METHODOLOGY FOR THE VALIDATION OF FOOD PHOTOGRAPHIC ATLASES: A REVIEW

Valentina Llavayol Alvariño[1]; Isabella Alejandra Díaz[1]; Noelia Dayana Landarin[1]; Barbara Gissel Lira[1]; Mauro Damián López[1]; Pamela Sofía Martínez,; Keila Natali Noir; Luisa Saravia Makowski[1]; Virginia Natero Felipe[1]
[1]Escuela de Nutrición, Universidad de la República, Montevideo, Uruguay

BACKGROUND AND OBJECTIVES
Food consumption is a determinant of the nutritional status of populations and, consequently, their health status. Food photographic atlases are visual reference tools for measuring food consumption. They represent different foods which are typically consumed by a specific population in a country or region, and therefore, they must be designed and validated with these populations to provide reliable measurements.
The aim of this study was to explore the different methods used for the validation of food photographic atlases.
METHODS
A review was conducted on the original literature regarding the validation processes of food photographic atlases published between 2013 and 2023 in three main online databases (Pubmed, Ebscohost, and Scielo). The Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) was used for the presentation of RESULTS.
RESULTS
Of the 15 articles included, 9 conducted perception studies, 3 conducted memory studies, and 3 combined both methodologies. All used convenience samples, and only 4 studies involved the consumption of the foods being assessed.
The number of series evaluated per study ranged from 7 to 95, and the series evaluated per participant ranged from 6 to 23.
For statistical analysis, the three main methods used were the average percentage error, followed by the mean difference and the average difference between the estimations and the images. The most commonly used tests for assessing differences were Wilcoxon and t-tests, while Spearman correlation and Cohen's Kappa were used to assess correlation.
CONCLUSIONS
Methodological differences remain substantial, and the main limitations observed were the use of convenience samples and the lack of food consumption during the evaluation. Combining perception and memory methodologies is recommended for greater methodological robustness.

A SYSTEMATIC SCOPING REVIEW OF FOOD ENVIRONMENTS IN URBAN BANGLADESH

Esther Choo[1]; Amy Margolies[2]
[1]Food systems and nutrition, Independent Consultant, Seattle, United States of America; [2]Nutrition, Diets, and Health, International Food Policy Research Institute, Washington, United States of America

BACKGROUND AND OBJECTIVES
Bangladesh, like many low-and middle-income countries (LMICs), has experienced rapid rural to urban migration, with 41% of the population now living in urban areas. Urbanization has affected urban food environments (FE) and the dietary patterns of urban and peri-urban (UPU) populations. While Bangladesh has seen declines in child stunting under five in both urban and rural areas in the past decade, overnutrition is a growing problem. The rise in overweight and obesity is influenced by urban diets, which are insufficiently diverse and increasingly dominated by unhealthy, ultra-processed foods (UPFs). We conducted a scoping review to assess the state of the evidence on the contributions of UPU FE to the growing challenge of the double burden of malnutrition in Bangladesh, including a review of the relationship between FEs and nutrition outcomes and evaluations of FE interventions.
METHODS
A comprehensive search of peer-reviewed journal articles was conducted in Scopus covering multiple FE domains and targeting the five most populated UPU areas in Bangladesh. Two independent reviewers screened titles and abstracts. We describe and summarize the FE evidence from January 2001 – April 2023.
RESULTS
We screened 275 articles and included 32 articles in the review. Vendor/product properties and desirability were the most widely studied FE dimensions. Multiple studies found vendors failed to meet food hygiene standards. Availability, accessibility, desirability, vendor and product properties, food prices, affordability, and convenience influenced consumption or food purchase in urban Bangladesh. Fast food consumption was driven by convenience, affordability, and accessibility. A wide range of indicators were used to measure FEs; there were no standardized indicators measuring FE dimensions. No evaluations of urban FE interventions were identified.
CONCLUSIONS
This review highlights concerns of food safety, convenience and accessibility of fast food, vulnerabilities of migrant workers and dwellers of informal urban settlements, and targeted UPF marketing towards children and youth in urban Bangladesh. There is a lack of evidence on innovative and effective interventions to promote healthier UPU FE, which are urgently needed to increase the availability and affordability of nutritious foods and to curb unhealthy diets contributing to urban-rural disparities in overnutrition.

VARIABLES ASSOCIATED WITH DIET QUALITY AMONG MANUFACTURING WORKERS: A SURVEY FROM NORTHEAST BRAZIL

Ingrid Bezerra[1]; Anissa Souza[2]; Karina Torres[1]; Raiane Costa[2]; Gabriela Pereira[2]; Antonio Oliveira[3]
[1]Nutrition department, Federal University of Rio Grande do Norte, Natal, Brazil; [2]Postgraduate Program in Health Sciences, Federal University of Rio Grande do Norte, Natal, Brazil; [3]Pharmacy Department, Federal University of Rio Grande do Norte, Natal, Brazil

BACKGROUND AND OBJECTIVES
Diet quality refers to the overall pattern of individuals' food choices over time, with various determinants influencing these choices. The aim of the present study was to identify the factors that affect diet quality among industrial workers in Rio Grande do Norte, Brazil, focusing on differences between men and women.
METHODS
Demographic, socioeconomic, and anthropometric factors, along with food consumption and motivations for food choices, were analyzed. The NOVA classification was used to categorize food groups, and the Diet Quality Index-International (DQI-I) was applied to determine diet quality scores. The sample included 921 workers from industries of varying sizes and sectors.
RESULTS
The RESULTS indicated that diet quality was positively associated with higher consumption of unprocessed or minimally processed foods (p=<0.001) and lower consumption of ultra-processed foods (p=<0.001), with no significant differences between sexes. Additionally, men with lower incomes showed better diet quality scores (p=0.03), possibly due to a higher consumption of traditional foods. Among women, particularly older women (p=0.010) and those more concerned with weight control (p=0.005), better diet quality was observed, reflected in higher consumption of fruits, vegetables, and fibers. Motivations related to the natural content of foods positively influenced both sexes (p=0.013; p=0.025). However, no significant associations were found between DQI-I scores and anthropometric parameters, such as BMI and waist circumference.
CONCLUSIONS
These findings conclude that cultural and socioeconomic factors play important roles in defining diet quality in working populations, directly impacting adherence to healthy eating practices and, consequently, better food choices. The study's analysis underscores the importance of interventions focused on nutritional education to enable better access to higher-quality foods for these populations.

ASSOCIATION BETWEEN DIETARY PATTERNS, GLOMERULAR FILTRATION RATE AND PROTEINURIA IN PATIENTS WITH CHRONIC KIDNEY DISEASE, CHILEAN NATIONAL HEALTH SURVEY

Francisca Peña[1]; Silvana Saavedra,[2]; Caterina Tiscornia[3]; Aicardi Valeria[4]; Duran Aguero Samuel[5]
[1]Escuela de Nutrición y Dietética, Facultad de Medicina y Ciencias de la Salud, Universidad Mayor, Huechuraba, Chile; [2]Carrera de Nutrición y Dietética, Facultad de Ciencias de la Salud, Autonomous University of Chile, Providencia, Chile; [3]Escuela de Nutrición y Dietética, Universidad Finis Terrae, Providencia, Chile; [4]Unidad de Diálisis, Clínica Indisa, Santiago, Chile; [5]Faculty of Health Sciences, San Sebastián University, Providencia, Chile

BACKGROUND AND OBJECTIVES
Chronic kidney disease (CKD) is a public health problem in the world, affecting 10% of the world population (1,2). In Chile, CKD reaches 3.2% of the adult population (>18 years of age), while the prevalence in those >40 years of age reaches 15.4% and a prevalence of 12.1% is reported in the primary health care (3,4). There are dietary patterns that have been shown to protect renal and cardiovascular function, including the Mediterranean, DASH (dietary approaches to stop hypertension) and vegetarian diets (5,6). The aim of this study is to associate the RESULTS of food consumption presented in the national health survey 2026-2017 with the reduction of GFR and proteinuria as markers of damage and progression of CKD.
METHODS
Secondary analysis study carried out using the National Health Survey 2016-2017 database. This survey includes individuals aged 18 and older, both Chilean and foreign, who habitually reside in occupied private households, located in urban areas across the 16 regions of Chile. Variables included were feeding healthy and unhealthy patterns, renal outcomes: glomerular filtration rate (eGFR) proteinuria (ACR), clinical, sociodemographic and nutritional parameters. For the association between renal outcomes and consumption of healthy and unhealthy patterns, Chi-square test (chi²) was used. To analyze the effect of the variables and renal outcomes, the logistic regression model was used and adjusted for: food, age, sex, geographic area, and years of study, physical activity, nutritional status, sleep and smoking.
RESULTS
A total of 5261 subjects are included. 63,9% women. Mean age 50 ± 18.3 years. Significant association was found between GFR and intake of alcohol ($p<0.001$), sugary drinks ($p<0.001$); and RAC with intake of alcohol ($p<0.001$) and sugary drinks ($p<0.001$). Logistic regression model shows significant associations with GFR and fish consumption (OR: 0. 64 (0.43-0.95)), years of education (OR: 0.63 (0.53-0.76)), physical activity (OR: 0.75 (0.58-0.98)) and ACR with consumption of sugar-sweetened beverages (OR: 1.27 (1.01- 1.59)), alcohol (OR: 1.27 (1.01- 1.61)), years of study (OR: 0.55 (0.38- 0.78).
CONCLUSIONS
The main result of the present investigation is that for eGFR, fish consumption is a protective factor and in the case of ACR, sugar-sweetened beverages and alcohol consumption are risk factors. Early detection and timely care by dietitian-nutritionists at the primary care level is essential to correctly guide patients and prevent the progression of CKD.

NUTRITIONAL STATUS AND DIETARY INTAKE OF LOW-INCOME POPULATIONS ASSISTED BY PUBLIC SOCIAL SERVICES IN NORTHEASTERN BRAZIL

Ingrid Bezerra,[1]; Ligia Garcia[2]; Karina Torres,[1]; Anissa Souza[3]; Maria Isabel Celestino,[1]; Maria Luiza Lucena,[1]; Marilia Aires,[1]; Diogo Lima,[1]; Gabrielle Tomaz,[1]; Larissa Mont'alverne Jucá Seabra Seabra,[4]; Nila Pequeno,[1]; Antônio Oliveira,[3]

[1]Nutrition Department, Federal University of Rio Grande do Norte, Natal, Brazil; [2]Faculty of Health Sciences of Trairi, Federal University of Rio Grande do Norte, Natal, Brazil; [3]Postgraduate Program in Health Sciences, Federal University of Rio Grande do Norte, Natal, Brazil; [4]Department of Nutrition, Federal University of Rio Grande do Norte, Natal, Brazil

BACKGROUND AND OBJECTIVES

Food and nutrition are critical issues for public health, both locally and globally. From this perspective, income transfer programs represent a social protection mechanism for economically vulnerable populations, breaking the intergenerational cycle of poverty among beneficiary families and promoting the realization of the Human Right to Adequate Food (HRAF) and Food and Nutrition Security (FNS).1,2. The present study aimed to determine the nutritional status and evaluate the dietary intake of a low-income population assisted by public social service facilities in northeastern Brazil.

METHODS

To achieve this, a descriptive, cross-sectional, and prospective study was conducted. Anthropometric nutritional status was assessed using Body Mass Index (BMI), and dietary intake evaluation was performed through a 24-hour dietary recall. The RESULTS were analyzed based on the macronutrient and micronutrient recommendations outlined in the Dietary Reference Intakes (DRIs).

