delhi, India; [2]Centre for Community Medicine, All India Institute Of Medical Sciences Delhi, New Delhi, India; [3]Department of Biochemistry, All India Institute Of Medical Sciences Delhi, New Delhi, India; [4]Department of Hematology, All India Institute Of Medical Sciences Delhi, New Delhi, India; [5]Department of Paediatrics, Maulana Azad Medical College, New Delhi, India

BACKGROUND AND OBJECTIVES

Anemia affects approximately 78% of Indian children aged 6–23 months [1]. Despite efforts under the Anemia Mukt Bharat program, adherence to Iron and Folic Acid (IFA) syrup remains low [1,2]. Home food fortification with Small Quantity Lipid-based Nutrient Supplements (SQLNS), yet to be studied in India, could offer better outcomes. This study compares the efficacy of daily supplementation of oral SQLNS vs. oral IFA syrup for anemia prophylaxis among non-anemic children aged 6 months to 24 months, measured by change in hemoglobin, after 3 months of intervention.

METHODS

This community based non-inferiority parallel group open-labelled randomized control trial was conducted among non-anemic children aged 6 months to 2 years. A total of 100 children were randomised to receive either SQLNS or IFA syrup for 3 months. Hemoglobin levels were measured at baseline and endline, with the primary outcome being the difference in mean hemoglobin levels.

RESULTS

Baseline characteristics were similar between the two groups. Mean adherence rates were 54% for the SQLNS group and 73% for the IFA group. The change in hemoglobin levels (mean ± SD, g/dL) was 0.11 ± 1.1 for SQLNS and 0.36 ± 1.37 for IFA, with the SQLNS group showing a 0.25 g/dL lower mean increase compared to the IFA group. Adverse events were reported more frequently among participants receiving IFA syrup (72%) compared to those receiving SQLNS (48%).

CONCLUSIONS

Both SQLNS and IFA syrup effectively improved hemoglobin levels. However, due to higher adverse events with IFA syrup, SQLNS is the preferred option.

SOAP45_12

FOOD INSECURITY AND OBESITY AMONG SYRIAN FEMALE REFUGEES IN TÜRKIYE

Kübra Esin[1]; Feride Ayyıldız[2]
[1]Nutrition and Dietetics, Tokat Gaziosmanpasa University, Tokat, Türkiye; [2]Nutrition and Dietetics, Gazi University Faculty of Health Sciences, Ankara, Türkiye

BACKGROUND AND OBJECTIVES

Food insecurity is a risk factor for obesity among refugees, especially in women (1-3). The food insecurity-obesity paradox suggests that the overconsumption of low-cost, high-calorie, and less nutritious food, often linked to low socioeconomic status, can lead to overweight and obesity (4). This study aims to evaluate the association between household food insecurity and obesity among Syrian female refugees living in Türkiye.

METHODS

This descriptive cross-sectional study was conducted with 180 Syrian female refugees aged 18–64 living in Türkiye. Participants' sociodemographic data, anthropometric measurements, and food insecurity status were assessed. The Body Mass Index (BMI) was calculated by dividing weight (kg) by height squared (m^2) and categorized according to the World Health Organization classification. The FAO's Food Insecurity Experience Scale was used to determine the level of food insecurity (5).

RESULTS

The mean age of the individuals was 26.2± 9.17 years. Among the women in the study, 64.4% were single, and 71.7% were university graduates. It was found that 14.4% of the women had food security whereas the rest of them experienced some sort of food insecurity (46.7% mild food insecurity, 21.1% moderate food insecurity, and 17.8% severe food insecurity). The food-insecure group had a significantly higher mean BMI (24.7±4.98 kg/m2) than the food-secure group (23.5±4.123 kg/m2) ($p=0.04$) and a significantly higher number of overweight and obese women ($p=0.048$). There was a statistically significant positive correlation between the FIES scores and BMI values of the participants ($r: 0.236$, $p<0.01$). When there is a 1 unit increase in BMI value, there is a 0.221 increase in the total FS value ($p:0.003$).

CONCLUSIONS

In conclusion, this study found a positive association between food insecurity and obesity among Syrian female refugees living in Türkiye. Investigating the relationship between food insecurity and obesity among refugees is essential for developing effective policies and assistance programs. Comprehensive mixed-method studies are needed to understand this issue fully and to inform targeted interventions.

SOAP45_13

ASSOCIATION BETWEEN VICTIMIZATION AND UNHEALTHY EATING PATTERNS AMONG LOW-INCOME WOMEN OF COLOR

Sel Hwahng[1]; Marian Frimpong[2]; Casey Rebholz[3]
[1]Women's and Gender Studies, Towson University, Towson, United States of America; [2]Case Management, Service Coordination, Inc., Baltimore, United States of America; [3]Epidemiology, Johns Hopkins University, Bloomberg School of Public Health, Baltimore, United States of America

BACKGROUND AND OBJECTIVES

Low-income women and women of color (WOC) often exhibit poor diet quality and high rates of cardiometabolic disease. Healthy eating is considered a key factor for cardiometabolic health. As an “upstream” risk factor, victimization and neglect have also been associated with poor negative cardiometabolic outcomes. Further examining this association may contribute to the development of effective healthy eating interventions for WOC with victimization experiences.

METHODS

Twelve low-income, cis-gendered and transgender, Black, Latina, South Asian and Filipina WOC, 18-65 y.o., from New York City and Baltimore, Maryland were interviewed. WOC were asked about the following topics: 1) familial and social networks; 2) experiences with food during early life; 3) eating patterns and food preparation; 4) body image; 5) economic issues; 6) substance use over the life course; and 7) victimization experiences over the life course.

RESULTS

Physical, verbal, and sexual victimization were associated with unhealthy eating patterns mediated by negative mental health and/or substance use. Mental health issues that were mentioned by participants included depression, anxiety, anorexia, and bulimia. Substances used included alcohol, cannabis, and/or methamphetamine. Some women also engaged in “harm reduction” approaches to mitigate or prevent the consumption of unhealthy food while under the influence of substances. One approach was to arrange the environment before engaging in substance use to prominently display healthy food options while hiding unhealthy food options.

CONCLUSIONS

More research is needed to examine the association between victimization and unhealthy eating patterns among low-income women of color. Effectively addressing victimization among low-income WOC may result in the mitigation of unhealthy eating patterns. Training low-income WOC survivors of victimization to implement “harm reduction” approaches while under the influence of substances may also result in mitigating unhealthy eating patterns.

SOAP45_14

NUTRITION EDUCATION THROUGH MOBILE APP IMPROVED KNOWLEDGE BUT HAD LIMITED IMPACT ON ANEMIA PREVENTION PRACTICES AMONG ADOLESCENT GIRLS FROM LOW-MID SOCIOECONOMIC BACKGROUNDS

Rahayu Indriasari[1]; Marini Amalia Mansur[1]
[1]Nutrition Science Department, Faculty of Public Health, Hasanuddin University, Makassar, Indonesia

BACKGROUND AND OBJECTIVES

Previous studies have shown low awareness among adolescents about anemia prevention behaviors, making innovative nutrition education strategies essential to complement nutrition programs for anemia control in adolescents and accelerate their effectiveness. This study aims to develop an app-based intervention to change knowledge, attitudes, and anemia prevention practices among adolescent girls from lower-middle socioeconomic backgrounds.

METHODS

A quasi-experimental study with a pre- and post-test design with a control group was conducted in two selected high schools in an urban area, where one school was designated as the treatment group (n=30) and the other as the control group (n=38). Participants were randomly recruited from each school and consisted of first- and second-year female students (aged 14–17). The intervention was delivered through a series of educational materials on anemia via the Android-based EndMia app for 10 weeks. The control group received the educational materials electronically after the intervention was completed in the treatment group. Pre-test and post-test measurements of knowledge, attitudes, intentions, and practices were conducted using a valid questionnaire. To assess the impact of the intervention on changes in outcome variables, statistical tests were conducted to compare the mean scores of knowledge, attitudes, and practices before and after the intervention within each group and to compare the magnitude of these changes between the two groups.

RESULTS

The study RESULTS showed an increase in knowledge in both groups at the end of the intervention, but the changes were greater and significant ($p<0.05$) in the treatment group compared to the control group. Improvements in attitudes, intentions, and practices were observed in the treatment group but not in the control group, although the effects were relatively small ($p>0.05$).

CONCLUSIONS

The findings suggest that the mobile phone app has a potentially positive impact on anemia prevention behaviors, though broader strategies beyond nutrition education are necessary, especially in economically disadvantaged contexts.

SOAP45_15

COMPARISON OF WEIGHING SCALES FOR CHILDREN AGES 0 TO 59 MONTHS IN TWO MUNICIPALITIES IN LAGUNA, PHILIPPINES

Divine Grace Domingo[1]; Nancy Tandang[2]; Maria Theresa Talavera[1]; LEILA SACDALAN AFRICA[3]; Angelina Bustos[3]; Daniel Salunga[4]; Ellen Ruth Abella[5]
[1]Institute of Human Nutrition and Food, University of the Philippines Los Baños, Laguna, Philippines; [2]Institute of Statistics, University of the Philippines Los Baños, Laguna, Philippines; [3]Institute of Human Nutrition and Food, University of the Philippines Los Baños (UPLB), Los Baños, Philippines; [4]Swiss Centre for International Health / Faculty of Medicine, Swiss Tropical and Public Health Institute / University of Basel, Basel, Switzerland; [5]Nutrition Surveillance Division, National nutrition, taguig, Philippines

BACKGROUND AND OBJECTIVES

Accurate weight measurement is critical for assessing growth and nutritional status in children. However, measurement errors due to equipment can affect reliability. This study evaluated the reliability and consistency of weight measurements by community health workers using four tools: SECA model 878, NutriScale Digital, Tanita model HD-662, and Salter Hanging Infant Weighing Scale

METHODS

A cross-sectional field trial was conducted in two municipalities in Laguna, Philippines. Three pairs of end-users measured the weight of 80 children aged 0 to 59 months across House-to-House and stationary setups in rural and urban areas. Inter-measurer and intra-measurer reliability were evaluated using correlation coefficients (CC), Technical Error of Measurement (TEM), and coefficient of variation (CV). TEM values below 0.1 kg and %TEM within acceptable limits (≤1.5% for intra-measurer and ≤2% for inter-measurer) were benchmarks for reliability.

RESULTS

NutriScale exhibited the lowest TEM values (0.03–0.07 kg) and %TEM across all settings, making it the most reliable tool. Tanita followed closely, with TEM values ranging from 0.05 to 0.09 kg. Salter, while considered the gold standard, recorded higher TEM values (0.03–0.13 kg) and consistently overestimated weights, particularly in rural and House-to-House setups. SECA demonstrated some variability, with TEM values between 0.06 and 0.10 kg, but remained within acceptable reliability limits. Significant differences in weight measurements were observed between House-to-House and stationary setups for some tools, particularly in the rural area.

CONCLUSIONS

SECA, Tanita, and NutriScale are reliable alternatives to the Salter scale for weighing children aged 0 to 59 months. NutriScale demonstrated the highest reliability across rural and urban areas and in both house-to-house and stationary settings. Tanita and SECA also performed well, with minor variability between settings. Accurate RESULTS require proper calibration, initial training, and regular recalibration. These steps are crucial for ensuring consistency, especially in community programs like Operation Timbang (OPT).

THE URGENT NEED FOR COMPREHENSIVE TOOLS TO MEASURE HUNGER AND MALNUTRITION IN CHILDREN

Andrea Galante[1]; Carmen Tse[2]; Robert Apkaribo[3]; Albert Kwansa
[1]Global Center, World Vision International , Rome, Italy; [2]Global Health and Nutrition Team, World Vision International, Vaughan, Canada; [3]School of Medicine and Population Health, The University of Sheffield, Sheffield, United Kingdom

BACKGROUND AND OBJECTIVES

Hunger and malnutrition remain urgent global crises, disproportionately affecting children and adolescents and perpetuating cycles of poverty and inequality. Despite their critical importance, current tools for measuring these issues often fail to capture the full extent of the problem, especially at the individual level for children and adolescents. This review highlights the pressing need for standardized, comprehensive tools that can capture the various aspects or dimensions of children and adolescents' hunger and food insecurity, ensuring effective interventions and policies.

METHODS

A scoping review was conducted between July and September 2024, employing a two-stage search strategy to identify relevant tools and indicators. Academic and grey literature were retrieved from relevant sources and systematically analyzed, focusing on validation, reliability, and applicability to children aged 0–19 years. Tools were assessed against criteria such as their capacity to capture multidimensional aspects of hunger, their cultural adaptability, and their ability to measure the severity of food insecurity

RESULTS

The review identified 67 tools, including 33 that address child and adolescent hunger and food insecurity; however, only a few directly engage children and adolescents as respondents. Existing tools, such as the Child Food Insecurity Experience Scale (CFIES), show potential but have limitations in accurately capturing the severity of food insecurity and the unique needs of adolescents. Furthermore, significant gaps remain in assessing the socio-cultural and psychological dimensions of food insecurity, while standardized anthropometric measures for children and adolescents continue to be inadequate

CONCLUSIONS

The findings underscore the critical need for comprehensive, age-sensitive, and culturally adaptable tools to measure hunger and malnutrition accurately. Enhancing existing tools like CFIES while developing frameworks that capture the multidimensional nature of food insecurity will enable better-targeted interventions. Addressing these gaps is essential to support effective policy-making and ensure progress toward eradicating child hunger and malnutrition

SOAP46_01

UNRAVELING THE IMPACT OF PREWEANING KETOSIS ON METABOLIC PROGRAMMING AND ITS IMPLICATIONS FOR OBESITY

Fu-Jung Lin[1]
[1]Department of Biochemical Science & Technology, National Taiwan University, Taipei, Taiwan

BACKGROUND AND OBJECTIVES

Ketone bodies rise during limited carbohydrate intake. Typically below 0.1 mM in healthy adults, they reach 0.5–2 mM (nutritional ketosis) in breastfed infants. Limited breastfeeding has been linked to increased childhood obesity risk. This study investigates the impact of preweaning ketosis on obesity, particularly in the context of beige adipogenesis, and explores the underlying molecular mechanisms.

METHODS

Two ketone body-deficient models, early weaning and Hmgcs2 knockout (KO) mice, were used to assess preweaning ketosis effects on beige adipogenesis and thermogenesis. In early weaning, pups were weaned at postnatal day 12 (P12; EW group), while control suckling mice (SK group) continued breastfeeding. A rescue group (EW-MCT) was supplemented with medium-chain triglycerides (MCTs) until P21. Mice were assessed after 12 weeks of HFD feeding. In Hmgcs2 KO mouse model, control and Hmgcs2 KO adult mice underwent cold exposure experiments, followed by analyses of body temperature and inguinal white adipose tissue (iWAT). Molecular mechanisms were explored using bulk RNA sequencing and single-cell RNA sequencing (scRNA-seq).

RESULTS

Early-weaned pups showed greater weight gain, increased fat weights, adipocyte hypertrophy, and hepatic steatosis compared to the control SK group after 12 weeks of HFD. MCT supplementation reduced HFD-induced weight gain, adiposity, adipocyte hypertrophy, and hepatic steatosis. Glucose intolerance and insulin resistance in the EW group were rescued by MCT supplementation. In the Hmgcs2 KO model, control mice displayed increased beige adipocytes and thermogenic gene activation in iWAT during cold exposure. In contrast, Hmgcs2 KO mice showed fewer beige adipocytes, reduced thermogenesis, and lower body temperature. scRNA-seq identified a subset of adipocyte precursor cells (APCs) in the stromal vascular fraction (SVF) induced by elevated βHB levels.

CONCLUSIONS

Loss of preweaning ketogenesis through early weaning exacerbated obesity, impaired glucose metabolism, and reduced thermogenesis in diet-induced obese mice, while MCT supplementation during lactation rescued these abnormalities. Similarly, loss of endogenous ketogenesis in Hmgcs2 KO mice impaired cold-induced beige fat formation. These findings underscore the critical role of preweaning ketosis in regulating beige adipogenesis, thermogenesis, and metabolic health, suggesting potential interventions for early metabolic programming.

PREVALENCE OF UNDERNUTRITION AND FEEDING DIFFICULTIES AMONG CHILDREN WITH DISABILITIES IN UGANDA: A CROSS-SECTIONAL STUDY

Zeina Makhoul[1]; Bella Kyarisiima[2]; Grace Amongin[2]; Maria Nakibirango[3]; Moses Fisha Muhumuza[4]; Carolyn Moore[5]
[1]Programs, SPOON, Portland, United States of America; [2]Nutrition, CoRSU Rehabilitation Hospital, Kisubi, Uganda; [3]Research, CoRSU Rehabilitation Hospital, Kisubi, Uganda; [4]Orthopedics, CoRSU Rehabilitation Hospital, Kisubi, Uganda; [5]Policy and Advocacy, SPOON, Portland, United States of America

BACKGROUND AND OBJECTIVES

Globally, over 240 million children have disabilities, with those living in low- and middle-income countries facing significant barriers to adequate healthcare and nutrition. Despite the well-established link between disability and nutrition, considerable data gaps persist, globally and in Uganda, regarding the nutritional status of children with disabilities. This study aimed to estimate the prevalence of undernutrition and risk for feeding difficulties, and to assess common feeding practices among children with disabilities receiving services at a leading rehabilitation hospital in Uganda.

METHODS

We conducted a cross-sectional analysis of data from 350 children with disabilities aged birth to 10 years, collected between July 2024 and January 2025. Data included demographics, anthropometric measurements (weight, height, and mid-upper arm circumference [MUAC]), hemoglobin levels, risk for feeding difficulties, and caregiver-reported feeding practices. Undernutrition was assessed using the World Health Organization *z*-scores for anthropometric measurements, MUAC cut-off points, and anemia criteria. Statistical comparisons were made using ANOVA and Pearson's chi-squared tests.

RESULTS

The majority of participants were under 5 years old (89.4%) and more than half were male (56.6%). The most prevalent disabilities were cleft clip/palate (56.9%), followed by cerebral palsy (36.3%) and other disabilities (6.9%). Undernutrition was common: 44.7% of children were underweight, 38.1% stunted, 14.0% wasted (using MUAC), and 42.1% anemic. Children with cerebral palsy had significantly lower anthropometric *z*-scores and higher rates of underweight ($p<0.05$) and wasting ($p<0.05$) compared to children with other disabilities. Additionally, 88.3% of children were at risk for feeding difficulties, with common issues including coughing or choking and prolonged mealtimes. While most caregivers reported responsive feeding practices, interaction with infants and children during feeding was identified as a key area of improvement.

CONCLUSIONS

This study highlights the high burden of undernutrition and feeding difficulties among children with disabilities in Uganda. The findings underscore the urgent need for inclusive policies and community-based nutrition and feeding programs tailored to the needs of children with disabilities in Uganda and similar settings.

MATERNAL HEIGHT AND SMALL VULNERABLE NEWBORN OUTCOMES: A STUDY FROM RURAL NEPAL

Elizabeth Hazel[1]; Lauren Hale[1]; Seema Subedi[2]; Subarna Khatry,[3]; James Tielsch,[4]; Luke Mullany,[5]; Steven Leclerq,[6]; Robert Black[7]; Anne Cc Lee[8]; Joanne Katz,[1]
[1]Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [2]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [3]NNIPS, Nepal Nutriton Intervention Project Sarlahi, Kathman, Nepal; [4]Department of Global Health, George Washington University Milken Institute School of Public Health, Washington, DC, United States of America; [5]Research and Exploratory Development Department, Johns Hopkins University Applied Physics Laboratory, Laurel, MD, United States of America; [6]Center for Human Nutrition and Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, United States of America; [7]Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, United States of America; [8]Warren Alpert Medical School, Brown University, Providence, United States of America

BACKGROUND AND OBJECTIVES

Childhood stunting highlights the life-course and inter-generational effects of undernutrition. Women who experience chronic undernutrition as children are often of short stature, leading to poor birth outcomes such as stillbirth, preterm delivery, low birthweight, and/or small-for-gestational age. Small vulnerable newborn (SVN) is a new metric that defines categorical combinations of preterm/term delivery and small, appropriate, or large for gestational age. These SVN categories capture the distinct etiology and epidemiology of babies born too soon, too small, or both. SVN prevalence and neonatal mortality risk are inequitably concentrated in sub-Saharan Africa and South Asia. We aim to describe the association of maternal height and risk of SVNs in rural Sarlahi District, Nepal, a setting in South Asia.

METHODS

The Nepal Oil Massage study (NOMS) followed 29,887 pregnant women through delivery to collect birth outcomes and neonatal survival. Short maternal stature was defined as <145 centimeters (cm), moderately short as 145-149 cm, and non-short stature as ≥150 cm. Size for gestational age centiles were calculated using infant sex, gestational age (using timing of last menstrual period), and birthweight using the Intergrowth-21 standard population. Missing birthweight was imputed. SVNs were defined as babies born term or post-term (≥37 weeks) and small for gestational age (SGA, <10th percentile) (TSGA), term appropriate or large for gestational age (TAGA/TLGA, ≥10th percentile) and preterm (PAGA/PLGA), or PSGA. We performed multinomial analysis to generate odds ratios of SVN for the three height categories adjusted by maternal education, parity, and age.

RESULTS

Among the cohort, 3111 (14.2%) of women were <145 cm and 6525 (29.7%) were 145-149 cm. The prevalence of SVNs was 41.6% TSGA, 13.5% PAGA/LGA, and 2.1% PSGA. Women with short stature were 2.1 times (95% CI: 1.9-2.3) more likely to have a baby born TSGA compared to women with non-short stature. There were higher odds of preterm birth outcomes among women with short stature compared to non-short stature women (PAGA/PLGA (1.7, 95% CI: 1.5-1.9) and PSGA (2.9, 95% CI: 2.3-3.5). Women with moderately short stature were also at higher risk of TSGA (1.5, 95% CI: 1.4-1.6), PAGA/PLGA (1.4, 95% CI: 1.3-1.5), and PSGA (1.6, 95% CI: 1.4-2.0).

CONCLUSIONS

Infants born to women with both short and moderately short stature had higher odds of all SVN phenotypes in rural Nepal. Using the SVN metric in nutritional analyses of live birth outcomes allows for a more refined description of prevalence and risk.

INTAKE24-MALAYSIA: A DISCOVERY APPROACH ON ADAPTING AN ONLINE 24-HOUR DIETARY ASSESSMENT TOOL IN A MULTICULTURAL ENVIRONMENT

Nik Nur Izzati Nik Mohd Fakhruddin[1]; Shaleen Tho Rajasegaram[1]; Nurul Natasha Osman[1]; Amutha Ramadas[1]; Emma Foster[2]; Tracy Mccaffrey[3]; Choon Ming Ng[4]; Nur Suraiya Abu Hassan Shaari[5]; Seok Shin Tan[1]; Jessica Watterson[2]; Chris Prawira[2]; Patrick Olivier[2]
[1]Jeffrey Cheah School of Medicine & Health Sciences, Monash University Malaysia, Bandar Sunway, Malaysia; [2]Action Lab Monash University, Monash University Clayton Campus, Clayton, Australia; [3]Department of Nutrition, Dietetics and Food, Monash, Melboune, Australia; [4]Centre for Holistic Initiatives for Learning and Development, Yong Loo Lin School of Medicine, National University of Singapore, Lower Kent Ridge Road, Singapore; [5]Centre for Dietetics Studies, Universiti Teknologi MARA, Puncak Alam, Malaysia

BACKGROUND AND OBJECTIVES

Dietary assessment tools are essential for evaluating dietary habits and informing effective nutrition interventions. However, many of these tools fall short of addressing the complexities of multicultural environments. In Malaysia, a country rich in ethnic diversity, including Malays, Chinese, Indians, and Indigenous peoples, there is a significant need for an adapted approach to dietary assessment. This protocol outlines the adaptation and validation process for Intake24 Malaysia (Intake24-MY), an online dietary assessment tool tailored to reflect the multicultural dietary patterns of Malaysia.

METHODS

The methodology consists of two phases: (1) adaptation of Intake24 for the Malaysian context and (2) validation of the newly developed tool, Intake24-MY. Phase 2 (validation) is structured into four key phases: (i) validating food portion photographs (ii) pilot testing for system usability and food item identification (iii) relative validation against interviewer-led 24-hour dietary recalls and (iv) absolute validation in a controlled-single meal-setting.

RESULTS

Phase 1 compiled a comprehensive food list that includes both traditional and convenience foods representative of Malaysia's ethnic diversity, translated the text and food items within the system into Bahasa Melayu, Mandarin, and Tamil and created food portion size images and new food composition data to enhance the tool's relevance for the Malaysian context. A food list comprising 3,808 items, including 1,548 Malaysian foods, has been established, and the initial translation work is complete. Phase 2(i) has been completed with six food items that had a wide range of portion size estimates, with some foods showing more variation than others.

CONCLUSIONS

A systematic approach to improving Intake24 for multicultural contexts will provide valuable insights for future adaptations. Intake24-MY aims to enhance access to an open-source dietary assessment tool for diverse populations by including cultural perspectives, making it more effective for various communities.

BACKGROUND AND OBJECTIVES

Parental perceptions of food influence children's food choices, shaping their dietary habits and nutritional status1. This study aimed to examine dietary patterns, nutritional status, and impact of parental perceptions on children's food choices using a mixed-method approach2.

METHODS

Anthropometric, dietary and sociodemographic data were collected from 919 children (3-11 years) and their parents across three provinces in China. Dietary patterns were identified using principal component analysis3. A subsample of 40 parents completed a 7-day food photographic diary4 and interviews, with data analysed thematically5.

RESULTS

Stunting, wasting, and underweight were low (1-2%), while 16.4% and 10.8% of children were overweight and obese, respectively, with higher rates among primary schoolchildren (36.3%). Two dietary patterns were identified: "Mixed-Westernised" (high in sugar, fat, and processed ingredients) and "Mixed-Diversified" (rich in varied, unprocessed foods). Regression analyses showed that higher "Diversified diet" z-scores were significantly associated with higher height-for-age z-scores (β=0.75; 95% CI=0.11, 1.39, p=0.022), and lower weight-for-age z-scores (β=-1.27; -2.30, -0.23, p=0.016), after adjusting for confounders. Thematic analysis showed rural and urban parents both prioritised healthy diets and food safety, though regional and age-related differences were evident. Parents of preschool children emphasized dietary diversity, while those with primary schoolchildren prioritised taste preferences. Rural parents emphasised price, variety, and ingredient quality, often using homegrown produce and family/online recipes. Urban parents prioritised health, convenience, and professional advice, preferring online shopping, supermarkets, frozen/ready-to-eat foods, and supplementation.

CONCLUSIONS

Sociocultural environment significantly shapes children's dietary patterns, impacting their nutritional status. Interventions tailored to these factors are necessary to improving children's nutrition.

ASSOCIATION OF ULTRA-PROCESSED FOOD CONSUMPTION WITH BLOOD PRESSURE IN BRAZILIAN AND BRITISH ADOLESCENTS

Carolina Carvalho[1]; Jennifer Carter
[1]Public Health Department, Federal University of Maranhão, São Luís, Brazil

BACKGROUND AND OBJECTIVES

Ultra-processed foods (UPF) are known as a central part of the current unsustainable food system, considering the higher gas emissions, land and energy used in their production (1). Besides that, the high consumption of UPF has been linked to obesity and other health problems. Studies in adults have shown a positive association between UPF consumption and blood pressure(2). However, longitudinal studies across childhood and adolescence are scarce. This study assessed the association between UPF consumption and body composition indicators in Brazilian and British adolescents.

METHODS

We used data from the British cohort ALSPAC (n=5278) and the Brazilian cohorts Pelotas 2004 (n=3126) and BRISA (n=747). Childhood exposure to ultra-processed foods (UPF) was assessed at ages 3.0-5.1 years in ALSPAC, 6.0-7.5 years in Pelotas 2004, and 1.0-2.8 years in BRISA. Food frequency questionnaires were used in ALSPAC and Pelotas, while a 24-hour recall was used in BRISA. The blood pressure was measured at the average ages of 13.8, 11, and 12 years using similar blood pressure monitors. Body mass index was calculated (BMI – weight(kg)/height(m)2). Linear regression models, adjusted for maternal education, family income, pre-pregnancy BMI, total grams of non-UPF, and the ratio of Energy Intake to Estimated Energy Requirements (EI/EER), were used to assess the association between tertiles of UPF consumption and systolic and diastolic blood pressure (SBP and DBP).

RESULTS

The mean of UPF consumed in the third vs first tertile was 579g vs 267g in ALSPAC, 1871g vs 493g in PL 2004, and 342g vs 46.5g in BRISA. Higher UPF consumption was observed among children of mothers with low socioeconomic status. Children in the third tertile of UPF consumption had an SBP level 4 mmHg higher than those in the first tertile (115.0 mmHg vs. 111.0 mmHg, $p<0.001$), while for DBP, the difference was 2.5 mmHg (67.6 mmHg vs. 65.1 mmHg, $p<0.001$). The differences were of the same magnitude between males and females. After additional adjustment for BMI, the estimates lost significance for SBP (113.0 mmHg vs. 113.0 mmHg, $p<0.001$) and DBP (66.6 mmHg vs. 66.0 mmHg, $p=0.270$).

CONCLUSIONS

Higher UPF consumption was only linked to increased SBP and DBP in Pelotas 2004 Cohort. It is important to note that in ALSPAC, it was not possible to adjust for the ratio of EI/EER to control for misreporting, which may have attenuated the estimates in this cohort. The associations were mainly attenuated by adjustment for BMI, which shows that BMI accounts for most of the association between UPF and blood pressure in these children.

THE ROLE OF NON GOVERNMENTAL ORGANIZATIONS IN SCALING UP IMPACT OF NUTRITION PROGRAMS FOR CHILDREN 0-5 YEARS OLD IN THE WESTERN VISAYAS REGION - A CASE STUDY RESEARCH

Abigail Lim Tan[1]; Gilbert Ryan Chan[2]; Jayson G. Maulit,[2]; Danilo A. Songco,[2]
[1]Faculty, Health Sciences Program, Ateneo de Manila University, Quezon City, Philippines; [2]Master in Development Management, Asian Institute of Management, Makati, Philippines

BACKGROUND AND OBJECTIVES

Child malnutrition in Western Visayas, Philippines, remains a multidimensional crisis with far-reaching consequences. Stunting affects over 40 percent of children under five in the region, significantly higher than the national average of 28.8 percent, while wasting impacts 5.58 percent, reflecting acute malnutrition (Philippine Statistics Authority, 2021). Using the Social Enterprise Compass, Theory of Change (TOC) model, and Root Cause Analysis framework, this case study research evaluated the important role of non government organizations in increasing impact and achieving a decrease in stunting and wasting rates and scalability of operations in nutrition programs.

METHODS
Primary data collection was done through validation workshops and key informant interviews with all the key stakeholders that were recognized in our initial stakeholder analysis for a specific NGO in Western Visayas that implements nutrition programs. These were transcribed and analyzed thematically to gather key insights. Secondary data collection was done through the collection and review of Government or Public Data (Philippine Statistics Authority, National Nutrition Council, Department of Finance), local Nutrition Budgets (Iloilo Provincial Office), and profiles of other NGOs functioning as social enterprises for scalaibility to supplement the RESULTS.
RESULTS

Using the theory of change model, a roadmap was created that illustrates how their organization can scale up their impact to reach the nutrition goal of eradication of stunting and wasting in Western Visayas by 2030. It is also important for the communities to be involved in program planning and implementation. Involvement of community members can be done by adding capacity building components and strengthening the livelihood programs that can feed into the supply chain of the mixed model approach.

CONCLUSIONS

Through this case study, we have found that it is possible for a non governmental organization to scale up their nutrition program’s impact and help eradicate stunting and wasting in under 5 children in Western Visayas by adopting a mixed model approach for scaling up. Shifting to the mixed model approach of creating a for-profit entity that will act as a social enterprise whose profits all go back to support the nutrition programs will not only be profitable in the long run, but also help reach all the stunted children aged 0-5 years old in Region VI.

BACKGROUND AND OBJECTIVES

The government of Ethiopia is piloting the scaleup of Multiple Micronutrient Supplementation (MMS) to replace Iron-Folate Acid Supplementation (IFA) as part of routine antenatal care (ANC). Adherence to prenatal supplementation is sub-optimal in many settings, including in Ethiopia, and to achieve high adherence for MMS it is important to learn lessons from IFA. Through analysis of data from a two-arm cluster randomised control trial, we aimed to assess the drivers of adherence for IFA and MMS in Ethiopia, generating transferable learning between the two supplements about what works to improve effective use.

METHODS

Multi-respondent facility surveys were conducted over 42 districts, 5 regions of Ethiopia. Baseline data was collected in January 2023 with an endline survey two years later in January 2025. At both survey points data was collected in 209 health facilities, interviewing 10,305 mothers with a recent live birth and 209 health staff. Data on sociodemographic variables, the number and timing of antenatal care contacts, the receipt, use, and adherence to either IFA or MMS were analysed at baseline and endline. Analysis focused on whether and how the drivers of MMS or IFA adherence differ.

RESULTS

At baseline in the IFA arm**,** 49% of mothers reported taking at least 90 IFA tablets by the end of pregnancy. The mean gestation week at first ANC was 22(±8) weeks and one-fifth (18%) of the mothers (95% CI:16, 19) had their first ANC within 12 weeks of pregnancy. Although receipt of IFA at least once during pregnancy was almost universal (91%) by the end of pregnancy, just 63% of early attenders were given IFA at their first ANC visit. Both late first ANC attendance and not giving supplements to all women at the first visit were identified as adherence bottlenecks, limiting the amount of exposure time available to complete 90 IFA tablets. Endline data analysis will explore the size of these bottlenecks for IFA and for the newly introduced MMS, examining differences between IFA and MMS study arms and over time within the IFA study arm.