RESULTS

Partial RESULTS of the study included 54 individuals, with a higher prevalence of women (89%), with a mean age of 48 ± 12.44 years, 63% of whom are beneficiaries of the Bolsa Família Program. A prevalence of 70.4% of overweight was identified, according to BMI classification. Regarding dietary intake, the average calorie consumption was 1089 kcal/day, which was lower than the estimated Total Energy Expenditure of 1716.39 ± 249.85 kcal/day. Macronutrient distribution fell within the acceptable ranges of the AMDR, while probable inadequacies were observed in the intake of calcium (98.1%), vitamin D (98.1%), magnesium (88.9%), vitamin A (88.9%), zinc (83.3%), vitamin C (79.6%), vitamin B12 (77.8%), iron (57.4%), and dietary fiber (63%).

CONCLUSIONS

The findings highlight the need for further studies addressing qualitative aspects of the diet and periodic monitoring of nutritional indicators in this population, aiming to guide healthier and more adequate dietary practices.

SOCIAL INEQUALITIES, NUTRITIONAL STATUS AND BEHAVIOURAL DIFFICULTIES IN CHILDHOOD ACROSS COHORT STUDIES: A STUDY PROTOCOL

Isabel Giacomini[1]; Alicia Matijasevich[2]; Bernardo Lessa Horta[3]; Marly Augusto Cardoso[4]
[1]Nutrition Department, Universidade de São Paulo, São Paulo, Brazil; [2]Departamento de Medicina Preventiva, Faculdade de Medicina da Universidade de São Paulo (FMUSP), São Paulo, Brazil; [3]Department of Social Medicine, Faculty of Medicine, Federal University of Pelotas, Pelotas, Brazil; [4]Department of Nutrition, School of Public Health, University of São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
There is evidence linking nutritional status to child behaviour and overall well-being (Martoccio et al., 2020, Beynon, 2023), yet little is known about how this relationship is influenced by contexts of socioeconomic disadvantage. This study investigates and compares the association between social inequalities, nutritional status, and behaviour problems in childhood across different settings.
METHODS
A literature review identified cohorts that administered the parent version of the Strengths and Difficulties Questionnaire (SDQ-P) (sdqinfo.org) to assess child behaviour problems, alongside socioeconomic and demographic data. Eight cohorts from Brazil, Ghana, Portugal, Norway, Ireland, and Australia were invited to participate, and data were requested from principal investigators or responsible agencies. After data acquisition, variables will be harmonised to ensure comparability. Household wealth will be assessed using richness indexes based on assets and income variables, categorised into cohort-specific quintiles. Anthropometric data will be standardised into sex- and age-specific z-scores according to the World Health Organization growth parameters(WHO, 2007;de Onis et al, 2007). Analyses will follow a two-stage individual participant data meta-analysis framework(Tierney et al., 2024).
RESULTS
The final sample included 20,210 children: 5,077 from three Brazilian regions; 420 from Amadora, Portugal; 930 from Trondheim, Norway; 959 from Ghana; 3,828 from Australia; and 8,996 from Ireland. The children's ages ranged from 3.4 to 9.4 years (mean 5.4 ± 0.9 years) at behaviour assessment, with 49.1% being girls. Regarding nutritional status, 2.7% were classified as thin, 11.7% as overweight, and 7.5% as obese. Most children had received any breastmilk (80.3%), 39.7% were firstborn, and 8.5% were premature. Additionally, 6.9% of mothers were teenagers (<19 years old) at the child's birth, 12.8% were immigrants, and 15.9% had not completed lower secondary education at baseline. Overall, 9.2% of children were classified as having behaviour problems based on the total difficulties scale, though prevalence varied widely, from 2.8% in Norway to 47.8% in Brazil's Northeast. Final pooled analyses will quantify these associations and explore contextual effects.
CONCLUSIONS
This project sheds light on the role of nutritional status and socioeconomic disparities in shaping childhood mental health. The findings aim to inform public health policies and interventions to mitigate the impact of social inequalities on child well-being.
CONFLICTS OF INTERESTS

TEMPORAL TREND OF FOOD ACQUISITION LOCATIONS IN BRAZIL

Marcos Anderson Lucas da Silva; Claudia Cristina Gonçalves Pastorello[1]; Luisa Gazola Lage[1]; Maria Laura Da Costa Louzada,[1]
[1]NUPENS, Nutrition, Faculdade de Saúde Pública USP, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
The eating habits of the Brazilian population have changed significantly in recent decades, and one of the determinants of this is the transformation of food environments, including food acquisition locations. This study objective to describe the temporal trend of food acquisition locations in Brazil from 2002 to 2018.
METHODS
The latest data from the Household Budget Surveys (2002-2003, 2008-2009, and 2017-2018) were used, providing the most up-to-date information on food acquisitions, including their purchase locations. Six categories of food acquisition locations were analyzed: supermarkets; minimarkets; fresh produce; bakeries, butcher shops, and others (fish markets, restaurants, bars, and cafeterias). The quantity of food acquired (grams and liters) at the purchase locations was converted into calories. Subsequently, the share of each acquisition location in the total calories purchased was estimated. Simple linear regression models were applied to assess the statistical significance of temporal changes in the caloric share of each purchase location.
RESULTS
There was a significant and statistically meaningful increase in the share of purchases made in supermarkets, rising from 52.94% of acquired calories in 2002-2003 to 60.57% in 2008-2009 and reaching 72.75% in 2017-2018. This growth was accompanied by a significant reduction in the share of minimarkets, which dropped from 30.38% in 2002-2003 to 20.01% in 2008-2009 and fell to 9.32% in 2017-2018. Regarding fresh produce, there was a sharp decline between 2002-2003 (7.79%) and 2008-2009 (3.75%), followed by stagnation in 2017-2018 (3.68%). Lastly, bakeries and butcher shops didn't show statistically significant changes over the period. Bakeries accounted for 7.43% in 2002-2003, rose to 7.90% in 2008-2009, and decreased to 6.87% in 2017-2018. Meanwhile, butcher shops recorded 2.66% in 2002-2003, increased to 3.01% in 2008-2009, and declined to 2.63% in 2017-2018.
CONCLUSIONS
The growing share of supermarkets in Brazilian food purchases reflects a significant environmental change, weakening small establishments and strengthening large retail chains. This shift may lead to a monopoly in food supply, affecting availability and prices, directly influencing consumer choices and, consequently, the quality of diets.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

ACCEPTABILITY OF ANTENATAL MULTIPLE MICRONUTRIENT SUPPLEMENTATION COMPARED TO IRON AND FOLIC ACID SUPPLEMENTATION IN PREGNANT WOMEN: A NARRATIVE REVIEW

Mihaela Ciulei[1]; Filomena Gomes[2, 1]; Carolina Pereira[1]; Participating Investigators Of Included Acceptability Case-Studies[1]; Martin Mwangi[1]
[1]Healthy Mothers Healthy Babies Program, Micronutrient Forum, Washington, D.C., United States of America; [2]NOVA Medical School, Universidade NOVA de Lisboa, Lisbon, Portugal

BACKGROUND AND OBJECTIVES
This review examines the acceptability of multiple micronutrient supplements (MMS) vs iron and folic acid (IFA) in pregnant women from low- and middle-income countries (LMICs) and proposes a comprehensive acceptability framework for future research and programs**.**
METHODS
We identified 602 studies from Embase, Medline, Scopus databases, selecting 21 for full-text review. Inclusion criteria covered MMS and/or IFA trials in women of reproductive age, assessing acceptability (e.g., sensory, ease of consumption, cultural, socioeconomic factors), adherence, and both qualitative or quantitative data.
RESULTS
Five of the 21 studies defined acceptability definition or outlined constructs for assessment, leading to our proposed definition of acceptability: "*Acceptability is the (comprehensive assessment of) pregnant women's willingness and satisfaction in integrating the intervention (i.e., MMS) into their daily routine and involves evaluating factors such as sensory attributes (e.g., taste), ease of consumption, and overall pregnancy experience (e.g., side effects), recognizing cultural nuances and individual preferences. It extends beyond adherence, encompassing cultural appropriateness, socio-economic considerations, and the overall compatibility of the MMS with individual preferences and lifestyles*." Three peer-reviewed articles and 3/5 case studies fit the inclusion criteria. MMS showed higher acceptability than IFA in effectiveness studies (n=4; 3 non-peer reviewed) vs efficacy trials (n=2), driven by fewer side effects and perceived benefits such as positive pregnancy experience, improved energy, appetite, and mood. Facilitating factors included cost parity, trust in health providers and services, and availability, while barriers included unpleasant smell and taste, rumors, lack of family support, cost, and healthcare access. MMS adherence was higher in 2/5 effectiveness studies and 1/2 efficacy trials with fewer side effects than IFA in most cases.
CONCLUSIONS
This review proposes a comprehensive definition of acceptability and emphasizes its role in improving the acceptance of prenatal micronutrient supplements. Public health programs in LMICs should consider the multifaceted nature of acceptability of MMS from the perspective of deliverers and recipients, addressing cultural, sensory, and socioeconomic factors.

EFFICACY OF NAFEEDTA-FORTIFIED WHEAT FLOUR IN COMBATING IRON DEFICIENCY ANEMIA IN MOROCCAN WOMEN

Meryem Lazrak[1]; Houda El Hsaini[1]; Khalid El Kari[2]; Hassan Aguenaou[2]; Cornelia Loechl[3]
[1]Higher School of Paramedical Sciences, Health Sciences Research Center (CReSS), International University of Rabat, Rabat, Morocco; [2]Joint Research Unit on Nutrition and Food, RDC-Nutrition AFRA/IAEA, Ibn Tofail University-CNESTEN, Rabat, 10001, Morocco, Rabat, Morocco; [3]International Atomic Energy Agency (IAEA), IAEA Department of Nuclear Sciences and Applications, Vienna, Austria

BACKGROUND AND OBJECTIVES
Iron deficiency anemia (IDA) remains a significant public health challenge in Morocco, with dietary inhibitors such as polyphenols and phytic acid impairing non-heme iron absorption. Despite efforts to enrich wheat flour with elemental iron, anemia persists. This study evaluates the bioavailability and efficacy of NaFeEDTA as an alternative iron fortificant to address these inhibitory effects. Specifically, it aims to assess the effectiveness of NaFeEDTA-fortified bread, consumed alone or with green tea, among anaemic and non-anaemic Moroccan women of reproductive age.
METHODS
A total of 46 women of reproductive age were divided into two groups: anaemic (AG; n=21, aged 19–39 years) and non-anaemic (NAG; n=25, aged 18–41 years). Two test meals were used in this study. In Meal 1, Na57FeEDTA was added to the brioche, accompanied by 300ml of water. In Meal 2, Na58FeEDTA was added to the brioche, along with 300ml of green tea. After six days, a crossover design was implemented, allowing each participant to serve as their own control. Fractional iron absorption (FIA) was measured by analyzing erythrocyte incorporation of 57Fe and 58Fe markers 14 days post-ingestion, using inductively coupled plasma mass spectrometry (ICP-MS).
RESULTS
The mean fractional absorption (MAF) of iron NaFeEDTA was 36.7% (range: 24.2-39.8) in AG and 16.7% (range: 9.2-24 ,2) in NAG ($p < 0.001$) from a test meal consumed with water and 4.1% (2.8-6.1) in AG and 1.4% (0 ,8-2,9) in NAG from a test meal consumed with tea. The mean inhibition was almost equal to 87.5% and 86.2% respectively in AG and NAG. The AFM was 2 times greater in case of iron deficiency anemia
CONCLUSIONS
NaFeEDTA demonstrates high bioavailability, particularly among anaemic women, and its use as a wheat flour fortificant can significantly address IDA in Morocco. While tea consumption reduces iron absorption, it remains sufficient to meet daily requirements. Public health strategies promoting tea consumption an hour before or after meals could further enhance intervention outcomes. The fortification of wheat flour with NaFeEDTA offers a sustainable solution to reduce the burden of IDA in Morocco.

EATING FOR TWO: “DO PREGNANT WOMEN IN RURAL AREAS MEET THEIR REQUIREMENTS FOR NUTRIENT INTAKE AND DIETARY DIVERSITY?"

Yetunde Omotola Ogundairo[1]; Oladejo Adepoju[1]; Adesola .O. Olumide[2]
[1]Human Nutrition and Dietetics, UNIVERSITY OF IBADAN, IBADAN, Nigeria, Federal Republic of; [2]Institute of Child Health, University College Hospital and University of Ibadan, Ibadan, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
Adequate Nutrition is crucial during pregnancy for the health and well-being of the mother and foetus. Every year, about 800,000 pregnant women die globally with 90% from developing countries and 20% from Nigeria. Despite numerous interventions aimed at tackling this problem in developing countries, challenges still persist with inadequate intake of nutrient and dietary diversity of second-trimester pregnant women. Therefore, this study assessed nutrient intake and dietary diversity of rural pregnant women from two selected Local Government Area (LGAs) in Ibadan, Nigeria.
METHODS
A cross-sectional study involving 140 second-trimester pregnant women recruited from five rural communities in each of the selected LGAs. A semi-structured, interviewer-administered questionnaire was used to obtain information on socio-demographic characteristics, 24-hour dietary recall assessed nutrient intake and Food Frequency Questionnaire to assess dietary diversity of the women. Data was analyzed using descriptive, Inferential Statistics and Esha food processor for nutrient analysis. Women Dietary Diversity Score (WDDS) were categorized as low (0-3), minimum (4-5) and high (6-9).
RESULTS
Mean age was 27.83±6.32 and 29.19±6.3 in both LGAs. Few percentages of women in both LGAs consume foods rich in Folate (6.02% vs7.80%); Calcium (10.84% vs 2.60%); Iron (10.84% vs 2.60%); Zinc (16.87% vs27.2%); Iodine (1.2% vs1.3%); Vitamin C (12.5% vs 5.58) and Vitamin A (10.8% vs7.80%). Minimum DDS for Lagelu and Egbeda LGAs were (58.6% vs 51.4%) while a negative moderate correlation was observed with WDDS and marital status in Lagelu LGAs.
CONCLUSIONS
To address these nutritional needs, tailored intervention programs should be designed specifically for rural pregnant women.

SETTING TARGETS FOR A GRADUAL SODIUM REDUCTION PROGRAM IN URUGUAY: COMPARISON WITH REGIONAL BENCHMARKS AND ANALYSIS OF REDUCTION STRATEGIES

Virginia Natero[1]; Ares Gastón[2]; Antúnez Lucía[2]; Alcaire Florencia[2]
[1]Unidad Académica Departamento de Alimentos, Universidad de la Republica, Montevideo, Uruguay; [2]Instituto Polo Tecnológico de Pando, Universidad de la Republica, Montevideo, Uruguay

BACKGROUND AND OBJECTIVES
Purpose: The objectives of the study were to: i) assess the sodium content of food products available in the Uruguayan market, ii) evaluate progress in achieving regional sodium reduction benchmarks; and iii) compare two approaches to gradual sodium reduction -maximum targets and gradual percentage reductions- considering potential effectiveness and sensory perception thresholds.
METHODS
Methods: This study employed a cross-sectional design. Information from the labels of all processed and ultra-processed products available at nine supermarkets in two cities was collected using a smartphone application. Information about sodium content was extracted from the food labels. Data were analyzed using descriptive statistics. The Mann-Whitney U test was used to assess differences in the sodium content following the two reduction strategies
RESULTS
RESULTS: A total of 4,719 products were analyzed, wich had a median sodium content of 389.3 mg/100 g. When comparing median sodium content to the targets set by the Pan American Health Organization (PAHO) for 2021, 32 of the 62 subcategories exceeded the established benchmarks, while 30 subcategories fell below them. Products with a sodium content above the PAHO threshold required a median reduction in sodium content ranging from 4.1% and 69.7%. At the aggregate level, percentage reductions were significantly more effective in reducing sodium content compared to maximum target strategies based on the 50th or 75th percentile.
CONCLUSIONS
Conclusion: RESULTS from the present work underscore the need to adapt regional targets for the development of a sodium reduction program in Uruguay. The advantages of a sodium reduction program based on combining percentage reductions and maximum targets are discussed.

THE IMPACT OF TAILORED HOME-BASED CARE AND COUNSELLING INTERVENTION ON CHILD GROWTH

Abdulai Abubakari[1]; Alhassan Abdul-Mumin[2]; Faith Agbozo[3]; Silas Wumpini Seth,[3]; Albrecht Jahn,[4]
[1]Department of Global Health, University for Development Studies, Tamale, Ghana, Tamale, Ghana; [2]Department of Paediatrics and Child Health, University for Development Studies, Tamale Teaching Hospital, Tamale, Ghana; [3]Department of Family and Community Health, University of Health and Allied Sciences, Ho, Ghana; [4]Institute of Global Health, University of Heidelberg, Heidelberg, Germany, Heidel, Germany

BACKGROUND AND OBJECTIVES
This research investigates the impact of a tailored home-based counseling and care intervention on child health outcomes among vulnerable populations.
METHODS
The research was a community-based trial nested in a longitudinal prospective cohort study. The study involved two groups: vulnerable newborns receiving the intervention and healthy newborns who served as controls. The intervention lasted 6 months, the critical postpartum period and all two groups were followed up for six months. The intervention focused on strengthening the capacity of primary-level health facilities to provide post-discharge support to mother-newborn pairs. 223 each of high-risk and normal newborns were recruited. Data was generated through monthly visits using a checklist. Analysis was done using a proportion t-test and linear regression.
RESULTS
Infants in the intervention group experienced a 72.5% reduction in wasting compared to 61.7% in the control group. Moreover, the intervention group exhibited faster growth (‘catch up’) compared to the control group at visit 4, as every one-month increase in the age of the intervention group led to 452 grams increase in weight ($p = 0.000$, 95% CI: 0.281 – 0.623) compared to only 107 grams among the control group ($p = 0.024$, 95% CI: 0.014 – 0.201), reflecting improved nutritional outcomes.
CONCLUSIONS
These findings underscore the effectiveness of tailored home-based care and counseling interventions in enhancing child health outcomes. Therefore, to reduce neonatal mortality rate, interventions should be tailored and implemented during the postnatal period or the so-called “fourth trimester”.

PREVALENCE, ATTITUDES, AND PRACTICE RELATED TO FOOD SUPPLEMENTS USE: INSIGHTS FROM THREE WESTERN BALKAN COUNTRIES

Bojana Vidovic[1]; Slavica Nikolic[1]; Jelena Rajic[1, 2]; Mitar Delevic[1, 3]; Mirjana Djermanovic; Relja Surucic
[1]Department of Bromatology, University of Belgrade-Faculty of Pharmacy, Belgrade, Serbia; [2]-, Medicine and Medical Devices Agency of Serbia, Belgrade, Serbia; [3]-, Institute for Public Health of Montenegro, Podgorica, Montenegro

BACKGROUND AND OBJECTIVES
Food supplements are often associated with a healthy lifestyle. Despite the rising market and popularity, some regions and countries lack surveys on intake and practices related to these products. This study aimed to assess the prevalence, attitudes, practices, and factors associated with food supplement use in three Western Balkan countries.
METHODS
The survey was conducted among adults in Serbia, Montenegro, and the Republic of Srpska (Bosnia and Herzegovina) using an online self-administered questionnaire between July and October 2024. The questionnaire comprised 46 items covering socio-demographic, economic, lifestyle, diet, and food supplement domains.
RESULTS
According to the collected survey data, over 70% of participants consumed at least one food supplement during the past year. The most commonly used food supplements in all three countries were vitamin and/or mineral supplements, followed by probiotics, omega-3, and herbal supplements. The main general reason for using food supplements was to maintain overall health, while specific reasons were immune and energy support. Food supplement use was associated with more favorable health status and lifestyle habits. Self-reported level of knowledge, beliefs regarding food supplements, and factors influencing consumers' intention to purchase food supplements varied among countries. Adverse effects related to food supplement use were reported by 4% of participants.
CONCLUSIONS
The RESULTS of this study provide valuable insights into the prevalence and practice related to food supplements in three Western Balkan countries. Further research is needed to identify the targets for public health interventions to promote rational and safe food supplement use.

PREDICTORS OF CAREGIVER SATISFACTION WITH THE STATE OF RHODE ISLAND SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS AND CHILDREN

Ophelia Mensah[1, 2]; Fred B. Addo[1, 2]; Emilie Signore[1]; Kathryn Roy[3]; Ann Barrone[3]; Nick Hamdi[4]; Sarah Amin[1]; Isaac Agbemafle[1, 2]

[1]Department of Nutrition, University of Rhode Island, North Kingstown, United States of America; [2]Fred N. Binka School of Public Health, University of Health and Allied Sciences, Hohoe, Ghana; [3]Special Supplemental Nutrition Program for Women, Infants and Children, Rhode Island Department of Health, Providence, United States of America; [4]College of Health and Wellness, Johnson and Wales University, Providence, United States of America

BACKGROUND AND OBJECTIVES

Previous evaluations of the special supplemental nutrition program for women, infants and children (WIC) have been associated with positive health outcomes in women and children. However, these evaluations have not examined the WIC program from the caregiver's perspective in the state of Rhode Island. Hence, the aim of this study was to determine the factors influencing caregiver satisfaction with WIC.

METHODS

This cross-sectional study involved 163 caregivers receiving online or in-person WIC services in Rhode Island. Data was collected on socio-demographic characteristics, experiences with WIC, awareness of WIC services and caregiver satisfaction using a self-administered semi-structured questionnaire. Using a 3-item Likert scale (dissatisfied, neutral, satisfied), caregivers rated their satisfaction on customer service, duration of appointment and overall satisfaction with WIC. An ordered logistic regression model was used to determine the predictors of overall satisfaction with WIC.

RESULTS

The mean age of the caregivers was 30 years, 52.8% were high school graduates, about half were non-Hispanic, and 52.8% were unemployed. Eight percent of the caregivers reported difficulties with WIC while 14.7% suggested changes to improving access to WIC. The frequently reported difficulty was "the WIC foods were not available or easily found". The commonly reported change was "make it easier to identify WIC products in stores". For a unit increase in overall satisfaction, the odds of being satisfied with WIC was lower among caregivers who had less than high school education (OR= 0.14, 95% CI= 0.02, 0.79) or some college certificate (OR= 0.16, 95% CI= 0.03, 0.92) as compared to caregivers with college degree or higher. Unlike caregivers who preferred English, caregivers who preferred to receive WIC services in Spanish were 97% less likely to be satisfied with WIC (OR= 0.03, 95% CI= 0.01, 0.09). Caregivers who are currently enrolled in WIC were 13.5 times more likely to be satisfied with WIC as compared to caregivers who have dropped out of WIC (OR= 13.57, 95% CI= 1.74, 25.80). For a unit increase in overall satisfaction, caregivers who received referrals from WIC were 4.6 times more likely to be satisfied with WIC as compared to those who did not receive referrals (OR= 4.63, 95% CI= 1.28, 16.71).

CONCLUSIONS

Educational level, preferred language, currently enrolled in WIC and received referrals from WIC were associated with caregiver overall satisfaction with WIC. These factors should be considered in designing interventions to increase WIC enrolment and continued participation.