CONCLUSIONS

Both health system and user bottlenecks were observed to limit universal coverage and adherence of IFA. Incremental improvements in the behaviours of health workers when distributing prenatal supplementation and the preferences of women around timing of first ANC and consumption could improve the current sub-optimal uptake, crucial to the full benefit of prenatal nutritional supplements is to be realised.

Estimating the effective coverage of prenatal multiple micronutrient supplementation and iron-folate supplementation in Ethiopia: RESULTS from a large-scale pragmatic cluster-randomised trial

Atkure Defar[1]; Masresha Tessema[2]; Alemneh Kabeta Daba[3]; Bedassa Tessema[4]; Charles Opondo,[5]; Girum Taye[6]; Anene Tesfa,[2]; Senait Alemayehu[6]; Elias Asfaw[2]; Lars-åKe Persson[7]; Joanna Schellenberg[7]; Tanya Marchant[7]

[1]Disease control, London School of Hygiene & Tropical Medicine, Addis A, Ethiopia; [2]Nutrition, Environmental Health and Non-communicable Disease Research Directorate, Ethiopia Public Health Institute, Addis Ababa, Ethiopia; [3]College of Medicine and Health Sciences, Hawassa, Hawassa, Ethiopia; [4]Nutrition Research, Ethiopian Public Health Institute, Addis Ababa, Ethiopia; [5]Medical Statistics, London School of Hygiene & Tropical Medicine, London, United Kingdom; [6]Health System Research Directorate, Ethiopia Public Health Institute, Addis Ababa, Ethiopia; [7]Disease control, London School of Hygiene & Tropical Medicine, London, United Kingdom

BACKGROUND AND OBJECTIVES

Effective coverage measures aim to estimate the proportion of a population in need of a service that receive a positive health outcome, taking account of health system processes, health care quality and the series of complex interactions between care providers and care users. Using a coverage cascade of programmatic steps, these measures provide essential information for decision making about where and how programme improvements can be made. Few examples of effective coverage exist for nutritional interventions. Accessing data from the multiple micronutrient supplementation (MMS) trial in Ethiopia, the objectives of this presentation are to define, calculate and examine effective coverage measures for prenatal nutritional supplement programmes in Ethiopia.

METHODS

The MMS trial is a pragmatic, facility-based, randomised trial conducted in 42 districts over 5 regions of Ethiopia between January 2023 and December 2024. Districts are randomised to one of two arms, either to retain iron-folic acid (IFA) supplementation as part of routine antenatal care or switch to MMS. Detailed data about processes and birth weight outcomes are collected in both study arms, including through comprehensive facility surveys at start-up and endline. Accessing these data, effective coverage estimates will be calculated separately for MMS and for IFA. In doing so it will be possible to identify and quantify where opportunities are lost to maximise the potential effectiveness of each supplement. This analysis will be carried out at the start-up period and at endline to examine whether and how the programme effectiveness changed over time.

RESULTS

In January 2023, data were collected from 209 health facilities, 209 health workers and 10,305 women. The effective coverage of MMS was estimated to be 9.7%. Across the effective coverage cascade the largest drop in coverage was observed because of inadequate roll-out of MMS stock in facilities. In the same period, the effective coverage of IFA was estimated to be 3.2%, with inadequate training of health staff causing the largest drop in coverage. Endline analysis of effective coverage of both programmes will be done in April 2025 using the same survey METHODSand RESULTS will be presented in detail alongside a critical analysis of opportunities to strength programme effectiveness.

CONCLUSIONS

Effective coverage cascades for prenatal nutritional supplements in Ethiopia reveal opportunities for system strengthening that enhances the potential health benefit available to women and their newborns.

EFFECT OF THE INTERVENTION WITH THE MOBILE APPLICATION 'AMAMANTAPP' ON KNOWLEDGE, ATTITUDES AND PRACTICES OF HUMAN MILK DONATION IN BREASTFEEDING WOMEN: RANDOMISED CONTROLLED TRIAL

Violeta Rojas,[1, 2]; Nervo Verdezoto,[3]; Juan Pablo Aparco[4, 2]; Adela Alcedo[5]; Dayana Isolina[5]; Jimenez Josely[5]; Yauri Kiary[5]; Eduardo Cruz[6]; Jaime Pizarro[6]; Joseph Avila[6]; Sissy Espinoza-Bernardo[2, 1]; Ana Higa[1, 2]

BACKGROUND AND OBJECTIVES

Background: Breastfeeding in preterm infants is disrupted, requiring donated breast milk. Human Milk Banks become allies in reducing the mortality of premature babies. However, the number of donors is insufficient to meet the demand. Low donations are due to lack of knowledge about donation and to perceptions, beliefs and attitudes that influence the predisposition to donate. As a solution, we propose the development and evaluation of a mobile application to promote a culture of human milk donation.Objective: To determine the effect of the mobile application Amamantapp on knowledge, attitudes and practices towards human milk donation among breastfeeding women in Lima, Peru.

METHODS

Methods:A randomised controlled trial involving 112 breastfeeding mothers was conducted. The intervention group (n=54) received human milk donation education on a mobile app, the control group received printed educational materials. The intervention time was 8 weeks. Participants were enrolled during the days following delivery in the inpatient ward of a mother and child hospital in the city of Lima. For the development of the mobile application, the design thinking methodology was used, which identified the needs of the participants. The mobile intervention was then developed and used for a period of 60 days in the intervention group. Knowledge, attitudes and practices will be assessed with a CAP questionnaire before and after the mobile intervention.

RESULTS

The RESULTS of the study showed no differences in socio-demographic characteristics such as age, educational level, number of children, number of children, income, marital status, internet access and employment status between the breastfeeding mothers in the intervention group and the control group. When analysing the effect of the Amamantapp mobile application, significant differences were found between groups with higher knowledge scores for the intervention group (MD (mean difference): 0.94 points, p=0.04). No differences were found in attitudes or practices towards milk donation in the breastfeeding mothers participating in the study.

CONCLUSIONS

Breastfeeding women showed an improvement in knowledge about human milk donation using the mobile application Amamantapp. The RESULTS further showed that improving attitudes and practices towards human milk donation using mobile applications requires further study.

NOURISHING NATIONS' SURVEY OF SMALL-SCALE FISH PROCESSORS TO INFORM TRAINING TO IMPROVE FOOD SAFETY AND FISH HANDLING AND PROCESSING IN RURAL NIGERIA

Terezie Tolar-Peterson[1]; Kathleen Ragsdale[2]; Joseph N. Nuntah[3]; Henrietta N. Ene-Obong[4]; Lauren Pincus[5]; Monica Pasqualino[6]; Kendra Byrd[7]
[1]Health Science and Human Ecology, California State University, San Bernardino, San Bernardino, United States of America; [2]Social Science Research Center, Mississippi State University, Starkville, United States of America; [3]Department of Fisheries Technology, Edo State College of Agriculture and Natural Resources, Iguoriakhi, Nigeria, Federal Republic of; [4]Department of Human Nutrition and Dietetics, University of Calabar, Cross River, Nigeria, Federal Republic of; [5]Agriculture and Market Systems, Mercy Corps, Portland, United States of America; [6]Bloomberg School of Public Health, Department of International Health, Johns Hopkins University, Baltimore, United States of America; [7]Food and Markets Department, University of Greenwich Natural Resources Institute, Chatham, United Kingdom

BACKGROUND AND OBJECTIVES
Nutrient-dense and relatively inexpensive, fish contribute to the food security and livelihoods of resource-limited households across sub-Saharan Africa (SSA). For example, Nigeria is one of many countries in SSA that rely on fish for their main animal source food [1]. However, foodborne illness linked to inadequate food safety/hygienic practices during processing is a public health concern in Nigeria and throughout SSA [2-5] where, for example, rural fish processors rely on traditional METHODSthat can expose fish/fish products to contaminants [6,7]. To inform development of training to strengthen hygienic fish handling/processing and improve the quality and safety of fish/fish products among low-literate fish processors, we conducted a baseline survey to collect demographics and identify critical knowledge gaps and current fish handling/processing practices.
METHODS

Administered to purposive sample of fish processors (N=99) in rural Nigeria, the survey focused on knowledge and practices regarding nutrition and fish handling/processing.

RESULTS

Most respondents were women (73.7%), 29-49 years old (84.8%), married (79.1%), with households (HH) of 4-6 members (52.5%). Five percent had not completed primary school, 21.2% had a primary education, 35.4% had a secondary education, and 24.2% had some post-secondary technical training. A majority reported that their HH had a pour-flush toilet (86.9%), used a community borehole for water (86.5%), had access to electricity (42.2%), and that at least one HH member owned a smartphone (63.6%). Most reported some formal training in fish for human nutrition (93%) and knowledge of health benefit of consuming fish (93%), yet few had knowledge of risks associated with consuming improperly smoked fish (18.2%) or improperly sun-dried fish (12.1%). Most respondents smoked the fish (84.9%) in cut-out drum kilns (78.8%) using firewood (63.6%). Most preserved the smoked fish on drying racks placed over the kilns (68.7%). A majority reported receiving nutrition and food safety information in the past 30 days (55.6%), yet 39.3% did not respond to the follow-up question about this information's source. Most had engaged in fish processing ≥3 years (78.8%) and had access to clean water at their processing site (82.8%). Yet only 10.1% practiced handwashing with soap during fish handling/processing and only 36.4% reported using protective gloves during fish handling/processing.

CONCLUSIONS

Educating fish processors about entry points through which processed fish are contaminated can improve the safety of fish/fish products, leading to less foodborne illness in Nigeria.

IMPACT OF ECONOMIC DISPARITY ON PREGNANCY WEIGHT GAIN IN A LMIC COUNTRY

Yasaswi N Walpita[1, 2]; Shreenika De Silva Weliange[1, 2]; Upul Senarath[1, 2]; Indika Siriwardena,[2]; Vithanage Pujitha Wickramasinghe[3, 4]
[1]Department of Community Medicine, University of Colombo, Colombo, Sri Lanka; [2]Sri Lanka Office, South Asia Infant Feeding Research Network, Colombo, Sri Lanka; [3]Department of Paediatrics, University of Colombo, Colombo, Sri Lanka; [4]Sri Lanka, College of Paediatricians, Colombo, Sri Lanka

BACKGROUND AND OBJECTIVES

Optimal weight gain in pregnancy is considered an important parameter determining the maternal and neonatal outcomes globally (1,2). These nutritional parameters are confounded by socioeconomic standards leading to further aggravation of health inequalities in LMICs. This study aimed to see the association of wealth index with pregnancy weight gain in a cohort of mothers from Sri Lanka.

METHODS

A retrospective cohort study was conducted among 1875 mothers who delivered term live babies during 2022/2023 period. A stratified cluster sample was used to represent three residential sectors equally. Data was collected from pregnancy records and by interviewing mothers. The wealth index was calculated using household ownership of selected assets, materials used for housing construction, and types of water access and sanitation facilities. Impact of economic disparity measured by wealth index, on pregnancy weight gain was assessed by using the Lorenz curves and calculation of Gini coefficient.

RESULTS

Of the total sample, 62.4% mothers had inadequate weight gain, while 9.8% had excess weight gain. There was no significant difference in the mean pregnancy weight gain among wealth quintiles or residential sector ($p>0.05$). However, the Gini coefficient for percentage of mothers with adequate weight gain over economic quintiles was 0.46.

CONCLUSIONS

The Gini coefficient is higher than the generally accepted value of 0.4, indicating some inequality in pregnancy weight gain among wealth quintiles. This could lead to disparities in the resultant maternal and neonatal outcomes based on wealth standards. The intervention planning needs to be targeted accordingly.

SOAP49_02

EFFECTS OF MECHANICAL STIMULATION ON MUSCLE HYPERTROPHY IN ADULT AND AGING MICE

Chanikan Bumrungkit[1]; Noriyuki Yanaka[1]; Thanutchaporn Kumrungsee[1, 2]
[1]Food and AgriLife Science, Graduate School of Integrated Sciences for Life, Hiroshima University, Higashihiroshima, Japan; [2]Smart Agriculture, Graduate School of Innovation and Practice for Smart Society, Hiroshima University, Higashihiroshima, Japan

BACKGROUND AND OBJECTIVES

Sarcopenia is a progressive loss of muscle mass and strength with age. With no drugs available, nutrition and exercise are the only available strategies to slow its progression by maintaining muscle mass. Preserving muscle mass primarily relies on inducing muscle usage or movement, typically through exercise. However, for those unable to exercise intensively, alternative approaches are needed. This study explored mechanical massage or stimulation (MS) as a potential alternative approach to induce muscle movement and enhance muscle hypertrophy.

METHODS

A commercially available massage gun, adapted from massage devices used in previous studies (1,2), was used as the MS device. Tibialis anterior (TA) muscles of adult (8-week-old) and aging (18-month-old) mice were injured by cardiotoxin (CTX, 10 μM) injection. At 4 days post-injury, the injured muscles were subjected to MS treatment for 7 days (2 min twice a day), followed by recovery until 28 days post-injury. This injury-MS treatment-recovery cycle was repeated to further induce muscle hypertrophy. Histochemical and immunofluorescent analyses were used to assess muscle morphology and myofiber types.

RESULTS

In adult mice, MS treatment enhanced muscle hypertrophy, as evidenced by an increase in regenerating myofiber size (2769.32 ± 303.40 μm² [no MS] vs. 3480.25 ± 138.17 μm² [MS], $p = 0.0588$), a greater amount of large myofibers (>3001 μm², $p < 0.05$), a lower amount of small myofibers (<3000 μm², $p < 0.05$), and an increased fusion index. In contrast, in aging mice, MS treatment did not show those hypertrophic effects. When analyzing the number of regenerating myofibers in the whole regenerating muscle, muscle hypertrophy significantly increased the number of regenerating myofibers in adult mice but failed in aged mice. However, with MS treatment, a significant increase in the number of regenerating myofibers was observed in both adult and aging mice, indicating its potential for promoting muscle hypertrophy in aging. MS treatment shifted myofiber types in regenerating adult and aging muscles, reducing type IIB and increasing type IIX (aging) and IIA (adult) myofibers.

CONCLUSIONS

MS treatment following injury enhances muscle hypertrophy in adult mice and shows potential in aging mice, suggesting it as a novel approach to promote muscle growth and prevent sarcopenia.

SOAP49_05

PREDICTORS OF STUNTING IN YOUNG CHILDREN IN A VULNERABLE POPULATION: INFLUENCE OF PARENTAL HEIGHTS

Upul Senarath[1, 2]; Shreenika De Silva Weliange[3, 2]; Yasaswi N Walpita[3, 2]; Dhammica Rowel,[4]; Abner Daniel,[4]; Kunarathinam Partheepan,[2]; Indika Siriwardena,[2]; Vithanage Pujitha Wickramasinghe[5, 6]
[1]Community Medicine, University of Colombo, Colombo, Sri Lanka; [2]Sri Lanka Office, South Asia Infant Feeding Research Network, Colombo, Sri Lanka; [3]Department of Community Medicine, University of Colombo, Colombo, Sri Lanka; [4]Sri Lanka Country Office, UNICEF Sri Lanka, Colombo, Sri Lanka; [5]Paediatrics, University of Colombo, Colombo, Sri Lanka; [6]Sri Lanka, College of Paediatricians, col, Sri Lanka

BACKGROUND AND OBJECTIVES

Nutrition is a core development indicator in any country. However, there are vulnerable populations such as those living in tea and rubber plantations (estate sector) in Sri Lanka, where there is a higher rate of undernutrition in children. The prevalence of stunting have declined from 2006 to 2016, with specific interventions and for further reduction it is necessary to explore parental factors that have had generational effects (1,2). The objective of this study is to determine the influence of parental height as a predictor of stunting in children aged 12-23 months, in the estate sector Sri Lanka.

METHODS

Children aged 12-23 months and born during 2022/23 in the estate sector were studied. A sample of 636 term-born children was assessed. Heights and weights of children and their mothers and fathers were measured. Other data were obtained by interviewing mother and from health records. Stunting was defined as HAZ<-2.0 according to WHO growth standards.

RESULTS

In the sample majority of mothers were less than 35 years of age, and belonged to the poorer weight quintiles. Of the children, 20.8% had a birth weight less than 2.5 kg. Currently 28.5% of children were stunted (HAZ<-2.0), and 12.3% were wasted (WHZ<-2.0). The prevalence of stunting was higher among boys, those born with a low birth weight, born at lower gestational age, having persistent growth faltering during 4 to 5 months and not having minimum dietary diversity. Mean maternal heights in stunted and non-stunted children were 150.1 cm and 153.1 cm, ($p<0.001$) and paternal heights were 163.6 cm and 165.8 cm ($p<0.001$), respectively. Multivariate regression analyses revealed maternal and paternal heights as significant predictors of stunting independent of sex, birth weight and age categories.

CONCLUSIONS

Maternal and paternal heights determine linear growth failure in children in estate sector after adjusting for sex, age, birth weight category. Maternal and paternal height are often used as indicators of genetic potential for height. If both parents are shorter, their children may have a lower potential height, regardless of environmental factors. While the parental heights play a role in determining child growth potential, environmental factors are modifiable and need to be addressed and improved to reach each child's 'fullest' potential.

SOAP49_06

SYSTEMATIC REVIEW AND META-ANALYSES ON THE EFFECTS OF ASPARTAME ON GLUCOSE, INSULIN AND APPETITE-REGULATING HORMONES

Lucy Boxall[1]; Fatemeh Eskandari[1]; Julie Wallis[1]; Aleksandra Bielat[1]; Katherine Appleton[1]
[1]Psychology, Bournemouth University, Bournemouth, United Kingdom

BACKGROUND AND OBJECTIVES

Controversy around the role of aspartame (E951) in healthy diets, physical health and non-communicable disease continues [1-3]. Some of this controversy is based on some proposed actions of aspartame on appetite regulation [2,3]. This work sought to systematically identify and summarize all studies investigating an effect of aspartame on glucose, insulin and appetite-regulating hormone responses.

METHODS

Following registration of our protocol (PROSPERO ID: CRD42024540781), five academic databases and four trial registries were searched over all years of records, and supplemented with additional searches, to identify as many relevant articles as possible. Search hits were screened by two independent reviewers, and data were subsequently extracted for all included articles and combined.

RESULTS

Our searches were completed from June – Sept. 2024. Systematic processes resulted in the identification of 101 articles of relevance to our research questions. These articles reported on 100 different experiments, 79 of which lasted for less than 1 day in duration, 8 experiments lasted 2-30 days and 13 experiments lasted for more than 30 days. Ninety experiments involved healthy adults, 3 experiments included adults with aspartame sensitivity and 12 experiments involved adults with compromised glucose metabolism in the form of diabetes mellitus. Experiments varied widely in aspartame provision and comparator/s, and while almost all assessed glucose and/or insulin responses, few experiments investigated other appetite-regulating hormones. Meta-analyses of acute crossover studies revealed little to no effects of aspartame on glucose or insulin responses when compared with vehicle or other low-calorie sweeteners (LCS), and lower blood glucose and insulin levels when compared with sugars, other carbohydrates or other nutritive elements. Over the medium-term, effects were reduced and became inconsistent. In long-term studies, no effects of aspartame consumption were found, but high heterogeneity between studies remained. Comparable effects were also found in those with aspartame sensitivity and compromised glucose metabolism.

CONCLUSIONS

Our findings suggest little to no effects of aspartame consumption on glucose metabolism over the short- or longer-term. Further studies over the long-term, investigating a range of appetite-regulating hormones, and comparing aspartame with other LCS would be of value.

BACKGROUND AND OBJECTIVES

Suboptimal gestational weight gain (GWG) is a measure of poor pregnancy health and fetal growth, and may lead to adverse pregnancy outcomes. There is limited data on this association from low-income settings.

METHODS

We conducted secondary analysis of a randomized controlled pragmatic effectiveness study of balanced energy protein supplementation in rural Amhara, Ethiopia (ISRCTN15116516). Pregnant women were enrolled at ≤24 weeks gestational age and followed up at monthly antenatal care visits until birth. Total GWG was calculated as weight from enrollment until last ANC visit, and the weekly GWG rate as the total GWG divided by the number of weeks between first and last weight measure. GWG was categorized into tertiles (reference: lowest GWG group). The associations between GWG and birth outcomes were tested using logistic regression for dichotomous outcomes of low birth weight (<2500g), small-for-gestational age (SGA), large-for-gestational age (LGA), and stillbirth, and linear regression for continuous outcomes of length, weight, length-for-age (LAZ), and weight-for-age z-scores (WAZ). Multivariate models adjusted for maternal enrollment gestational age (GA) and weight, imbalanced baseline covariates, and clustering by health center.

RESULTS

Women in the highest tertile of GWG rate had lower odds of delivering a low birth weight (Odds Ratio [OR]=0.54 [95% CI: 0.30, 0.99]) or SGA baby (OR=0.46 [95%CI: 0.35, 0.61]), compared to those in the lowest tertile. Infants born to women in the top tertile of GWG rate had higher infant birth weight (123 g (95%CI: 63, 183]), LAZ (0.25 z (95%CI: 0.03, 0.48)), and WAZ (0.42 z, 95%CI: 0.31, 0.52). There was no association with stillbirth and length.

CONCLUSIONS

Higher total GWG and GWG rate were associated with lower odds of low birthweight and SGA, and higher birthweight, LAZ and WAZ in rural Ethiopia.

SOAP49_08

WORKPLACE BREASTFEEDING SUPPORT IN LOW- AND MIDDLE-INCOME COUNTRIES: A SCOPING REVIEW OF LITERATURE SINCE 2016

Bongekile P. Mabaso[1]; Catherine Pereira-Kotze,[2]; Tanya Doherty[3]
[1]Dietetics and Human Nutrition, University of KwaZulu-Natal - Pietermaritzburg Campus, Pietermaritzburg, South Africa; [2]Health Systems Research Unit, South African Medical Research Council, London, United Kingdom; [3]Health Systems Research Unit, South African Medical Research Council, Cape Town, South Africa

BACKGROUND AND OBJECTIVES

Despite global efforts to improve breastfeeding rates, workplace support remains a significant barrier, particularly in low- and middle-income countries (LMICs) where 85% of the global population resides. While workplace breastfeeding support has been well-studied in high-income countries, evidence from LMICs remains limited and fragmented, compromising maternal and child health outcomes and threatening global breastfeeding targets.

Objective: To comprehensively map the landscape of literature on workplace breastfeeding support in LMICs published since the 2016 Lancet Breastfeeding Series, examining the extent, range, and nature of available research.

METHODS

A systematic scoping review following PRISMA-ScR guidelines was conducted. Five electronic databases were searched for literature published between January 2016 and December 2024. The World Bank's income classification was used to determine LMIC status. Initial search yielded 20,696 articles, with 157 articles meeting inclusion criteria after thorough screening.

RESULTS

Preliminary RESULTS: Analysis of 108 articles reveals a steady increase in publications from 5 articles in 2016 to 19 in 2023. Studies span 24 countries, with strongest representation from Indonesia (13), Ghana (11), Brazil (10), and South Africa (8). Research methodologies evolved from predominantly quantitative studies in 2016-2019 to a more diverse methodological landscape by 2020-2024, including increased qualitative and mixed-METHODSapproaches. Key research themes included workplace facility assessment, maternity leave policy impacts, implementation of support programs, and cost-effectiveness analyses. Recent years show increased attention to informal sector workers and policy implementation studies.

CONCLUSIONS

While findings demonstrate growing research interest and methodological diversity in LMIC workplace breastfeeding support, significant gaps remain in informal employment contexts, multi-stakeholder perspectives, and intervention impacts. Urgent action is needed to generate context-specific evidence for effective policy and practice in LMICs.

BACKGROUND AND OBJECTIVES

The Developmental Origins of Health and Disease (DOHaD) theory has highlighted that parental characteristics during preconception have been associated with child's health and chronic diseases risks across the life course. While preconception research predominately focuses on maternal influence on offspring nutritional outcomes, the role of fathers remains underexplored. This study aimed to investigate the associations between paternal preconception BMI and child nutritional risk, including dietary intake and eating behaviors.

METHODS

This longitudinal cohort study included children aged 18 months to 5 years recruited from The Applied Research Group for Kids (TARGet Kids!), a primary care research network in Ontario, Canada. Nutritional risk was assessed using the Nutrition Screening for Every Preschooler/Toddler (NutriSTEP®), a parent-reported validated questionnaire. Two NutriSTEP® subscales—dietary intake and eating behaviors—were also analyzed. Mixed-effects models were employed to examine the relationship between paternal preconception BMI and child nutritional risk while adjusting for covariates, including paternal age, education, ethnicity, and family income. Child sex and age group were tested as effect modifiers.

RESULTS

A total of 146 children with 314 repeated NutriSTEP® observations were included, with a mean (SD) NutriSTEP® total score of 10.99 (5.27). The mean (SD) paternal preconception BMI was 26.82 (3.93), with 63.51% of fathers classified as overweight or with obesity (BMI ≥25 kg/m²). Higher paternal preconception BMI was positively associated with the NutriSTEP® total score (β = 0.25, 95% CI: 0.04–0.45, p = 0.02) and the dietary intake subscore (β = 0.15, 95% CI: 0.04–0.26, p = 0.006). After adjusting for potential confounders, the association for the dietary intake subscore did not change in a meaningful way (β = 0.12, 95% CI: 0.01–0.23, p = 0.03). RESULTS did not differ in any clinically substantial way by child sex or age group.

CONCLUSIONS

Higher paternal preconception BMI may be linked to poorer dietary intake in children, highlighting the potential importance of paternal health in early childhood nutrition and growth trajectories. Further evidence on paternal health needs to inform preconception care guidelines and early-life interventions to promote healthier behaviors in families.

USERS' PERCEPTIONS OF FOOD CHOICES AND PURCHASING BEHAVIOR IN FOOD/BEVERAGE DELIVERY APPS

Jamile Tahim[1]; Bibiana Moraes[2]; Ilana Bezerra[2]
[1]Graduate Program in Public Health, Ceará State University, Fortaleza, Brazil; [2]Graduate Program in Nutriton and Health, Ceará State University, Fortaleza, Brazil

BACKGROUND AND OBJECTIVES

The use of meal delivery apps (MDAs) represents an important phenomenon that is still poorly understood in terms of its influence on individuals' food choices. The aim of this study was to understand perceptions covering influences on food choices and food/beverage purchasing behavior in MDAs.

METHODS

This is a qualitative study with 11 users of food/beverage delivery apps (≥18yrs; 18.2% men) who took part in an online Focus Group (FG) via the Google Meet web conferencing platform. The participants were selected by public invitations in the digital sphere and included individuals from each of the five regions of Brazil: North, Northeast, Midwest, South and Southeast. Transcription was carried out in Microsoft Office, with audio checking and exploratory reading, and thematic analysis was used, generating the following themes: food availability, cost and desirability, based on the theoretical framework of the digital food environment (DFE) dimensions. The research was approved by the Research Ethics Committee of the State University of Ceará (#6.542.4).

RESULTS

The FG was conducted synchronously and lasted 78 minutes. The availability of food was related to the diversity of types of ready-to-eat food and the possibility of eating what is not prepared at home, ranging from healthy foods to combos that were cited as unhealthy options (pizza and sandwiches with soft drinks). Convenience was perceived as the ease of ordering ready-made food at any time, saving time and effort, especially on days when meals are not planned at home. Cost was perceived in relation to price and marketing, with emphasis on promotional items, accumulation of points and rewards with purchases, being an aspect pointed out as influencing the purchase of food/beverages. Desirability was associated with the intention to buy items that generate feelings of pleasure and emotional compensation when eating.

CONCLUSIONS

This study highlighted the need for public policies and regulations aimed at the digital food environment in order to increase the supply and sale of healthy food at affordable prices and reduce the rewards and benefits associated with unhealthy food. Actions are also needed to deal with the complexity of obstacles in home meal preparation that favor the acquisition of unhealthy items by MDAs.

Malnutrition in children under 1 in Afghanistan- a mixed-METHODSstudy to explore causes and needs of children and caregivers

Giulia Scarpa[1]; Javad Mohammadi[2]; Amber Alayyan[1]; Atefe Rasouli[2]; Aman Rahimi[2]; Thomas Roederer[1]; Jessica Sayyad[1]
[1]Public Health, Epicentre Medecins Sans Frontieres, Paris, France; [2]Public Health, Medecins Sans Frontieres, Herat, Afghanistan

BACKGROUND AND OBJECTIVES

Malnutrition in children is very high in Afghanistan, and the situation has worsened in recent years (1, 2). More than 45% of malnourished children accessing MSF health facilities in Herat were aged less than 6 months in 2022. However, the causes of malnutrition in children under 1 were unclear. The aim of this work was to identify and explore the causes and the needs of moderately and severely malnourished children aged 0-11 months living in Herat Province and neighboring provinces by caregivers and health care workers.

METHODS

To achieve this, we conducted a mixed METHODSstudy in two phases, including program data from the health facilities in Herat (Afghanistan) collected between August and September 2022, and in-depth interviews with caregivers of malnourished and non-malnourished children, and key informants conducted between January and June 2023.

RESULTS

Two hundred fifty-nine questionnaires were analyzed. Fifty-four percent of the malnourished children accessing MSF health facilities were girls. Sixty-seven percent of the mothers reported to breastfeed their children under 1 at the time of the interview, however they thought that the time was inadequate or the quantity of milk inappropriate. Only 18% of the mothers exclusively breastfed their child in the first six months of life. More than half (64%) of the mothers perceived to not have enough food to eat for them, and 21% for their children. Poverty, unemployment and schools closure were perceived as the main key drivers contributing to the decrease of women empowerment with a direct effect on young child nutrition. Caregivers reported that young children's diet was poor and very limited in fruits and vegetables. Women reported to not be supported while caring for their children, including for breastfeeding. Additionally, mothers said to be malnourished during pregnancy, and feel depressed and lonely since the beginning of the pregnancy.

CONCLUSIONS

This work contributes to the field of global public health and nutrition in a prolonged crisis context. Insights from our research include: 1) Strengthening education, and health promotion on breastfeeding and child nutrition, including Infant and Young Child Feeding (IYCF) experts and local nutritionist, 2) supporting mothers to breastfeed longer and exclusively in the first six months of life, and 3) guaranteeing psychological support to women before and after pregnancy to prevent maternal depression, and better look after their babies.

ULTRA PROCESSED FOOD, NUTRIENT INTAKE AND RISK OF ADVERSE PREGNANCY OUTCOMES

Sivan Ben Avraham[1]; Sivan Yochpaz,; Yam Nof,; Dana Lihi Gal,; Ida Michnik,[2]; Laurence Mangel,; Dror Mandel,[3]; Ronit Lubetzky,[3]; Danit R. Shahar,[1]
[1]Department of epidemiology, biostatistics and community health sciences, Ben Gurion University of the Negev, Be'er Sheva, Israel; [2]Dana-Dwek Children's Hospital, The Nutrition & Dietetics Unit, Tel Aviv Sourasky Medical Center, Tel Aviv-Yafo, Israel; [3]Dana-Dwek Children's Hospital, Departments of Neonatology and pediatrics, Tel Aviv Sourasky Medical Center, Tel Aviv-Yafo, Israel

BACKGROUND AND OBJECTIVES

Maternal nutrition in pregnancy has an influence on both short and long-term health outcomes of mother and child. Ultra-Processed Food (UPF) intake was previously associated with lower dietary quality, additionally concerns have been raised regarding the potential presence of endocrine-disrupting chemicals (EDCs) in UPF. Anogenital distance can serve as a marker for endocrine disruption in-utero.

METHODS

A cohort of 290 mothers was enrolled between March-2023 and December-2024, and followed for one month postpartum. Data collection included sociodemographic and lifestyle questionnaires, a Food Frequency Questionnaire (FFQ) modified to enhance measurement accuracy of food processing, clinical data and anogential distance (AGD) measurements. Maternal urine and milk samples were collected one month postpartum. The NOVA classification was used to classify foods by their degree of processing and mothers with high UPF intake in terms of percent of energy (eUPF) and percent of total food weight (wUPF) were compared to those with low intake.

RESULTS

Of 204 mothers completing the questionnaires those in the top quartile of eUPF (Q4) consumed 41% compared with 21% in quartiles 1-3 (Q1-3), and wUPF-Q4 consumed 19% vs. 6% in Q1-3. eUPF-Q4 mothers were more likely multipara (72% vs. 55%) had assisted or c-section delivery (35% vs. 18%) and a higher birth weight (BW) infant (mean$\pm$sd: 3415$\pm$398 vs. 3272$\pm$389 g) compared to Q1-3 ($p<0.05$ for all). Energy intake was similar but eUPF-Q4 mothers consumed more carbohydrates, and less potassium, vitamin C, folate and % energy from protein, ($p<0.05$ for all). More mothers in the wUPF-Q4 were underweight (8% vs. 5%) or obese (14% vs. 4%) compared to wUPF-Q1-3 ($p<0.05$). Male infants born to eUPF-Q4 mothers had a shorter average anopenile distance than those born to Q1–Q3 mothers (46.5±10.6 vs. 49.6±7.1 mm), but the difference was not significant ($p = 0.2$). In a model controlling for pre-pregnancy BMI, maternal age, infant BW and week of birth, for every 1% increase in eUPF the risk for assisted or c-section delivery increased by 5%.

CONCLUSIONS

UPF consumption was associated with unfavorable dietary profile and with adverse pregnancy outcomes. Associations with markers of endocrine disruptions were not statistically significant and require further research.