USING THE DIFFUSION OF INNOVATION THEORY TO UNDERSTAND HOW TRADITIONAL HEALTH BELIEFS WERE PRACTICED IN THE SOCIAL SYSTEM AND INFLUENCED EXCLUSIVE BREASTFEEDING IN PALAWAN, THE PHILIPPINES

Zeyuan Wang[1, 2]; Erica Di Ruggiero[1, 3, 4]; Lincoln Lau[5, 6]; Mary L'abbe[7]
[1]Social and Behavirol Health Sciences, University of Toronto, Toronto, Canada; [2]Culinaria Research Center, University of Toronto Scarborough, Toronto, Canada; [3]Center for Global Health, University of Toronto, Toronto, Canada; [4]Institute of Health Policy, Management & Evaluation, University of Toronto, Toronto, Canada; [5]Clinical Public Health Division, Dalla Lana School of Public Health, University of Toronto, Toronto, Canada; [6]Research, International Care Ministries, Manila, Philippines; [7]Nutritional Sciences, University of Toronto, Toronto, Canada

BACKGROUND AND OBJECTIVES
Exclusive breastfeeding (EBF) is vital for maternal and infant health, yet the EBF rate in the Philippines is only 29%. Traditional health beliefs (THBs) have been reported to negatively influence EBF. However, Palawan, a province known for its diverse topographies, ethnic groups, and THBs, remains understudied.
METHODS
This study explored the influence of THBs on EBF in Palawan using the social systems framework of the Diffusion of Innovation Theory (DoI). Sixteen barangays were selected through maximum variation sampling, and 104 individuals, such as lactating mothers, community leaders, traditional healers, and health workers, were interviewed. Data were analyzed inductively to summarize relevant THBs, followed by deductive analysis using DoI relevant to understand how the social systems influenced EBF.
RESULTS
Five types of THBs were identified, varying across regions, with remote areas having more THBs than urban areas. THBs potentially influenced EBF both negatively and positively. The data analysis through the DoI shows people in urban and remote areas had opposite attitudes toward THBs.THBs were widely accepted and passed down by experienced community members. Socioeconomic factors and misunderstandings between health professionals and local people hindered people from seeking medical consultations in remote communities.
CONCLUSIONS
Similar THBs are popular in the Philippines and other Southeast Asian countries. THBs are understudied but could contribute to EBF. More studies should be conducted to deeply understand THBs not just from physical perspectives, but also from social, economic, and cultural perspectives. Training health professionals to understand THBs and build trust with local communities is crucial for promoting EBF effectively.

BACKGROUND AND OBJECTIVES
Globally, plant-based diets are gaining in popularity. Whilst their cardiometabolic benefits are well-documented, there is a lack of studies examining the associations between plant-based diets and risk of hypothyroidism.
METHODS
We analysed data from the UK Biobank cohort. Multivariable Cox proportional hazards regression models were used to estimate hazard ratios (HRs) and 95% confidence intervals (95% CIs) for incident hypothyroidism across vegans, vegetarians, pescatarians, poultry eaters, low meat eaters, and high meat eaters aged 40-69 years. Ancillary to this, we carried out logistic regression analyses to evaluate associations between the diet groups and prevalent hypothyroidism (according to International Classification of Diseases (ICD) codes at baseline.
RESULTS
We included 494,437 individuals from the UK Biobank, of which 231,906 followed a high-meat, 236,510 a low-meat, 5,662 a poultry-based, 11,286 a pescatarian, 8,654 a vegetarian, and 419 a vegan diet. During a median (SD) follow-up of 12.7 (± 3.2) years, 24,240 participants developed hypothyroidism. In multivariable Cox regression models without adjustment for body mass index (BMI), none of the diets were significantly associated with the risk of hypothyroidism. However, there was a tendency for a higher risk of hypothyroidism among vegetarians compared to people following a high-meat diet (HR: 1.08, 95% CI: 0.98 - 1.19). After controlling for BMI the association for vegetarians (HR = 1.18, 95% CI 1.07 – 1.30) became stronger and statistically significant. Furthermore, we observed a positive association between a vegetarian (OR: 1.37, 95% CI: 1.14 - 1.63) and a poultry diet (OR: 1.35, 95% CI: 1.10 - 1.63) with hypothyroidism prevalence.
CONCLUSIONS
In the present study, we found a moderately higher risk of hypothyroidism among vegetarians, after controlling for BMI, a potential collider. This slightly higher risk of hypothyroidism among vegetarians, requires further investigation, taking iodine status and thyroid hormone levels into account.

DEVELOPMENT AND VALIDATION OF A CULTURALLY ADAPTED FOOD FREQUENCY QUESTIONNAIRE FOR OLDER ADULTS

Elias Acevedo[1]; Victor Prieto,[2, 3]; Sena Geraldine[1]; Rodríguez Raquel[4]; Paula Moliterno[5]; Simoncelli Mariana[1]; Makowski, Luisa Saravia[6]

[1]Nutrición Poblacional, School Nutrition - University of the Republic, Montevideo, Uruguay; [2]Area de Investigación, Edificio Parque Batlle - UdelaR, Montevideo, Uruguay; [3]Escuela de Nutricion, Universidad de la Republica, Montevideo, Uruguay; [4]Nutrición Basica, School Nutrition - University of the Republic, Montevideo, Uruguay; [5]Österreichisches Akademisches Institut für Ernährungsmedizin (ÖAIE), Österreichisches Akademisches Institut für Ernährungsmedizin (ÖAIE), Wien, Austria; [6]Montevideo, School Nutrition - University of the Republic, Montevideo, Uruguay

BACKGROUND AND OBJECTIVES

The Food Frequency Questionnaire (FFQ) is a key tool in epidemiological studies for evaluating dietary patterns and their relationship with non-communicable diseases. Until now, our country lacked a FFQ specifically developed and validated for its population. The aim of this study was to develop and validate a FFQ tailored to older adults in the country, taking into account cultural diversity in terms of food consumption.

METHODS

Two 24-hour dietary recalls (24hR) were conducted—one on a weekday and one on a weekend—among a convenience sample of 76 older adults from the capital and border regions, ensuring cultural representativeness. Based on the obtaineddata, a list of 63 food items and food groups most frequently consumed was created. The frequency categories followed Willett's model, with a reference period of the last six months.

The FFQ was validated within 124 older adults, who completed three 24hRs (two weekdays and one weekend day), with the average intake from the three 24hRs used as the reference method. Correlations between both methods were assessed using Pearson and Spearman coefficients, with logarithmic normalization applied when necessary.

RESULTS

The FFQ was proven reliable for the population of older adults of the country, showing varying estimation accuracy depending on the nutrient. Correlations ranged from poor for nutrients like Vitamin A (0.279) to fairfor proteins (0.353) and carbohydrates (0.416), compared to the average of the three 24hRs.

CONCLUSIONS

The developed FFQ is a promising tool for epidemiological studies in older adults in the country, contributing to a better understanding of their dietary patterns and their relationship with non-communicable diseases. Future research should focus on optimizing the questionnaire to improve the accuracy of estimation for certain nutrients.

ENHANCING EARLY DETECTION AND REFERRAL FOR MALNOURISHED CHILDREN

Swe Linn Maung[1]; Matama Esther[1]
[1]PDQ Nutrition, Save the Children International , Yangon, Myanmar

BACKGROUND AND OBJECTIVES
The 2022 assessment identified 86 children as acutely malnourished using WHZ, compared to 27 using MUAC, showing a discrepancy of 59 children (31%). This highlights the need for innovative methods to improve active case detection. Since MUAC is the primary screening tool, expanding its cut-off points is essential to include more children. Research indicates that early admission to OTP leads to shorter treatment durations and better recovery outcomes, while late admissions result in prolonged treatment due to severe malnutrition and associated complications.

1. To provide evidence supporting the expansion of MUAC criteria for early malnutrition detection, from 12.5 cm to 13.0 cm.
2. To ensure early identification and timely treatment of malnourished children, improving treatment outcomes.

METHODS
Over seven months, CHW regularly screened children in camps using MUAC tape. Children with MUAC up to 13.0 cm were referred to OTP/TSFP centers, where nutrition workers measured MUAC, weight, height, age, and sex to assess malnutrition severity. Children with MUAC between 12.5 cm and 13.0 cm were tracked as study participants. If rescreened and classified as malnourished by WHZ, they were admitted to the OTP/TSFP program.

RESULTS
Over seven months, 687 children (313 boys, 376 girls) with a MUAC of 12.5-13.0 cm were referred for WHZ screening. Among them, 11 (4 boys, 7 girls) had SAM, and 123 (75 boys, 48 girls) had MAM. A total of 134 malnourished children received treatment.
The three centers typically handle 48-70 cases monthly. The expanded MUAC referral added 7-30 cases monthly, identifying 24% (134 of 566) of total malnutrition cases.
Comparing outcomes, MAM cases identified via expanded MUAC had a 100% cure rate, versus 96% for routine screening. No deaths, defaulters, or non-responders were reported in the expanded MUAC group, unlike the 4% non-response rate in routine screening.

CONCLUSIONS
Expanding the MUAC cut-off from 12.4 cm to 13.0 cm could identify 20% more children with acute malnutrition, primarily detecting more MAM cases. This initiative proved effective in early malnutrition detection and improved treatment outcomes for MAM and SAM children. Successful implementation requires stakeholder engagement, community awareness, training, resources, and functional treatment centers.

EFFECT OF MATERNAL AGE ON NEONATAL MORTALITY MEDIATED BY SMALL VULNERABLE NEWBORNS

Seema Subedi[1]; Elizabeth Hazel[1]; Subarna Khatry,[2]; James Tielsch,[3]; Luke Mullany,[4]; Steven Leclerq,[5]; Robert Black[6]; Anne Cc Lee[7]; Joanne Katz,[5]
[1]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [2]NNIPS, Nepal Nutriton Intervention Project Sarlahi, Kathman, Nepal; [3]Department of Global Health, George Washington University Milken Institute School of Public Health, Washington, DC, United States of America; [4]Research and Exploratory Development Department, Johns Hopkins University Applied Physics Laboratory, Laurel, MD, United States of America; [5]Center for Human Nutrition and Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, United States of America; [6]Department of International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, United States of America; [7]Warren Alpert Medical School, Brown University, Providence, United States of America

BACKGROUND AND OBJECTIVES
Neonatal mortality, with a prevalence of 22 deaths per 1,000 live births in South Asia, remains a critical public health issue.(1) Over half the neonatal deaths are comprised of babies that are born preterm, small-for-gestational age (SGA) or both- also known as small vulnerable newborns (SVNs)- and maternal nutrition and maternal age are key risk factors.(2) Maternal age is associated with neonatal mortality (3-6), but the extent to which this association is mediated by SVN categories, reflecting nutrition status, is unclear. This study examines maternal age, neonatal mortality, and the mediating role of SVN.
METHODS
This secondary analysis uses data from the Nepal Oil Massage Study, a cluster-randomized trial (2007–2011) on neonatal outcomes in rural Nepal (n=29,887 pregnant women). The main outcome is neonatal mortality, with maternal age (categorized as <18, 18-19, 20-24, 25-34, >34 years of age) as the independent variable and SVN as the mediator. SVN was defined as babies born either 1) None: non-preterm and non-SGA, 2) Only preterm: preterm and non-SGA, 3) Only SGA: non-preterm and SGA and 4) Both: preterm and SGA. We used logistic regression to assess maternal age's total effect on neonatal mortality, followed by models including each SVN category (direct effects). Covariates included maternal education, ethnicity, maternal height, interpregnancy interval, antenatal care, child sex, and multiple births. Analyses were stratified by parity (nullipara vs. multipara).
RESULTS
Among nullipara, maternal age showed no significant association with neonatal mortality. Among multipara, babies had a high mortality risk born to women aged >34 compared to those born to women aged 20–24 [Odds ratio (OR)=1.73, 95% CI: 1.17-2.50]. Adding "only preterm" reduced the effect but not significant(OR=1.36, 0.60-3.08), while adding "Only SGA" significantly increased the effect (OR=2.08, 1.27-3.41). Adding "both" reduced the effect but not significant (OR=0.96,0.42–2.23).
CONCLUSIONS
Maternal age >34 in multipara women is associated with higher neonatal mortality, effect amplified by SGA status of the baby, highlighting the influence of maternal nutrition. Interventions improving maternal nutrition could reduce SGA births and neonatal mortality in older multipara women.