WEIGHT GAIN DURING KEY DEVELOPMENTAL PERIODS AND BIOLOGICAL AGE ACCELERATION IN YOUNG ADULTHOOD: EVIDENCE OF SEX-SPECIFIC ASSOCIATIONS IN A YOUNG FILIPINO COHORT

Romaniya Voloshchuk[1]; Linda Adair,[1]; Nanette Lee,[2]; Christopher W Kuzawa[3]
[1]Nutrition, University of North Carolina at Chapel Hill, Chapel Hill, United States of America; [2]Office of Population Studies, University of San Carlos - Talamban Campus, Cebu City, Philippines; [3]Human Evolutionary Biology Search, Harvard University, Cambridge, United States of America

BACKGROUND AND OBJECTIVES

Epigenetic clocks [ECs] use DNA methylation to estimate biological age. Biological age acceleration [AgeAccel] predicts morbidity and mortality. Low birth weight and high adiposity in adolescence and adulthood are associated with AgeAccel. We aimed to test the association of weight gain relative to growth trajectory with AgeAccel estimated by commonly-used ECs and their combination at age 21yrs in a young Filipino population.

METHODS

We used data from the Cebu Longitudinal Health and Nutrition Survey from 1983 to 2005 (n=1,745, 47% female). Relative weight gain [RWG] during key time intervals (0-6mo, 6mo-1yr, 1-2yrs, 2-8.5yrs, 8.5-11yrs, 11-15yrs, 15-18yrs, and 18-21yrs) was represented by standardized residuals derived from regressing weight on all previous weight and height (length up to 2yrs) measurements and concurrent height. AgeAccel was represented by six ECs: Horvath, Hannum, PhenoAge, GrimAge, DNA methylation estimator of telomere length [DNAmTL], and Dunedin Pace of Aging [DunedinPACE]. We also created FactorAge using factor analysis of these six ECs. We used multivariate regression to test the association of relative weight gain and AgeAccel. Adjusted models included the following covariates: smoking, average lifetime household wealth index, white blood cell proportions, and parity and total months breastfeeding in females. Final analyses were stratified by sex and adjusted for multiple comparisons using the Benjamini-Hochberg method.

RESULTS

In males, we found statistically significant associations between RWG 6mo-1yr and Hannum, DNAmTL, DunedinPACE, and FactorAge, and between RWG 11-15yrs and Hannum, GrimAge, PhenoAge, and FactorAge in unadjusted models. In adjusted models, one standard deviation [1SD] RWG 11-15yrs corresponded to 0.07 (95% CI: 0.01, 0.14) SD FactorAge. In females, we found statistically significant associations between RWG 11-15yrs and PhenoAge, DunedinPACE, and FactorAge and RWG 18-21 and all ECs, except Horvath in unadjusted models. In adjusted models, 1SD RWG 11-15 yrs was associated with 0.09 (95% CI: 0.04, 0.15) DunedinPACE and 1SD RWG 18-21yrs – with 0.08 (95% CI: 0.01, 0.15) SD FactorAge and 0.10 (95% CI: 0.04, 0.15) SD DunedinPACE, respectively.

CONCLUSIONS

We did not find associations between gaining weight faster than expected given growth trajectory in childhood and AgeAccel at 21yrs, but our RESULTS support the association of recent weight gain and AgeAccel in early adulthood in females. Inquiries into the timing of puberty may elucidate the association between RWG 11-15yrs and AgeAccel in males.

SOAP49_16

EXAMINATION OF FOOD SECURITY AND NUTRITION SECURITY STATUS BY DEMOGRAPHIC VARIABLES AMONG PARTICIPANTS IN THE SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS AND CHILDREN (WIC) IN VENTURA, CA, USA

Dena Herman[1]; Kana Ogaki[2]; Holly Wilhalme[3]
[1]Family and Consumer Sciences, California State University, Northridge, Los Angeles, United States of America; [2]Center for Nutrition and Health Impact, (CNHI), Omaha, United States of America; [3]General Internal Medicine, UCLA, Los Angeles, United States of America

BACKGROUND AND OBJECTIVES

The definition of food security (FS) is a household's ability to have access at all times to enough food for an active, healthy lifestyle (ERS, 2024). The concept of nutrition security (NS) expands this understanding by going beyond the concept of adequacy and assessing a household's ability to obtain foods that meet their nutrition and health needs and dietary preferences, considering dietary quality, affordability and food safety (CNHI, 2025). The objective of this study is to examine the relationship between food and nutrition security and identify the specific risk and protective factors that can be attributed to FS and NS among a population of low-resourced women and their families participating in the Special Supplemental Nutrition Program for Women, Infants and Children (WIC), living in Ventura, CA.

METHODS

In addition to providing demographic data, study participants (n=984) were administered the 6-item, U.S. Food Security Survey Module (USDA, 2024) and the Center for Nutrition in Health Impact (CNHI, 2025) Food and Nutrition Security Related Measures as part of a cross-sectional study examining usage of WIC Farmers Market Nutrition program benefits. Descriptive and bivariate analyses were conducted to examine the association between demographics and food and nutrition security. Multinominal logistic regression was used to further explore demographics and nutrition security-related measurement predictors for food and nutrition security.

RESULTS

A total 20.9% of study participants reported experiencing both food insecurity and nutrition insecurity (FI/NI), 1.5% reported experiencing FS and NI (FS/NI), 39.7% reported experiencing FI and NS (FI/NS), and 37.8% reported experiencing FS and NS (FS/NS). Language, educational attainment, race, income level, and household size were associated with the four categories of food and nutrition security ($P<0.05$). Multinomial analyses showed that those who reported earning <$20,000/year had 0.279 (CI:0.097, 0.802) times lower odds of being FS/NS compared to those who made >$60,000/year. English speakers also had 0.518 (CI: 0.313, 0.858) times lower odds of being FS/NS versus Spanish speakers.

CONCLUSIONS

Further studies are needed to identify protective factors that prevent food and nutrition insecurity among people in low-resource settings, which can inform program and policy strategies to address food access and food quality for low-resourced populations.

SOAP 52 - PUBLIC HEALTH AND NUTRITION THROUGHOUT LIFE CYCLE

SOAP52_01

LONG-TERM EFFECTS OF MULTIPLE MICRONUTRIENT SUPPLEMENTATION DURING PREGNANCY, LACTATION, AND EARLY CHILDHOOD ON COGNITIVE DEVELOPMENT: SYSTEMATIC REVIEW

Souheila Abbeddou[1, 2, 3]; Dimitrios Petalios[4]; Paolo Sarfatti[4]; Alice Deshons[5]; Mélanie Broin,[5]; Carl Lachat[4]
[1]Public Health and Primary Care, Ghent University, Ghent, Belgium; [2]College of Medicine and Health Sciences, Arba Minch, Arba Minch, Ethiopia; [3]IMCAN, Infant, Maternal, Child, and Adolescent Nutrition, Ghent, Belgium; [4]Food Technology, Safety, and Health, Ghent University, Ghent, Belgium; [5]Nutrition Research Facility, Agropolis International, Montpellier, France

BACKGROUND AND OBJECTIVES

Biological and environmental factors like inadequate nutrition, poor health care, and suboptimal environmental motivation limit early childhood development and academic potential. Evidence shows that maternal micronutrient supplements (MMS) improve birth outcomes, and micronutrient powders (MNPs) enhance anemia and iron levels in children aged 2–12, but their impact on cognition remains unclear. This systematic review evaluates the long-term cognitive effects of maternal MMS and early childhood point-of-use MNPs on children aged 4–14 years in low- and middle-income countries.

METHODS

We conducted a systematic search of published articles using the following databases: MEDLINE (PubMed), EMBASE, CENTRAL (Cochrane Library), Web of Science, CINAHL, SCOPUS, and Google Scholar. The review included randomized controlled trials that evaluated the long-term effects of maternal MMS and MNPS during early childhood on cognitive, motor, and behavioral development in children and adolescents aged 4–14 years. Search records were exported to EndNote and subsequently imported into Covidence. Covidence was used to remove duplicates, conduct title and abstract screening, and data extraction.

RESULTS

A total of 8,815 records were identified through six databases and grey literature searches. Ten studies were included in the systematic review: six focused on maternal supplementation during pregnancy, three on early childhood interventions, and one on both. In addition to cognitive development, five studies reported on motor development, and five studies on behavioral development and mental health. Most studies were conducted in Asia, with one reporting on two interventions in Tanzania and another in Peru. The included studies were (cluster)-randomized controlled trials, with sample sizes ranging from 184 to 2,879 participants. Although most findings were not statistically significant, the two largest studies on maternal MMS using the UNIMMAP formulation suggested potential long-term benefits for children's cognitive development. There were concerns regarding power of several studies to show a meaningful difference. Evidence on point-of-use MNPs during early childhood was insufficient to draw definitive CONCLUSIONS about their effects or absence of effects.

CONCLUSIONS

Maternal MMS during pregnancy and lactation did not show significant long-term effects on child development. However, few studies suggested potential associations with cognitive development. Overall, evidence on the long-term effects of maternal MMS and the point-of-use MNPs on cognitive development is limited, emphasizing the necessity for further research.

NUTRITION CARE PROCESS IMPLEMENTATION AND ASSOCIATED DETERMINANTS IN THE SCANDINAVIAN REGION; AN INIS 2023 UPDATE STUDY

Gideon Iheme[1, 2]; Evelina Liljeberg,[1, 3, 4]; Ylva Orrevall,[5, 6]; Lovestam Elin,[1]
[1]Food Studies, Nutrition and Dietetics, Uppsala University, Uppsala, Sweden; [2]Human Nutrition and Dietetics, Michael Okpara University of Agriculture Umudike, Umuahia, Nigeria, Federal Republic of; [3]Women's and Children's Health, Uppsala University, Uppsala, Sweden; [4]Geriatrics, Rehabilitation Medicine and Pain Centre, Uppsala University Hospital, Uppsala, Sweden; [5]Clinical Nutrition, Medical Unit Women's Health and Allied Health Professionals Theme, Karolinska University Hospital, Solna, Sweden; [6]Medicine, Karolinska Institutet, Huddinge, Sweden

BACKGROUND AND OBJECTIVES

The Nutrition Care Process (NCP) and Terminology (NCPT) is globally recognized as a standardized model that facilitates good nutritional practices and outcome evaluation in clinical nutrition care. According to our previous INIS (International Nutrition Care Process and Terminology Implementation Survey) study from 2017, regular use of the NCP among Scandinavian dietitians ranged from 40% to 56%, while terminology implementation was lower (16-36 %). The INIS 2023 Update Study aims to build on the previous study to provide an updated picture of the Nutrition Care Process implementation and associated determinants among registered dietitians in the Scandinavian region.

METHODS

This cross-sectional study employed a convenience sampling approach to electronically distribute validated questionnaires to 461 registered dietitians in Denmark, Norway and Sweden. Extent and length of NCP implementation were assessed and scores categorized into five levels ranging from "very low implementation" to "very high implementation". Attitudes were assessed with the respondents indicating their agreement with statements on a Likert scale between 1-5. Participants were also asked to indicate implementation barriers and enablers. Descriptive statistics, together with chi-square and Kruskal Wallis tests were computed for the categorized and continuous variables.

RESULTS

In this 2023 update study, 59% of respondents reported high NCP (process) implementation and 37% indicated high NCPT (terminology) use. Sweden consistently showed higher process and terminology implementation, followed by Denmark and Norway. A high median score (4-5) of respondents NCP/NCPT attitude was reported. Key enablers of NCP/NCPT implementation included the presence of a designated leader (61-80%), sufficient practice time (67-86%), electronic health record (EHR) support (63-90%), and conducive workplace settings. Barriers varied by country: Norway faced challenges with limited financial support (71%) and knowledge gaps (69%); Sweden cited lack of time (78%) and training (81%); while Denmark highlighted insufficient training (73%) and limited management support (74%).

CONCLUSIONS

NCP Implementation appear to have increased slightly overtime, while still terminology use remains implemented to a lower extent compared to the working process. Given the variation in barriers across countries, tailored strategies are needed to address different regional needs.

THE EFFECT OF HEALTHY DIETARY INTERVENTIONS ON PHYSICAL ACTIVITY, SCREEN TIME, AND SLEEP IN ADULTS WITH OVERWEIGHT OR OBESITY

Guiomar Masip[1, 2, 3, 4]; Mª Isabel Benedicto-Toboso[3, 4, 2, 1]; Alicia Larruy-García[1, 2, 3, 4]; Isabel Rueda-De Torre[2, 1, 3, 4]; Ivie Maneschy,[1, 2, 3, 4]; Luis Moreno Aznar[1, 2, 3, 4]; María L. Miguel-Berges[2, 1, 3, 4]
[1]Growth, Exercise, Nutrition and Development (GENUD) Research Group, University of Zaragoza Spain, University of Zaragoza, Zaragoza, Spain; [2]Instituto de Investigación Sanitaria de Aragón (IIS Aragón), Zaragoza, Spain., Instituto de Investigación Sanitaria de Aragón (IIS Aragón), Zaragoza, Spain., Zaragoza, Spain; [3]Centro de Investigación Biomédica en Red de Fisiopatología de la Obesidad y Nutrición (CIBERObn), Instituto de Salud Carlos III, Madri, Spain; [4]Instituto Agroalimentario de Aragón (IA2), Universidad de Zaragoza-CITA, Zara, Spain

BACKGROUND AND OBJECTIVES

Diet quality is a key determinant of obesity risk. Prior evidence suggests that dietary interventions may also impact lifestyle behaviors, such as physical activity, sleep duration and sedentary behavior. Hence, understanding the relationship between diet quality and lifestyle behaviors is of utmost importance to create effective strategies to manage weight gain and improve overall health. Our aim was to evaluate the impact of three dietary interventions on lifestyle factors in participants with overweight or obesity during a 12-week randomized controlled trial.

METHODS

A randomized controlled trial was conducted with 45 participants recruited at baseline, of whom 37 completed the 12-week intervention. Participants were randomly assigned to one of three dietary interventions: a calorie-restricted Mediterranean diet, a low-carbohydrate diet, or a high-protein diet. Lifestyle factors, including physical activity, sleep duration, and screen time, were assessed using questionnaires administered before and after the intervention. Mean values for lifestyle factors were calculated for both pre- and post-intervention periods, and t-tests were used to assess mean difference.

RESULTS

Participants in the calorie-restricted Mediterranean diet and low-carbohydrate diet groups showed significant improvements in physical activity and reductions in screen time after the intervention. The Mediterranean diet group increased physical activity by 1825.9 METs/week (p=0.001), while the low-carbohydrate diet group increased it by 146.5 METs/week (p=0.01). Screen time was reduced by 25.9 minutes/day (p=0.002) in the Mediterranean diet group and by 54.74 minutes/day (p=0.001) in the low-carbohydrate diet group. No changes were observed in sleep duration.

CONCLUSIONS

Adherence to healthy dietary interventions, such as the calorie-restricted Mediterranean diet and the low-carbohydrate diet, have positive effects on lifestyle factors, such as physical activity and screen time, even though they were not the primary focus of the intervention. Although no significant changes were observed in sleep duration, these findings highlight the potential for dietary interventions to influence multiple aspects of lifestyle, which may contribute to improved health outcomes in individuals with overweight or obesity.

DIETARY BEHAVIOUR OF PREGNANT WOMEN IN ETHIOPIA: THE MISSING ASPECT OF CARE

Simegn Alamirew[1]; Stefanie Lemke[1]; Barbara Stadlmayr[2]
[1]BOKU University, Department of Agricultural Sciences, Institute for Development Research, Vienna, Austria;
[2]Institute for Development Research, Universität für Bodenkultur Wien (BOKU), Wien, Austria

BACKGROUND AND OBJECTIVES

Nutrition and adequate dietary intake have a profound impact on both maternal health and the physical and cognitive development of the fetus [1,2] Understanding the determinants that shape dietary behaviour of pregnant women is essential for promoting healthy diets during pregnancy. Dietary behaviour refers to all phenomena related to food choice, eating behaviour and dietary intake [3,4].

METHODS

A mapping review was conducted using three databases, including studies published between 2000 and 2022. An innovative adapted socio-ecological framework [5] integrated with the UNICEF framework on maternal and child nutrition[6] was employed to categorize emerging factors.

RESULTS

A total of 68 factors influencing dietary behaviour of pregnant women were identified The focus was at the intrapersonal/individual (31/68) and the interpersonal/household (21/68) level, while factors at the community (11/68) and the institutional level (5/68) were scarce. We identified a research gap concerning the various aspects of care for women, particularly in relation to socio-cultural aspects, such as gender roles, decision-making power and workload of women, psychological factors and eating practices related to food taboos. None of the studies investigated the influence of resources at institutional level.

CONCLUSIONS

The focus in maternal nutrition is still placed on the individual responsibility of women, instead of addressing the structural conditions that would enable women access to resources such as land and education. Further research should consider the interconnections of factors at all levels of the socio -ecological framework and place an emphasis on care for women and healthy environments.

SOAP52_07

RISK FACTORS ASSOCIATED WITH UNDERNUTRITION AMONG 6- TO 23-MONTH-OLD RURAL INFANTS AND YOUNG CHILDREN IN A DISTRICT OF HELA PROVINCE IN PAPUA NEW GUINEA: A CROSS-SECTIONAL STUDY

Hellen Pebe[1, 2]; Elias Namosha[1]; Georgia Guldan[1]
[1]School of Medicine and Health Sciences, Division of Public Health, University of Papua New Guinea, Port Moresby, Papua New Guinea; [2]Public Health Directorate, Hela Provincial Health Authority, Tari, Hela Province, Papua New Guinea

BACKGROUND AND OBJECTIVES

Inadequate complementary feeding contributes to children's undernutrition, widespread issues affecting child health in Papua New Guinea (PNG). Internationally recommended infant and young child feeding (IYCF) practices, about which little are known in PNG, promote healthy nutritional status. This cross-sectional study aimed to characterize children's diets and explore associations between complementary feeding behaviors and indicators and child, caregiver and other characteristics and child undernutrition.

METHODS

Health-facility-based interviews provided information from a convenience sample of 144 caregiver-child pairs of 'healthy' children aged 6-23m and caregivers (94% mothers) aged 14-37y in rural areas of one Hela province district. Anthropometric measurements (lengths and weights) of the children were also performed according to standard procedures. WHO/UNICEF caregiver and child food groups consumed yesterday were elicited and IYCF Indicators calculated to understand child diets. Pearson's chi-square tests assessed associations between IYCF Indicators and other household characteristics and behaviors and undernutrition (stunting, underweight and wasting).

RESULTS

Stunting, underweight, and wasting were found in 36.8, 11.1 and 6.9% of the children, respectively. IYCF Indicators were unsatisfactory, with minimum dietary diversity achieved by only 24 (16.7%), minimum meal frequency by 38 (26.4%) and minimum acceptable diet by 12 (8.3%) children. Sweet potatoes, other vegetables, instant noodles and oil were the most commonly eaten foods by both children and caregivers. Stunting was associated with having grandmother or other adoptive caregiver (p=0.024), longer walk time to health center $\geq$2h (p=0.009), father not residing continuously at home (p=0.047), ZVF consumption (p=0.016). Underweight was associated with less educated fathers (p=0.024), caregivers having >1child under 2y (p=0.015), female sex (17.3%girls vs 7.3%boys; p=0.015). Wasting was associated with early ISSSF (p=0.006).

CONCLUSIONS

Very suboptimal complementary feeding with inadequate dietary diversity and feeding frequency, few Vitamin A-rich vegetables and animal proteins offered evidence to guide urgently needed targeted IYCF nutrition-specific interventions to improve IYCF practices and nutritional status of children aged 6-23 months in rural Hela province. Potential exists for improvement through evidence-based integrated approaches disseminating IYCF guidelines.

SCALING UP ANTENATAL MULTIPLE MICRONUTRIENT SUPPLEMENTATION (MMS) IN AFRICA: A POSITION PAPER

Elisabeth Tshiama Mukendi[1]; Carolina Pereira[2]; Filomena Gomes[3, 2]; Mihaela Ciulei[2]; Rijuta Pandav[2]; Maurine Waudo[2]; Tarik Taye Birhanu[4]; Abeba Ayele[4]; Marti Van Liere[2, 5]; Saskia Osendarp[2, 5]; Monica Fox[6, 7]; Martin Mwangi[2, 5]

[1]Healthy Mothers Healthy Babies Program, Micronutrient Forum, Kinshasa, Congo, Democratic Republic of the; [2]Healthy Mothers Healthy Babies Program, Micronutrient Forum, Washington, D.C., United States of America; [3]NOVA Medical School, Universidade NOVA de Lisboa, Lisbon, Portugal; [4]Children's Investment Fund Foundation, Children's Investment Fund Foundation, London, United Kingdom; [5]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [6]International Health, Johns Hopkins University, Bloomberg School of Public Health, Baltimore, United States of America; [7]Program Quality and Impact (PQI) Team, Vitamin Angel Alliance, Goleta, United States of America

BACKGROUND AND OBJECTIVES

Maternal undernutrition in Africa remains a significant public health challenge,contributing to negative pregnancy outcomes, neonatal mortality, andperpetuating intergenerational cycles of poor health. Antenatal MultipleMicronutrient Supplementation (MMS), a cost-effective intervention recognizedglobally for its potential to improve maternal and neonatal health, reduces risks oflow birth weight, preterm birth, small for gestational age, and stillbirth whileoffering a $37 return for every $1 invested. Despite its benefits, MMS adoptionacross African countries remains suboptimal. This position paper synthesizes theoutcomes of the 2nd Africa Maternal Nutrition and MMS Technical Meeting: A PathToward Introduction and Scale-up of MMS in Africa, held in Nairobi, Kenya, fromthe 16th to 18th of October, 2024.

METHODS

The 3-day meeting convened more than 100 government representatives from 17 African member states, in addition to donors and experts, to align on a shared vision for MMS introduction and scale-up in Africa. We have analyzed the key messages of every activity of the meeting, including panels, presentations (from global experts and country representatives), and individual interviews, resulting in key recommendations.

RESULTS

The participants emphasized MMS integration into antenatal care (ANC) as a cornerstone of maternal nutrition strategies and identified actionable recommendations to overcome policy, supply chain, financing, and implementation barriers. The six key recommendations include 1) leveraging global advocacy opportunities (e.g., through a full endorsement of MMS by WHO), 2) adopting country-specific approaches for effective implementation of MMS, 3) building government ownership to ensure long-term sustainability, 4) strengthening the supply chain to ensure MMS availability aligns with national strategies and demand forecasts, 5) sharing knowledge and resources (comprehensive tools and funding mechanisms for MMS), and 6) integrating MMS into ANC services and community-based delivery platforms to ensure that MMS is not introduced or delivered as a stand-alone intervention.

CONCLUSIONS

Key messages of this position paper include the urgency of scaling MMS, the role of implementation science in tailoring programs to local contexts, and the need of regional collaboration to share lessons and facilitate progress. An additional "Call to Action" was established to provide a detailed roadmap to guide stakeholders in scaling up MMS as an urgent priority to enhance maternal and neonatal health, advance gender equality, and fulfill Africa's global health commitments.

EATING BREAKFAST DURING ADOLESCENCE HAS A POSITIVE IMPACT ON BODY MASS INDEX IN ADULTHOOD

Laurent BEGHIN[1]; Jules Morcel[1]; Nathalie Michels[2]; Stefaan De Henauw[3]; María L. Miguel-Berges[4]; Angela Polito[5]; Luis Moreno Aznar[6]; Frederic Gottrand[7]
[1]INFINITE, Hospital Center University De Lille, Lille, France; [2]Public Health, Ghent University, Ghent, Belgium; [3]Department of Public Health and Primary Care, Ghent University, Ghent, Belgium; [4]Growth, Exercise, Nutrition and Development (GENUD) Research Group, Universidad de Zaragoza, Zar, University of Zaragoza Faculty of Health Sciences, Zaragoza, Spain; [5]Nutrition, Agricultural Research Council Research Center on Food and Nutrition (formerly INRAN),, Roma, Italy; [6]GENUD (Growth, Exercise, Nutrition and Development) Research Group, Universidad de Zaragoza, Zaragoza, Spain; [7]INFINITE, Lille university hospital, lille, France

BACKGROUND AND OBJECTIVES

Overweight/obesity is a major worldwide public health concerns, closely linked to adolescent dietary habits. Although the importance of breakfast skipping is widely recognized, a significant proportion of adolescents tend to skip this meal, which may have long-term consequences on their body mass index (BMI). The primary aim of this study was to assess the influence of adolescent breakfast habits on adulthood BMI. The secondary aim was to assess the influence of adulthood breakfast habits on BMI and cardiovascular risk.

METHODS

A nested cohort of 182 adolescents (12.5 to 17.5 years) were clinically reassessed at adulthood (22 to 31 years). Four European centers took part in the study: Ghent (Belgium), Lille (France), Roma (Italy) and Zaragoza (Spain). Breakfast habits were collected at adolescence and adulthood during 3 days from 24-hour dietary recalls. BMI and cardiovascular factors such as PDAY (Pathobiological Determinants of Atherosclerosis in Youth risk score), and its blood parameters (HDL-cholesterol, Hb1Ac) were collected at adulthood. Data were analyzed using mean comparison and ANCOVA test, adjusted for age, gender, centers and socioeconomic status, with SPSS™ software. No artificial intelligence was used

RESULTS

Adulthood BMI was significantly lower: 23.05 ± 4.19 *kg/m2* (n=105) for adolescent who ate breakfast in adolescence comparing to whom did not: 25.58 ± 5.41 *kg/m2* (n= 45; p=0.003). PDAY, HDL-C and HbA1c were significantly lower in adulthood who ate breakfast both actually and during adolescence.

CONCLUSIONS

The lowest and favorable adulthood BMI were obtained for adolescent who ate breakfast daily in adolescence. Adults who ate breakfast both daily and during adolescence exhibit better cardiovascular factors. This study shown the beneficial role of eating breakfast for preventing overweight/obesity and cardiovascular health early in life.

SOAP52_11

DETERMINANTS OF MALNUTRITION IN MALAWI: AN ETHNOGRAPHIC STUDY

Natalie Roschnik[1]; Dee Jupp[2]; Danielle Stein[3]; Brenda Phiri[4]; Steven Ellis[5]; Lupafaya Phindile[6]; Melissa Gladstone[7]
[1]Programme Quality Impact, Save the Children, Annecy, France; [2]Na, Empatika, London, United Kingdom; [3]Na, Empatika, Johannesburg, South Africa; [4]Operations, Save the Children International, Lilongwe, Malawi; [5]Na, Empatika, Jakarta, Indonesia; [6]Programme Quality and Impact, Save, Lilongwe, Malawi; [7]Na, University of Liverpool, Liverpool, United Kingdom

BACKGROUND AND OBJECTIVES

In Malawi, 37% of children under five are stunted, and only 36% are developmentally on track. The Nurturing Care Framework identifies five domains that children need to survive and thrive: safe and nutritious food; responsive care; good health; learning opportunities and safety and security. The goal of this study was to understand the complex drivers of caregiving behaviours across the five nurturing care domains in the Ntcheu and Balaka districts of Malawi to inform multi-sectoral stunting prevention programmes.

METHODS

An ethnographic study using the Reality Check Approach was conducted in 12 rural households which all included a pregnant woman or a child under 2 years. Researchers immersed themselves in these households for four days and nights, gathering information through informal conversations, participation in daily activities, observations, and group sessions focused on specific topics, to understand current caregiving behaviours and the factors driving these behaviours. The data was analysed using a grounded theory and Framework Analysis Approach.

RESULTS

The study revealed that children in the four locations studied are not receiving the nurturing care they needed to grow and develop to their full potential. Key issues identified include poor maternal, child, and family diets; inadequate infant and young child feeding; poor hygiene; low utilization of health and nutrition services; and limited child stimulation and learning opportunities. These problems are influenced by chronic poverty, food insecurity, climate crises, gender inequality, poor maternal mental health, and low access to and quality of services.

CONCLUSIONS

The research underscores the need for a multi-sector approach to improve maternal and child nutrition and development. It also stresses the importance of understanding the contextual determinants of caregiving behaviours to inform multi-sector programmes and policies to prevent malnutrition. Without addressing these determinants, caregiving practices will not improve, and countries like Malawi will struggle to meet their SDG health, nutrition, and development targets.

TRENDS IN FOOD CONSUMPTION IN INDIA: INSIGHTS FROM HOUSEHOLD CONSUMPTION EXPENDITURE SURVEYS (HCES)

Mudit Kapoor[1]; Shamika Ravi,[2]; Rajan Sankar[3]; Gaurav Dhamija[4]; Neha Sareen[5]
[1]Economics and Planning Unit (EPU) & Member at CECFEE, ISI Delhi, New Delhi, India; [2]Economic Advisory Council to Prime Minister of India, EAC-PM, New Delhi, India; [3]Independent Consultant, CECFEE, Indian Statistical Institute, Delhi, India; [4]Development Economics, Indian Institute of Technology (IIT) Hyderabad, Delhi, India; [5]Center for Research on the Economics of Climate, Food, Energy and Environment (CECFEE), Indian Statistical Institute, Delhi, Delhi, India

BACKGROUND AND OBJECTIVES

In the past decade, India has witnessed notable changes in food consumption patterns, propelled by economic growth, urbanization, and a heightened focus on nutritional awareness. Utilizing unit-level data from the household consumption expenditure survey (HCES) 2011-12 and 2022-23, this study aims to analyse the changes in consumption patterns of fresh fruits, dairy products, flesh products, vegetables, and cereals.

METHODS

We use a multi-level random effects model to estimate the average quantity of a particular food group consumed per adult female equivalent (AFE) in 30 days. We further assess variations in food consumption over time, across sectors, consumption classes, states, and survey months. Our analytical sample includes 257,905 and 99,785 households from HCES 2022-23 and 2011-12, respectively, with available data on monthly per capita expenditure and cooking arrangements.

RESULTS

The RESULTS indicate a significant increase in the consumption of fresh fruits, meat, fish, eggs, and dairy products, accompanied by reduced cereal consumption across rural and urban areas. We also find significant state-wise variations and seasonal patterns.

CONCLUSIONS

These findings suggest that the evolving consumption patterns are likely to have significant implications for the agricultural sector nationwide, especially in terms of farmers' crop selection. Policymakers should emphasize on sustainable agricultural practices to support these changes and improve health outcomes.

SOAP52_13

INTEGRATED APPROACHES TO PREVENT MALNUTRITION UNDER FIVE YEAR CHILDREN IN LOW- AND MIDDLE-INCOME COUNTRIES

Samina Bakhtawar[1]; Rakhshanda Ishaque[1]; Akbar Rajani[2]
[1]Research and Program, Vital Pakistan Trust, Karachi, Pakistan; [2]CEO, VITAL PAKISTAN TRUST, Karachi, Pakistan

BACKGROUND AND OBJECTIVES

Malnutrition remains a critical public health challenge in Low- and Middle-Income Countries (LMICs), significantly contributing to morbidity and mortality. The 2018 National Nutrition Survey (NNS) highlighted Pakistan's triple burden of malnutrition, with 40.2% of children experiencing stunting, 17.7% suffering from wasting, and 28.9% classified as underweight, with Sindh exhibiting the highest prevalence of wasting (23.3%). To address this, a gender-responsive, community-based intervention was implemented to enhance service accessibility and improve nutritional outcomes.

METHODS
METHODSA community-based approach was implemented to provide primary healthcare including maternal and child outpatient care, immunization, and malnutrition management. Key activities included mass screenings, simplified treatment protocols, awareness campaigns, MIYCN counseling, breastfeeding support, and referrals to Nutrition Stabilization Centers (NSCs). Ready-to-use therapeutic food was provided to children, while pregnant and lactating women (PLW) and adolescent girls received iron and folic acid supplementation. Early Childhood Development (ECD) initiatives and community engagement strategies, such as family support groups and nutrition festivals, were also integrated.
RESULTS

Between December 2023 and May 2024, 54,792 children and 20,736 pregnant women were screened, identifying 2,327 severely malnourished children, of whom 126 were referred to Nutrition Stabilization Centers (NSCs). Additionally, 11,121 children were immunized, 5,216 received treatment under Integrated Management of Neonatal and Childhood Illness (IMNCI) protocols, and 11,190 pregnant women and 3,968 adolescents received Iron and Folic Acid supplementation. Community outreach efforts engaged 26,252 individuals through support groups, provided ANC, IYCF, and PNC counseling to 29,105 women, and raised awareness among 79,145 individuals through sessions and 153,535 via FM radio broadcasts. A total of 659 children were identified through family-led MUAC screening, with caregivers trained on MUAC measurement. Additionally, 20 focus group discussions were conducted to assess community perceptions and improve intervention strategies.

CONCLUSIONS

The project demonstrated the effectiveness of integrating preventive and curative measures, with community engagement playing a vital role in early identification, timely interventions including immunization uptake. Sustainable, long-term, and scalable strategies are essential to further reduce malnutrition and enhance child health outcomes in LMICs.

THE COST OF A NUTRIENT ADEQUATE DIET RELATIVE TO INCOME IN THE PHILIPPINES

Lynda O'Neill[1]; Petra Klassen Wigger[2]; Shu Wang[3]; Eric Scuccimarra[3]; Shweta Singh[4]; Fabio Mainardi[3]
[1]Nutrition and Digestion, Nestlé Institute of Health Science, Lausanne, Switzerland; [2]R&D Communications, Nestlé Research, Lausanne, Switzerland; [3]Health Data and Labs, Nestlé Institute of Health Science, Lausanne, Switzerland; [4]Nutrition and Digestion, Nestlé Institute of Health Science, Singapore, Singapore

BACKGROUND AND OBJECTIVES

The 2030 Sustainable Development Goal (SDG) 2 ('End hunger, achieve food security and improved nutrition and promote sustainable agriculture') highlights the importance of food security. Previous research developed a food security metric, the Cost of Nutrient Adequacy (CoNA) (Bai et al, 2021). We aimed to benchmark the CoNA in the Philippines relative to the expenditure on food per capita per day.

METHODS

The Philippines Household Income and Expenditure Survey from 2018, containing income and food purchases of a nationally representative sample of 147,718 households, for 1 year, was utilized. Purchases were mapped to local retail prices and nutrient composition. The CoNA was defined as the least-cost diet meeting requirements for energy and nutrients for women of reproductive age.

RESULTS

The CoNA was 3.57 Int$, and was driven largely by vitamin D, followed by potassium and calcium. The average expenditure on food per capita per day ranged from 1.98 Int$ (lowest income quintile) to 3.84 Int$ (highest income quintile). A constraint was then added to include rice (a fortified food) to achieve a more realistic diet. This resulted in the CoNA increasing by 43% as up to 320g (2 servings) a day of rice were included.

CONCLUSIONS

The CoNA remains out of reach for all but the wealthiest, with vitamin D being the most expensive nutrient followed by potassium. The affordability of micronutrients partially explains the deficiencies in this country and highlights the need for fortification beyond the current programs. Fortification may ultimately contribute to the realization of SDG 2.

SOAP52_16

NUTRIENT ADEQUACY RATIO (NAR) AND MEAN ADEQUACY RATIO (MAR) OF ESSENTIAL AMINO ACID INTAKE OF STUNTED AND NORMAL CHILDREN

Nia Wirawan,[1]; Umi Fahmida[2]; Ratna Chrismiari Purwestri[3]; Badriul Hegar[4]; Ina Timan[5]; Aria Kekalih[6]
[1]Department of Nutrition, Faculty of Health Science, Universitas Brawijaya,, Malang, Indonesia; [2]Nutrition, SEAMEO RECFON, Central Jakarta, Indonesia; [3]Forestry and Wood Sciences, Czech University of Life Sciences Prague, Prague, Czechia; [4]Pediatric, Fakultas Kedokteran Universitas Indonesia, Central Jakarta, Indonesia; [5]Clinical Pathology, Fakultas Kedokteran Universitas Indonesia, Central Jakarta, Indonesia; [6]Community Medicine, Faculty of Medicine Uni, Jakarta, Indonesia

BACKGROUND AND OBJECTIVES

Amino acids be the emerging nutrients that hypothesized to be associated with linear growth when many studies found that protein intake is considerably adequate and micronutrient intervention showed an unsatisfactory effect for linear growth improvement. Moreover, the prevalence of stunting in the food producing area are common, left the question on how is the intake of the children. A comparative cross-sectional study aimed to compare amino acid intake between stunted non-wasted (SNW) and non-stunted non-wasted (NSNW) children aged 12-23 months living in a rural agricultural area with high prevalence of stunting

METHODS

Nine-days self-estimated food record was applied to collect the amino acid intake of 151 children. The amino acid food databases from Japan food composition tables were incorporated. Nutrient Adequacy Ratio (NAR), a measure that expresses an individual's intake of a nutrient as a percentage (capped at 100%) of the corresponding recommended allowance for the amino acid, given the respondent's age and sex and mean adequacy ratio (MAR) calculated by averaging the NAR that quantifies the overall nutritional adequacy of a population based on an individual's diet using the current recommended allowance for a group of nutrients of interest was calculated.

RESULTS

The RESULTS showed that NAR and MAR of the essential amino acid using the prescriptive body weight of normal children tends to be higher than stunted children eventhough all essential amino acid requirement were met in both groups and no statistically diferences between groups.

CONCLUSIONS

This RESULTS lead to the question whether the current amino acid intake recommendation is still relevant for children living in deprived hygiene sanitation environment and where the enteric enteropathy disorder (EED) might be prevalent. The EED might resulted to not all the ingested amino acids can be absorbed and enter the blood stream as significant amounts of dietary amino acid are catabolized by enterocytes during first-pass metabolism and not effectively used for the growth of the children.

OVERWEIGHT AND OBESITY AMONG SCHOOL CHILDREN IN A CORRELATION WITH BODY COMPOSITION AND PHYSICAL ACTIVITIES

Ha Nguyen Thu[1]; Nga Thuy Tran[1]; Khanh Van Tran[1]; Tran Thanh Duong[2]
[1]Department of Micronutrients, National Institute of Nutrition, Hanoi, Vietnam; [2]Director , National Institute of Nutrition, Hanoi, Vietnam

BACKGROUND AND OBJECTIVES

Since the early adolescent years is a critical period to prepare children for the growth spurt associated with puberty, it is essential to understand the effects of nutritional status on growth potential. This study investigates the relationship between body composition, bone mineral density, and physical activity levels in 10-year-old children, focusing on overweight and obesity (O&O) status. The objective is to identify potential intervention strategies to reduce the burden of overweight and obesity while optimizing physical health in children.

METHODS

Children aged 10 years from three elementary schools in an urban area of Vietnam were assessed for nutritional status. A total of 120 children with a Body mass index-for-age (BAZ) score > 1 were categorized into the O&O group, while 120 children with $-1 \leq BAZ \leq 1$ were classified as the normal weight group. Body composition and bone mineral density (BMD) were evaluated using Dual-Energy X-ray Absorptiometry (DXA). Physical activity levels were monitored using GeneActive accelerometers worn on the wrist for one week.

RESULTS

Both O&O and normal weight children exhibited BMD levels lower than the age-specific average, with O&O children showing higher whole-body and leg BMD compared to their normal-weight peers (0,76 and 0,90 compared to 0,73 and 0,84 g/cm). The O&O children also had a higher body fat score and a lower lean score compared to the normal-weight group (2,47 to 2,01 and -3,44 to -4,36). In terms of physical activity, O&O children engaged in an average of 4.5 minutes of moderate- to vigorous-physical activity (MVPA) per day, while normal-weight children averaged 8.7 minutes per day. Notably, girls have very limited time participated in MVPA, only 1.9 minutes per day (O&O group) and 1.4 minutes per day (normal-weight group). O&O boys had significantly less MVPA than normal-weight boys (13.7 minutes versus 15.8 minutes per day).

CONCLUSIONS

This study suggests that urban children in Vietnam may face multiple health risks due to poor body composition and sedentary lifestyles. Both O&O and normal-weight children failed to achieve adequate BMD with the O&O group demonstrated higher level. In addition, both groups are still not in desirable body composition range for either fat or lean mass. Despite a school regimen requiring physical activity per 45-minute class, none of the children reached the World Health Organization's recommendation of 60 minutes of MVPA per day. These findings underscore the need for further evaluation of body composition and the promotion of physical activity in schools to prevent O&O and to enhance the well-being of adolescents.

SOAP02_07

INTERMITTENT FASTING DOES NOT IMPACT SLEEP QUALITY RELATIVE TO AD LIBITUM EATING IN OVERWEIGHT/OBESE ADULTS - A SYSTEMATIC REVIEW AND META-ANALYSIS OF RANDOMIZED CONTROLLED TRIALS

Yi Ning Yong[1]; Alan J. Mccubbin[1]; Denise M. O'driscoll[2, 3]; Marie-Pierre St-Onge[4]; Maxine P. Bonham[1]
[1]Department of Nutrition, Dietetics and Food, Monash University, Melbourne VIC, Australia; [2]Eastern Health Clinical School, Monash University, Melbourne VIC, Australia; [3]Department of Respiratory and Sleep Medicine, Eastern Health, Melbourne VIC, Australia; [4]Department of Medicine, Columbia University Irving Medical Center, New York, NY, United States of America

BACKGROUND AND OBJECTIVES

Overweight and obesity can result in poorer sleep quality and a significantly increased risk of developing obstructive sleep apnea (OSA), an additional risk factor for cardiovascular disease. Intermittent fasting (IF) regimens offer a less prescriptive, alternative strategy to improve weight and cardiometabolic health markers. While weight loss through caloric restriction and lifestyle modifications can improve sleep quality, the specific effect of IF, which may independently influence circadian rhythms, has not been previously investigated. This systematic review and meta-analysis assessed the independent effects of IF on sleep and cardiometabolic outcomes associated with OSA risk among adults with overweight/obesity (PROSPERO ID: CRD42024539606).

METHODS

A literature search was performed up to May 2024, and identified 12 randomized controlled trials (18 comparisons and 928 participants) that reported on sleep outcomes and compared IF (n=9 time-restricted eating (TRE); n=3 alternate-day modified fasting (ADMF)), versus *ad libitum* eating. Random effects meta-analyses were performed for primary (PSQI global score and sleep efficiency) and secondary outcomes (sleep duration, anthropometric measures, daily energy intake and blood pressure). Subgroup analyses were conducted based on IF mode/length of eating window.

RESULTS

Compared to *ad libitum eating*, IF produced a significantly greater reduction in weight (Mean difference: -2.2 kg; 95% CI: -3.0, -1.5), BMI (-0.7 kg/m2; -0.9, -0.4), fat mass (-1.5 kg; -1.9, -1.1), waist circumference (-2.4 cm; -3.2, -1.6), daily energy intake (-267 kcal; -404, -129), systolic (-1.6 mmHg; -2.8, -0.3) and diastolic blood pressure (-1.5 mmHg; -2.6, -0.4). Despite this, there were no changes from baseline for sleep quality, efficiency, or duration ($p>0.05$). Subgroup analyses showed greater reductions following ADMF and 6h-TRE for weight, BMI and fat mass (6h-TRE only) compared to 10h-TRE ($p<0.05$). Sleep quality was only assessed as a secondary outcome in 11/12 studies.

CONCLUSIONS

Compared to *ad libitum* eating, IF reduced body weight and improved cardiometabolic markers with no independent beneficial or detrimental effects on sleep quality. This data supports IF as an alternative option to continuous energy restriction in populations with obesity and sleep disorders, such as OSA. Larger clinical trials with sleep measures as primary outcomes are required to better understand whether IF regimens can benefit overall sleep hygiene.

SOAP02_08

FOOD-BASED INDEXES FOR ASSESSING DIET QUALITY IN RELATION TO CHRONIC INFLAMMATION

Gynette Reyneke[1]; Kelly Lambert,[2]; Eleanor Beck,[1]
[1]Health Sciences, UNSW Sydney, Sydney, Australia; [2]School of Medical, Indigenous and Health Sciences, University of Wollongong, Wollongong, Australia

BACKGROUND AND OBJECTIVES

Chronic inflammation is associated with increased risk of non-communicable diseases, a major global health concern. Intensified interest in the diet-disease relationship has led to extensive research assessing dietary inflammatory potential. Diet quality indexes are used to quantify dietary patterns, however, the optimal tool for assessing dietary inflammation remains undetermined. This review aimed to comprehensively summarise and evaluate food-based indexes and their association with chronic inflammation.

METHODS

A systematic literature search of databases was conducted up to March 2024, to identify studies that (i) described the development and validation of original dietary-inflammation indexes or (ii) assessed associations between existing indexes and inflammatory biomarkers. Heat maps were developed to highlight foods and food groups across indexes.

RESULTS

Forty-three dietary indexes, evaluated across 65 studies, were categorised into four distinct groups: original dietary-inflammation indexes (n=6), and those based on dietary patterns (n=18), dietary guidelines (n=14), or therapeutic diets (n=5). Fruits, vegetables, whole grains, and legumes were consistently classified as favourable (anti-inflammatory), while red/processed meats and added sugars tended to be classified as unfavourable (pro-inflammatory). However, there was inconsistency in inclusion of some foods. Indexes based on the Mediterranean diet and dietary guidelines were the most extensively utilised, demonstrating inverse associations with inflammation across diverse populations. In addition, the Anti-Inflammatory Diet Index (AIDI), Dietary Inflammation Score (DIS), and Empirical Dietary Inflammatory Index (EDII) represent robust food-based indexes to assess dietary inflammatory potential. Inter-correlation analyses revealed strong correlations among multiple indexes associated with reduced inflammation.

CONCLUSIONS

This review identified several validated food-based indexes for assessing diet quality in relation to inflammation, with some consistency between algorithms. However, methodological variations in index development and utilisation, highlight the need for further validation studies. Future research should focus on examining diverse populations and inflammatory biomarkers, dietary composition, scoring methods, and validated outcomes, when selecting indexes to assess diet-inflammation relationships. Understanding the underlying basis and characteristics of each index should inform their use in nutrition research and clinical practice.

SOAP02_09

A HEALTHY BRAZILIAN DIET WITH ENERGY RESTRICTION IMPROVES ANTHROPOMETRY AND MODULATES SALIVARY AND GUT MICROBIOTA IN ADULTS WITH EXCESS BODY WEIGHT

Gabriela Macedo Fraiz[1]; Dandara Bonifácio[1]; Hércia Stampini Duarte Martino[1]; Frederico Augusto Ribeiro De Barros[2]; Josefina Bressan[1]; Fermín I. Milagro[3, 4]
[1]Nutrition and Health, Universidade Federal de Viçosa, Viçosa, Brazil; [2]Food and Technology, Universidade Federal de Viçosa, Viçosa, Brazil; [3]Center for Nutrition Research, University of Navarra, Pamplona, Spain; [4]CIBEROBN, Carlos III Health Institute, Madrid, Spain

BACKGROUND AND OBJECTIVES

Energy-restricted diets are associated with various physiological benefits, including excess body weight and metabolic health improvements. This study explores the effects of a healthy, energy-restricted, Brazilian diet low in ultra-processed foods on anthropometric parameters and alterations in intestinal and salivary microbiota diversity and composition.

METHODS

This is a secondary analysis based on a randomized clinical trial involving 59 adults, male and female, with excess body weight (BMI ≥ 27 kg/m²) (Ethics Committee approval: 6.197.412; REBEC registration: RBR-9832wsx). Participants followed a diet rich in typical Brazilian *in natura* and minimally processed foods, with -500 kcal/day from their total energy requirement. Salivary and gut microbiota were analysed through 16S rRNA gene of the V4 region. Alpha diversity (Chao 1, Simpson, and Shannon indices) and beta diversity (Bray-Curtis dissimilarity) were calculated. Differential analysis to identify discriminant taxa between baseline and endpoint used generalized linear mixed models (FDR < 0.1).

RESULTS

After the intervention, weight loss averaged -2.7 kg (-4.3 – -1), accompanied by reductions in BMI of -1 kg/m² (-1.5 – -0.4), waist circumference of -2.4 cm (-4.5 – -0.7), and hip circumference of -2.5 cm (-4.5 – -0.2), as well as decreases in body fat of -2.1 kg (-3.8 – -0.9), all <0.001. No significant changes on muscle mass were observed (-0.2 kg [-1.6 – 0.6], p=0.089). Alpha diversity of the salivary microbiota significantly increased at the ASV level (Simpson index, p = 0.037). In the faecal microbiota, Chao 1 increased at amplicon sequence variants (ASV) (p = 1.7e-06), genus (p = 6.2e-05), and species (p = 4.2e-05) levels, and the Shannon index increased at ASV (p = 0.005) and species (p = 0.014) levels. No significant changes were observed in the Bacillota/Bacteroidota ratio in either salivary (p = 0.17) or gut (p = 0.95) microbiota. Differential analysis revealed a decrease in pathogenic, pro-inflammatory bacteria in the salivary microbiota (e.g., *Selenomonas* and *Campylobacter*). In gut microbiota, a significant increase was observed in genera associated with short chain fatty acid production and anti-inflammatory effects (e.g., *Adlercreutzia* and *Catenibacillus*).

CONCLUSIONS

A healthy, Brazilian diet low in ultra-processed foods combined with energy restriction promoted significant weight loss and induced a beneficial microbial shift in both salivary and gut microbiota, key contributors to improve metabolic health.

SOAP02_10

PLANT-BASED DIETARY INDICES AND RISK OF A FIRST CLINICAL DIAGNOSIS OF CENTRAL NERVOUS SYSTEM DEMYELINATION IN AUSTRALIAN ADULTS

Aliki Kalmpourtzidou[1, 2]; Hajar Mazahery[3]; Lucinda Black[2]; Ausimmune Investigator Group[4]; Barbara Brayner[2]
[1]Department of Public Health, Experimental and Forensic Medicine, Università Degli Studi di Pavia - Scientific Center, Pavia, Italy; [2]Institute for Physical Activity and Nutrition, School of Exercise and Nutrition Sciences, Deakin University Melbourne Burwood Campus, Burwood, Australia; [3]Curtin School of Population Health, Curtin University, Bentley, Australia; [4]Neuroepidemiology Group, Florey Institute of Neuroscience and Mental Health, Parkville, Australia

BACKGROUND AND OBJECTIVES

The role of diet and risk of MS is of growing interest to the scientific and MS community. We aimed to test associations between plant-based indices and the likelihood of a first clinical diagnosis of central nervous system demyelination (FCD), a common precursor to the diagnosis of MS.

METHODS

We used data from the 2003–2006 Ausimmune Study, a case-control study conducted in four regions of Australia (1). Adult participants were recruited as cases if they had an FCD within the study period (n=282); controls (n=558) were randomly selected from the general population. Participants with complete dietary data and total energy intake ranging from 500 to 3,500 kcal/day for women and 800 to 4000 kcal/day for men (2) were included in the current analysis (264 cases, 474 controls). A validated semiquantitative FFQ was used for the dietary assessment (3). Three plant-based indices were calculated from the FFQ: 1) plant-based dietary index (PDI); 2) healthy plant-based dietary index (hPDI); and 3) unhealthy plant-based dietary index (uPDI). Each index comprised 18 food groups, further divided into three broader food categories, specifically healthy plant foods (whole grains, fruit, vegetables, nuts, legumes, tea and coffee), unhealthy plant foods (fruit juices, refined grains, potatoes, sweets and desserts) and animal foods (animal fat, dairy, egg, fish, seafood, meat) (4). Logistic regression was used to test associations between each plant-based index, food category, and likelihood of FCD. Model 1 was adjusted for age, study region and sex. Model 2 was additionally adjusted for education, history of infectious mononucleosis, smoking history, serum 25-hydroxyvitamin D concentration, total energy intake and dietary misreporting.

RESULTS

A weak positive association was found between uPDI and risk of FCD in model 1 (OR: 1.02; 95% CI: 1.00, 1.05; P-value: 0.041). However, in the fully adjusted models, there were no associations between plant-based indices nor food categories and the likelihood of FCD.

CONCLUSIONS

Our findings suggest no associations between plant-based diets and the likelihood of FCD. Whether these findings are consistent across populations is unknown; associations could be tested in other cohorts to help elucidate any role of plant-based dietary patterns in MS risk.

SOAP02_11

THE EFFECT OF ISOMALTULOSE INTAKE ON GLP-1 RESPONSE IN THE GENERAL POPULATION AND PARTICIPANTS WITH IMPAIRED GLUCOSE TOLERANCE/T2D: SYSTEMATIC REVIEW AND META-ANALYSIS

Lisa Schweitzer[1]; Stephan Theis[1]; Yoghatama Cindya Zanzer[1]
[1]BENEO-Institute, BENEO GmbH, Obrigheim (Pfalz), Germany

BACKGROUND AND OBJECTIVES

The incretin hormone glucagon-like peptide-1 (GLP-1) is crucial for maintaining glucose homeostasis and promoting satiety. Isomaltulose (Palatinose™), a slowly digestible carbohydrate, has been shown to enhance GLP-1 release compared to high-glycaemic index (HGI) carbohydrates. A consolidated evaluation of this evidence is lacking. Therefore, this systematic review and meta-analysis aimed to synthesize available data on isomaltulose and GLP-1 response.

METHODS

A systematic search of EMBASE and MEDLINE (PubMed) was conducted to identify randomized controlled trials comparing acute GLP-1 secretion after the intake of isomaltulose versus HGI carbohydrates from inception to 01 December 2024. Studies combining isomaltulose with other functional substances were excluded. Following screening process, a total of seven studies fulfilled the inclusion criteria and were included, while four studies were excluded. The standardized mean difference (SMD) was used to synthesize the pooled effect size using a random effects model with inverse-variance method.

RESULTS

Isomaltulose significantly increased GLP-1 secretion compared to HGI carbohydrates [SMD: 1.29; 95% confidence interval (CI): 0.72, 1.85; n=147; P=0.0004] with a low degree of heterogeneity ($I2$=33%; P=0.13). Subgroup analysis based on health status showed that isomaltulose significantly increased GLP-1 secretion in both apparently healthy subjects (SMD: 1.25; 95% CI: 0.32, 2.19; n=88; P=0.02) and those with impaired glucose tolerance/ type 2 diabetes (SMD: 1.35; 95% CI: 0.36, 2.34; n=59; P=0.02), compared with HGI carbohydrates.

CONCLUSIONS

Replacing HGI sugars and carbohydrates with isomaltulose consistently enhances GLP-1 secretion irrespective of subject´s health status. These findings highlight the use of Palatinose™ (isomaltulose) as a beneficial carbohydrate ingredient for nutritional products supporting weight management.

SOAP02_12

Adherence to a traditional Chinese diet and its association with non-communicable diseases and mortality: RESULTS from the China Health and Nutrition Survey

Jizhao Niu[1]; Bai Li[1]; Angeliki Papadaki[1]
[1]Center for Exercise, Nutrition and Health Sciences, University of Bristol, Bristol, United Kingdom

BACKGROUND AND OBJECTIVES

Two-thirds of deaths were related to non-communicable diseases (NCDs). Traditional diets may reduce the risk of NCDs. This study aimed to firstly investigate the impact of adherence to the traditional Chinese diet (TCD) on NCDs and all-cause mortality.

METHODS

This study utilised data from the China Health and Nutrition Survey, a prospective cohort study conducted across multiple waves, with data collected between 1997 and 2011 selected for analysis. Eligible participants were aged 18 to 74 years, had participated in at least two survey waves, and had no known NCDs at baseline. Adherence to the TCD was assessed using a recently developed TCD index, based on three 24-hour recalls data collected within this cohort. Outcomes included obesity, central obesity, hypertension, diabetes, cancers, cardiovascular diseases (CVDs), and all-cause mortality. Multilevel logistic regression models were used to analyse the longitudinal associations between TCD adherence and NCD-related outcomes; multivariable Cox regression was utilised to assess the relationship between TCD adherence and all-cause mortality.

RESULTS

A total of 11,219 adults were followed for a median of nine years. In the fully adjusted analysis, high, compared to low, TCD adherence, was associated with higher odds of obesity (OR:1.20, 95%CI:1.03-1.37) and central obesity (OR:1.13, 95%CI:1.05-1.21), but lower odds of hypertension (OR:0.82, 95%CI:0.67-0.97) and CVDs (OR:1.20, 95%CI:0.68-0.96). Additionally, in the adjusted multivariable model, high, compared to low, TCD adherence was associated with a reduced risk of all-cause mortality (HR:0.56, 95%CI:0.50-0.64).

CONCLUSIONS

High TCD adherence was associated with lower odds of hypertension and CVDs, as well as reduced risk of all-cause mortality, but with higher odds of obesity.

BACKGROUND AND OBJECTIVES

Children/adolescents in Ghana experience a double burden of malnutrition driven in part by unregulated exposure to unhealthy food promotion (FProm) and provision (FProv) in schools. This study aimed to identify which key national stakeholders influence the development and implementation of FProm and FProv policies in Ghana's Urban School Systems.

METHODS

A Net-Map interview method was employed. It involved two group interviews with purposefully selected participants with working experiences in FProm and FProv. Through interactive questioning, stakeholders and their connections (command, advocacy, technical assistance, funding), influence (0=not influential at all, 5=highest level of influence), and relevant opinion leaders were identified. A social analysis software (VisuaLyzer version 2.2) was used to analyse the network characteristics and visualize the Net-Map.

RESULTS

The FProm Network encompassed 22 stakeholders, 29 connections and a high centralization (96%), comprising 2 core and 20 peripheral stakeholders. Key influencers included the Nutrition and Health Promotion Units of Ghana Health Service (GHS), the Food and Drugs Authority (FDA), and the media. World Vision and non-governmental organizations which support government and academic institutions were funding stakeholders. The FDA exercises formal authority, while the GHS, FDA, and Ministry of Gender, Children and Social Protection (MGCSP) lead advocacy and technical assistance efforts. Twenty-seven stakeholders and 46 connections were identified from the FProv Net-Map. The network centralization was 94% comprising 4 core and 23 peripheral stakeholders. The most influential stakeholders were the Ministry of Education (MoE), the Ghana School Feeding Program (GSFP), the Ministry of Food and Agriculture (MOFA), and GHS. United Nations agencies (UNICEF and WFP) and the Department of Children of MGCSP were funders. Government agencies FDA, MoE, Ghana Education Service, and MOFA, provided formal authority. Government agencies were the main providers of information (advocacy, technical assistance and dissemination) to NGOs and the private sector.

CONCLUSIONS

Influential government stakeholders were identified for the FProm network (GHS and FDA) and the FProv network (GHS, MoE, GSFP and MOFA). These influential government agencies demonstrate high centralization and control [FProm-96%; FProv-94%]. This highlights their central roles in leadership, policy formulation and programme implementation in addressing NCD control among children/adolescents in Ghana's Urban School Systems.

SOAP02_14

ASSOCIATION OF OVERWEIGHT/OBESITY, SARCOPENIA, AND SARCOPENIC OVERWEIGHT/OBESITY WITH HYPERTENSION IN THE ELDERLY: A CROSS-SECTIONAL STUDY

Jiongnan Wang[1]; Chi Zhai[1]; Shiyu Yin[1]; Guiju Sun[1]
[1]Department of Nutrition and Food Hygiene, School of Public Health, Southeast University, Nanjing, China

BACKGROUND AND OBJECTIVES

Sarcopenia, sarcopenic obesity, and hypertension are increasingly significant public health challenges worldwide. This study aimed to investigate the association between overweight/obesity, sarcopenia, sarcopenic overweight/obesity and hypertension among elderly participants and explored its influencing factors.

METHODS

This cross-sectional study included 834 participants. Based on measured values of muscle strength, skeletal muscle mass, and body mass index (BMI), the participants were categorized into four groups: overweight/obese, sarcopenia, sarcopenic overweight/obese and normal. Univariate and multiple logistic regression models were used to examine the relationships.

RESULTS

The mean age of the participant was 72.66 years (SD: 5.66), the BMI was 24.97 kg/m2 (SD: 3.30). The prevalence of hypertension was 68.47%. The prevalence of overweight/obesity, sarcopenia, sarcopenic overweight/obesity were 53.36%, 6.24%, and 10.67%, respectively. There were significant differences in age, BMI, waist circumference, muscle strength, physical function, and body composition variables. In the adjusted model for age, gender, other social demographic characteristics, health behavior variables, sarcopenia (OR: 2.60; 95% CI: 1.24–5.42), overweight/obesity (OR: 2.43; 95% CI: 1.74–3.39) and sarcopenic overweight/obesity (OR: 2.26; 95% CI: 1.29–3.98) were significantly associated with hypertension. The RESULTS of the multivariate logistic regression revealed that age and waist circumference maintained a significant association with hypertension. The findings from the restricted cubic splines regression analysis indicated that there is a linear positive correlation between age and hypertension for individuals aged 60 to 78.04 years, and age-adjusted waist circumference exhibited a linear positive association with hypertension.

CONCLUSIONS

This study demonstrated that overweight/obesity, sarcopenia and sarcopenic overweight/obesity are all significantly correlated with hypertension.

ADOLESCENT DIETARY PATTERNS AND RISK OF CHRONIC LIVER DISEASE MORTALITY AND INCIDENT LIVER CANCER: A PROSPECTIVE COHORT STUDY

Longgang Zhao[1]; Xinyuan Zhang[2]; Yun Chen[1]; Yikyung Park[3]; Linda Liao[4]; Jessica Petrick[5]; Peter Campbell[6]; Katherine Mcglynn[4]; Xuehong Zhang[1]
[1]School Of Nursing, Yale University, New Haven, United States of America; [2]Channing Division of Network Medicine, Brigham and Women's Hospital, Boston, United States of America; [3]Division of Public Health Sciences and Department of Surgery, Washington University in Saint Louis, St. Louis, United States of America; [4]Division of Cancer Epidemiology and Genetics, National Cancer Institute, Bethesda, United States of America; [5]Slone Epidemiology Center, Boston University, Boston, United States of America; [6]Department of Epidemiology & Population Health, Albert Einstein College of Medicine, bronx, United States of America

BACKGROUND AND OBJECTIVES

Healthy dietary patterns in adulthood have been associated with favorable liver health, but no study has examined the role of the adolescent diet in adverse liver outcomes. We evaluated the relationship between adolescent dietary patterns and the risk of chronic liver disease mortality and liver cancer in adulthood.

METHODS

We analyzed data from the NIH-AARP Diet and Health Study, a prospective cohort study, comprising 241,628 adult participants who had recalled their dietary intake at ages 12-13. (mean: 61 years). We employed principal component analyses to derive dietary patterns based on 37 food items from the food frequency questionnaire. We used the Cox proportional hazards regression model to estimate the multivariable HRs and 95% CIs for associations between different dietary patterns and adverse liver outcomes with adjustments for potential confounders including adult and adolescent characteristics.

RESULTS

With a median of 15.5 years follow-up, we documented 437 chronic liver disease deaths and 419 incident liver cancers. We identified three dietary patterns: a plant-based pattern (high in fruits and vegetables), a Western modern pattern (high in ice cream and doughnuts, but low in milk and vegetables), and a Western traditional pattern (high in hot dogs and French fries, but low in milk and butter). After controlling potential confounding factors, the adolescent Western modern pattern score was positively associated with the risk of chronic liver disease mortality (HR quartile 4 vs quartile 1=1.40, 95% CI=1.06-1.86, P trend=0.05). None of the dietary patterns during adolescence were associated with liver cancer risk.

CONCLUSIONS

For the first time we found a positive correlation between Western modern patterns during adolescence and mortality from chronic liver disease. If confirmed by future research, these findings crucially inform the significance of a healthy adolescent diet in preventing liver disease.

Does vitamin E in mono-supplementation affect the risk of heart failure? RESULTS of a systematic review

Nena Karavasiloglou[1]; Charlotte Marie Bercovici[1]; Agnès De Sesmaisons Lecarré[1]; Vânia Mendes[1]; Androniki Naska[2]; Alfonso Siani[3]; Maret G. Traber[4]; Misha Vrolijk[5]; Silvia Valtueña Martínez[1]
[1]Nutrition and Food Innovation Unit, European Food Safety Authority, Parma, Italy; [2]Dept. of Hygiene, Epidemiology and Medical Statistics, School of Medicine, National and Kapodistrian University of Athens, Athnes, Greece; [3]Institute of Food Sciences, Consiglio Nazionale delle Ricerche (CNR), Avellino, Italy; [4]Linus Pauling Institute, Oregon State University, Corvallis, United States of America; [5]Department of Pharmacology and Toxicology, Research Institute of Nutrition and Translational Res, Maastricht University, Maastricht, Netherlands

BACKGROUND AND OBJECTIVES

The role of vitamin E (α-tocopherol) in cardiovascular (CV) health remains controversial despite its potential to prevent oxidative damage. Previous cohort studies have suggested an association between vitamin E intake and reduced CV events, yet randomized controlled trials (RCTs) have not consistently shown a beneficial effect on CV morbidity or mortality. This systematic review aims to assess the effect of vitamin E supplementation on the incidence of heart failure (HF).

METHODS

We conducted a comprehensive literature search in MEDLINE, Embase, and the Cochrane Library databases, adhering to the PRISMA guidelines (PROSPERO Reg. number CRD42024554076). RCTs in adults that compared any form of α-tocopherol in mono-supplementation to placebo (parallel, crossover, or factorial designs) and reported on HF incidence (i.e. non-fatal HF, hospitalisation, or death) were eligible. The internal validity of the studies was assessed using a customized version of the Office of Health Assessment and Translation Risk of Bias (RoB) tool.

RESULTS

Five independent RCTs met the inclusion criteria. Two RCTS were judged at low RoB and three at moderate RoB. A meta-analysis was not performed due to the heterogeneity of the studies in terms of HF outcomes, participant baseline characteristics, and vitamin E doses. Two RCTs conducted in high CV risk populations indicated an increased incidence of HF with vitamin E supplementation at doses of 268-273 mg/day. No significant effect was observed in RCTs involving participants with low or no prevalent CV disease. Variations in the impact on left ventricular ejection fraction (LVEF) were noted across studies, suggesting a potential differential effect on HF with reduced ejection fraction (HFrEF) versus HF with preserved ejection fraction (HFpEF).

CONCLUSIONS

Vitamin E supplementation could increase the risk of incident HF among patients with existing, or at high risk of, ischemic heart disease, particularly affecting LVEF and potentially increasing the risk of HFrEF. No effect was observed in populations with low CV risk profiles. These findings highlight the necessity for careful consideration of vitamin E supplementation in individuals at risk for HF. However, data is limited, and further research is warranted to explore the differential effects of supplemental vitamin E on HF subtypes and to clarify the underlying mechanisms.

SOAP05_02

THE EFFECT OF ALMONDS ON MENTAL HEALTH AND GUT HEALTH: A 12-WEEK RANDOMISED CONTROLLED TRIAL

Luke Sartori[1]; Noa Argomaniz[1]; Dominic Farsi[1]; Joseph Chilcot[2]; Kevin Whelan[1]; Eirini Dimidi[1]
[1]Department of Nutritional Sciences, King's College London Waterloo Campus, London, United Kingdom; [2]Department of Psychology, King's College London Guy's Campus, London, United Kingdom

BACKGROUND AND OBJECTIVES

Whole dietary interventions may reduce symptoms of depression and anxiety, but adherence can be difficult. Single-food interventions like almonds may improve adherence. Almonds contain micronutrients associated with cognitive benefits and have a prebiotic effect on the gut microbiome. This randomised controlled trial assessed the effects of whole almonds on mental and gut health in adults with mild to moderate symptoms of depression and anxiety.