UNDERSTANDING AND ENHANCING INDIVIDUAL NUTRITION COUNSELING BY SCHOOL NUTRITION TEACHERS: CURRENT PRACTICES AND CHALLENGES

Hayami Mitsumoto[1]; Naomi Hayami[1]
[1]Graduate School of Human Life and Ecology, Osaka Metropolitan University - Sugimoto Campus, Osaka, Japan

BACKGROUND AND OBJECTIVES
In Japan, the nutrition teacher system plays a central role in promoting school-based nutrition education. One of the key responsibilities of nutrition teachers is to provide individual nutrition counseling. However, there is a need to enhance this counseling to address the diverse health issues faced by students, including overweight, obesity, and underweight. This study aims to examine the current state of individual nutrition counseling provided by nutrition teachers, identify associated challenges, and clarify the factors necessary for the implementation and continuation of such counseling.
METHODS
A self-administered anonymous questionnaire survey was conducted between November and December 2024, targeting nutrition teachers in four prefectures in Japan. A total of 168 nutrition teachers participated in the survey. The questionnaire included items on basic demographic attributes, perceptions of individual counseling, implementation status, and perceived challenges. Descriptive statistics, chi-square tests, and Fisher's exact probability tests were used to analyze differences between groups based on counseling, implementation, and continuation status.
RESULTS
Among the participants, 54 nutrition teachers (32.1%) reported implementing individual counseling, while 114 (67.9%) did not. Within the implementation group, 63.0% indicated their efforts were self-initiated, and 51.9% responded that counseling was conducted upon request from school nurses. Regarding the perceived necessity of counseling among school staff, 96.3% of school nurses, 83.4% of homeroom teachers, and 83.3% of administrators acknowledged its importance. In contrast, within the non-implementation group, a significantly higher proportion expressed interest in learning how to establish a cooperative system within the school to enable counseling ($p=0.032$). Additionally, among those who implemented counseling, 19 (35.2%) reported continuous counseling efforts, while 35 (64.8%) did not. In the continuation group, the initiation of counseling by nutrition teachers themselves was significantly higher ($p=0.017$) compared to the non-continuation group.
CONCLUSIONS
The findings suggest that establishing a support system through collaboration with school staff, particularly school nurses, is critical for the successful implementation of individual nutrition counseling. Furthermore, fostering nutrition teachers' initiatives and enhancing their counseling skills are essential for sustainable efforts. Addressing these factors may contribute to more effective nutrition education and better health outcomes for students.

EPO5_111

NUTRITIONAL, ANTINUTRITIONAL AND SENSORY CHARACTERISTICS OF PUFF-PUFF ENRICHED WITH CIRINA FORDA (WESTWOOD) POWDER

Adebola Adepoju[1]; Oluwaseun Ariyo[1]; Oladejo Adepoju[1]
[1]Human Nutrition and Dietetics, University of Ibadan First Gate, Ibadan, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
Pastry snacking is highly prevalent among young adults in Nigeria. It substantially contributes to their energy intake but is nutrient-poor. Due to budgetary and lifestyle constraints, young adults are nutritionally vulnerable; hence, there is a need to enrich existing snacks. The paucity of research on puff-puff necessitated this study. *Cirina forda* (Westwood) is a nutrient-dense, cheap, indigenous edible insect; therefore, this study was designed to develop and determine the nutrient, antinutrient content, and acceptability of *Cirina forda*-enriched puff-puff.
METHODS
Three samples were prepared (100:0, 95:5 and 90:10 of wheat flour to *Cirina forda* powder) using a standardized recipe. The samples' proximate, minerals, vitamins and antinutrient contents were analyzed using AOAC (2005), flame photometry, atomic absorption spectrophotometry, and spectrophotometric methods, respectively. Sensory evaluation was conducted on a 9-point hedonic scale using 30 semi-trained panelists among undergraduates of University of Ibadan. RESULTS were compared using ANOVA at $p<0.05$.
RESULTS
Samples 90:10 (7.83%) and 95:5 (7.33%) had higher protein content compared to the control (1.93%) ($p<0.05$). The control had the highest fat content (19.25%). Sample 90:10 provided 110mg, 2.19mg, 1.75mg, 22.15µg; sample 95:5 provided 100mg, 2.09mg, 1.65mg, 21.04µg; while sample 100:0 provided 60mg, 1.66mg, 1.34mg, 16.53µg of calcium, iron, zinc and vitamin A, respectively. Antinutrient values were negligible. Sample 100:0 (control) had the highest sensory scores followed by Sample 95:5, while Sample 90:10 scored the lowest.
CONCLUSIONS
Puff-puff enriched with *Cirina forda* at 5% inclusion level produced a nutritious snack accepted by young adults, hence, commercial adoption is recommended for better nutrition outcomes among this population.

INTEGRATING A DIGITAL TECHNOLOGY TO SUPPORT FOOD FORTIFICATION TRACEABILITY: A CASE STUDY OF THE DIGITAL FORTIFICATION QUALITY TRACEABILITY PLUS (DFQT+) PILOT IN NIGERIA, BANGLADESH, AND INDIA

Florencia Vasta[1]; Svenja Jungjohann[2]; Oluwatoyin Oyekenu[3]; Nandinee Chowdhury,[4]; Marie Krottenthaler[5]; Valerie Friesen,[6]
[1]Nutrition, The Global Alliance for Improved Nutrition (GAIN), Washington, United States of America; [2]Knowledge Leadership, GAIN, Genève, Switzerland; [3]Nutrition, GAIN, Abuja, Nigeria, Federal Republic of; [4]Nutrition, GAIN, Dhaka, Bangladesh; [5]Nutrition, GAIN, Utrech, Netherlands; [6]Knowledge Leadership, GAIN, London, United Kingdom

BACKGROUND AND OBJECTIVES
Food fortification is proven to reduce micronutrient deficiencies when high-quality fortified foods are available and consumed by populations. Consistent collection and use of data across the fortification value chain is necessary to monitor if this is achieved. However, challenges to monitoring include limited investment and/or willingness to collect/share data, which create barriers to traceability of quality from inputs to market.
The objective is to describe how the Digital Fortification Quality Traceability Plus (DFQT+) technology (a system that enables traceability of micronutrient/fortified food quality across the value chain) was integrated into edible oil fortification programs in Bangladesh, India, and Nigeria and summarize learnings.
METHODS
We describe the integration process, assess the barriers and facilitators, and summarize the implications for those involved and the programs.
RESULTS
A consortium of partners, including non-governmental organizations, micronutrient suppliers, technology experts, among others, successfully integrated the DFQT+ in each country through an iterative process. Barriers to successful integration included a need for interoperability with existing systems, weak enabling environment, and capacity constraints among development and implementing teams. Facilitators included a mandatory regulatory landscape, cross-country sharing of learnings, an agile approach (e.g., iterative, human-centric), and inclusion of key stakeholders/champions. Consideration of the context and enabling environment was critical for success.
CONCLUSIONS
The DFQT+ technology can effectively trace micronutrient/fortified food quality and provide essential data for monitoring program performance and potential for impact. These learnings can inform further pilot and scale up efforts and integration of the technology in other countries and to more users and food vehicles.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

STAKEHOLDER EXPERIENCES AND PERSPECTIVES ON THE IMPLEMENTATION, PROCESSES, AND IMPACT OF INTEGRATED NUTRITION INTERVENTIONS IN UGANDA: APPLYING THE RE-AIM FRAMEWORK FOR FUTURE PROGRAM DESIGN AND SUSTAINABILITY

Edgar Agaba[1]; Peter, Rukundo[2]; Ole Iversen Per[3]; Xikombiso Mbheneyane[4]
[1]Division of Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa; [2]Department of Nutritional Science and Dietetics, Kyambogo University, Kampala, Uganda; [3]Division of Clinical Nutrition, University of Oslo, Oslo, Norway; [4]Division of Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa

BACKGROUND AND OBJECTIVES
Malnutrition remains a major public health issue in Uganda contributing to high morbidity and mortality. Despite ongoing efforts to address these issues, there is lack of evidence on the experiences, processes, & perspectives of all stakeholders—including implementers and beneficiaries of integrated nutrition interventions. This knowledge gap impedes the understanding of implementation challenges and restricts efforts to improve program design, effectiveness, and sustainability, hindering the successful scaling and impacts.
Objective: To explore experiences of implementers & beneficiaries of Uganda's integrated nutrition program & examine the knowledge, perceptions, perspectives of stakeholders (policy & decision-makers, implementers & beneficiaries) following program implementation.
METHODS
A cross-sectional qualitative design with participatory action research approach was used to examine the experiences and perspectives of stakeholders involved in Uganda's integrated nutrition program-Uganda Community Connector (UCC). Using purposive sampling, 151 beneficiaries and 24 key informants were selected from 6 districts. Ethical approval was obtained from Stellenbosch University (South Africa) & Makerere University's School of Public Health (Uganda). Data were analyzed using Dedoose software to assess five key dimensions: reach, effectiveness, adoption, implementation, and maintenance (RE-AIM framework).
RESULTS
RESULTS show that the UCC effectively targeted high-risk groups (women & <5yrs), leading to improved maternal & child health outcomes & better dietary practices. Households reported adoption of healthier practices for nutrition & health such as WASH, better health seeking behaviors & dietary diversification. Successful implementation was facilitated by integration with local government structures, and stakeholders stressed the importance of continued community and government engagement. However, sustaining these gains was challenging due to financial constraints, shifting national priorities, and gaps in local government funding. Participation in UCC intervention was inconsistent due to cultural, logistical barriers, and time constraints. Youth engagement in agriculture & micro-enterprises was hindered by limited resources and exclusion from decision-making. Other challenges, such as inadequate support for community health workers and environmental shocks affected the UCC's impact.
CONCLUSIONS
While UCC achieved positive impacts, challenges faced in maintaining participation highlights the need for better infrastructure, financial support, and coordination in future initiatives. Continued government involvement are crucial for long-term success.
CONFLICTS OF INTERESTS

THE EFFECT OF PHYSICAL ACTIVITY AND MEDITERRANEAN DIET ADHERENCE ON MENTAL HEALTH IN HEALTH MAINTENANCE: A CROSS-SECTIONAL STUDY

Feride Ayyıldız[1]; Kafa Nihan[2]
[1]Nutrition and Dietetics, Gazi University Faculty of Health Sciences, Ankara, Türkiye; [2]Physiotherapy and Rehabilitation, Gazi University Faculty of Health, Ankara, Türkiye

BACKGROUND AND OBJECTIVES
Lifestyle factors such as adequate and balanced nutrition and regular physical activity contribute positively to the development of both physical and mental health. The goal of this study was to assess how university students' physical activity levels and adherence to the Mediterranean diet relate to their mental health.
METHODS
A total of 187 university students (62.0% F, 38% M) participated in the study. We used the MEDAS to assess adherence to the Mediterranean Diet, the International Physical Activity Questionnaire (IPAQ-SF) to assess physical activity status, and the Warwick-Edinburgh Mental Well-being Scale Short Form (WEMWBS-SF) to assess mental well-being. A total score of 7 and above on the Mediterranean Diet Adherence Scale (MEDAS) indicates acceptable adherence to the Mediterranean diet, and a score of 9 and above indicates strict adherence.
RESULTS
The mean age of the participants was 20.0±1.28 years, while the mean BMI was 21.0±2.83 kg/m² for female and 23.9±2.78 kg/m² for male. In present study, 74.1% of female and 71.8% of male were in the normal body weight class according to BMI. In addition 63.6% of the individuals did not adherence to the Mediterranean Diet. Also, 50.8% of the individuals had a low activity level, and 16.0% had a high activity level. While there was a significant negative correlation between BMI and IPAQ (r:-0.280 $p<0.001$), no significant relationship was found between MEDAS score, WEMWBS-SF score, IPAQ and BMI ($p>0.05$).
CONCLUSIONS
The study found no relationship between the individuals' adherence to the Mediterranean Diet, physical activity levels, and mental well-being. This may be due to the fact that the rate of those who comply with the adherence to the Mediterranean Diet is low and the rate of those with low physical activity level and those with normal BMI is high. Future studies aim to reach more individuals with different BMIs.

SPATIAL ANALYSIS AND MAPPING OF CHILD MALNUTRITION AMONG INDIGENOUS PEOPLE IN MALAYSIA

Mohd Hazrin Hasim[1]; Khairul Nazrin Khalil[2]; Norhafizah Sahril[2]; Chong Chean Tat[3]
[1]Survey Research Center, Institut Kesihatan Umum, Shah Alam, Malaysia; [2]Family Health Research, Institut Kesihatan Umum, Shah Alam, Malaysia; [3]Nutrition Epidemiology Research, Institut Kesihatan Umum, Shah Alam, Malaysia

BACKGROUND AND OBJECTIVES
Child malnutrition remains a pressing health concern among the Orang Asli in Malaysia, exacerbated by disparities in geographical and socioeconomic factors. This study aims to perform spatial analysis and mapping of child malnutrition in urban (Kg. Sg Ruil), fringe (Kg. Kenang), and remote (Kg. Sg Tiang) areas, identifying the patterns and determinants of malnutrition across these settings. Addressing these disparities is critical for designing targeted interventions to improve child health outcomes.
METHODS
This cross-sectional study collected anthropometric data (height-for-age, weight-for-height, and weight-for-age) from Orang Asli children in the three communities. Data on household income, food security, and access to healthcare were obtained through structured surveys. Spatial mapping was conducted using Geographic Information System (GIS) tools to visualize malnutrition prevalence and its association with environmental and infrastructural variables.
RESULTS
RESULTS indicate significant spatial disparities in child malnutrition. In urban Kg Sg Ruil, a rising trend of overweight and obesity was observed (15%), attributed to dietary shifts and reduced physical activity. Fringe Kg Kenang exhibited mixed malnutrition patterns, with 20% undernutrition and 10% overweight, reflecting transitional lifestyles. Remote Kg Sg Tiang showed the highest undernutrition rates (35%), influenced by limited healthcare access and food insecurity.
CONCLUSIONS
This study underscores the importance of spatially targeted interventions to combat child malnutrition among the Orang Asli. Tailored strategies addressing urban dietary shifts, fringe area inequalities, and remote area deprivation are essential. Spatial analysis provides a valuable tool for policymakers to allocate resources effectively and reduce health disparities.

MACRONUTRIENT EVALUATION OF A NOVEL COMPLEMENTARY FOOD TARGETING VULNERABLE INFANTS AND YOUNG CHILDREN IN ZAMBIA DURING THE FIRST 1,000 DAYS OF LIFE: COMPLEMENTARY FOOD FOR AFRICA+DRIED FISH POWDER (COMFA+FISH) INSTANT PORRIDGE

Kathleen Ragsdale[1]; Terezie Tolar-Peterson[2]; Slyvia Banda[3]; Kendra Byrd[4]; Madeline Burdine[1]; Harleen Kaur Maroak[2]; Katie Roman[5]; Samantha Rios,[2]
[1]Social Science Research Center, Mississippi State University, Starkville, United States of America; [2]Health Science and Human Ecology, California State University, San Bernardino, San Bernardino, United States of America; [3]African Women Entrepreneurs Program (AWEP), Sylva Foods Solutions, Lusaka, Zambia; [4]Food and Markets Department, University of Greenwich Natural Resources Institute, Chatham, United Kingdom; [5]College of Agriculture and Life Sciences, Mississippi State University, Starkville, United States of America

BACKGROUND AND OBJECTIVES
Even when consumed in small quantities, dried fish powder (DFP) from small pelagic fish contains nutrients such as iron and zinc in concentrations appropriate for infant feeding, as well as essential fatty acids vital for health. When added to infants and young children's (IYC) complementary foods—such as high carb/low protein maize porridge that is, of necessity, widely consumed on a daily basis by vulnerable IYC across sub-Saharan Africa—DFP can increase the nutrient concentration of the porridge substantially, which can help address the high prevalence of nutrient deficiencies during this vulnerable period of growth.
METHODS
We added 8g of locally sourced DFP to each 50g sachet of ComFA+Fish Instant Porridge to fill macro-/micronutrient gaps among vulnerable IYC. We present data on the porridge's macronutrient composition for IYC ages 6–8 months, 9–11 months, and 12–23 months.
RESULTS
For 6–8 month-olds, they should continue to breastfeed, complementary foods should be provided 2-3 times/day, and the reference weight for this calculation is 7.9–8.9kg. One ComFA+Fish Instant Porridge sachet two times/day provides: 1) 377 kcal (~50% of estimated kcal needs for 6–8 month-olds) [1,2]; 2) 10.8g of protein (~100% of estimated protein needs for 6–8 month-olds) [3-5]; and 3) 1.66g total fat (~5% of estimated fat needs for 6–8 month-olds) [1,3,5]. For 9–11 month-olds, they should continue to breastfeed, complementary foods should be provided 3-4 times/day, and the reference weight for this calculation is 9.3–10kg. One ComFA+Fish Instant Porridge sachet three times/day provides: 1) 565 kcal (~60% of estimated kcal needs for 9–11 month-olds) [1,2]; 2) 16.2g of protein (~134% of estimated protein needs for 9–11 month-olds) [3-5]; and 3) 2.49g total fat (~7.3% of estimated fat needs for 9–11 month-olds) [1,3,5]. For 12–23 month-olds, they should continue to breastfeed, complementary foods should be provided 3-4 times/day, and the reference weight for this calculation is 10.3–13.75kg. Two ComFA+Fish Instant Porridge sachets three times/day provides: 1) 1,131 kcal (~100% of estimated kcal needs for 12–23 month-olds) [1,2]; 2) 32.4g of protein (~270% of estimated protein needs12–23 month-olds) [3-5]; and 3) 4.98g of total fat (~14% of estimated fat needs12–23 month-olds) [1,3,5].
CONCLUSIONS
Based on the RESULTS, we will: 1) adjust the formulation to ensure that recommended serving sizes meet recommended dietary reference intake (DRI) values without compromising acceptability among IYC; 2) conduct Sensory Panels to test the formulation.

FORTIFYING MILK WITH VITAMIN D: A SOLUTION TO IMPROVE NUTRITIONNAL STATUS IN VITAMIN D

Mathilde Guerville[1]; Charlotte Magnant[1]; Emmeline Salameh[1]; Romane Troadec[1]; Amandine Ligneul[1]
[1]Nutrition Department, Lactalis Research & Development, Retiers, France, Retiers, France

BACKGROUND AND OBJECTIVES
Vitamin D has many essential roles in the proper functioning of the body. In its latest opinion published in 2019, the National Agency for Health Safety, Food, Environment and Work (ANSES) triples the nutritional need for vitamin D for the entire population. The objective of this article is to show the interest of vitamin D fortification in milk to improve the vitamin D status of the French population.
METHODS
We analyzed the National Individual Food Consumption Study 3 (INCA3), conducted in 2014-2015 on the French territory to know the nutritional intake of Vitamin D. Then we compared it with the nutritional status in blood thanks to the ESTEBAN study conducted in 2016 in France.
RESULTS
We showed that the dietary intake of vitamin D is significantly lower than the recommendations of ANSES (15 µg/ day) throughout life. This insufficient dietary intake RESULTS in a biological vitamin D status below the plasma deficiency threshold (30 nmol/L). Milk is an everyday food, consumed by most of French people. Numerous studies in the literature show that fortifying milk with vitamin D can be a solution to increase dietary intake of vitamin D and thus compensate for nutritional deficiency.
CONCLUSIONS
In conclusion, the fortification of milk with vitamin D is an effective solution to improve the biological status of vitamin D and thus compensate for a general deficiency in the French population.

SCHOOL-BASED NUTRITION INTERVENTIONS IN PERU: A BIBLIOGRAPHIC REVIEW OF THE LAST 10 YEARS

Tania Arauco-Lozada[1]; Haydee Cárdenas-Quintana[2, 1]; Curi-Quinto Katherine[1, 3]
[1]Doctorado en Nutrición, Universidad Nacional Agraria La Molina, Lima, Peru; [2]Instituto de Seguridad Alimentario Nutricional, Universidad Nacional Agraria La Molina, Lima, Peru; [3]Departamento de Investigación en Nutrición, Instituto de Investigación Nutricional, Lima, Peru

BACKGROUND AND OBJECTIVES
Globally, over the past 30 years, the prevalence of overweight and obesity among children and adolescents aged 5 to 19 years has increased dramatically, from 8% in 1990 to 20% in 2022. In middle-income countries like Peru, which still face challenges with nutritional deficiencies, the increasing rates of overweight and obesity contribute to a double burden of malnutrition, being a significant public health concern. School-based interventions are emerging as a promising approach to address this issue. This review aims to synthesize the current evidence on the effectiveness of school-based nutrition interventions and identify the key factors that enable or hinder their successful implementation within the country.
METHODS
A bibliographic literature search was conducted in PubMed, Scielo, and Google Scholar databases to identify relevant studies published in the last 10 years (2014-2023), written in English or Spanish. The search strategy included terms related to school-based, nutrition, and obesity prevention interventions.
RESULTS
The review identified six studies that met the inclusion criteria. Most studies (5 out of 6) reported positive impacts of the interventions on students' nutritional knowledge, attitudes, and practices. Several studies showed improvements in dietary behaviors, such as increased consumption of fruits and vegetables and decreased ultra-processed foods. However, the sustainability of these behavioral changes over time and their direct impact on students' nutritional status were less consistent across the studies. Furthermore, the varying methodologies and intervention durations across the studies may have influenced the outcomes.
CONCLUSIONS
Nutritional interventions in schools can improve the dietary habits and nutritional knowledge of school students in Peru. However, there is no standardized evidence on their efficacy, methodology, or effectiveness, and the long-term effectiveness of these interventions on nutritional status remains a challenge that requires further research.

ASSOCIATION BETWEEN ULTRA-PROCESSED FOOD CONSUMPTION, DIETARY INFLAMMATORY INDEX, AND OBESITY PARAMETERS: A REVIEW

Luciano Pedro da Silva Junior; Maria Alvim Leite[1]; Euridice Martinez Steele; Renata Bertazzi Levy[1]
[1]Center for Epidemiological Research in Nutrition and Health (NUPENS/USP), School of Public Health of University of São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
Obesity is a chronic low-grade inflammatory disease characterized by prolonged periods of positive energy balance. It is known that dietary patterns rich in ultra-processed foods are associated with weight gain, overweight and obesity. Many mechanisms have been proposed to justify this association, and the role of dietary inflammation, which the dietary inflammatory index can measure, is often discussed. However, the associations between the consumption of ultra-processed foods, dietary inflammatory index, and obesity parameters are not yet clear in the literature. This work aims to carry out a literature review on the association between the consumption of ultra-processed foods, dietary inflammatory index and obesity parameters.
METHODS
This is a narrative literature review conducted between January and May 2024. The keyword “Ultra-processed foods” was combined with the boolean operator “AND” to the outcomes of interest: “Weight Gain”,” Overweight”, “Obesity’, “Adiposity” and “BMI” in the database Pubmed. The same was done for “Ultra-processed foods” with “Dietary Inflammatory Index”. Original studies conducted on humans, which focused on analyzing the association between the consumption of ultra-processed foods and the inflammatory index of the diet were selected, while reviews and studies using animal models were excluded.
RESULTS
Ecological studies demonstrate positive associations between diets rich in ultra-processed foods and higher rates of obesity. Cross-sectional studies have identified that individuals with higher consumption of ultra-processed foods present higher inflammatory scores, as well as a greater prevalence of overweight and obesity. Cohort studies frequently show that greater consumption of ultra-processed foods is associated with increased body weight and adiposity, in addition to higher dietary inflammatory index scores. Overall, dietary inflammation is hypothesized to be a mechanism through which ultra-processed foods contribute to weight gain, but there is a lack of studies specifically testing this hypothesis, such as using mediation analysis.
CONCLUSIONS
Despite the limitations, the findings converge on the idea that ultra-processed foods contribute to a pro-inflammatory dietary pattern and are associated with obesity parameters, however, prospective studies that test the mediating effect of inflammation are needed. These RESULTS highlight the importance of public policies aimed at reducing the consumption of ultra-processed foods.