METHODS

Adults aged 18-45y with Patient Health Questionnaire Anxiety and Depression (PHQ-ADS) scores of 10-29 were randomised to 56g/d whole almonds (intervention) or two iso-caloric muffins/d (control) for 12 weeks. Symptoms of depression/anxiety (primary outcome) were assessed via the PHQ-ADS. Functional impairment, mental wellbeing, psychological distress and gastrointestinal symptoms were measured with validated questionnaires. Group differences were analysed using linear mixed models.

RESULTS

Eighty-four participants (mean age 25 y, BMI 23 kg/m², 76% female, 46% white ethnicity) were randomised. Almonds had no significant impact on depression/anxiety, mental wellbeing, or psychological distress, versus control (Table 1). However, almonds significantly reduced functional impairment and led to lower reports of hard stools (Table 1). No differences were observed in other gastrointestinal symptoms.

Table 1. Mental Health and Gastrointestinal Symptoms (mean, SD)

	Almonds (n = 40)		Control (n = 41)		p-value at endpoint
	Baseline	Endpoint	Baseline	Endpoint	
Depression and anxiety	16.0 (5.2)	11.6 (5.3)	16.3 (5.1)	12.5 (5.3)	0.42
Functional impairment	13.8 (5.2)	9.42 (5.2)	13.7 (5.11)	12.3 (5.3)	0.05
Mental wellbeing	40.9 (12.8)	53.2 (13.0)	39.7 (12.7)	52.0 (13.0)	0.98
Psychological distress	24.0 (4.9)	20.0 (5.0)	24.4 (4.9)	21.5 (5.0)	0.43
Hard stools	0.23 (0.2)	0.11 (0.2)	0.24 (0.2)	0.27 (0.2)	<0.001

CONCLUSIONS

While almonds did not significantly reduce symptoms of depression/anxiety compared to control, they improved functional impairment and reduced hard stools, suggesting potential benefits for gut dysfunction. Microbiome and short-chain fatty acid analyses are ongoing.

SOAP05_04

IS EXTREME OBESITY ASSOCIATED WITH UNHEALTHY AND UNMANLY TESTOSTERONE LEVELS?

Adela Penesová[1, 2]; Libusa Nechalova[1, 3]; Ivan Hric[2, 1]; Jana Babjakova[4]; Viktor Bielik[2]
[1]Institute of Clinical and Translational Research, Biomedical Research Center SAS, Bratislava, Slovakia; [2]Department of Biological and Medical Science, Faculty of Physical Education and Sport, Comenius University in Bratislava, Bratislava, Slovakia; [3]Department of Biological and Medical Science, Faculty of Physical Education and Sport, Comenius University in Bratislava, Bra, Slovakia; [4]Institute of Hygiene, Faculty of Medicine, Comenius University in Bratislava, Bratislava, Slovakia

BACKGROUND AND OBJECTIVES

Obesity is one of the risk factors for lower testosterone level in men. Given the fundamental role of sex hormones in regulating body composition, energy homeostasis, and reproduction in humans, more emphasis should be placed on the potential role of androgen dysregulation in the pathophysiology of various obesity phenotypes and metabolic syndrome. Low testosterone by itself increases adiposity, creating a self-perpetuating cycle of cardiometabolic complications. Obesity-associated hypogonadism is mostly functional and reversible, but substantial weight loss is needed. This study aims to observe the relationship between BMI, and testosterone levels in patients with extreme obesity attending a weight loss program in the outpatient clinic at the Biomedical Research Center.

METHODS

This interventional study involved 16 men with extreme obesity (EO) with an average age of 37.7 ± 10.0 years, and a body mass index (BMI) of 50,0 ± 10,6 kg/m² presenting to the Diabetes outpatient department. Eleven healthy men without obesity were controls (mean age was 31.0 ± 15.5 years and BMI 25,4 ± 2,3 kg/m²). Body composition, metabolic parameters, and testosterone levels were measured before and after the intervention (weight loss program).

RESULTS

At baseline total testosterone (TT) levels were significantly lower in patients with obesity in comparison to controls (5,9 ± 3,4 vs. 20,0 ± 7,0 nmol/l, $p < 0.001$). At baseline, 12 patients with EO (75%) had low TT levels (<8.33 nmol/l). A significant inverse correlation between body fat percentage (%BF) and testosterone levels ($r = -0.84$, $p < 0.001$), as well as positive correlation between baseline testosterone concentrations and total cholesterol levels were evaluated ($r = 0.78$, $p < 0.01$). After the weight loss testosterone levels and metabolic parameters significantly improved ($p < 0.01$).

CONCLUSIONS

We found that increasing %BF progressively lowers testosterone levels associated with extreme obesity.. Therefore, these findings suggest that addressing obesity, lifestyle changes, and weight loss could help mitigate hormonal imbalances and low testosterone, which are linked to sexual and metabolic health risks in patients with obesity.

ASSOCIATIONS OF DIETARY FAT INTAKE WITH COGNITIVE FUNCTION AND ITS DECLINE: A PROSPECTIVE COHORT STUDY

Minyu Wu[1, 2]; Liyan Huang[1]; Jie Shen[1]; Hui Chen[1]; Yuhui Huang[1]; Gulisiya Hailili[1]; Mengjia Zhao[1]; Geng Zong[3]; Shuang Rong[4]; Xiaoran Liu[5]; Changzheng Yuan[1, 2, 6]
[1]School of Public Health, Zhejiang University, Hang Zhou, China; [2]The Second Affiliated Hospital, Zhejiang University School of Medicine, Hang Zhou, China; [3]CAS Key Laboratory of Nutrition, Shanghai Institute of Nutrition and Health, University of Chinese Academy of Sciences, Shanghai, China; [4]School of Public Health, Wuhan University, Wuhan, China; [5]Rush Institute for Healthy Aging, RUSH University Medical Center, Chicago, United States of America; [6]T.H. Chan School of Public Health, Havard University, T.H. Chan School of Public Health, Boston, United States of America

BACKGROUND AND OBJECTIVES

Evidence regarding the association between dietary fat intake and cognitive function remains inconsistent. This study aimed to examine the associations of total dietary fat and specific fatty acids with cognitive function and its decline among middle-aged and older adults.

METHODS

The current study included 6,408 participants (59.73% women; mean age 67.7 years) with cognitive function scores and without severe cognitive dysfunction from 2013 to 2020 in the Health and Retirement Study (HRS). Dietary fat intake (total, animal, vegetable) and specific fatty acids (saturated, monounsaturated, polyunsaturated, trans) were assessed using a 168-item food frequency questionnaire. The cognitive function was evaluated by the Telephone Interview for Cognitive Status-Modified (TICS-m). Linear mixed-effects models were used to estimate the beta coefficients (β) and the 95% confidence intervals (CI).

RESULTS

Higher intake of total fat (βQ5 vs. Q1: 0.401; 95% CI: 0.162 to 0.639; $P < 0.001$) and vegetable fat (βQ5 vs. Q1: 0.582; 95% CI: 0.342 to 0.822; $P < 0.001$) were associated with better cognitive function. Replacing 5% of total energy intake from animal fat with vegetable fat corresponded to better cognitive function (β: 0.176; 95% CI: 0.080 to 0.273; $P < 0.001$) and slower annual cognitive decline (β: 0.124; 95% CI: 0.001 to 0.247; $P < 0.049$). The highest intake of monounsaturated fatty acids (βQ5 vs. Q1: 0.673; 95% CI: 0.364 to 0.981; $P = 0.003$) and n-3 polyunsaturated fatty acids (βQ5 vs. Q1: 0.373; 95% CI: 0.050 to 0.696; $P = 0.031$) showed a relationship with better cognitive function. Conversely, higher intake of trans fatty acids was inversely associated with cognitive function (βQ5 vs. Q1: -0.482; 95% CI: -0.758 to -0.205; $P = 0.002$) and faster annual cognitive decline (β: -0.017; 95% CI: -0.029 to -0.005; $P = 0.003$). Isocaloric substitution of n-6 with n-3 polyunsaturated fatty acids was significantly associated with a higher cognitive function (β: 1.136; 95% CI: 0.174 to 2.099; $P = 0.021$).

CONCLUSIONS

This study demonstrates the heterogeneous associations between total fat, specific fatty acids, and cognitive function and decline, emphasizing the potential benefits of total fat, vegetable fat, and monounsaturated fatty acids while highlighting the detrimental effects of trans fatty acids. Findings also suggest that replacing animal fat with vegetable fat could serve as a strategy to improve cognitive function.

SOAP05_08

THE PRICE OF PREVENTION: A COST ANALYSIS OF A BREAST CANCER PREVENTION DIET FOR WOMEN RESIDING IN SOWETO, SOUTH AFRICA

Christine Taljaard-Krugell[1]; Cornelia Conradie[1]; Inarie Jacobs[2]
[1]Centre of Excellence for Nutrition, North-West University, Potchefstroom, South Africa; [2]Nutrition and Metabolism branch, International Agency for Research on Cancer, Lyon, France, Lyon, France, France

BACKGROUND AND OBJECTIVES

Modifiable lifestyle factors, including diet, are crucial for cancer prevention. The high cost of a healthy diet has been reported a barrier to adhering to dietary guidelines. However, previous research indicates that moderate adherence to the South African Food Based Dietary Guidelines (SA-FBDGs) could reduce breast cancer risk in women residing in Soweto, South Africa. This study aims to conduct a cost comparison between diets with low and moderate adherence to the SA-FBDGs.

METHODS

Two sets of three-day diets were compiled to compare the costs of low and moderate adherence to the SA-FBDGs: one with an adherence score of 3.5 (low adherence) and the other with a score of 5.5 (moderate adherence). The dietary prescriptions were based on the mean characteristics (body mass index, age, and physical activity levels) and food preferences of the South African Breast Cancer study's control group. Food prices from the May 2024 South African Consumer Price Index were used to cost the diets. Diet cost was calculated as direct costs and costs relative to the Food Poverty Line and the national minimum wage.

RESULTS

A diet with low adherence to the SA-FBDGs costs an average of 31.6 ZAR (1,7 USD) per day, while a moderate adherence diet costs 38.9 ZAR (2,1 USD) per day—a difference of 7.30 ZAR (0.4 USD) or 18.8%. The cost of the low and moderate adherence diet account to 119,1% and 146.6%, of the South African Food Poverty Line, respectively. The moderate adherence diet, relative to the daily minimum wage, costs 3.3% more than the low adherence menu (14.3% vs 17.6%).

CONCLUSIONS

Despite the modest extra cost of a moderate adherence diet, healthier diets remain unaffordable for many South African women, especially women living on an income below the food poverty line. Our findings echo the overwhelming narrative that cost could be a significant barrier for women to adhere to dietary guidelines to reduce the risk e.g. breast cancer. A dual approach addressing both health and nutrition education and economic barriers is crucial to reducing breast cancer risk.

1 USD = 18,1828 ZAR

SOAP05_10

Dietary interventions to improve disease severity in people living with psoriasis: RESULTS from the MEditerranean and Time-Restricted Eating Diets for Psoriasis (METRED-P) feasibility trial

Sylvia Zanesco[1]; Maruthappu Thiviyani[1]; Christopher E.m Griffiths,[2]; Rachel Gibson[1]; Wendy L. Hall[1]
[1]Department of Nutrition, King's College London Waterloo Campus, London, United Kingdom; [2]St John's Institute of Dermatology, King's College London, London, United Kingdom

BACKGROUND AND OBJECTIVES

Obesity has been identified as a cause and consequence of psoriasis incidence and severity (1). The only available dietary recommendation for people with psoriasis is a low-calorie diet for weight-loss, specific to people living with obesity (2). In view of the inflammatory nature of psoriasis, the aim of this study was to investigate the effect of anti-inflammatory diets; the Mediterranean diet (MD) and Time-Restricted Eating (TRE) on body weight and skin severity.

METHODS

The METRED-P (NCT05820698) was a randomised parallel-arm feasibility pilot study recruiting adult volunteers between June 2023-July 2024. The main inclusion criteria were a body mass index (BMI) between 20-40 kg/m2, no systemic therapies (or on systemic therapies > 6 months), a baseline Psoriasis Area Severity Index (PASI) > 5 points, and no underlying health conditions. Participants were randomised by variance minimisation to a TRE, MD, or MD with TRE. The TRE group was instructed to follow a 10:14 hour eating:fasting pattern, whilst participants on the MD were advised to consume a diet rich in olive oil, nuts, fruits, vegetables, whole grains, and oily fish. The dietary advice for the MD with TRE group was a combination of the MD and TRE guidelines. Psoriasis severity was defined by an objective PASI score. Body composition was determined using TANITA® scale. Measurements were taken from participants at baseline and after 12-weeks for repeated measures. Differences between groups were analysed with linear mixed models.

RESULTS

Twenty-two participants enrolled in the METRED-P study a majority of which were female (64%) and of white ethnicity (68%). The mean (SD) age and BMI were of 44.0 (10.0) years and 28.0 (6.3) kg/m2 Following TRE, MD, and MDTRE guidance (without energy restriction advice) for 12 weeks resulted in modest weight loss (kg) with mean differences (SD, *n*) of -3.0 (2.5, *n*=*5*), -1.6 (2.0, *n*=7), and -2.0 (1.5, *n*=5) respectively. There was a modest improvement in mean differences in PASI (SD, *n*) subject to TRE, MD, and MDTRE advice of -6.2 (4.6, *n*=5), -4.1 (3.3, *n*=7) and -1.5 (3.0, *n*=5) points respectively. There were no significant differences at endpoint between treatment groups for body weight or PASI.

CONCLUSIONS

This pilot data suggests all three interventions may have beneficial effects on psoriasis severity and lead to modest weight-loss. Further analysis of METRED-P data will determine the optimal study protocol for a fully powered diet intervention trial in people with psoriasis.

HYPOTHESIS- AND DATA-DRIVEN DISEASE RISK SCORES IN YOUNG ADULTS – AN ANALYSIS IN THE GERMAN DONALD COHORT STUDY

Michaela Mark[1]; Samuel Muli[1]; Ines Perrar[1]; Christina-Alexandra Conzen[1]; Ute Nöthlings[1]
[1]Nutritional Epidemiology, Institute of Nutritional and Food Science, Bonn, Germany

BACKGROUND AND OBJECTIVES

Disease risk scores (DRSs) are used to identify individuals at risk for non-communicable diseases. However, little is known about their potential use in young adult populations. We aimed to derive DRSs using both a hypothesis- and a data-driven approach to describe subgroups of young adults regarding their disease risk profile.

METHODS

In the open DOrtmund Nutritional and Anthropometric Longitudinally Designed (DONALD) cohort study, we calculated seven hypothesis-driven DRSs (Framingham Risk Score - Adult Treatment Panel III (FRS-ATP III, sex-specific), Prospective Cardiovascular Münster Study Score (PROCAM-2007), Life's Simple 7 (LS7), German Diabetes Risk Score (GDRS-2022), Fatty Liver Index (FLI), Hepatic Steatosis Index (HSI), Proinflammatory Score (PIS)) among 492 adult participants (20–47 years). Additionally, among 457 of these participants cluster analysis (hierarchical, k-means) was conducted with continuous metabolic risk factors (body mass index (BMI), waist circumference (WC), systolic and diastolic blood pressure, total cholesterol, high-density-lipoprotein, low-density-lipoprotein, triglycerides, fasting glucose, γ-glutamyltransferase, aspartate-aminotransferase, alanine-aminotransferase). We compared the DRSs using age- and sex-adjusted linear regressions and chi-square tests. The importance of each score component was examined using forward selection and age- and sex-adjusted logistic regressions. Longitudinal tracking of DRSs was assessed via concordance in tertile and cluster membership.

RESULTS

Cluster analysis identified two clusters (1: "comparably high-risk"; 2: "comparably low-risk"). The following RESULTS were observed in cluster 1 (41.1%) compared to cluster 2 (58.9%): Participants showed higher median values in all DRSs, a higher absolute type 2 diabetes risk (GDRS-2022), elevated liver parameters (FLI, HSI), a more unfavourable cardiovascular health (LS7), and a higher absolute CHD risk (FRS-ATP III (females)) (P<0.05). Among score components, WC and BMI were the most important risk factors. The DRSs showed considerable tracking within a median follow-up of 4.9 years.

CONCLUSIONS

Differences in DRSs may already exist in young, rather healthy adults. The disease risk profiles are especially shaped by anthropometric markers and are relatively stable over time.

SOAP05_14

ADHERENCE TO THE 2018 WORLD CANCER RESEARCH FUND/AMERICAN INSTITUTE FOR CANCER RESEARCH CANCER PREVENTION RECOMMENDATIONS AMONG ADULTS WITH AND WITHOUT CANCER IN CHILE

Solange Parra-Soto[1]; Villagrán Carla[1]; Duran Aguero Samuel[2]; Malcomson Fiona[3]; Freisling Heinz[4]; Celis-Morales Carlos[5]

[1]Departament Nutrition and Public Health, Biobio University Campus Fernando May, Chillán, Chile; [2]Faculty of Health Sciences, San Sebastián University, Providencia, Chile; [3]Faculty of Medical Sciences, Newcastle University, Newcastle upon Tyne, United Kingdom; [4]Nutrition and Metabolism, IARC - International Agency for Research on Cancer, Lyon, France; [5]School of Cardiovascular & Metabolic Health, University of Glasgow, Glasgow, United Kingdom

BACKGROUND AND OBJECTIVES

The World Cancer Research Fund/American Institute for Cancer Research (WCRF/AIRC) Cancer Prevention Recommendations are lifestyle-based guidelines that aim to reduce cancer risk. However, most existing research on adherence to these recommendations has been conducted predominantly in high-income countries and among non-diverse populations, leaving significant gaps in understanding among cancer survivors and diverse ethnic groups. This study aims to assess adherence to the WCRF/AICR Recommendations among cancer survivors and the general population in Chile.

METHODS

A cross-sectional study was conducted with 230 participants, including 80 cancer survivors and 150 adults without a history of cancer, matched by sex and age, from a south-central region of Chile. A survey was administered to evaluate adherence to the WCRF/AICR Cancer Prevention Recommendations. Total adherence scores, ranging from 0 to 7 points, were calculated based on dietary, physical activity, and anthropometric data. Associations were analysed using chi-square tests or ANOVA, stratified by population sociodemographic characteristics. Approved by Herminda Martin Clinical Hospital's ethics committee.

RESULTS

The mean adherence score in the cancer survivor population was 4.4 ± 0.86 points, compared with 4.5 ± 0.99 points in the general population. The Recommendations with the lowest adherence were fruit and vegetable intake (17.5%), sugary drink consumption (5%), and dietary fibre intake (3.7%). Conversely, the Recommendations with the highest adherence were fast food intake (91.3%), physical activity (85.5%), and red and processed meat intake (78.8%). Significant differences were observed by SES and education level, with lower SES individuals scoring 4.5 ± 1.1 and higher SES individuals scoring 4.6 ± 0.91 (p=0.001), while those with lower education scored 4.2 ± 1.1 compared with 4.7 ± 0.96 for higher education (p=0.001). In the general population group, the recommendations with the lowest adherence were physical activity (35.3%), maintaining a healthy weight (16.7%), and fibre intake (1.3%). The recommendations with the highest adherence were fast food intake (84.7%) and alcohol consumption (90.7%).

CONCLUSIONS

This study reveals moderate adherence to the WCRF/AICR Recommendations among adults with and without cancer in Chile, with low adherence to fibre, fruits, and vegetables in both groups. These findings underscore the need for targeted interventions to improve dietary and lifestyle behaviours to support cancer prevention and survivorship in diverse settings.

SOAP05_15

PROSPECTIVE ASSOCIATIONS OF SUGAR-SWEETENED BEVERAGES, FRUIT JUICES AND ARTIFICIALLY SWEETENED BEVERAGES CONSUMPTION WITH PREDIABETES RISK IN THE ROTTERDAM STUDY

Maria Gorety Jacobo Cejudo[1]; Marinka Steur[2, 1]; Ochoa-Rosales Carolina[3, 4]; Julianne Van Oortmerssen[1]; Maryam Kavousi[1]; Marianne Geleijnse[5]; Trudy Voortman[1]
[1]Epidemiology, Erasmus University Medical Center, Rotterdam, Netherlands; [2]Human Nutrition and Health, Wageningen University, Wageningen, Netherlands; [3]BrainLat Institute, Adolfo Ibáñez University - Headquarters President Errázuriz, Las Condes, Chile; [4]Center for Social and Cognitive Neuroscience (CSCN), School of Psychology, Universidad Adolfo I, Santiag, Chile; [5]Division of Human Nutrition and Health, Wageningen University, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES

Higher consumption of sugar-sweetened beverages (SSBs) has been linked to increased risk of pre(diabetes), but the associations of potential alternative beverages such as fruit juices and artificially-sweetened beverages (ASBs) with prediabetes risk remain controversial. We aimed to estimate the associations between SSBs, fruit juices, and ASBs consumption with prediabetes risk, and to estimate the effects of the modelled replacement of SSBs with fruit juices, ASBs, coffee, tea, or milk on prediabetes risk.

METHODS

We examined 6,355 middle-aged and senior Dutch adults [mean age 61.8(SD 7.7) years, 61% women, 16% obese] of the prospective population-based Rotterdam Study cohort, without diabetes at baseline (1990-2006). Consumption of beverages, except for water, was assessed using validated food-frequency questionnaires. Participants were followed from baseline through 2015 for the occurrence of prediabetes, ascertained through information from medical records, hospital discharge letters, and blood-glucose measurements. We used multivariable Cox proportional hazards regression models, adjusted for sociodemographic, lifestyle, and dietary factors, to estimate hazard ratios (95% CIs) for prediabetes risk across tertiles of beverage intake among consumers (T1-T3), with non-consumers serving as the reference. Replacements between beverages were modelled using the leave one out model.

RESULTS

Among consumers of SSBs (37%), fruit juices (62%), and ASBs (13%), median (IQR) intake levels were 42 (15-109), 68 (23-140), and 64 (25-175) mL/day, respectively. During 10 years of follow-up, 1,077 participants developed prediabetes. No significant associations were observed between SSBs or ASBs and prediabetes risk. Fruit juice intake was associated with lower prediabetes risk only at intakes >139 mL/d (HRT3vs.non-consumers: 0.80, 95%CI: 0.67-0.97). The modelled replacement of a 150 mL/day serving of SSBs with an equivalent additional serving of tea or ASBs was associated with lower prediabetes risk.

CONCLUSIONS

In this population of middle-aged and older Dutch individuals with low SSBs and ASBs consumption, these beverages were not linked to prediabetes risk. Fruit juice intake showed inconsistent associations with prediabetes risk, warranting further research. Lastly, tea may be a suitable alternative to SSBs for reducing prediabetes risk.

SOAP08_01

DRIED FRUIT INCREASES STOOL WEIGHT AND STOOL FREQUENCY IN CHRONIC CONSTIPATION: A RANDOMISED, PLACEBO-CONTROLLED, FOOD INTERVENTION TRIAL

Dominic Farsi[1]; Simon Steenson[1]; Zoi Katsirma[1]; Valeria Rucco[1]; Daniel So[1]; Alice Adami[1]; Philippa Gibson[1]; Julian Marchesi[2]; S. Mark Scott[3]; Ana Rodriguez-Mateos[1]; Eirini Dimidi[1]; Kevin Whelan[1]
[1]Department of Nutritional Sciences, King's College London, Waterloo Campus, London, United Kingdom; [2]Department of Metabolism, Digestion and Reproduction, Imperial College London, London, United Kingdom; [3]Blizard Institute, Queen Mary University of London, London, United Kingdom

BACKGROUND AND OBJECTIVES

Chronic constipation is a common gastrointestinal (GI) disorder that impacts quality of life yet has high treatment dissatisfaction (1,2). Fruits are often recommended to manage constipation, despite few clinical trials of their effectiveness. Proposed mechanisms are that fruits contain fibre that may reduce gut transit time and increase stool weight, while some fruits contain sorbitol that has osmotic effects in the gut (3). There remains limited evidence on the contribution of fibre or sorbitol, alone or in combination, on constipation. We investigated the impact of dried fruit (fibre and sorbitol), fruit juice (sorbitol but no fibre) and a fruit-flavoured placebo (no fibre or sorbitol) on symptoms of constipation.

METHODS

Participants meeting Rome IV criteria for functional constipation were randomised to 4 weeks of: (1) 90 g/d dried fruit (30g each of prunes, raisins, apricots); (2) fruit juices from the same fruits (plums, grapes, apricots; volumes matched to dried fruits for sorbitol and energy); or (3) fruit cordial placebo (water/sugar with fruit flavourings; volumes matched for energy to other arms). The primary outcome was change in stool weight measured from 7-day total stool collection. Clinical outcomes included stool consistency and frequency, GI symptoms, constipation symptoms (PAC-SYM, CCCS) and quality of life (PAC-QOL).

RESULTS

150 people with constipation were recruited (88% female; mean age 33.9 y, SD 12.7). Change in stool weight was significantly different between groups (p=0.047): dried fruit (mean +21.2 g/d, SD 38.7), fruit juice (+13.2 g/d, SD 40.2) and placebo (+1.6 g/d, SD 25.8;), with significantly greater increases following dried fruit than placebo (p=0.042). There were significantly greater increases in complete bowel movements (p=0.039) and complete spontaneous bowel movements for dried fruit (p=0.025), and spontaneous bowel movements for fruit juice (p=0.026), versus placebo. There were no differences in clinical scores between groups, although change in PAC-QOL satisfaction subscale score (a lower score indicating improved quality of life) was significantly lower for dried fruit (mean -5.8, SD 5.2) versus placebo (-2.8, 6.2; p=0.029). Dried fruits did not induce significant GI side effects, while change in severity of borborygmi was greater for juice (mean +0.1, SD 0.6) than dried fruit (-0.2, 0.5; p = 0.032).

CONCLUSIONS

This is the largest clinical trial testing the impact of fruit in chronic constipation, indicating dried fruits containing both fibre and sorbitol were most effective. Analysis of gut microbiome (16S sequencing) and gut transit time (SmartPill™) data is underway.

SOAP08_02

FRONT-OF-PACK FOOD LABELING (FOPL) AS A STRATEGY TO ADDRESS NON-COMMUNICABLE DISEASES IN NIGERIA: CHALLENGES AND OPPORTUNITIES

Semnen Lambert Osakue[1]; Smorenburg Herbert[2]; Ngozi Mercy Nnam[3]; Kingsley Kola Akinroye[4]
[1]Food, Nutrition and Food System, Choices International Foundation, Lagos, Nigeria, Federal Republic of; [2]Food, Nutrition and Food System, Choices International Foundation, The Hague, Netherlands; [3]Nutrition and Dietetics, University of Nigeria, UNN Nsukka, Enugu, Nigeria, Federal Republic of; [4]Food Labelling and Non-Communicable Diseases, Nigerian Heart Foundation, Lagos, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES

The Double Burden of Malnutrition (DBM) in Nigeria, characterized by the coexistence of undernutrition and overnutrition, along with diet-related non-communicable diseases (NCDs), poses a significant Public Health issue. Globally, it is associated with high morbidity and mortality rates.This study aims to identify policy gaps and recommend improvements to better address the DBM in Nigeria. This will facilitate the national efforts in achieving both the national and global nutrition targets.

METHODS

A qualitative research design was utilized, combining a comparative policy analysis with stakeholder interviews. The policy analysis compared Nigeria's food and nutrition policies with international guidelines from organizations such as UN, FAO, WHO, EAT forum, Global Alliance for Improved Nutrition (GAIN), World Food Program (WFP), World Bank (WB), UNICEF, International Food Policy Research Institute (IFPRI) and the Global Panel on Agriculture and food systems for Nutrition. Semi-structured interviews were conducted with stakeholders from government, academia, private sectors, and NGOs to gain deeper insights into policy gaps and implementation challenges.

RESULTS

The comparative analysis revealed significant gaps in the National Policy on Food and Nutrition in Nigeria (NPNF), particularly in strategies addressing overnutrition and diet-related NCDs. Key strategies like front-of-pack labeling (FOPL), reformulation policies, and private sector engagement were missing. FOPL, a strategy enabling consumers to make well-informed nutrition decisions through interpretive labels on food products, was identified as a critical component lacking in the current policy. Stakeholder interviews emphasized the need for capacity building, including enhanced funding, regulatory frameworks, and public awareness campaigns. Challenges highlighted include complex consumer behavior, regional disparities, and inadequate enforcement mechanisms within the food regulator agencies

CONCLUSIONS

An integrated approach addressing undernutrition, overnutrition, and diet-related NCDs is crucial for combating the DBM in Nigeria. Implementing FOPL can empower consumers to make healthier food choices through clear and accessible information on the nutritional quality of food products. Successful implementation requires robust regulatory frameworks, comprehensive public awareness campaigns, and targeted consumer behavior research. Strengthening food regulatory agencies capacity and ensuring sustainable funding are essential for effective enforcement and monitoring.

SOAP08_03

PATIENTS WITH PHENYLKETONURIA SHOW IMPAIRMENT IN THEIR EXECUTIVE FUNCTIONS FOLLOWING INADEQUATE METABOLIC CONTROL, BUT INDEPENDENT OF THEIR HABITUAL DIET

Kathrin Sinningen[1]; Beatrice Hanusch[1]; Thomas Lücke[1]
[1]Research Department of Child Nutrition, University Hospital of Pediatrics and Adolescent Medicine, Ruhr-University Bochum, Bochum, Germany

BACKGROUND AND OBJECTIVES

Phenylketonuria (PKU; OMIM #261600) is a metabolic disorder characterized by phenylalanine (Phe) accumulation that leads to severe neurological impairments and cognitive deficits if left untreated. European guidelines recommend a strict dietary adherence for treatment until the age of 12 (blood Phe < 360 µmol/L), after which the therapy can be loosened (120-600 µmol/L) but should be followed for life. Until 2017, however, a limit of 1200 µmol/L was recommended. The aim of this study was to investigate whether the cognitive performance of adult, early diagnosed and treated PKU patients is impaired compared to healthy age-matched individuals.

METHODS

A computer-based cognition testing of 18 patients with PKU (11 f; 35 ± 12 years) and 19 controls (10 f; 36 ± 11 years) was performed. The parameters working memory (2-back task), inhibitory control (flanker task), visual-spatial memory (corsi-block-tapping task), information processing (switching costs, switch task), attention (M3 task), and memory (word recall) were tested. Dietary habits were rated using the World Index for Sustainability & Health (WISH; scale: 0 - 130 points), and body mass index (BMI) was recorded. Phe concentrations of the last year were available from 13 PKU patients. Normally distributed data (mean ± standard deviation) were analyzed by t-test, non-normally distributed (median [P25;P75]) by Mann-Whitney U-test.

RESULTS

PKU patients (BMI: 25.0 ± 5.5; WISH: 60.6 ± 16.4; Phe: 732 ± 370 µmol/L) performed worse in individual cognitive tasks than controls (BMI 24.5 ± 4.0; WISH: 59.4 ± 18.3). The switching costs were lower in controls (12.0 ± 5.6 s) than in patients with PKU (18.9 ± 8.0 s; $p = 0.01$). Patients with PKU recalled fewer words in the word recall task (8.0 [6.0;9.3]) than controls (10.0 [8.0;10.0], $p = 0.03$). In the flanker task, PKU patients made more errors in incongruent sequences (PKU: 8.6 [2.9;17.9] vs. Co: 2.9 [0.0;5.7]; $p = 0.02$), and processed congruent sequences slower (300 ms [281;339] vs. 270 ms [267;305]; $p = 0.02$). The latter also correlated positively with the mean Phe concentration of the previous year ($r = 0.69$; $p = 0.01$). There was no correlation with the WISH score.

CONCLUSIONS

PKU patients show deficits in individual cognitive parameters. The diet measured by the WISH score does not appear to be associated with the patients' cognitive performance cognition. These finding suggests that patients with PKU could benefit from Phe concentrations of 120-600 µmol/L, as recommended by European guidelines.

BACKGROUND AND OBJECTIVES

Studies suggest an inverse relationship between vitamin D and depression, potentially mediated by anti-inflammatory effects. However, data linking these three aspects is limited, particularly in adolescence. Therefore, we examined the interrelationship among vitamin D, inflammation and depression in children and adolescents.

METHODS

We used data from (1) a cross-sectional study [n=465] and (2) a RCT [n=92], both conducted at a psychiatric hospital. In both studies, depression severity was evaluated using Beck Depression Inventory II (BDI-II), and Diagnostic System for Mental Disorders in Childhood and Adolescence via self-assessment (DISYPS Self) and parent reports (DISYPS Proxy). In study 1, serum 25(OH)D and CRP were measured in all participants. In a subsample [n=177], we additionally measured TNF-α, IFN-γ, IL-1β, IL-6, IL-8, IL-10. In study 2, participants with vitamin D deficiency (25(OH)D ≤ 30 nmol/L) and at least mild depression (BDI-II > 13) from the cross-sectional cohort were randomly assigned to the intervention (2640 IU vitamin D3/day for 28 days) or the placebo group, both alongside treatment as usual (Libuda et al. 2020). In this secondary analysis, we examined whether intervention effects depended on baseline inflammation status measured by CRP.