THE PATHWAYS BETWEEN MOTHERS' EXPOSURE TO DOMESTIC VIOLENCE AND CHILD GROWTH: A CAPABILITY APPROACH TO CLIMATE-VULNERABLE HAOR AREAS OF BANGLADESH

Barnali Chakraborty[1]; Darak Shrinivas[2]; Hinke Haisma[3]
[1]Department of Public Health, North South University, Bashundhara 1229, Dhaka, Bangladesh; [2]Health Group, Prayas Amrita Clinic, Pune, Maharashtra 411 004, India; [3]Population Research Centre, University of groningen Landleven 1, 9747 AD, Groningen, Netherlands

BACKGROUND AND OBJECTIVES
Healthy child growth outcomes are determined by the parental/caregiver's capabilities to provide good care to the children to grow well, built on Amartya Sen's concept of the capability approach. Evidence shows that mothers who are deprived of the capability to stay away from violence are deprived of the capability to provide good care to children. We intend to analyse how mothers' capabilities to stay away from domestic violence may shape the multidimensional child growth outcomes in climate-vulnerable haor areas of Bangladesh.
METHODS
A qualitative study using a participatory approach was conducted in three sub-districts from Sunamganj, Habiganj and Kishorganj districts that are dominated by haor (low-lying areas) and subject to long term flood. Parents having children under two years old participated in the study. Specific interview guides shaped the interviews and focus group discussions in the first round (from Dec 2016 and January 2017), whereas visual tools were used to facilitate the discussions in the second round (February 2019). Eight IDIs and 25 focus group discussions were conducted with fathers and mothers. Inductive codes were generated and matched with the constitutive elements of the capability approach to extract the findings.
RESULTS
The participants highlighted that a mother's capability to stay away from violence affects her capability to provide good care to the child and compromises healthy child growth. Deprivation of this capability depresses her motivation to feed and take care of herself and her child. It affects her capability of being healthy and nourished and her capability of expressing love and affection to the child. A range of factors lead to domestic clashes, including long-term floods and unpredicted seasonal calamities and subsequent agricultural loss and financial insufficiency, lack of education leading to a large number of children, and high temper of the husband or couples, men's addiction to wine, cannabis, and extramarital affairs, women's lack of access to financial resources and social acceptance of yelling or beating on wives .
CONCLUSIONS
The findings shed light on the pathways between violence, love and care, nutrition and child growth outcomes using the notion of human capabilities. The contextual insights can be incorporated into the existing nutrition-sensitive intervention programmes to address the social challenges for achieving healthy child growth outcomes in haor.

BEYOND HEALTH: SCOPING REVIEW OF THE WIDER IMPACT AND INFLUENCE OF ULTRA-PROCESSED FOODS IN FOOD SYSTEMS

Karen Ullian[1, 2]; Antonieta Medina-Lara[2]; Steven Cummins,[1]; Laura Cornelsen,[1]
[1]Department of Public Health, Environments and Society, Faculty of Public Health and Policy, London School of Hygiene & Tropical Medicine, London, United Kingdom; [2]Public Health Economics Group, Public Health and Sport Sciences, University of Exeter, Exeter, United Kingdom

BACKGROUND AND OBJECTIVES
Most research on Ultra-Processed Foods (UPF) directly focuses on health outcomes associated with consumption of UPF, with less emphasis on its wider role in the economy and the environment, as well as its impacts on food systems. This scoping review aims to synthesize the current literature and to identify evidence gaps beyond direct health impacts.
METHODS
Comprehensive searches across PubMed, Scopus, and Web of Science was conducted in January 2025 to assess the existing evidence on UPFs. Only reviews conducted in a systematic way and assessing UPF beyond health or diet outcomes, were included. No restrictions were applied to date of publication or language. Included reviews were organised by themes and synthesised in a narrative summary.
RESULTS
Of the 256 reviews identified on UPFs, only eleven were focused on non-health aspects. All reviews were recent (2020-2024), written in English, and most were from Australia. Funding was reported in all reviews and was of low risk of bias. These reviews focused on four broad themes. Theme 1 'Policy, governance, and systemic drivers of UPF consumption' (n = 5), presented the power of UPF corporations to influence research and prevent, delay, dilute or modify policymaking. Theme 2 'Corporate influence and market practices' (n = 4), demonstrated the macroeconomic incentives towards continued increase in sales of UPFs. Theme 3 'Environmental impact' (n = 1), investigated the pollution involved in the life cycle of UPFs. Theme 4 'Methodological quality of UPF research' (n = 1), stated methodological issues on systematic reviews with meta-analysis on UPF. Identified gaps related to solutions on how to manage the power and influence of UPF corporations (Theme 1), and on how to tackle the rules of the system towards incentives for healthier food production (Theme 2), as well as the need of further research about the environmental impact of UPF (Theme 3). No further gaps were identified regarding Theme 4.
CONCLUSIONS
There is a need for future research to address knowledge gaps relating to the impact of UPFs in relation to their environmental impact, and how to best develop policies and governance systems to regulate UPFs.

TRENDS IN NUTRIENT CONSUMPTION AMONG UNDERNOURISHED WOMEN OF REPRODUCTIVE AGE IN AN URBAN SLUM OF A LOW- AND MIDDLE-INCOME COUNTRY (LMIC): COMPARATIVE ANALYSIS BETWEEN 2017 AND 2024

Md. Shabab Hossain[1]; Ar-Rafi Khan,[1]; Mustafa Mahfuz[1]; Tahmeed Ahmed[1]
[1]Nutrition Research Division, International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B), Dhaka, Bangladesh

BACKGROUND AND OBJECTIVES
Dietary intake patterns of children and women of reproductive age residing in urban slums have been influenced by several factors between 2017 and 2024, such as rising food prices, economic disparities, geopolitical issues, and the lingering effects of the COVID-19 pandemic. These factors have led to shifts in the nutrient consumption patterns, with many households turning to processed foods that do not meet nutritional needs. This study aimed to compare the data on nutrient consumption between 2017 and 2024 for age- and nutritional status-matched non-pregnant women of reproductive age residing in an urban slum.
METHODS
The 2017 data was collected from a completed study of undernourished (body mass index, BMI < 18.5 kg/m²) non-pregnant women of reproductive age (18-35 years) residing in a major urban slum of the country. In 2024, similar data was collected from women of the same age and nutritional status from an ongoing study living in the same slum. Nutrient consumption was recorded using 24-hour dietary recall, with reference values derived from Dietary Reference Intake (DRI) guidelines as outlined by the National Institutes of Health (NIH).
RESULTS
Dietary consumption of 101 women (43 from 2017, 58 from 2024) showed significant reductions in various nutritional parameters. Socio-demographic parameters showed no major differences, except for a significant drop in median family income, from USD 181 in 2017 to USD 125 in 2024 ($p<0.05$). Total energy, protein (including first class protein), fat, and carbohydrate intake significantly decreased from 2017 to 2024 ($p<0.05$). In 2024, only 29% of women consumed adequate total energy and 55% consumed adequate protein, compared to 55% and 88% in 2017, respectively ($p<0.05$). In 2024, average intake of calcium and iron was only 24% and 57% of the recommended daily allowances (RDAs), respectively; and intake of vitamins B2, B12, C, E, and folate was only 46%, 21%, 43%, 14%, and 22% of their respective RDAs. The consumption of each of these micronutrients, again, showed a significant decline compared to 2017 ($p<0.05$).
CONCLUSIONS
The study suggests that nutrient consumption among women in the urban slum significantly decreased between 2017 and 2024, likely due to economic pressures, food insecurity, and shifts toward processed foods. Further studies are recommended for investigating and addressing this issue and improve dietary habits in such populations.

ENHANCING BREASTFEEDING PRACTICES OF PREGNANT WOMEN THROUGH COMMUNITY-BASED DRAMA IN SELECTED RURAL COMMUNITIES

Yetunde Omotola Ogundairo[1]; Oladejo Adepoju[1]; Adesola .O. Olumide[2]
[1]Human Nutrition and Dietetics, UNIVERSITY OF IBADAN, IBADAN, Nigeria, Federal Republic of; [2]Institute of Child Health, University College Hospital and University of Ibadan, Ibadan, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
While the use of drama for educational and entertainment purposes are well-established, its application in scientific research is still emerging. This study, therefore, investigates the impact of community-based drama on breastfeeding knowledge and practices of pregnant women in selected rural communities in Ibadan, Oyo State, Nigeria.
METHODS
The study employed a quasi-experimental design. 200 second trimester pregnant women were randomly selected from 10 communities and assigned into experimental (100) and control (100) groups. Data on socio-demographics, breastfeeding knowledge and practices were obtained using Computer Aided Personal Interview at baseline and endline. The intervention group received a four-episode drama while the control group received health talk for a period of two-weeks each. Descriptive and inferential statistics were used to analyse obtained data at 5% level of significant.
RESULTS
Mean age were 27.3±6.0 and 28.3±6.7 for intervention and control groups respectively. Breastfeeding knowledge mean score increased from (13.62 ±4.45) at baseline to (17.97±2.29) at endline for intervention and from 13.96±4.20 at baseline to 16.71±2.33 at endline for control group. A slight increase occurred in breastfeeding practices from 6.07±1.20 at one month to 6.14±1.09 at three months for the intervention group and from 5.62 ±1.35 to 5.62±1.33 for the control group. A statistically significant relationship occurred between breastfeeding knowledge and breastfeeding practice mean score at one and six months. Age, parity and income were identified as strong predictors for breastfeeding knowledge and practices.
CONCLUSIONS
Community-based drama significantly improved breastfeeding knowledge and practices of rural women, hence highlighting its potential as an effective intervention.

FOOD FORTIFICATION STRATEGIES IN THE FIGHT AGAINST CHILD MALNUTRITION: SYSTEMATIC REVIEW

Fernande HONFO[1]; Sorotori Hervé Nahini[2]
[1]Département de Nutrition et des Sciences et Technologies Alimentaires, Université d'Abomey-Calavi, Cotonou, Benin; [2]Département de Nutrition et des Sciences et Technologies Alimentaires, Université d'Abomey-Calavi (UAC - Entrée principale), Abomey Calavi, Benin

BACKGROUND AND OBJECTIVES
Child malnutrition is one of the main causes of morbidity and mortality among infants and children in Africa. To prevent malnutrition or reduce its consequences, several strategies are implemented. The present study carried out a systematic review of food fortification strategies in the fight against child malnutrition.
METHODS
Preferred Reporting Items for Systematic reviews and Meta-Analyses (PRISMA) method with the main search keyword “food fortification in Africa” was used to select 8 articles out of the 574 initially considered. The target groups were children aged 0-5 years.
RESULTS
In some studies, children's weight and height respectively increased from 7.8 to 12.4 kg and from 71.1 to 85.5 cm for the intervention group, and from 7.8 to 11.5 kg and from 71.8 to 83.6 cm for the control group after 6 months of intervention. In other studies, the prevalence of good nutritional status rose from 0 to 45.16% for the treatment group and from 0 to 18.75% for the control group; that of the prevalence of moderate acute malnutrition from 32.26 to 6.45% for the treatment group and from 34.38 to 31.25% for the control group; and that of the risk of moderate acute malnutrition from 0 to 4.16% for the treatment group and from 0 to 18.75% for the control group. control group, and the risk of malnutrition from 67.74 to 48.39% for the treatment group treatment group and from 65.62 to 31.25% for the control group.
CONCLUSIONS
Analysis showed a better improvement in children's nutritional status when supplementation and fortification.