RESULTS

73.5%–83.2% of participants had at least mild depression, and 43.2% were at risk of vitamin D deficiency. Linear regression showed an inverse association between vitamin D levels and BDI-II scores. Logistic regression confirmed an inverse association between vitamin D and depression in DISYPS Proxy, but not DISYPS Self. Although 25(OH)D weakly correlated with inflammation markers e.g. CRP (r= -0.21, p< 0.0001), their inclusion in the regression models did not change the association with depression. Study 2: CRP levels were in the normal range (<5 mg/L) in 91.3% of the participants. No significant interaction between intervention and CRP status on depression severity was found for any of the depression assessment tools. Stratified analyses by CRP status showed no inflammation-dependent effects of vitamin D supplementation on depression.

CONCLUSIONS

Our RESULTS suggest a modest inverse relationship between vitamin D and depression in children and adolescents. Although vitamin D was linked to certain inflammatory markers, anti-inflammatory effects did not

https://doi.org/10.1017/jns.2026.10126 Published online by Cambridge University Press

mediate the cross-sectional association, nor were supplementation effects influenced by CRP status. The RESULTS need cautious interpretation since CRP levels in our sample were predominantly in the normal range.

SOAP08_05

ADHERENCE TO THE EAT-LANCET PLANETARY HEALTH DIET, MORTALITY OUTCOMES AND ENVIRONMENTAL IMPACTS AMONG MYOCARDIAL INFARCTION PATIENTS

Marinka Steur[1]; Manuela Rossi[1]; Esther Cruijsen[1]; Neha Khandpur[1]; Marianne Geleijnse[1]
[1]Division of Human Nutrition and Health, Wageningen University, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES

The potential impact of the EAT-Lancet Planetary Health Diet (PHD) on mortality risk in patients with cardiovascular disease (CVD) is unknown. We aimed to develop a PHD Index (PHDI) for Dutch CVD patients and to evaluate its associations with all-cause and CVD mortality, and with dietary environmental impacts.

METHODS

Post-myocardial infarction patients enrolled in the Alpha Omega Cohort (2002-2006, age 60-80 years, 80% male) were followed for cause-specific mortality through December 31, 2022. For patients who completed a food frequency questionnaire (FFQ) at baseline (n=4,365), we calculated a PHDI as the sum of 13 food group-specific PHD subscores (0-10 each, maximum adherence: 130). Beverages, except for milk, were not part of the PHDI. Life cycle assessment data, including greenhouse gas emissions (GHGE), fossil energy use (FEU) and land use (LU), were linked to FFQ items. We used Cox proportional hazards models to assess the associations of the PHDI with all-cause and CVD mortality. Hazard ratios with 95% confidence intervals (95% CI) were adjusted for demographic, lifestyle and health confounders. Linear regression was used to model associations of the PHDI with dietary environmental impacts, adjusting for age, sex and energy intake.

RESULTS

The median (interquartile range) of the PHDI was 47 (40-54), indicating a relatively low adherence. PHD subscores varied substantially for dairy and potatoes, but not for red meat due to its high overall consumption, resulting in a minimal contribution of red meat to the PHDI. During 56,152 person-years of follow-up, 2,869 patients died, including 1,112 from CVD. Those with greater adherence to the PHDI had a 16% (95% CI 6-25%, Q4 versus Q1) lower risk of all-cause mortality (p for trend: 0.004) and a 24% (9-36%) lower risk of CVD mortality (p for trend: 0.005). The PHDI was positively associated with environmental impact indicators (Q4 versus Q1: +5.5% for GHGE, +10.0% for FEU and +8.2% for LU, all p for trend <0.001).

CONCLUSIONS

Greater adherence to the PHDI was associated with lower risks of all-cause and CVD mortality in CVD patients. However, the PHDI did not adequately capture interindividual variations in food intake in this population with a traditional Dutch diet, which contributed to positive associations between the PHDI and dietary environmental impacts. Nevertheless, these findings provide support for a transition towards diets aligned with EAT-Lancet PHD recommendations to improve the long-term health of CVD patients.

BETTER DIETARY QUALITY IS LINKED TO LOWER PRE- AND POSTNATAL DEPRESSIVE AND ANXIETY SYMPTOMS IN WOMEN WITH OVERWEIGHT AND OBESITY

Janina Hieta[1, 2]; Eeva-Leena Kataja[3, 4]; Tero Vahlberg[5]; Ella Koivuniemi[2]; Noora Houttu[1]; Outi Pellonperä[6]; Kati Mokkala[2]; Hasse Karlsson[4, 3]; Kirsi Laitinen[2, 1]

BACKGROUND AND OBJECTIVES

Depressive and anxiety symptoms have been associated with various adverse pregnancy outcomes and may negatively affect the health and development of the child. Mental health problems during pregnancy are also linked to an increased risk of postnatal depression and anxiety. Thus, it is important to find strategies for preventing or reducing these symptoms during pregnancy and postpartum. Previous research has shown a link between diet and mental health symptoms, primarily in women with normal weight. Thus, this study aims to investigate the link between diet quality and perinatal depressive and anxiety symptoms among pregnant women with overweight and obesity. Women with overweight and obesity are at increased risk for mental health challenges during and after pregnancy, making it important to investigate how diet may influence both depressive and anxiety symptoms in this risk group.

METHODS

In total, 439 women with overweight and obesity were recruited for the mother-child dietary intervention trial in early pregnancy. Dietary quality with respect to that recommended was assessed using the validated Index of Diet Quality (IDQ). The IDQ questionnaire consists of 18 multiple-choice questions about the frequency and quality of foods including whole grains, vegetable oil spreads, dairy, vegetables, fruits, and sugar-rich foods. The total IDQ score ranges from 0 to 15 points. Depressive symptoms were assessed with the Edinburgh Postnatal Depression Scale (EPDS) and anxiety symptoms with the Symptoms Checklist (SCL-90) in early and late pregnancy, as well as three, six and 12 months postpartum. The associations between the mother's diet and depressive and anxiety symptoms were tested with Spearman correlations.

RESULTS

Both mean EPDS ($r=-0.12$, $p=0.01$) and SCL-90 ($r=-0.13$, $p=0.01$) scores were negatively correlated with IDQ in early pregnancy. Mean EPDS scores were also negatively correlated with IDQ ($r=-0.13$, $p=0.03$) at six months postpartum. No differences were observed in the other measurement points.

CONCLUSIONS

RESULTS suggest that overall better dietary quality is linked to lower depression and anxiety symptoms in early pregnancy and at six months postpartum in women with overweight and obesity. These findings should be considered in maternal healthcare to integrate mental health and nutrition support, especially for this population at higher risk of perinatal mental health problems. However, further research on this topic is still needed.

CHANGES IN THE CRITICAL NUTRIENT CONTENT OF PACKAGED FOODS AND BEVERAGES AFTER THE INITIAL IMPLEMENTATION OF THE PERUVIAN FRONT-OF-PACKAGE WARNING LABEL POLICY: A NONEXPERIMENTAL PROSPECTIVE STUDY

Jonathan Lara-Arevalo[1]; Lorena Saavedra-Garcia,[2]; Francisco Diez-Canseco,[2]; Natalia Rebolledo,[3]; Donna R. Miles,[4]; Bridget Hollingsworth,[4]; J. Jaime Miranda,[2]; Lindsey Smith Taillie[1, 4]
[1]Department of Nutrition, University of North Carolina in Chapel Hill, Chapel Hill, United States of America; [2]CRONICAS Center of Excellence in Chronic Diseases, Universidad Peruana Cayetano Heredia, Campus Miraflores, Lima, Peru; [3]CIAPEC, Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile; [4]Carolina Population Center, University of North Carolina in Chapel Hill, Chapel Hill, United States of America

BACKGROUND AND OBJECTIVES

In June 2019, the first phase of the Peruvian Food Labelling Law mandating front-of-package warning labels (FOPWL) for unhealthy packaged foods and beverages was implemented. This study assesses nutrient content changes in packaged products to evaluate reformulation after the policy's initial implementation.

METHODS

Nutritional facts panel data was collected in a representative sample of packaged foods and beverages available in Peruvian markets at two time periods: pre-implementation (T0: March-April 2019; n = 2,481) and post-implementation (T1: March 2020–February 2021; n = 3,018). Quartiles of nutrients of concern (i.e., total sugars, saturated fats, sodium, and trans fats per 100 g/100 mL) and the proportion of food and beverage products meeting criteria for FOPWL (i.e., products "high-in" or "contains trans fats") were compared pre- and post-implementation of the law in cross-sectional samples. A longitudinal subsample (i.e., the same product collected at both T0 and T1; n = 1,694) was also analyzed. Marginal means from logistic regression and quantile regressions were used for comparisons.

RESULTS

Cross-sectional analysis showed a significant decrease (T0 versus T1) in the proportion of products containing any FOPWL for both foods (66.5% to 59.4%; p<0.01) and beverages (27.4% to 18.5%; p <0.01). The proportion of food and beverages meeting criteria for "high-in" sugar FOPWL significantly decreased over time in breakfast cereals, sweet bakery, sweet spreads, and sweetened beverages (from 51.4% to 40.7%; p<0.01). The proportion of products "high-in" saturated fats significantly decreased in ready-to-eat meals and sweet bakery products from 57.4% to 42.6% (p<0.01). The only food group with a notable reduction in the proportion of "high-in" sodium was savory spreads (42.9% vs 31.0%; p=0.02), while the proportion of "contains trans fats" only significantly decreased in sweet bakery (19.5% vs 10.2%; p < 0.01). Longitudinal analyses showed similar RESULTS, with additional reductions in the proportion of ice creams and milk-based products with "high-in" sugar FOPWL.

CONCLUSIONS

After implementing Peru's Food Labelling Law, sugars and saturated fats significantly decreased in several packaged food and beverage products. These findings highlight FOPWL policies' potential to drive manufacturer reformulation in the food supply, thus reducing dietary risk factors for non-communicable diseases (NCD). Further research should evaluate the long-term impact of these changes on dietary quality and NCD prevention.

RELATIONSHIP BETWEEN DIETARY PATTERNS, FOOD MOLECULAR COMPOSITION, AND TYPE 2 DIABETES RISK IN A COLOMBIAN AFRO-DESCENDANT COMMUNITY

Jeison Suescum[1, 2]; Viviana Ortega Burbano[1, 2]; Yurdey Herrán Murillo[1, 3]; Catalina Parra Martinez[1, 4]; Mateo Reinoso Sanchez[1, 3]; Andres Rodriguez Vergara[1, 4]; Juliana Chaura Cortés[1]; Diana María Caicedo Borrero[4]; Milton Fabián Súarez Ortegón[4]; María Teresa Varela Arévalo[3]; María Del Pilar Zea León[4]; Andrés Jaramillo-Botero[1, 2]
[1]Pontificia Universidad Javeriana, IÓMICAS Research Institute, Cali, Colombia; [2]Faculty of Engineering and Sciences, Pontificia Universidad Javeriana, Cali, Colombia; [3]Faculty of Humanities and Social Sciences, Pontificia Universidad Javeriana, Cali, Colombia; [4]Faculty of Health Sciences, Pontificia Universidad Javeriana, Cali, Colombia

BACKGROUND AND OBJECTIVES

Type 2 diabetes (T2D) disproportionately affects vulnerable communities, particularly afro-descendant populations in Colombia. This study investigates the relationship between dietary patterns, molecular composition of foods, social determinants of health, and risk of T2D to establish nutritional intervention paths.

METHODS

A interdisciplinary cross-sectional study was conducted in a cohort of 326 normoglycemic adults from Padilla, Cauca, Colombia. Dietary patterns were assessed using a food frequency questionnaire, while T2D risk was estimated with an adapted FINDRISC (Finnish Diabetes Risk Score) scale. Social determinants of health were evaluated through a questionnaire tailored to identify factors, such as socioeconomic status, that may influence dietary choices and the risk of T2D. Identified dietary patterns were classified using factor analysis, and a subsample of participants with high and low diabetes risk was selected for detailed food analysis (group diet) using liquid chromatography-mass spectrometry (HPLC-MS) under standardized protocols established by the Periodic Table of Food Initiative (PTFI) at the Center of Excellence (iÓMICAS).

RESULTS

Data from 326 afro-descendant individuals revealed that over 50% had some level of T2D risk according to the FINDRISC scale. Two primary dietary patterns were identified within the community, and their potential links to diabetes risk are under exploration. Social determinants data provided insights into the socioeconomic status of the population, highlighting its influence on dietary choices. The interplay between social determinants, dietary patterns, and diabetes risk is being investigated further. We are currently using the metabolomics food profile to correlate with biomarkers associated with T2D risk, which is expected to enable personalized nutrition and preventive strategies.

CONCLUSIONS

Our findings reveal a high prevalence of T2D risk in this afro-descendant population, shaped by both dietary and socioeconomic factors. The study highlights the importance of integrating social determinants into dietary research to fully understand their impact on health outcomes. While the association between dietary patterns and diabetes risk is still exploratory, the RESULTS provide a solid foundation for future hypotheses and targeted interventions. We will present on the molecular composition of foods that correlate highly with social determinants to influence the metabolic health outcome in this community, in order to inform community-level strategies to reduce T2D risk.

SOAP08_10

HIGH PREVALENCE OF VITAMIN B12 DEFICIENCY IN SUBJECTS WITH ATROPHIC GASTRITIS

Kiyoshi Tanaka[1]; Misora Ao[2]
[1]Research Support Center, Shizuoka General Hospital, Shizuoka, Japan; [2]Department of Health and Nutrition, Osaka Shoin Women's University, Higashi-osaka, Japan

BACKGROUND AND OBJECTIVES

Vitamin B12 (VB12) has unique features; complex absorption process and large hepatic storage. VB12 is first liberated from food by gastric acid, then binds to intrinsic factor (IF) secreted from gastric parietal cell, and VB12-IF complex is absorbed from terminal ileum. Thus, VB12 deficiency is an inevitable consequence of gastrectomy. Conventional theory holds that VB12 deficiency occurs years after gastrectomy because of the large hepatic storage. However, gastrectomy is mostly indicated for patients with gastric cancer, most of which develops after long-standing atrophic gastritis (AG). Then, we have made a hypothesis that VB12 absorption is already impaired years before surgery, and VB12 deficiency occurs much earlier than previously considered, and performed two studies.

METHODS

(Study 1) VB12 status was evaluated in patients before and after gastrectomy. Severe VB12 deficiency and deficiency were defined as serum VB12<150pmol/L and 150-258 pmol/L, respectively. Plasma homocysteine (Hcy) concentration was also measured reflecting folate, VB12, or vitamin B6 status. (Study 2) Healthy subjects visiting the hospital for health checkup were evaluated for their blood VB12, folate, Hcy, and ferritin levels. AG grade was based on endoscopical classification and blood pepsinogen-1 and -2 levels were measured.

RESULTS

(Study 1) Severe VB12 deficiency and deficiency were present in 19.0% and 52.4%, respectively in patients within three years after surgery. They were already present even before gastrectomy. Plasma Hcy concentration was inversely associated with serum VB12 concentration. VB12- and iron-deficiency anemia co-existed. (Study 2) The prevalence of VB12 severe deficiency/deficiency was 26.5%. According to the AG classification, serum albumin, ferritin and pepsinogen-1 concentrations were significantly lower in subjects with advanced stage than those with less-advanced stage. In the pepsinogen-based high-risk group, serum VB12 and ferritin concentrations were significantly lower.

CONCLUSIONS

VB12 deficiency is prevaent in patients early after and before gastrectomy, also in those with AG. AG, quite common in the elderly, is mostly asymptomatic and often left undiagnosed, and VB12 deficiency is likely to be unrecognized. Mean corpuscular volume (MCV), commonly used parameter in the differential diagnosis of anemia, is increased in VB12 deficiency and decreased in iron deficiency. Since gastrectomy and AG impair the absorption of both nutrients, MCV within the reference range does not exclude VB12 deficiency, and evaluating VB12 status by its serum level is recommended in those with gastrectomy or AG.

SOAP08_11

EFFECTS OF AN ANTI-INFLAMMATORY DIET ON INFLAMMATION AND OXIDATIVE STRESS PARAMETERS IN PATIENTS WITH KNEE OSTEOARTHRITIS

Sabine Chmelar[1, 2]; Elisabeth Höld,[1]; Gabriele Leitner[1]; Stefan Nehrer[3]; Oliver Neubauer[3, 4, 5]; Karl-Heinz Wagner[4, 5]; Barbara Wondrasch[1]
[1]Department of Health, University of Applied Sciences, Sankt Pölten, Austria; [2]Vienna Doctoral School of Pharmaceutical, Nutritional and Sport Sciences (PhaNuSpo), University of Vienna, Vienna, Austria; [3]Department for Health Sciences, Medicine and Research, University for Continuing Education Krems, Krems, Austria; [4]Research Platform Active Ageing, University of Vienna, Vienna, Austria; [5]Department of Nutritional Sciences, University of Vienna, Vienna, Austria

BACKGROUND AND OBJECTIVES

Osteoarthritis (OA) has long been considered as a degenerative disease of cartilage tissue resulting from bodily wear and tear. However, there is accumulating evidence that inflammation plays a key role in the pathogenesis of OA. While exercise therapy is an effective component of early treatment, nutritional therapy has played a subordinate role up to now and is mainly limited to reducing existing overweight. In the course of the NUMOQUA project (Nutrition and movement to improve quality of life with knee osteoarthritis), a new anti-inflammatory therapeutic diet named “Austrian Osteoarthritis Cuisine” was developed. It is based on the framework of the New Nordic Diet combined with the food-based dietary guidelines of Austria, the guidelines for OA, the Austrian food culture, and the principles of a sustainable diet. The present study examines the effects of the “Austrian OA Cuisine” combined with the evidence-based training program GLA:D® (Good Life with osteoArthritis in Denmark) on blood inflammatory and oxidative stress parameters in patients with knee OA in Austria.

METHODS

A total of 63 participants aged 50 to 75 with knee OA were included and randomly assigned either to the intervention group or the control group. All participants took part in the GLA:D® program in the first six weeks. Additionally, the intervention group received nutritional group training and individual nutritional counselling on the “Austrian OA Cuisine” over nine months. The control group received general information about a healthy lifestyle. Measurements of inflammatory and oxidative stress parameters were performed at baseline and at three follow-up dates within one year.

RESULTS

The recruitment of patients was finished in January 2024 and data collection will be completed by January 2025. The RESULTS will provide insight into whether the intervention has effects on various blood-based biomarkers (e.g., interleukin-18, tumor necrosis factor alpha, matrix metalloproteinase-3, ferric reducing ability potential, oxidized LDL cholesterol).

CONCLUSIONS

The prevalence of OA is expected to increase in future due to ongoing demographic changes and rising obesity rates. The study will provide important evidence about the influence of this interdisciplinary approach on the chronic low-grade inflammation in patients with knee OA and whether this could be a sustainable strategy in the future to address the disease process of OA without negative side effects.

BACKGROUND AND OBJECTIVES

Excess salt consumption is a major public health problem, contributing to the global hypertension and cardiovascular burden. The nation has recently released new guidelines setting the lowest maximum sodium content in prepackaged foods, aiming to mitigate sodium-related health risks and align with international recommendations. This abstract aims to present an overview of the new guidelines on the lowest maximum sodium content in prepackaged food and assess their public health implications and potential impacts on the food industry in this nation.

METHODS

Adapting WHO global sodium benchmarks for 18 food categories, the country developed the benchmarks for 11 food groups relevant to the local food supply. A review of the eating behaviors, food consumption, prepackaged food consumption, and food sale data was conducted to compare sodium limits across various food categories with the local and global benchmarks. Stakeholder interviews and secondary data analysis were employed to evaluate potential challenges and opportunities for implementation.

RESULTS

The guidelines introduced sodium benchmarks for 11 common prepackaged food groups in the nation, based on the WHO thresholds. The benchmarks had been introduced to all provinces to ensure adoption at all local levels. However, the mechanism and resources for the implementation of the benchmarks are limited. The benchmarks represent a 20–30% reduction in sodium thresholds, positioning the country among the countries active in sodium reduction efforts. While public health experts lauded the initiative for its potential to increase healthy food options and reduce cardiovascular disease burden, concerns from food industries were about reformulation costs, product acceptability, and compliance timelines. Acceptability of the guideline may be strengthened with the adoption of interim, stepwise targets for food categories that greatly exceed the benchmarks, based on locally collected data.

CONCLUSIONS

The nation’s new sodium guidelines mark a critical step towards improving population health through dietary sodium reduction. Successful implementation will require multisectoral collaboration, consumer education, and technological innovation in food production.

BACKGROUND AND OBJECTIVES

Food labelling, especially front-of-pack nutrition labelling (FOPNL), can encourage consumers to make healthier dietary choices and incentivise food reformulation (1,2). In November 2022, in a multi-country capacity building workshop held in Armenia, countries highlighted the need to understand food labelling policies in their countries better. This survey reports the estimates of the prevalence of FOPNL and other food labelling elements in: Armenia, Belarus, Georgia, Kazakhstan, Kyrgyzstan and Russia.

METHODS

First, the survey was piloted in two countries (Portugal and United Kingdom). Then, in each country under study, researchers visited one large and one small neighbourhood store and randomly selected and photographed the package of approximately 330 products. Products were classified as "healthy" or "unhealthy" according to the WHO Regional Office for Europe nutrient profile model (second edition) (3).

RESULTS

Our preliminary analysis estimates the prevalence of elements covered by the ingredient list, the nutrient declaration, and the presence and type of FOPNL, per country (Table 1). The next stage of analysis will compare the prevalence of these elements between “healthy” and “unhealthy” products.

Table 1. Preliminary estimates of prevalence of different labelling elements (% (n))

Countries	Number of products	List of ingredients	Nutrient declaration	FOPNL
Georgia	330	94.5 (312)	99.7 (329)	3 (10)
Belarus	310	87.7 (272)	89.7 (278)	5.2 (16)
Kyrgyzstan	346	98.8 (342)	98 (339)	9.5 (33)
Armenia	330	89.7 (296)	95.2 (314)	3.3 (11)
Russia	282	99.3 (280)	98.9 (279)	8.5 (24)
Kazakhstan	330	96.1 (317)	91.8 (303)	9.1 (30)

CONCLUSIONS

This survey is the first to analyse the prevalence of labelling elements in these countries, providing an essential basis to support improvements in food labelling policy. Early findings suggest that there are significant variations and a limited prevalence of FOPNL, likely due to a lack of harmonized regulations and current voluntary guidelines instead of mandatory legislation in place. NB: Data extraction and analysis is ongoing and more RESULTS will be presented at the 23rd IUNS-ICN.

[1]Jeffrey Cheah School of Medicine and Health Sciences, Monash University Malaysia, Bandar Sunway, Malaysia; [2]School of Pharmacy, Monash University Malaysia, Bandar Sunway, Malaysia

BACKGROUND AND OBJECTIVES

Cardiovascular diseases (CVDs) remain the leading cause of global mortality and disability, with developing countries accounting for 75% of CVD-related deaths and 80% of the disease burden. Digital health interventions (DHIs) present a promising approach to address key risk factors for the primary prevention of CVDs in developing economies, necessitating an evaluation of their efficacy. We aim to explore the effectiveness of DHIs in the primary prevention of CVDs in these settings.

METHODS

We systematically searched recent randomized controlled trials (RCTs) using PRISMA guidelines across five databases (Ovid Medline, Scopus, PubMed, Embase, and Cochrane Central Register of Controlled Trials). The trials reported on DHIs targeting health-related behaviour and/or outcomes associated with CVD, including its risk factors. Study inclusion and exclusion criteria were defined using the PICOTS framework.

RESULTS

The trials employed diverse DHIs aimed at behaviour change interventions, primarily assessing outcomes such as anthropometry, blood pressure, glucose control, blood lipids, metabolic syndrome, and cumulative CVD risk. Significant improvements in body mass index, weight, waist circumference, blood pressure, and triglyceride levels were observed, demonstrating DHIs' potential.

CONCLUSIONS

While DHIs show modest efficacy in primary CVD prevention, identified research gaps highlight the need for studies addressing practical implementation challenges. Advancing DHI strategies could enable their adoption as a primary intervention for CVD prevention in the near future.

Food Additive Preservatives and Antioxidants and Risk of Type 2 Diabetes – RESULTS From a Large Prospective Cohort

Anaïs Hasenböhler[1]; Guillaume Javaux[1]; Marie Payen de la Garanderie[1]; Fabien Szabo De Edelenyi[1]; Cédric Agaësse[1]; Alexandre De Sa[1]; Mélanie Deschasaux-Tanguy[1]; Emmanuel Cosson[2]; Fabrice Pierre[3]; Xavier Coumoul[4]; Bernard Srour[1]; Mathilde Touvier[1]
[1]Centre of Research in Epidemiology and StatisticS, Nutritional Epidemiology Research Team (EREN), Université Sorbonne Paris Nord and Université Paris Cité, INSERM, INRAE, CNAM, Bobigny, France; [2]Diabetology, endocrinology and nutrition Department, Avicenne Hospital, AP-HP, Bobigny, France; [3]Toxalim (Research Centre in Food Toxicology), Université de Toulouse, INRAE, ENVT, INP-Purpan, UPS, Bobigny, France; [4]INSERM T3S, UMR-S 1124, Université Paris Cité, Paris, France

BACKGROUND AND OBJECTIVES

Experimental studies suggested potential metabolic effects of preservative and/or antioxidant food additives on pancreatic tissue, insulin disruption, and inflammation, but epidemiological data is lacking. This study aimed to investigate for the first time the associations between exposures to a wide range of preservatives and antioxidants and type 2 diabetes (T2D) risk in a large population-based cohort.

METHODS

Participants (n=108,723, 79.2% women, mean age=42.5y, SD=14.6) from the French NutriNet-Santé prospective cohort (2009-2023) completed repeated 24h-dietary records including specific brands of industrial products. Preservative and antioxidant exposure was assessed using composition databases and laboratory assays. We characterised associations between time-dependent exposures to preservatives and antioxidants and risk of T2D using multivariable Cox models adjusted for known confounders.

RESULTS

1131 T2D cases were identified during follow-up. Higher intakes of the following additives were associated with a higher risk of developing T2D: potassium sorbate (HR higher vs non/low-consumers = 2.15, 95%CI [1.76-2.63]), potassium metabisulphite (1.29 [1.10-1.51]), acetic acid (1.31 [1.08-1.60]), sodium acetates (1.23 [1.01-1.50]), calcium propionate (1.44 [1.22-1.70]), sodium ascorbate (1.41 [1.19-1.66]), alpha-tocopherol (1.30 [1.05-1.60]), sodium erythorbate (1.43 [1.20-1.69]), phosphoric acid (1.39 [1.10-1.75]), extracts of rosemary (1.20 [1.02-1.41]), sodium nitrite (1.50 [1.26-1.78]) and citric acid (1.29 [1.11-1.51]).

CONCLUSIONS

This large prospective cohort revealed associations between exposures to food additive preservatives and antioxidants widely used in industrial foods and increased T2D risk . If confirmed, these findings could lead to a re-evaluation of regulations governing the use of these additives by the food industry, to improve consumer protection.

BACKGROUND AND OBJECTIVES
Meta-analyses of observational studies on the effect of dairy on cognitive function have yielded inconclusive RESULTS, potentially due to unmeasured confounding. To address this, we aimed to investigate the effect of the lactase persistence genetic variant, avoiding the no-unmeasured confounding assumption. The CC genotype is associated with lower lactase production and, consequently, lower non-fermented dairy consumption. We used it as an instrument to assess long-term consumption of non-fermented dairy and its effect on cognitive function.
METHODS

We included 43,836 individuals over 55 years old with genotyping, dietary assessment data, and cognitive function measurements from three population-based studies: CoLaus|PsyCoLaus (Switzerland), the Rotterdam Study (the Netherlands) and the Canadian Longitudinal Study on Aging (CLSA - Canada). We performed a one-sample Mendelian randomization using two-stage least-squares regression. First, we estimated non-fermented dairy consumption by T-allele frequency. Second, we used the estimated non-fermented dairy consumption in a linear regression model on cognitive function. General cognition, assessed by the Mini-Mental State Examination (MMSE) and the Mental Alternation Test, was our primary outcome. Secondary outcomes included measures of executive function, verbal fluency, verbal learning, and memory.

RESULTS

Per T-allele, non-fermented dairy intake was 15.3 grams/day higher in PsyCoLaus, 49.8 grams/day in the Rotterdam Study and 0.21 times/day in CLSA. We found no association between the genetically predicted difference and the MMSE in PsyCoLaus or the Rotterdam Study. Lactase persistent individuals scored 4.4 (95% CI 2.8-6.0) points more on average for the Mental Alternation Test in CLSA. Among secondary outcomes, there was a higher verbal fluency, verbal learning and executive function among lactase persistent individuals in CLSA. Such inconsistencies and the generally small magnitude of effect sizes may suggest that there is no real effect between non-fermented dairy intake and cognitive function.

CONCLUSIONS
The evidence for a causal effect of non-fermented dairy consumption on general cognitive function is weak, consistent with previous RESULTS from classic analysis from observational studies. This suggests that interventions targeting dairy consumption are unlikely to have a relevant effect on cognitive function.

SOAP14_03

FRONT-OF-PACK NUTRITION LABELLING TO PROMOTE HEALTHIER DIETS: A FIVE-YEAR UPDATE ON CURRENT PRACTICE AND OPPORTUNITIES TO FURTHER STRENGTHEN REGULATION WORLDWIDE

Alexandra Jones[1]; Damian Maganja[1]
[1]Food Policy, The George Institute for Global Health, Barangaroo, Australia

BACKGROUND AND OBJECTIVES

Unhealthy diets are a leading cause of death and disability globally. The WHO recommends Member States implement front-of-pack nutrition labels (FOPNL) as a 'best-buy' policy for addressing diet-related non-communicable diseases. The evidence base for FOPNL continues to evolve rapidly. Recent authoritative guidance from Codex Alimentarius Commission (2021) and WHO (to be finalised early 2025) supports government action but does not specify that countries should use a particular label. There is significant variation in FOPNL adopted by governments, and food industry resistance to progressive policies persists. This study aims to conduct an updated analysis of FOPNL regulations adopted worldwide to support policymakers to design and implement best-practice regulation.

METHODS

We use a framework for analysing public health law and available best-practice guidance to evaluate key components of FOPNL regulations endorsed by governments up to December 2024.

RESULTS

FOPNL adoption has grown, from 32 governments in 2019 to at least 45 in 2024, with over 15 of these using mandatory legislation. Label formats vary, reflecting WHO findings that there is no single best-performing format. There have been recent increases in use of summary indicator systems (e.g. Nutri-Score in 8 European countries) and nutrient-specific warning-style labels (e.g. 9 countries, particularly in the Americas region). Recently adopted FOPNL regulations provide updated insights on drafting of key terms such as regulatory objectives and specifications for label display to improve visibility and salience (e.g. in a uniform place on pack). There is a growing evidence base to support countries to develop valid scoring criteria, and increasing consideration of added sugars and ultra-processing as part of nutritional scoring. While data on FOPNL governance remains scarce, recent global guidance supports good governance of labelling regulations, including transparency and accountability in processes of label development, implementation, evaluation and enforcement to promote continuous improvement and withstand undue commercial interference.

CONCLUSIONS

Global interest in FOPNL remains high. Whether developing new FOPNL or reforming existing policies, these updated findings support policymakers to design and implement best-practice, evidence-informed regulations that are less likely to be contested successfully by industry and more likely to achieve public health impact.

SOAP14_04

THE OFFSPRING'S B-CELL MATURATION PROCESS DURING THE SUCKLING PERIOD AND THEIR INSULIN SENSITIVITY IN ADULTHOOD ARE DIFFERENTLY IMPACTED DEPENDING FROM HYPERGLYCEMIC OR EUGLYCEMIC DAMS

Paul Bobin; Isabelle Grit[1]; Corentin Massias[1]; Pierre De Coppet[1]; Blandine Castellano[1]; Agnès David-Sochard[1]; Mikaël Croyal; Marie-Cécile Alexandre-Gouabau[1]; Gwenola Le Dréan[1]
[1]UMR PhAN, Nantes Université - INRAE, Nantes, France

BACKGROUND AND OBJECTIVES

Gestational Diabetes Mellitus (GDM) is associated with a higher risk of type 2 diabetes (T2D) in offspring later in life, likely involving disruptions in pancreatic islets development and function in the newborn. During the breast-feeding period, β-cells undergo a maturation process that enhances their insulin secretory capacity. Furthermore, epidemiologic evidence highlights (1) the benefits of extended breastfeeding in reducing the risk of T2D in children born to mothers with GDM and (2) adaptations in the composition of GDM breast milk. However, the impact of breast milk composition during the critical βcell maturation period in the context of GDM remains unknown, even though breastfeeding represents a potential intervention target to mitigate the effects of maternal hyperglycaemia.

METHODS

We used a rodent model of maternal hyperglycaemia induced by a High Fat High Sucrose (HFHS) diet during gestation alone (4HFHS), or during gestation and lactation (7HFHS), compared to a Chow diet (euglycaemic CTL rats). Milk composition was characterised at postnatal day 1 (PND1) and at PND14 through analyses of fatty acids, amino acids, sphingolipids and lipidome profiles. The independent effects of the gestation and lactation periods were investigated by cross-fostering pups at PND0 among CTL, 4HFHS and 7HFHS dams. Pancreatic islets were isolated from offspring at PND0, PND14 and PND 220. Oral glucose tolerance tests were performed in adult offspring at PND60 and PND210, as well as euglycemic-hyperinsulinemic clamps at PND200.

RESULTS

Colostrum from 4HFHS; 7HFHS and CTL dams showed 3 distinct metabotypes. These differences in composition were maintained at PND14 in 7HFHS vs CTL milk. At PND0, pups born to hyperglycaemic mothers showed islet hypertrophy and hyperplasia associated to a lower percentage of β-cells. At PND14, genes involved in β-cells maturation (NeuroD, Glut2, Ins2) were increased, as well as plasma insulinemia and HOMA-β in pups nursed by 7HFHS versus 4HFHS dams. Moreover, at PND220, offspring nursed by CTL dams showed hyperglycemia (in males) and an insulin-sensitivity lower trend (in females) in response to a hypercaloric challenge from PND120 to PND220.

CONCLUSIONS

These preliminary RESULTS confirm that hyperglycaemia during gestation-lactation is associated with an adaptation of milk composition, and would have repercussions on offspring's β-cell maturation and metabolic trajectory later in their adult life according to their maternal glycemic status during gestation and lactation.

BACKGROUND AND OBJECTIVES

Chronic inflammation and oxidative stress are related to metabolic syndrome (MetS) pathophysiology. Flavonoids are dietary compounds with antioxidant and anti-inflammatory properties, which improve the metabolic profile of MetS. This study aimed to evaluate the association between dietary polyphenol intake and MetS components.

METHODS

A total of 224 individuals of both sexes, with a mean age of 50.8 years, diagnosed with MetS according to the National Cholesterol Education Program Adult Treatment Panel III (NCEP-ATP III) were included in the study. Two 24-hour dietary recalls were applied to assess dietary intake. Flavonoids intake was estimated using the Brazilian Food Composition Table, Phenol-Explorer, and United States Department of Agriculture (USDA) data. The main foods that contributed to flavonoids intake were calculated by their contribution percentage. Binary logistic regression models evaluated the association between flavonoids intake and MetS components

RESULTS

A total of 172 (76.8%) of the total participants were women. More than half were physically active or very active (52.9%). The median flavonoids intake was 54.0 mg/1000kcal/d (aglycone equivalent), and the subclasses distribution was flavones, flavonols, flavan-3-ols, flavanones, anthocyanins, and isoflavonoids. The individual compounds most taken were epicatechin, apigenin, and procyanidin dimer B2. Beans, oranges, and orange juice were the main foods contributing to flavonoids intake. Flavonoids intake was protective against low HDL-c concentrations (third vs. first tertile of intake, OR=0.35; 95%CI 0.13-0.88). No significant association was observed between other tested variables.

CONCLUSIONS

Higher dietary flavonoids intakes were associated with increased HDL-c, suggesting a likely beneficial effect of these compounds in attenuating cardiometabolic risk factors for MetS.

SOAP14_07

ASSOCIATION BETWEEN BLOOD PRESSURE AND WAIST-TO-HEIGHT RATIO IN SCHOOLCHILDREN AGED 6 TO 8 YEARS IN THE VALPARAÍSO REGION, CHILE

Mirta Crovetto Mattassi[1]; Katherine Concha[1]
[1]Salud, Comunidad y Gestión, Universidad de Playa Ancha, Valparaiso, Chile

BACKGROUND AND OBJECTIVES

Hypertension is a serious obesity-related disease that affects the pediatric population The incidence of pediatric hypertension is increasing worldwide, driven by rising rates of childhood obesity.7,8. In Latin America, recent studies have reported rates of altered blood pressure (ABP) that vary between 0.7% and 40.5% in children and adolescents.10 In Chile, a prevalence of 20.8% has been observed in the child population. In Chile, data from the nutritional map of the National School and Scholarship Board for the year 2023 showed that 49.3% of children entering the first year of elementary school in public schools are overweight and obese, and of these, 25.8% are severely obese, that is, 3 out of every 5 schoolchildren in Chile already have weight problems at an early age. This situation, if maintained over time, will prematurely confront them with cardiovascular risks, high blood pressure, metabolic alterations, diabetes and metabolic syndrome in adolescence, which will possibly extend into adulthood. Objective. To associate systolic and diastolic blood pressure with waist-to-height ratio (WHR) in schoolchildren aged 6 to 8 years.

METHODS

Cross-sectional study. The sample included 300 schoolchildren aged 6 to 8 years from Valparaíso. Blood pressure, waist circumference and height were evaluated. Data were collected during 2015, 2018, 2019 and 2022. Blood pressure was assessed according to the criteria of the American Academy of Pediatrics (2017). Statistical analysis: RESULTS were expressed as mean, 95% confidence interval (95% CI) for quantitative variables and qualitative variables were expressed in absolute (n) and relative (%) frequencies. Normality was verified with the Shapiro Wilk test ($p>0.05$). Associations were made between altered blood pressure and anthropometric variables (BMI, waist circumference, nutritional status) using the Proportion test and Chi Square test. Three different models were developed to determine the association between altered BP with WHR, WC and NS, adjusting for age in all models.

RESULTS

There is a relationship between systolic blood pressure and waist-to-height ratio in children aged 6 to 8 years ($p=<0.0073$).

CONCLUSIONS

Increase in blood pressure in the pediatric population is directly associated with an increase in waist-to-height ratio of >0.5. Therefore, controlling this ratio can help prevent the onset of metabolic diseases.

SOAP14_08

MOTIVATION AND OBSTACLES TO DIETARY MODIFICATION PROGRAM AMONG URBAN POOR HYPERTENSION PATIENTS

Nurul Ain Azizan[1]; Tin Tin Su[2]; Hazreen Abdul Majid[3]
[1]School of Biosciences, University of Nottingham Malaysia, Semenyih, Malaysia; [2]Jeffrey Cheah School of Medicine and Health Sciences, Monash University Malaysia, Subang Jaya, Malaysia; [3]School of Health and Rehabilitation Sciences, Health Sciences University, Bournemouth, United Kingdom

BACKGROUND AND OBJECTIVES

The study aimed to explore factors and barriers that influence the adherence to a dietary and lifestyle intervention among urban poor diagnosed with hypertension. After a year of dietary intervention, a qualitative study was conducted to assess the acceptability, enabling factors, and barriers in the intervention program among the participants.

METHODS

Participants were selected based on purposive sampling and either a compliant participant or partial or drop-outs from the intervention program. Urban poor housing complexes continue to be the setting for this study, following the intervention program that was conducted there. Three focus groups were formed, and discussion sessions were conducted to assess the participants' understanding of the program, their adherence, and changes in behaviour. Discussions were conducted until saturation was achieved. Data management and analysis involved transcription and translation of discussions, decoding using Microsoft Word and Excel, and using Nvivo for Windows software. Thematic analysis was used to analyze qualitative data, with themes revised and defined according to study objectives.

RESULTS

Four major themes come out from this; Understanding Healthy Lifestyle and Managing Hypertension, the Application of Dietary and Cooking Modification, Application of Blood Pressure Monitor and Nutrient Information through Food Labelling. From the discussion, mainly social and food environment really affecting their adherence to the intervention program, especially in changing diet and lifestyle. Family taste preferences and abundance of fast food eatery around their place can become barrier towards changing their diet and managing their blood pressure.

CONCLUSIONS

Based on these, it shows that any intervention program should not only focusing on the participant or the patient itself but should also include the whole family to empower them with knowledge and prevent them from getting other non-communicable diseases aside from hypertension.

ULTRA-PROCESSED DIETARY PATTERN ADHERENCE AND IRRITABLE BOWEL SYNDROME: EVALUATING THE ASSOCIATION USING DIFFERENT DIAGNOSTIC METHODS

Giovanna Andrade[1]; Maria Laura Louzada[2]; Renata Bertazzi Levy[3]; Carlos Augusto Monteiro[4]
[1]Nutrition, Faculdade de Saúde Pública USP, São Paulo, Brazil; [2]Department of Nutrition, Universidade de São Paulo, São Paulo, Brazil; [3]NUPENS, Faculdade de Medicina da Universidade de São Paulo (FMUSP), São Paulo, Brazil; [4]School of Public Health, University of Sao Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES

Ultra-processed foods (UPFs), as defined by the NOVA classification system, are ready-to-consume formulations comprised of processed food substances and sensory-related additives designed to displace fresh or minimally processed foods and freshly prepared dishes and meals while maximizing industry profits (1). While several longitudinal studies in high-income countries have demonstrated that UPF consumption increases the risk of chronic diseases including gastrointestinal disorders, fewer studies have been conducted in lower income settings (2). This study aims to assess the prospective association between adherence to an ultra-processed dietary pattern and the incidence of irritable bowel syndrome (IBS) in Brazil using different diagnostic methods.

METHODS

Data from over 10,000 adult participants of the web-based, nationwide NutriNet Brasil cohort were utilized. Dietary intake was assessed at baseline with at least two 24-hour dietary recalls using the Nova24h tool. New cases of IBS were identified through two methods: the Rome IV criteria and self-reported medical diagnoses by participants. The association between the UPF dietary share (% of total energy intake) and IBS incidence was estimated using Cox proportional hazards models for each diagnostic method separately.

RESULTS

Over an average follow-up of 2.8 years, 177 new cases of IBS were identified through self-reported medical diagnoses, while 775 cases were identified using the Rome IV criteria. Adjusted models indicated a significant increase in IBS risk across quartiles of UPF dietary share for both diagnostic methods. For self-reported medical diagnoses, comparing the lowest quartile to the highest quartile of UPF consumption, the risk of developing IBS increased by 1.65 (95% CI: 1.04-2.62). Similarly, when outcomes were assessed using the Rome IV criteria, the risk increased by 1.30 (95% CI: 1.05-1.60).

CONCLUSIONS

This study provides compelling evidence that a higher intake of UPFs is associated with an increased risk of developing IBS in the Brazilian adult population, regardless of the diagnostic method used. These findings underscore the necessity for public health strategies aimed at reducing UPF intake to mitigate the growing burden of diet-related diseases, including IBS.

ASSOCIATIONS OF FASTING BLOOD GLUCOSE AND HBA1C WITH FIBRINOGEN AND BLOOD CLOT CHARACTERISTICS AND INTERACTIONS WITH OF GENETIC POLYMORPHISMS

Cornelie Nienaber-Rousseau[1]; Zelda De Lange-Loots[1]; Marlien Pieters,[1]
[1]Nutrition, North-West University, Potchefstroom, South Africa

BACKGROUND AND OBJECTIVES

Cardiovascular disease (CVD) and type 2 diabetes (T2DM) are prevalent health issues, with T2DM contributing to a prothrombotic state that increase CVD risk through complex, not fully understood mechanisms. This study investigates both fibrinogen and its γ' variant, elucidating how genetic factors related to fibrinogen production and glycaemic control impact clot structure and stability.

METHODS

Fasting blood glucose (FBG) and glycated haemoglobin (HbA1c), total and γ' fibrinogen, as well as turbidimetrically determined plasma clot properties, were quantified and fibrinogen and *FXIII* SNPs were genotyped in 2,010, apparently healthy Black South Africans.

RESULTS

FBG showed a higher prevalence of euglycaemia (83.2%) than HbA1c (59.8%). Women had higher proportions of prediabetes and likely diabetes, particularly in HbA1c levels than men. Fibrinogen increased over clinical categories of increasing HbA1c and FBG ($p=0.00001$ and $p=0.03$). Fibrinogen increases with higher HbA1c and FBG levels, particularly among those at elevated risk, with differences observed across the whole group and by gender ($p < 0.001$). Although γ' fibrinogen levels tend to rise with HbA1c, we did not observe changes across FBG categories and lag time remained stable across all groups ($p > 0.05$). Slope decreased in high-risk FBG categories for the whole group ($p = 0.002$) and women ($p = 0.007$), while maximum absorbance varied among women and across FBG categories ($p < 0.05$). Clot lysis time (CLT) is prolonged in higher HbA1c and FBG categories, particularly among men ($p < 0.05$). Specific fibrinogen gene polymorphisms (*FGB* rs7439150, rs1800789, rs1800787, rs1800791, rs4220 and *FGG* rs1049636)—but not *FXIII*—demonstrated interactions with glucose markers, influencing total fibrinogen, γ' fibrinogen, and specific blood clot properties, namely maximum absorbance and CLT ($p < 0.005$). Notably, these polymorphisms did not affect lag time or slope.

CONCLUSIONS

Elevated HbA1c and FBG levels are associated with increased fibrinogen concentration and prolonged CLT, indicating a potential link between heightened glucose levels and a pro-thrombotic state, with additional variations observed in slope and maximum absorbance based on gender and risk category as well as gene-glucose milieu interactions.

TAXATION OF FOODS HIGH IN FAT, SUGAR AND SODIUM IN INDIA: A MODELLING STUDY OF HEALTH AND ECONOMIC IMPACTS

Maxime Roche[1]; Jingmin Zhu[1]; Jack Olney[1]; William Joe[2]; Manika Sharma[3]; Lindsay Steele[4]; Franco Sassi[1]
[1]Centre for Health Economics and Policy Innovation, Imperial College London, London, United Kingdom; [2]Population Research Centre, Institute for Economic Growth, Delhi, India; [3]Cardiovascular Health, Resolves To Save Lives Services PLC, Delhi, India; [4]Cardiovascular Health, Resolve to Save Lives, New York, United States of America

BACKGROUND AND OBJECTIVES

The consumption of foods high in fat, sugar, and sodium (HFSS) is rapidly increasing in India. Adult overweight and obesity levels have increased fourfold since 1975. The taxation of HFSS foods has been proposed to promote healthier diets. This study estimates the effect of this approach on nutrient intakes, diet-related diseases, and associated health burden and economic benefits.

METHODS

Nationally representative household expenditure survey data, dietary requirements, and food composition tables are used to proxy individual nutrient intakes. Consumer responsiveness to food price changes for three income terciles is estimated using an Almost Ideal Demand System model, to assess the impact of tax scenarios on food purchases and nutrient intakes. Longer-term policy impacts are estimated through a microsimulation model (Health-GPS), projecting policy outcomes in India, assuming an increasing cumulative trend in ultra-processed food intake. Estimated policy outcomes include changes in risk exposures, disease incidence and burden, healthcare demand and expenditure, and government tax revenue.

RESULTS

Applying the current highest Goods and Services Tax (GST) rate of 28% on HFSS foods based on the Food Safety and Standards Authority of India (FSSAI) 2022 draft definition is associated with a persistent average per capita decrease of 0.10 kg/m2 in body mass index and 20 mg in daily sodium intake. Over 30 years, this seemingly small average, population-wide, effect translates into a large cumulative reduction of 9 million cases and 19 million DALYs from ischemic heart disease, chronic kidney disease, stroke, diabetes, and asthma and USD 15 billion averted total health expenditure. Effects are larger for higher-income households. This is associated with a 20.8% increase in tax revenue and minor decreases in household spending. Applying a higher GST rate of 40% (current highest rate plus CESS, as for SSBs) would lead to larger effects.

CONCLUSIONS

The alignment of GST rates with nutrition and health objectives, targeting HFSS foods with higher rates, may provide critical incentives to improve dietary choices. It could mitigate rising diet-related diseases and morbidity, reduce healthcare costs and represent an important revenue source for the government. Food taxation with front-of-pack labelling and marketing restriction could achieve a larger impact.

THE ASSOCIATION BETWEEN GAMMA-GLUTAMYL TRANSFERASE AND METABOLIC SYNDROME AND ITS COMPONENTS AMONG ADOLESCENTS APPLYING INTERNATIONAL DIABETES FEDERATION (IDF) AND COOK'S CRITERIA

Farzad Esmaeili[1]; Siavash Safiee[1, 2]; Mitra Hashminia[1]; Fereidoun Azizi[3]; Maryam Tohidi[1]; Farzad Hadaegh[1]
[1]Prevention of Metabolic Disorders Research Center, Research Institute for Metabolic and Obesity, Research Institute for Endocrine Sciences, Tehran, Iran, Islamic Republic of; [2]Faculty of Medicine, Tehran Medical Branch, Islamic Azad University, Tehran, Iran, Islamic Republic of; [3]Endocrine Research Center, Research Institute for Endocrine Sciences, Shahid Beheshti University of Medical Sciences, Tehran, Iran, Islamic Republic of

BACKGROUND AND OBJECTIVES

The prevalence of metabolic syndrome (MetS), a cluster of metabolic abnormalities, is rising globally, particularly in the Middle East and North Africa region. Gamma-glutamyl transferase (GGT) is gaining attention as a biomarker for liver function and its association with MetS and its components.

METHODS

This cross-sectional study is part of the Tehran Lipid and Glucose Study (TLGS). We included 696 adolescents (347 males), aged 10-19 years, from the seventh examination survey (2018-2021). MetS was defined using both the International Diabetes Federation (IDF) and Cook's criteria. Serum GGT was measured, and its association both as a continuous and categorical variable, was assessed with MetS and its components using logistic regression, adjusting for potential confounders including age, sex, smoking, family history of type 2 diabetes mellitus, alanine aminotransferase (ALT), as well as other MetS components.

RESULTS

MetS prevalence was 15.66% and 9.19% according to Cook's and IDF criteria, respectively. Higher GGT levels were significantly associated with increased MetS risk by both definitions (odds ratio [95% confidence interval] = 1.28 [1.12-1.46] and 1.30 [1.14-1.49] per 5 U/L increase, respectively) after adjusting for age, sex, smoking, and family history of type 2 diabetes mellitus (T2DM). This association was attenuated upon adjusting for ALT levels. GGT levels were robustly associated with high waist circumference, with odds ratios of 1.98 [1.59-2.46] and 1.71 [1.38-2.11] per 5 U/L increase, respectively, even after adjusting for ALT. Associations with high blood pressure (21% and 17% increased risk by IDF and Cook's criteria) and triglycerides (13% and 16% increased risk by IDF and Cook's criteria) were significant but attenuated after ALT adjustment. No significant associations were found between GGT levels and high fasting plasma glucose or low high-density lipoprotein cholesterol.

CONCLUSIONS

Elevated serum GGT is strongly associated with a higher risk of MetS and its components, particularly central obesity, in adolescents. These findings suggest GGT as a valuable biomarker for early MetS detection.

DIETARY INFLAMMATORY INDEX AND ITS ASSOCIATION WITH METABOLIC SYNDROME AND CAROTID INTIMA-MEDIA THICKNESS IN CHILDREN AND ADOLESCENTS: A SYSTEMATIC REVIEW

Parto Hadaegh[1, 2]; Amir Abdi[2, 3]; Golaleh Asghari[4]; Farzad Hadaegh[2]
[1]Faculty of Nutrition Science and Food Technology, Shahid Beheshti University of Medical Sciences, Tehran, Iran, Islamic Republic of; [2]Prevention of Metabolic Disorders Research Center, Research Institute for Metabolic and Obesity, Research Institute for Endocrine Sciences, Tehran, Iran, Islamic Republic of; [3]Student Research Committee, School of Medicine, Islamic Azad University Tehran Medical Sciences, Tehran, Iran, Islamic Republic of; [4]Faculty of Nutrition Science and Food Technology, Department of Clinical Nutrition & Dietetics, Shahid Beheshti University of Medical Sciences, Tehran, Iran, Islamic Republic of

BACKGROUND AND OBJECTIVES

While the association between dietary inflammatory index (DII) and cardiometabolic outcomes is well-studied in adults, little is known about these relationships among children and adolescents. This systematic review aims to evaluate the association of DII with carotid intima-media thickness (CIMT) and metabolic Syndrome (MetS) in children and adolescents.

METHODS

We searched the publications in three literature databases (PubMed, Web of Science, and Scopus) for studies published between 1 January 2000 and 1 August 2024, which assessed the association of DII with MetS or CIMT among children and adolescents. Two reviewers screened and assessed the quality of studies using the Newcastle-Ottawa-Scale. Given the heterogeneity of study designs, a narrative synthesis approach was employed.

RESULTS

Out of 23,393 records identified, a total of 9 studies (four prospective cohort and five cross-sectional) met our inclusion criteria and were qualified; including six and three studies focused on MetS and CIMT as the outcome, respectively. These studies were focused on children and adolescents between 6 and 19 years of age from both sexes with a cumulative population of over 16,000 participants. The RESULTS on DII-CIMT association were conflicting, with two studies noting no associations, while another study observed a 2.46-fold higher risk for increased CIMT. The majority of studies assessing the DII-MetS association, observed a positive association with higher DII, conferring a higher risk of MetS up to three-fold.

CONCLUSIONS

Higher DII scores are associated with an increased risk of MetS in children and adolescents, though findings for CIMT are inconsistent. Further longitudinal studies are needed to clarify these associations.

PREVALENCE OF IRON DEFICIENCY ANAEMIA, OVERWEIGHT AND OBESITY AMONG WOMEN OF REPRODUCTIVE AGE IN MOROCCO

Abdourahmane Fall[1]; Meryem Lazrak[1]; Houda El Hsaini[1]; Laila El Ammari[2]; Hasnae Gamih[3]; Abdelhakim Yahyane[3]; Abdelaziz Benjouad[1]; Hassan Aguenaou[4]; Khalid El Kari[4]
[1]Higher School of Paramedical Sciences, Health Sciences Research Center (CReSS), International University of Rabat, Rabat, Morocco; [2]Ministère de la Santé et de la Protection Sociale, ., Rabat, Morocco; [3]Direction de la population, Ministère de la Santé et de la Protection Sociale, Rabat, Morocco; [4]Joint Research Unit on Nutrition and Food, RDC-Nutrition AFRA/IAEA, Ibn Tofail University-CNESTEN, Rabat, 10001, Morocco, Rabat, Morocco

BACKGROUND AND OBJECTIVES

Iron deficiency anaemia and obesity are two major public health concerns that disproportionately affect women of reproductive age (WRA), particularly in low- and middle-income countries. In Morocco, 61.3% of WRA are overweight or obese, with an obesity prevalence of 30.4%. At the same time, 34.4% of women of childbearing age are anaemic, and 49.7% suffer from iron-deficiency anaemia.

This study aims to estimate the prevalence of iron deficiency anaemia, overweight, and obesity among Moroccan women of reproductive age, with a particular focus on the coexistence of anaemia due to iron deficiency alongside overweight and obesity.

METHODS

This national cross-sectional study included a representative sample of 2090 WRA from the general Moroccan population. The data collection encompassed socio-economic parameters, anthropometric measurements and blood samples. Haemoglobin levels were assessed using photometric biosensor (Hemocue), while ferritin and C-reactive protein (CRP) were measured using immunoturbudimetry.

RESULTS

The prevalence of overweight/obesity among Moroccan WRA was 60.2%, iron deficiency was observed in 30.6%, and 34.4% of women were anaemic and 50.0% suffering from iron deficiency anaemia. The coexistence of overweight/obesity with anaemia was 19.2% and with iron deficiency it was 16.3%. Among overweight/obese women, 32.5% were anaemic, 28.4% had iron deficiency, and 47.6% suffered from iron deficiency anaemia. Notably, the prevalence of DBM was higher in urban areas compared to rural areas.

CONCLUSIONS

The coexistence of anaemia and overweight/obesity among Moroccan women highlights the double burden of malnutrition, necessitating integrated public health policies and national strategies to address both conditions simultaneously.

SOAP32_04

A LONGITUDINAL ASSESSMENT OF THE RELATIONSHIP BETWEEN LIFESTYLE-RELATED RISK FACTORS AND A COMPOSITE CVD RISK INDEX AMONG ADOLESCENTS IN MALAYSIA: THE MYHEARTS

Nithiah Thangiah[1]; Tin Tin Su[2]; Karuthan Chinna[3]; Muhammad Yazid Jalaludin[4]; Hazreen Abdul Majid[1]
[1]Social and Preventive Medicine, University of Malaya, Kuala Lumpur, Malaysia; [2]Jeffrey Cheah School of Medicine and Health Sciences, Monash University Malaysia, Subang Jaya, Malaysia; [3]FAculty of Business and Management, UCSI University, Kuala Lumpur, Malaysia; [4]Paediatrics, University of Malaya, Kuala Lumpur, Malaysia

BACKGROUND AND OBJECTIVES

The escalating prevalence of cardiovascular (CVD) risk factors and anticipated doubling of CVD burden in Malaysia is indeed worrisome. Strong associations have been shown between risk factor levels and the extent of atherosclerosis in adolescence. It is imperative that risk factors associated to CVD be optimally managed from young. The study aims to create a composite risk index of CVD among adolescents and examine the influence of demographic, socioeconomic and lifestyle-related risk factors on the composite risk index of biological CVD risk factors among adolescents aged 13 to 17 years in Malaysia.

METHODS

A total of 1320 adolescents from the Malaysian adolescent cohort were assessed from baseline at 13 years in 2012 and followed up at 15 and 17 years from 2014 to 2016. Eight biological CVD risk factors (consisting 3 components of blood pressure, cholesterol and body composition) with moderate correlation were identified. Subsequently, these risk factors were standardized and averaged to form a composite CVD risk index used as the outcome variable. Generalised estimating equation (GEE) using longitudinal linear regression was used to examine the effect of changes in adolescent lifestyle-related risk factors on the composite CVD risk index over time.

RESULTS

From the ages 13 to 17 years, both time periods; time 3 (β = -0.112, 95% CI = -0.170, -0.054) and time 2 (β = -0.068, 95% CI = -0.113, -0.022), female (β = 0.083, 95% CI = 0.010, 0.156), Chinese (β = 0.124, 95% CI = 0.012, 0.236), physical fitness (β = -0.002, 90% CI = -0.003, 0.00002, $p<0.10$) and BMI (β = 0.070, 95% CI = 0.061, 0.079) were significant predictors of attaining high scores of CVD risk.

CONCLUSIONS

Female adolescents were at higher risk of having increased CVD risk score compared to males. Compared to Malays, Chinese adolescents were at higher risk of increased CVD risk score. A minimal reduction in overall CVD risk score was found for increased physical fitness over time. Body mass index was highly significant and the strongest predicting factor for CVD risk during the adolescent period. A more robust and perhaps gender-specific Intervention programme focusing on healthy lifestyle (including maintaining ideal BMI and improving physical fitness) need to be implemented among school-going adolescents in Malaysia.

RELATION BETWEEN PLASMA RETINOL LEVEL WITH DIFFERENT TYPES OF DYSLIPIDEMIA IN THE MIDDLE-AGED AND THE ELDERLY: A CROSS-SECTIONAL STUDY

Ren Xiuwen[1]; Liu Lu[1]; Yu Liu[1]; Wang Xixiang[1]; Chi Zhang[2]; Zhou Shaobo[3]; Wang Ying[4]; Huang Chengjun[1]; Ren Jiaqi[1]; Yuan Linhong[1]
[1]School of Public Health, Capital Medical University, Beijing, China; [2]School of Biological Sciences, University of Nebraska-Lincoln, Nebraska, United States of America; [3]Faculty of Engineering and Science, University of Greenwich, Chatham ME4 4TB, China; [4]Suzhou Research Center of Medical School, Suzhou Hospital, Suzhou, China

BACKGROUND AND OBJECTIVES

The plasma retinol level is used as a recommended standard to evaluate the individual's nutritional status of vitamin A. Change of blood retinol level is strongly associated with lipid metabolism disorders. Therefore, the accurate relation between plasma retinol level with different types of dyslipidemia need exploration.

METHODS

A total of 538 dyslipidemia and 1116 healthy middle-aged and elderly subjects from the communities of Beijing were investigated. The Chi-square test and one-way ANOVA were used to compare the demographic characteristics. The general linear model was used to compare dietary consumption and plasma biochemical parameters. Person correlation analysis was used to explore the relationship between plasma retinol and lipids. Binary logistic regression and restricted cubic spline (RCS) were conducted to explore the association between plasma retinol and the risk of different type of dyslipidemia and the dose-response relationship.

RESULTS

A significantly positive correlation between plasma retinol level with LDL-C and negatively correlation with HDL-C was observed. These correlations changed in patients with different types of dyslipidemia. Compared to the participates with Q1 level of plasma retinol (<0.420μg/ml), Q2 (0.420-0.526μg/ml), Q3 (0.527-0.657μg/ml) and Q4 (>0.657μg/ml) levels showed significantly increased risk of dyslipidemia and mixed dyslipidemia. And participants with Q4 level of plasma retinol showed a sharp increased risk of hypertriglyceridemia combined with low high-density lipoprotein cholesterolemia. The RCS RESULTS indicated a non-linear (U-shaped) relation between plasma retinol and the risk of low high-density lipoprotein cholesterolemia.

CONCLUSIONS

Elevation in plasma retinol (above 0.525 μg/ml) indicated a significantly increased risk of dyslipidemia. The recommended plasma retinol level for the middle-aged and the elderly should be different type of dyslipidemia-dependent.

DEVELOPING A COMPREHENSIVE DIETARY INTERVENTION PACKAGE TO REDUCE THE DIETARY INFLAMMATORY INDEX (DII) IN PATIENTS WITH CORONARY ARTERY DISEASE (CAD) IN INDIA

Megha Suresh; Archna Singh[1]; Sabiha Khan[2]; Anudeep Pp[1]; Sherry Price[3]; Kamar Ali[2]; Neha Bakshi[2]; James R. Hebert[3]; Ambuj Roy[2]; Suparna Ghosh-Jerath[4]
[1]Biochemistry, All India Institute of Medical Sciences - New Delhi, New Delhi, India; [2]Cardiology, All India Institute of Medical Sciences - New Delhi, New Delhi, India; [3]Arnold School of Public Health, University of South Carolina, Columbia, United States of America; [4]Nutrition and Food Systems, The George Institute for Global Health India, New Delhi, India

BACKGROUND AND OBJECTIVES

Indian diets are diverse, offering a range of vital nutrients with anti-inflammatory potential. Yet they are often grain-heavy, with low intakes of vegetables, fruits, legumes, and nuts, and deteriorate further with increased consumption of sugars, salt, and processed foods. Robust evidence supports the cardioprotective benefits of anti-inflammatory diets like the Mediterranean diet (MD). Promoting such diets in the Indian context is crucial to reducing inflammation-related diseases like Coronary Artery Disease (CAD). Our goal was to create a personalized intervention for CAD patients, incorporating traditional foods aligned with the MD pattern for heart-healthy, low Dietary Inflammatory Index (DII) diets.

METHODS

Anti-inflammatory Indian foods comparable with the MD food items were identified and used for formulating standardized recipes and diet plans. Comprehensive food plans with well-balanced distribution of food groups across three major and three minor meals were developed. These were complimented with good cooking practices and lifestyle advice. The DII score of diet plans consisting of recipes with anti-inflammatory foods was computed.

RESULTS

A total of 117 customized anti-inflammatory season-specific (summer and winter) recipes A total of 117 customized anti-inflammatory season-specific (summer and winter) recipes were developed. These were incorporated into calorie-specific diet plans (1200, 1400, 1600, 1800, and 2000 Kcal) in 7-day cyclic menu formats. These customized diet charts were complemented by a booklet with general dietary guidelines, recipes, cooking instructions, portion size guides, eating-out advice, healthy snack choices, and lifestyle advice. The overall DII scores of the diet plan showed a high anti-inflammatory potential **(-7.8 to -8.4**) nearing the theoretical minimum (-8.87) reported. The DII of recipe combinations in one representative diet chart for all the three main meals was observed to fall within the following ranges: breakfast (**-2.61 to -5.83)**, lunch (**-7.12 to 4.10**), and dinner (**-7.12 to 4.16)**.

CONCLUSIONS

The low DII scores of these customized recipes provide evidence to enable the promotion of anti-inflammatory diets in the Indian context. The calorie-specific diet charts and patient information booklet are valuable take-home resources to support better health outcomes for CAD patients and their families. These can make a significant impact on patient knowledge, reinforce understanding, and help in improved compliance and health outcomes.

DIETARY PATTERN OF USERS OF LARGER CITY PARKS IN COLOMBO COMMERCIAL CITY, SRI LANKA

Shreenika De Silva Weliange[1]; Mayuri Priyadharshini[2]
[1]Community Medicine, University of Colombo, Colombo, Sri Lanka; [2]Health, Ministry of Health, Colombo, Sri Lanka

BACKGROUND AND OBJECTIVES

Regular park users are usually those who have initiated a process to be healthy. The objective was to assess the dietary habits among users of larger city parks in Colombo Commercial City.

METHODS

A community based descriptive cross-sectional study was conducted enrolling 411 users of six active large city parks in Colombo Commercial City by using systematic sampling technique. Pre-tested interviewer administered questionnaire was used in data collection which included a validated Food Frequency Questionnaire. SPSS version 26.0 was used for analysis. Chi square test with p value<0.05 was used to determine the level of significance.

RESULTS

The mean age of the park users were 55.09 years (SD: 11.22). Majority (65.9%) were males, and professional accounted for 40.4. More than half of the park users were in the normal BMI category (51%) while 38.9% were overweight. Of them 43.5% stated they had diabetes mellitus, 44.3% hypertension 39.9% dyslipidaemia and 11.4% ischemic heart disease.

Most of the park users ate three main meals (70.3%), one snack (50.4%) and consumed tea or coffee two times (54.7%) per day. Further a 7.5% park users ate away from home (7.5%) Most ate fried food 1-3 times per week (28.0%). Majority park users preferred water (89.8%and only 3.9% (n=16) preferred a sugar sweetened beverage after a meal.

A dietary score for fiber, antioxidants and energy dense food was calculated and their median values were 1.00, 0.56, and 2.33. This was later categorized as optimum and suboptimum where 94.2%, were classified as optimum diet, although the level of consumption of energy dense food was high.

25.1% stated that a good diet can achieve good health (25.1%), and adding salt (73.8%) and sugar (37.2%) was seen to be important to have better taste in food.

CONCLUSIONS

Although people come to the parks to be active and healthy it was seen that theses is room for improvement in the dietary beahvious and attitudes calling for promoting healthy eating and exploration of determinants of dietary behaviours

DEVELOPING MACHINE LEARNING MODELS TO PREDICT GASTROINTESTINAL CANCER RISK USING LIFESTYLE, DIETARY FACTORS, AND BIOMARKERS IN A COHORT STUDY

Daina Baublyte[1]; Jeonghee Lee[1]; Madhawa Gunathilake[1]; Jeongseon Kim[1]
[1]Cancer AI & Digital Health, National Cancer Center Graduate School of Cancer Science and Policy, Goyang-si, Gyeonggi-do, Korea, Republic of

BACKGROUND AND OBJECTIVES

Dietary factors play a critical role in cancer etiology but are underrepresented in predictive models for gastrointestinal (GI) cancer risk. The variability and limited availability of dietary intake data present significant challenges to developing robust machine learning (ML) models. This study aimed to develop and evaluate ML models to predict GI cancer risk by leveraging longitudinal data on dietary intake, lifestyle behaviors, and biomarkers from a South Korean cohort.

METHODS

We followed 7,862 adults (158 GI cancer cases and 7,704 controls) over 16 years. Anthropometric measures, clinical biomarkers, and dietary intake data were collected, with the latter assessed using a validated 106-item semi-quantitative food frequency questionnaire. Four ML models—logistic regression, random forests, gradient boosting machines, and support vector machines—were developed and evaluated. Among the 41 predictive features, 24 represented dietary intake variables. Tailored data sampling and model training approaches were applied to address class imbalance, enhancing the accuracy of predictions for minority-class outcomes (GI cancer cases).

RESULTS

Initial ML models showed inadequate performance predicting GI cancer risk due to class imbalance, achieving zero precision for GI cancer cases and high precision for controls (0.98). The proposed data sampling, model training, and feature selection strategies improved precision and F1-scores for GI cancer predictions by over 70%. Some models achieved a ROC-AUC score exceeding 0.8, precision above 0.7, and an F1-score above 0.7 on unseen test data.

CONCLUSIONS

Addressing class imbalance using tailored approaches substantially enhanced the predictive performance of ML models for GI cancer risk. These METHODSoffer applicability to other datasets and cancers with similar challenges. The combined predictive value of data on diet, lifestyle, and biomarkers provides a robust foundation for data-driven GI cancer screening and prevention strategies.

WHOLE GRAIN, HEART DISEASE AND MULTIMORBIDITY: A 15-YEAR POPULATION-BASED STUDY OF 146,329 ADULTS AGED 45 AND OLDER

Xiaoyue Xu[1]; Ling Zeng[1]; Yang Li[2]; Margo Barr[2]; Sara Grafenauer[3]; Aletta Schutte[1]
[1]School of Population Health, UNSW Sydney, Sydney, Australia; [2]International Centre for Future Health Systems, UNSW Sydney, Sydney, Australia; [3]School of Health Sciences, UNSW Sydney, Sydney, Australia

BACKGROUND AND OBJECTIVES

The health benefits of whole grains on heart disease are well established. However, research on the effects of whole grains on multimorbidity remain limited, which is the focus of our study.

METHODS

We retrospectively analysed data from the 45 and Up Study, a population-based study, spanning the period from 2005 to 2020. We followed 146,329 individuals aged ≥45 years, with no history of heart disease or multimorbidity at baseline, over a 15-year period. Dietary information was collected using a short food frequency questionnaire. Generalized Estimating Equation models were used to assess the longitudinal effects of whole grains on heart disease and multimorbidity (two or more chronic conditions).

RESULTS

During the first follow-up (2012-2015), 25,173 participants developed multimorbidity, with an additional 9,824 cases developed in the second follow-up (2018-2020). After multivariable adjustment, compared to individuals with lower consumption of brown/wholemeal bread, consuming more than seven slices weekly was associated with a 9% lower risk of heart disease (Odds Ratio (OR)=0.91, 95% CI: 0.87-0.95) and a 12% lower risk of multimorbidity (OR=0.88, 95% CI: 0.86-0.91); eating over 14 slices reduced risk of heart disease by 27% (OR=0.73, 95%CI:0.69-0.77) and multimorbidity by 34% (OR=0.66, 95% CI: 0.64-0.68). Regular whole grain cereal consumption lowered heart disease risk by 42% (OR=0.5895% CI: 0.56-0.61) and multimorbidity risk by 44% (OR=0.56, 95% CI: 0.54-0.57).

CONCLUSIONS

Whole grains are beneficial in lowering the risk of heart disease and multimorbidity. The implementation of whole grain inclusion as a healthy diet is necessary to prevent multimorbidity.

A FLAVONOID-RICH DIET IS ASSOCIATED WITH A LOWER RISK OF CHRONIC KIDNEY DISEASE: A UK BIOBANK PROSPECTIVE COHORT STUDY

William Bell[1]; S. Thompson Alysha[1]; P Bondonno Nicola[2, 3]; Jennings Amy[1]; Martina Gaggl[4]; Tilman Kühn[5, 1]; Cassidy Aedin[1]
[1]Co-Centre for Sustainable Food Systems, Institute for Global Food Security, Queen's University Belfast, Northern Ireland, UK, Belfast, United Kingdom; [2]Nutrition and Health Innovation Research Institute, Edith Cowan University, Copen, Denmark; [3]Danish Cancer Institute, Danish Cancer Institute, Copen, Denmark; [4]Center for Public Health, Medical University of Vienna, Wien, Austria; [5]Center for Public Health, Medical University of Vienna, Vienna, Austria

BACKGROUND AND OBJECTIVES

Flavonoids may improve kidney function. However, large-scale prospective studies are limited. Therefore, we conducted a population-based prospective study to investigate the relationship between flavonoid intakes, risk of chronic kidney disease (CKD), and all-cause mortality among individuals with CKD.

METHODS

We examined associations between a Flavodiet score (FDS), individual flavonoid-rich foods, and flavonoid sub-classes (based on ≥2 24-hour dietary assessments) and a) CKD risk among 109,954 adults, and b) all-cause mortality among 3,052 participants with CKD, aged 40-69 years using multivariable Cox regression analyses. Additionally, we used mediation analysis to examine potential mechanisms of action.

RESULTS

Over a median 10.5 years of follow-up, 4,307 cases of incident CKD were identified. A higher FDS (median 6 servings of flavonoid-rich foods per day) was associated with a 16% lower risk of CKD (HR (95% CI) Q4 vs Q1, P trend = 0.84 (0.77, 0.92), <0.001), in part mediated by levels of triglycerides (2.8%), high-density lipoprotein (5.8%), glycated hemoglobin (2.1%), Cystatin-C (16.8%), and C-reactive protein (2.2%). Additionally, we observed significant inverse associations between a range of flavonoid-rich foods (apples, oranges, berries, dark chocolate, and red wine) and flavonoid subclasses (anthocyanins, proanthocyanidins, flavonols, flavanones, and flavones) and CKD risk. In participants with CKD, a higher FDS (median 6 servings per day) was associated with a 35% lower risk of all-cause mortality (HR (95% CI) Q4 vs Q1, P trend: 0.65 (0.48, 0.88), 0.03), with greater intakes of tea, proanthocyanidins, theaflavins and thearubigins, flavonols, and flavan-3-ols also showing significant inverse associations with lower risk of all-cause mortality in participants with CKD.

CONCLUSIONS

A diet rich in flavonoids, characterised by a median 6 servings per day of commonly consumed flavonoid-rich foods such as apples, tea, and berries, was associated with a lower risk of CKD, and a lower risk of all-cause mortality in adults with CKD. Simple dietary adjustments to increase the consumption of these readily available foods and beverages could help lower CKD risk and improve prognosis in individuals with CKD.

SOAP32_15

A REVIEW OF POTASSIUM ENRICHED LOW SODIUM SALT STANDARDS AND RECOMMENDATIONS IN CLINICAL MANAGEMENT GUIDELINES IN CHINA: IMPLICATIONS FOR SCALING UP ITS USE GLOBALLY

Ge Zeng[1]; Dejing Meng[2]; Laura K. Cobb[3]; Ide Nicole[3]
[1]Director of Nutrition Program/ Chief Technical Officer, Sodium Reduction., Vital Strategies, Inc. (USA) Jinan Representative Office, Jinan, China; [2]Health Promotion, China Health Education Center, Beijing, China; [3]Cardiovascular Health, Resolve to save lives, New York, United States of America

BACKGROUND AND OBJECTIVES

Potassium enriched low sodium salt (LSS) lowers blood pressure by both reducing sodium intake and increasing potassium intake. LSS usage remains low in China, despite a mature and varied LSS market. To understand if the low usage could be related to LSS standards and recommendations in clinical management guidelines, we carried out a review.

METHODS

All standards and clinical management guidelines were identified through a systematic search of literature of two academic websites Wan Fang and CNKI, and academic or government websites since 1996. Inclusion criteria include 1) LSS standards or salt standards containing LSS definitions, 2) latest clinical management guidelines of diseases related to effects of LSS, including hypertension, cardio or cerebrovascular diseases, and kidney disease, 3) dietary and salt reduction guidelines.

RESULTS

Thirty-nine LSS standards and clinical management or salt reduction guidelines were identified, including 7 salt or LSS standards, 29 clinical management guidelines, and 2 salt reduction and one dietary guideline. LSS was firstly recommended by Chinese Guidelines for Management of Hypertension (2010), followed by Dietary Guidelines for Chinese Residents (2016). The first LSS standard was released in 1995; a single mandatory edible salt standard with an LSS definition was released in 2015. Besides sodium chloride (NaCl), other components and their proportions of LSS changed over time from potassium chloride (KCl) and magnesium sulfate in 1995 to only KCl in 2015. The 2015 standard introduced the first (and current) mandated warning statement “LSS should be cautiously used among people who are not suitable for high potassium intake, such as high-temperature workers, heavy-labour workers, patients with renal dysfunction and hypertensive patients taking antihypertensive drugs.” For clinical guidelines, 10 of 13 hypertension, 4 of 7 cardiovascular disease, 2 of 4 cerebrovascular disease, and 3 dietary or salt reduction guidelines recommended LSS use. Yet, the recommendations were inconsistent, particularly in terms of use among people with CKD. For example, ‘People with good kidney function are recommended to choose LSS.’, ‘People with renal dysfunction should consult doctors before potassium supplement.’, ‘intake of LSS is recommended for patients with stage 1 to 3 CKD.’ One of 5 kidney guidelines suggested “not to use LSS”.

CONCLUSIONS

To date the standards and guidelines are not consistent. Ensuring coherence between salt standards and various clinical guidelines will be important to increase uptake of LSS globally.

THE EFFECTS OF ELDERBERRY SUPPLEMENTATION ON SYSTEMIC AND TISSUE-LEVEL MARKERS OF CARDIOMETABOLIC HEALTH IN OVERWEIGHT AND OBESE OLDER ADULTS: A RANDOMISED CONTROLLED TRIAL

Celeste Lugtmeijer[1]; Cealan Henry[1]; Lauren Struszczak[1]; Joanna, L. Bowtell[1]; Mary, F. O'leary[1]
[1]Public Health and Sports Sciences, University of Exeter St Luke's Campus, Exeter, United Kingdom

BACKGROUND AND OBJECTIVES

Weight gain in older age is associated with cardiovascular disease and type 2 diabetes. As adipose tissue (AT) expands, immune cells infiltrate AT and promote tissue dysfunction and ectopic fat deposition in peripheral tissues (e.g. skeletal muscle (SkMus)). Black elderberry (Sambucus nigra L.) is rich in polyphenols. The objectives of this study were to investigate the effects of 4 weeks elderberry supplementation on SkMus and AT global proteome and on circulating markers of inflammation and cardiometabolic health.

METHODS

Twenty-four overweight and obese older adults (29.4 ± 3.8 kg/m²; 66.3 ± 4.7 yrs) supplemented with a standardised black elderberry extract (ElderCraft® 2,000 mg/day containing 302 mg anthocyanins) or placebo daily for 4 weeks. Subcutaneous AT and SkMus biopsies, serum inflammatory markers, and blood pressure were taken at baseline (D0) and post-supplementation (D28). Tandem-mass-tagged proteomic analysis was performed on tissue samples (Reactome differential pathway analysis via CAMERA algorithm).

RESULTS

Proteomic analysis identified 3,331 (AT) and 2,651 proteins (SkMus), with significant alterations in 21 (AT) and 24 (SkMus) pathways. In AT, this included an upregulation of proteins involved in keratinisation (FDR = 0.01; LogFC = 0.42) , apoptosis (FDR = 0.03; LogFC = 0.24), and clotting cascade (FDR = 0.02 ; LogFC = 0.34), and a downregulation of proteins related to energy metabolism (lipids, glycogen, branched-chain amino acids), aerobic respiration (FDR = 0.02; LogFC = -0.15) and epigenetic regulation of adipogenesis (FDR = 0.05; LogFC = -0.23). In SkMus, elderberry induced the upregulation of proteins related to aerobic respiration (FDR = 0.01; LogFC = 0.08), and cellular response to stress (FDR = 0.00; LogFC = 015), and a downregulation of proteins involved in glycosaminoglycan metabolism (FDR= 0.00; LogFC = -0.32). Blood pressure and serum inflammatory and cardiometabolic markers showed no significant changes over 4 weeks ($p > 0.05$).

CONCLUSIONS

Four-week elderberry supplementation influenced the metabolic behaviour of AT and SkMus. In AT, alterations in apoptosis and extracellular matrix regulation suggest a potential impact on the characteristics of AT hyperplasia in obesity. These promising findings were coupled with an absence of significant changes in clinical markers of inflammation or cardiometabolic health. This underscores the need for longer-term human studies to confirm and further investigate the metabolic, inflammatory and structural effects of elderberry supplementation.

ELIMINATING INDUSTRIAL TRANS-FATS: A COST-EFFECTIVE STRATEGY TO SAVE LIVES AND REDUCE HEALTHCARE COSTS GLOBALLY

Matti Marklund[1, 2, 3, 4, 5]; Elizabeth Drummond,[6]; Laura K. Cobb[6]; Lennert Veerman[7]; Jason Wu[8, 3]
[1]Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [2]Center for Human Nutrition, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [3]Food Policy, The George Institute for Global Health, Barangaroo, Australia; [4]Department of Public Health and Caring Sciences, Uppsala University, Uppsala, Sweden; [5]Welch Center for Prevention, Epidemiology, and Clinical Research, Johns Hopkins University, Baltimore, United States of America; [6]Cardiovascular Health, Resolve To Save Lives, New York, United States of America; [7]School of Medicine, Griffiths University, Brisbane, Australia; [8]School of Population Health, UNSW Sydney, Sydney, Australia

BACKGROUND AND OBJECTIVES

Industrial trans-fatty acids (iTFAs) are a major dietary risk factor for ischemic heart disease (IHD) and other non-communicable diseases, causing an estimated 278,000 cardiovascular deaths annually worldwide. In response, the WHO has called for their global elimination by 2023 [1]. This narrative review synthesizes findings from cost-effectiveness analyses conducted to explore the health and economic impacts of policies to eliminate iTFAs from food supplies, focusing on diverse contexts, including low- and middle-income countries (LMICs) and high-income countries.

METHODS

This review draws on multiple modelling studies conducted across various regions to examine the health impacts, economic costs, and cost-effectiveness of eliminating iTFAs. The review includes findings from Argentina [2], Australia [3], China [4], Indonesia [5], Kenya [6], Nigeria [7], and the United Kingdom[8]. These studies estimated averted IHD events and deaths, health-adjusted life years gained, healthcare cost savings, and implementation costs over varied time horizons, with two studies also simulating health equality impact.

RESULTS

Studies consistently project that mandatory limits or bans on iTFAs can prevent a substantial number of IHD cases and deaths across diverse settings, yielding significant public health and economic benefits. In LMICs, implementing mandatory limits in foods, fats, and oils could avert hundreds of thousands of IHD cases and deaths while generating cost savings for strained healthcare systems, even when baseline iTFA intake is relatively low. High-income countries show similar trends, where eliminating iTFAs also was estimated to promote health equity by providing the greatest benefits in vulnerable populations. Across all contexts, healthcare cost savings related to IHD were consistently projected to far exceed government implementation costs, sometimes by more than tenfold. For example, China is expected to save billions of USD in healthcare costs over the first 10 years, while incurring relatively modest policy implementation expenses.

CONCLUSIONS

Modelling studies suggest that eliminating iTFAs through mandatory limits or bans is a highly cost-effective or even cost-saving strategy to reduce the global burden of cardiovascular disease and improve public health equity. The findings underscore the substantial economic returns and health benefits of such policies, particularly in LMICs and other high-burden settings, and highlight the need for accelerated policy adoption to achieve the World Health Organization's elimination goals.

SOAP35_02

ULTRA-PROCESSED FOOD INTAKE AND RISK OF METABOLIC SYNDROME IN KOREAN ADULTS: A POOLED ANALYSIS OF THREE POPULATION-BASED PROSPECTIVE COHORTS

Yujin Kim[1]; Hannah Oh[2]
[1]Interdisciplinary Program in Precision Public Health, Department of Public Health Sciences, Korea University, Seoul Campus, Seoul, Korea, Republic of; [2]Department of Health Policy and Management, Korea University, Seoul Campus, Seoul, Korea, Republic of

BACKGROUND AND OBJECTIVES

Previous studies suggested an association between ultra-processed food (UPF) intake and impaired metabolism. However, studies specifically focusing on the risk of metabolic syndrome (MetS) using a prospective study design remain limited, particularly in Korea. Furthermore, the associations of UPF subgroups and individual items with the risk of MetS have not been thoroughly examined. Consequently, our analysis examined the associations of both combined and individual UPF intake with the risk of MetS.

METHODS

We conducted an individual-level pooled analysis of three cohorts of Korean Genome and Epidemiology Study (Ansan-Ansung, HEXA, and CAVAS; aged≥40y; n=38,155). Dietary intake was assessed at baseline using 103- and 106- item semi quantitative food frequency questionnaire and UPF intake was classified according to the NOVA classification system. Incidences of MetS were detected through follow-up interviews and health examinations. Hazard Ratios (HRs) and 95% confidence intervals (CIs) were estimated using multivariable Cox proportional hazard models, with adjustment for potential confounders.

RESULTS

Over the follow-up period of up to 18 years (290,592 person-years), a total of 4,941 incidences of MetS were identified. Every 5% higher intake of UPF (by weight ratio) was associated with an increased risk of MetS [HR (95% CI) = 1.04 (1.02, 1.06)]. Among UPF subgroups, every 5% higher intake of processed meat (e.g., ham/sausage, and fish cake/crab stick) [2.29 (1.52, 3.44)], ready-to-eat/heat mixed dishes (e.g., instant noodles, and pizza/hamburger) [1.15 (1.06, 1.24)], sugar-sweetened beverages (carbonated drinks) [1.04 (1.02, 1.07)], and ice cream [1.12 (1.03, 1.23)] were positively associated with the risk of MetS. These associations also persisted after further adjustment for sodium, potassium and calcium intakes.

CONCLUSIONS

Our findings indicate that a high consumption of UPFs, especially within the subgroups of processed meats, ready-to-eat or heat-mixed dishes, sugar-sweetened beverages, and ice cream, is associated with a increased risk of MetS among Korean adults.

SOAP35_05

ULTRA-PROCESSED FOOD CONSUMPTION AND INCIDENCE OF STEATOTIC LIVER DISEASE IN THE NUTRINET-BRASIL COHORT STUDY

Fernanda Silva[1, 2]; Euridice Martinez Steele[2]; Débora Pereira[1, 2]; Maria Alvim Leite[1, 2]; Fernanda Rauber[1, 2]; Maria Laura Da Costa Louzada,[2, 3]; Carlos Augusto Monteiro[2, 3]; Renata Bertazzi Levy[2, 1]
[1]Preventive Medicine, Faculdade de Medicina da Universidade de São Paulo (FMUSP), São Paulo, Brazil; [2]Center for Epidemiological Research in Nutrition and Health (NUPENS/USP), School of Public Health of University of São Paulo, São Paulo, Brazil; [3]Nutrition, School of Public Health of University of São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES

Steatotic liver disease (SLD) is currently the most common cause of chronic liver disease globally, with rising prevalence in South America and worldwide over recent decades (1). Emerging evidence suggests that the consumption of ultra-processed food (UPF) may play a role in the development of SLD (2). Therefore, the present study aims to investigate the prospective association between UPF consumption and the incidence of SLD.

METHODS

NutriNet-Brasil is a web-based cohort study launched on January 26, 2020, with over 100,000 participants (3). The present study included 23,089 participants aged 18 or older, living in Brazil, who were free of SLD and had completed at least two of three previous 24-hour dietary recalls (Nova24h) - developed and validated to collect dietary intake data according to the Nova system - at baseline (4), and completed at least one follow-up health questionnaire. Participants with cancer at baseline were excluded. The UPF consumption (as % kcal/day) was averaged across the Nova-24h assessments and divided into quintiles. Incident cases included individuals who reported a medical diagnosis of SLD during follow-up. Variables for adjustment, obtained at baseline, included age (as timescale), gender, ethnicity, education, marital status, socioeconomic status, smoking, frequency of alcohol consumption, coffee intake (grams/day), physical activity, hypertension, diabetes, cardiovascular disease, and hypercholesterolemia. Additional adjustments for body mass index (BMI) and total caloric intake were performed. A sensitivity analysis was conducted excluding participants with excessive alcohol consumption (>30g/day for men, >20g/day for women). Cox proportional hazards models were used to estimate hazard ratios (HR) and 95% confidence intervals (95% CI).

RESULTS

Over 24.7 months (interquartile range, 17.8-29.8), 949 incident cases were identified. The mean dietary share of UPF represented 31.9% (±11.0) of total energy intake. Individuals in the highest quintile of UPF (>40.8% kcal/day) had a 42% (HR, 1.42, 95% CI, 1.14-1.77) higher risk of SLD compared to those in the lowest quintile (<22.5% kcal/day). This association was maintained after adjustments for BMI and total caloric intake (HR, 1.32; 95% CI, 1.06-1.64). No differences were found in the sensitivity analysis.

CONCLUSIONS

Higher UPF intake was associated with an increased risk of SLD.Global efforts to reduce UPF intake, such as public awareness campaigns, UPF taxation, marketing restrictions, and subsidies for minimally processed foods,are important measures to control and prevent SLD.

FREQUENT CONSUMPTION OF UNHEALTHY FOODS IS ASSOCIATED WITH INCREASED BLOOD PRESSURE IN IBADAN, NIGERIA

Ibukun Afolami[1]; Shobi Otitoola[1]
[1]Human Nutrition and Dietetics, University of Ibadan First Gate, Ibadan, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES

The contribution of diets to cardiovascular health is a growing public health concern. In this study, we examined the relationship between the frequent consumption of unhealthy foods and blood pressure in an urban city in south-west Nigeria.

METHODS

The study was cross-sectional, conducted in three urban Local Government Areas (LGAs) in Ibadan, Nigeria. Informed consent was obtained from 327 participants. Food frequency questionnaires were administered to obtain the frequency of food consumption. Whole foods consumed within one year were categorized into recommended/healthy foods (fruits, vegetables, low-fat dairy, whole grains, lean meat, and poultry); and non-recommended/unhealthy foods (processed meat, sugar sweetened beverages/confectionaries, and high sodium foods). A modified food score was developed following recommendations from the Dietary Approaches to Stop Hypertension (DASH) healthy eating study. Height and weight of participants were measured using a stadiometer and weighing scale respectively. Participants' blood pressures were measured in mmHg using a digital sphygmomanometer. Statistical analysis was conducted using STATA (version 15.0).

RESULTS

Participants' age ranged from 17-65 years. Hypertension prevalence ranged from 1.1% to 24%. The average systolic and diastolic blood pressures were 119.8 ± 15.2 mmHg and 80.2 ± 14.0 mmHg respectively. 33% of participants had a family history of elevated blood pressure. Consumption of non-recommended/unhealthy foods more than once a week increased systolic blood pressure by 1.35 mmHg (95% CI, 0.65mmHg – 2.04mmHg). After adjustment for age, gender, and Body Mass Index (BMI), the consumption of non-recommended foods was still significantly associated with an increase in systolic blood pressure by 0.7mmHg (95% CI, 0.05mmHg – 1.32mmHg).

CONCLUSIONS

The frequent consumption of unhealthy foods increased blood pressure of Nigerians living in Ibadan. More studies are needed to determine the relationship between whole food consumption and cardiovascular health in the country.

Facultad de Veterinaria., Universidad de Zaragoza, Zaragoza, Spain

BACKGROUND AND OBJECTIVES

Childhood obesity is a significant risk factor for metabolic and cardiovascular diseases, associated with alterations in gut microbiota composition and its metabolic activity. Cereal-based products, widely consumed by children, frequently have inadequate nutritional profiles. This study aimed to evaluate the effects of nutritionally improved versus conventional cereal-based products on the gut microbiota-related metabolic pathways in children with overweight/obesity, in the context of Mediterranean diet.

METHODS

A randomized, crossover clinical trial was conducted with two 8-week intervention periods, separated by a 5-week washout phase. Children aged 6–12 years with overweight/obesity consumed either nutritionally improved or conventional bakery products, maintaining their habitual diet. The improved products were higher in fiber (39-49%), lower in saturated fats (43-73%) and sugars (39-200%), and included sourdough culture. Fecal samples were collected before and after each period. Bacterial functional profiles were predicted using PICRUSt2, focusing on glycolysis, fatty acid β-oxidation, pyruvate fermentation to acetate and lactate, and of nitrate reduction pathways.

RESULTS

Twenty-seven participants (mean age:11.25 ± 1.38) provided fecal samples at all four visits. There were no significant changes in the analyzed metabolic pathways. In the intervention group, glycolysis activity increased (29137.37 to 30329.38), as did pyruvate fermentation to acetate and lactate (31768.25 to 32070.86), while fatty acid β-oxidation decreased (3337.82 to 3084.35). In the control group, glycolysis activity decreased (28753.55 to 28315.50), fatty acid β-oxidation increased (1798.49 to 2697.92) whereas pyruvate fermentation to acetate and lactate decreased (28675.84 to 27648.16). However, nitrate reduction activity significantly increased in the control group (36.06 to 45.93) (p=0.029).

CONCLUSIONS

The inclusion of cereal-based products with improved nutritional profiles led to non-significant changes in the gut microbiota-associated metabolic pathways in children with overweight/obesity.

SOAP35_12

LOWER GLYCEMIC INDEX INTAKE AFTER WEB-BASED NUTRITION EDUCATION AMONG ADULTS WITH TYPE 2 DIABETES

Hayford Avedzi[1]; Allison Soprovich[2]; Kate Storey[2]; Steve T. Johnson[3]; Jeffrey A. Johnson[2]
[1]Health Sciences, Boston University, Boston, United States of America; [2]School of Public Health, University of Alberta, Edmonton, Canada; [3]Faculty of Health Disciplines, Athabasca University, Athabasca, Canada

BACKGROUND AND OBJECTIVES

Rigorous evidence is needed to support uptake of Diabetes Canada's evidence-based recommendations to include low glycemic index (GI) foods in daily meal planning as an effective dietary self-care strategy for people with type 2 diabetes (T2D).

This objective of this study is to evaluate the effectiveness of a 12-week lifestyle intervention with web-based GI-targeted nutrition education on dietary intake and GI-related knowledge among adults with T2D.

METHODS

Participants (N=67) were randomized to a control group that received standard printed copies of Canada's Food Guide and Diabetes Canada's GI resources or an intervention group that received those same materials, plus a customized online platform with six self-directed learning modules and supplementary print materials. Each module consisted of a customized video, links to reliable websites, chat rooms, and quizzes. Evidence-based GI concept information included GI values of foods and advice for low-GI shopping, recipes, and cooking tips by a Registered Dietitian. Support through email, text messaging, phone calls, or postal mail to reinforce participants' learning were also available. The primary outcome, daily dietary GI intake, was assessed using 3-day food records. Additional measures including GI knowledge and self-efficacy, glycated hemoglobin A1c, lipids, systolic blood pressure, body mass index, waist circumference, and computer proficiency, were assessed at baseline and at three months post-intervention.

RESULTS

Participants were 64% men; mean (standard deviation [SD]) age 69.5 (9.3) years, with mean diabetes duration of 19.0 (13.7) years, BMI 30.1 (5.7) kg/m2, and A1c 7.1 (1.2)% at baseline. Mean daily GI was similar between intervention (48.60, SD 7.79) and control (49.06, SD 7.94) at baseline. The intervention group had a reduction in GI units of 2.79 (7.77), while the control group increased by 0.76 (6.48). The between group difference in change was -3.77 (95%CI: -6.95, -0.58; p=0.02; effect size d=0.53). Statistically significant improvements in GI-related knowledge and self-efficacy were observed ($p<0.01$) for the intervention with moderate to large effect sizes (i.e., d=0.56 to d=0.92).

CONCLUSIONS

A web-based education program modestly improved GI dietary intakeover 3 months in this sample of adults with type 2 diabetes. Findings from this study provide evidence to support the translation of the GI concept to adults with T2D using a bundle of patient preferred interventions to effect change in GI-related dietary behaviours and intake.

SOAP35_14

CHANGES IN SELF-REPORTED CARDIOVASCULAR RISK FACTORS IN URUGUAYAN ADULTS: A PRE- AND POST-PANDEMIC COMPARISON

Isabel Pereyra[1]; Alfonsina Ortiz,[2]; Andrea Bissio,[2]; Florencia Bonjour,[2]
[1]Nutrition, Universidad Católica del Maule, Curicó, Curicó, Chile; [2]Ciencias de la Salud, Catholic University of Uruguay (UCU), Montevideo, Uruguay

BACKGROUND AND OBJECTIVES

The COVID-19 pandemic altered lifestyles worldwide, impacting cardiovascular disease (CVD) risk factors. The study aimed to determine changes in CVD self-reported risk factors comparing data from the pre-pandemic period to data collected at the time of the survey.

METHODS

A cross-sectional, online study was conducted, including 609 adults aged 18 and over. We selected a convenience sample by disseminating the link to the survey via emails, official university websites, and social networks.

All questions included response options of "Before the pandemic" and "Survey time" to evaluate changes over the specified period.

The outcomes were the incidence on reporting hypertension, diabetes mellitus (DM), hypercholesterolemia, current smoking, gain of body mass index (BMI) higher than one point and sedentarism.

RESULTS

RESULTS indicated a high prevalence of CVD risk factors, with 18.22% reporting hypertension, 20.19% dyslipidemia, 7.55% DM, and 72.13% sedentary behavior. Age, marital status, education, employment, and pre-pandemic obesity were significantly associated with increased risk. The <30 age group showed the highest BMI gain (42.24%), while the 45-60 age group had the highest dyslipidemia and DM incidence. Non-married individuals exhibited higher rates of DM, smoking, and sedentarism. Lower education levels were associated with increased BMI gain and smoking.

Multivariate logistic regression identified significant predictors of CVD risk. Obesity before the pandemic was strongly associated with hypertension (AOR = 5.83), DM (AOR = 5.62), and dyslipidemia (AOR = 2.82). Depression was significantly linked to increased DM (AOR = 7.66), dyslipidemia (AOR = 8.21), and smoking (AOR = 6.25). Sedentarism was significantly higher among individuals with non-full-time employment.

CONCLUSIONS

These RESULTS highlight the indirect health consequences of prolonged lockdowns, beyond the direct effects of COVID-19 itself.

The study found a rise in BMI, sedentarism, hypertension, diabetes mellitus, and dyslipidemia, particularly among individuals with lower education levels, those unemployed or not working full-time, and those experiencing depression.

Given the observed increase in cardiovascular risk factors, public health efforts should focus on mitigating the long-term health consequences of pandemic-related lifestyle changes.

SOAP35_16

CHANGES IN HEALTH AND NUTRITIONAL STATUS AMONG ADULTS BEFORE AND AFTER THE LOCKDOWN

Chona Patalen[1, 2]; Maria Stephanie Parani[1]; Apple Joy Ducay[1]; Gerard Bryan Gonzales,[2]
[1]Nutritional Assessment and Monitoring Division, Department of Science and Technology - Food and Nutrition Research Institute, Taguig, Philippines; [2]Department of Public Health and Primary Care, Faculty of Medicine and Health Science, Ghent University, Ghent, Belgium

BACKGROUND AND OBJECTIVES

This study examined health and nutrition vulnerabilities during COVID-19. Findings will inform future pandemic strategies and identify key determinants of nutritional resilience.

METHODS

This study is a longitudinal cohort study with two points, before and after the pandemic. Anthropometric, clinical and health, dietary, and socioeconomic data were compared and regression analysis was done to assess associations between changes in behavioral risk factors, in dietary intake, and cardiometabolic risk factors.

RESULTS

Prevalence of overweight and obesity, raised blood pressure, and high fasting blood glucose among adults and elderly increased in 2022. A remarkable percentage of adults who had normal nutritional status based on BMI, became overweight or obese after the follow-up. The percentage of former smokers and former alcohol drinkers increased during the COVID-19 pandemic indicating that some survey-respondents initiated smoking or drinking alcoholic beverages and stopped during the survey in 2022, while binge drinking or the excessive drinking of alcohol slightly increased. Physical activity status remained unchanged. In terms of dietary intake, a high percentage of adults and elderly in 2019 failed to meet the daily Recommended Energy Intake (REI), and majority were still not meeting the REI in 2022.

CONCLUSIONS

COVID-19 pandemic has derailed the progress towards attainment of the global targets for noncommunicable diseases for 2025, as evidenced by the increasing prevalence of biological NCD risk factors. This follow-up study is the first attempt to trace and collect data from sub-sample of participants of a cross-sectional nationwide survey.