EVALUATION OF THE CONTRIBUTION OF THE NATIONAL INTEGRATED SCHOOL FEEDING PROGRAM TO THE RESILIENCE OF SCHOOL COMMUNITIES

Fernande HONFO[1]; Létondé Japhet Dadegnon[1]
[1]Département de Nutrition et des Sciences et Technologies Alimentaires, Université d'Abomey-Calavi, Cotonou, Benin

BACKGROUND AND OBJECTIVES
The National Integrated School Feeding Program (PNASI) is implemented to promote the retention of children in school and improve the learning capacities of schoolchildren. This program also provides for capacity building and the implementation of multisectoral activities for the benefit of local actors. This study conducted in the town of Zè (Atlantic department) focused on the contribution of the PNASI to the resilience of school communities.
METHODS
Three Hundred (300) randomly selected households were surveyed using a mixed quantitative and qualitative approach in 9 school communities, 6 of which benefited from PNASI activities. The information collected during the individual interviews with the households made it possible, on the one hand, to identify the main activities of the PNASI from which the school communities benefited and, on the other hand, to evaluate the effects of these activities on food diversity and the economic vulnerability of school communities.
RESULTS
The RESULTS showed that the school canteen and nutrition education activities are those from which the school communities were able to benefit. In addition, non-PNASI school communities have an average Food Diversity Score (6.30) significantly higher than that of PNASI school communities (5.72; p=0.001) but have an average share of food expenditure (59.10%) higher than that of the PNASI school communities (57.51%), but without significant differences (p=0.3094).
CONCLUSIONS
It appears that apart from school meals for schoolchildren, the PNASI has no significant effects on households in school communities. The increase in complementary activities of the PNASI towards the communities could lead to a real impact on the latter.

ASSOCIATION BETWEEN SEX HORMONES AND BREAST COMPOSITION DURING AND AFTER PUBERTY

Ana Mariel López Fernández[1]; Maria Luisa Garmendia[2]; Marcela Jacard,[3]; Veronica Mericq[4]; Ana Pereira[2]
[1]Nutritionist, Instituto de Nutrición y Tecnología de los Alimentos de la Universidad de Chile, Macul, Chile; [2]CIAPEC, Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile; [3]Digital Hospital, Ministry of Health, Santiago, Chile; [4]Institute of Maternal and Child Research, University of Chile., University of Chile, Santiago, Chile

BACKGROUND AND OBJECTIVES
The association between sex hormones and breast density remains unclear, particularly during adolescence when hormonal fluctuations are pronounced. Previous research in young women has linked premenarcheal sex hormone-binding globulin (SHBG) and progesterone to higher percent fibroglandular volume (%FGV). Objective: to evaluate the relationship between sex hormones during and after puberty and breast composition (%FGV and AFGV).
METHODS
This study included 490 participants from a longitudinal cohort of 602 low-income Chilean girls born in 2002-2003. Anthropometric data, breast composition (BC) via dual-energy X-ray absorptiometry (DXA), and fasting blood samples for sex hormones (estradiol, testosterone, androstenedione, progesterone, dehydroepiandrosterone sulfate [DHEAS]) were collected at Tanner stage 4, 2 years post-menarche, and 4 years post-menarche. BC measures (%FGV and AFGV) were calculated using a two-compartment model of adipose and fibroglandular tissue (UCSF-developed software). Associations between hormones and BC were assessed using linear and mixed-effects regression models, adjusted for birth weight, maternal education, BMI z-score, and age at menarche.
RESULTS
At Tanner stage 4 (mean age 11.3 years), 53.3% of participants were overweight. At this stage, androstenedione, testosterone, and estrogens were positively associated with %FGV but not AFGV. Two years post-menarche, no significant associations were observed. By 4 years post-menarche, progesterone was positively associated with %FGV. Mixed-effects models across all periods showed positive associations between testosterone, androstenedione, progesterone, and DHEAS with BC in crude and adjusted models (Table 1). Table 1: Association between sex hormones and Breast Composition during and after puberty.

	%FGV				AFGV			
	Crude		Adjusted*		Crude		Adjusted*	
	B	95%CI	B	95%CI	B	95%CI	B	95%CI
Estradiol(pg/mL)	0.003	-0.02-0.02	-0.00	-0.02-0.01	-0.24	-0.35-(-0.13)	-0.24	-0.35-(-0.12)
Androstenedione(ng/mL)	3.79	2.31-5.28	3.09	1.80-4.37	46.07	34.94-57.20	43.83	32.68-54.98
Testosterone (ng/mL)	17.72	10.75-24.68	13.53	7.63-19.42	152.87	101.51-204.23	147.36	96.17-198.55
DHEAS (ng/mL)	0.002	0.00-0.00	0.00	0.00-0.00	0.04	0.03-0.04	0.04	0.03-0.04
Progesterone (ng/mL)	4.33	2.53-6.13	2.69	1.12-4.25	35.166	21.44-48.89	36.50	22.70-50.30

CONCLUSIONS
Our findings confirm positive associations between progesterone and androgenic hormones with %FGV and, to a lesser extent, AFGV, particularly during puberty and adolescence.

INVESTIGATING HMO-LIKE DIBLOCK MOLECULES AND THEIR IMPACT ON INTESTINAL BARRIER FUNCTION USING IN VITRO MODELS

Sonia Kassai[1]; Paul De Vos[1]
[1]Pathology and Medical Biology, University Medical Center Groningen, Groningen, Netherlands

BACKGROUND AND OBJECTIVES
The intestinal barrier is critical for gut health and preventing pathogen translocation, particularly in infants, whose immature gut barrier makes them more susceptible to infections and inflammation. Human milk oligosaccharides (HMOs), found naturally only in human breast milk, support gut health and barrier integrity, potentially offering protection against these vulnerabilities. Due to the difficulty and cost of synthesizing HMOs, HMO-like molecules could offer a promising alternative for infant formula supplementation for infants who are not breastfed. This study investigates the protective effects of HMOs and HMO-like diblock molecules on intestinal barrier function using various in vitro models.
METHODS
T84 intestinal epithelial cells were cultured on 96-well ECIS plates to confluency and pretreated with HMOs or HMO-like diblock molecules for 24 hours. Cells were then exposed to disruptors for another 24 hours. Barrier integrity was assessed via trans-epithelial electrical resistance (TEER) using the ECIS system. Post-treatment, cells were collected for PCR analysis of tight junction protein expression. Additionally, the molecules are being tested in LS174T goblet cells to observe effects on the mucosal barrier.
RESULTS
Preliminary RESULTS show that diblock molecules significantly preserved barrier integrity in cells treated with the disruptor A23187, as indicated by increased TEER. This TEER effect was not observed with Tunicamycin, which primarily affected tight junction gene expression. Diblock molecules altered the expression of occludin, claudin-2, and claudin-3. Experiments using LS174T cells are still in progress but will yield further gene expression data.
CONCLUSIONS
HMOs and HMO-like diblock molecules demonstrate potential protective effects against intestinal barrier disruption, possibly by modulating tight junction protein expression. These findings suggest the potential use of diblock molecules as functional ingredients with gut-protective benefits with prospective applications in infant nutrition.

CONTEXT-SPECIFIC FOOD-BASED RECOMMENDATIONS TO IMPROVE DIETS OF SCHOOL-AGED CHILDREN IN TWO PROVINCES WITH A HIGH BURDEN OF MICRONUTRIENT INADEQUACY IN THE PHILIPPINES

Ya-Fan Holly Chung[1]; Glaiza Calayo-Garvilles[2]; Dolly Reario[2]; Rolf Klemm[3]; Apple Joy Ducay[4]; Eva Goyena[4]; Amanda Palmer[1]

[1]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America; [2]Research, Helen Keller International, Philippines, Manila, Philippines; [3]Nutrition, Helen Keller Int, New United States of America; [4]Department of Science and Technology, Food and Nutrition Research Institute, General Santos Avenue, Taguig, Metro Manila, Philippines, Manila, Philippines

BACKGROUND AND OBJECTIVES

Suboptimal diets are a major contributor to the global disease burden and can contribute to malnutrition in all forms. In the Philippines, school-aged children are at high risk of inadequate dietary intake and poor nutritional status. This study aims to identify problem nutrients in the diets of school-aged children and develop food-based recommendations (FBRs) that would meet Recommended Nutrient Intake (RNI) levels for selected nutrients and daily energy requirements using locally available foods.

METHODS

A cross-sectional nutrition assessment was conducted in 2022 among children aged 5-10 years (n=342) at 22 schools in two Philippine provinces. Dietary data were collected using 24-hour dietary recalls. Optifood software was used for a linear programming analysis to identify problem nutrients and formulate FBRs. Problem nutrients were defined as those for which optimized diets were not able to provide 100% of the RNI. FBRs were evaluated based on achieving 65% RNI in the greatest number of assessed nutrients while not exceeding the upper limit for each nutrient.

RESULTS

Calcium was identified as a problem nutrient for children aged 7-10 years, while no problem nutrients were identified for children aged 5-6 years. Anchovies, milk, and chicken liver were nutrient-dense foods available in the local context that could fill the nutrient gaps. The selected FBRs for younger children provided ≥100% of the RNI for protein, vitamin A, thiamin, riboflavin, vitamin C, and iron. It provided 78% and 76% of the RNI for niacin and calcium, respectively. Another set of selected FBRs offered older children ≥100% of the RNI for protein, riboflavin, niacin, and iron. It supported 75%, 90%, 96%, and 93% of the RNI for calcium, vitamin C, thiamin, and vitamin A, respectively.

CONCLUSIONS

Developing FBRs that meet dietary adequacy for all the assessed nutrients was more challenging for children aged 7-10 years than for children aged 5-6 years. Context- and age-specific FBRs could help ensure adequate nutrient intakes among schoolchildren. However, further formative research to examine the feasibility and cost analysis is needed before implementation, such as in the context of school-based feeding programs (SBFPs).

BREAKING STEREOTYPES IN FOOD AND ACTIVITIES: UNDERSTANDING LINGUISTIC AND COGNITIVE MECHANISMS IN GENDERED CHOICES

Adoración Guzmán-García[1, 2]; Jérémie Lafraire[1, 2]
[1]EPHE - PSL, École Pratique des Hautes Études - Paris Sciences Lettres, Laboratoire CHArt, Cognitions Humaine et Artificielle, Campus Condorcet, Aubervilliers, France; [2]Research Center, Institut Lyfe, Écully, France

BACKGROUND AND OBJECTIVES
Gender stereotypes impact food preferences: meat is associated with masculinity, and vegetables with femininity (Stanley, Day, & Brown, 2023) These unconscious associations contribute to gender-based dietary patterns (CRÉDOC, 2019), which exacerbate public health challenges, such as widespread iron deficiency among women (70%; WHO, 2004). This study examined two mechanisms perpetuating such stereotypes: the inherence heuristic—a mental shortcut that explains regularities through intrinsic properties (e.g., “Women wear pink because pink is delicate”; Cimpian and Salomon, 2014) — and generics — expressions of generalizations (e.g., “Lions have manes”) with normative force (Berio & Musholt, 2023). Understanding these mechanisms is critical for designing interventions that challenge food stereotypes and encourage balanced diets.
METHODS
We examined gender stereotypes in activities (e.g., sewing; Liben et al., 2002) and food preferences (e.g., men-meat, women-vegetables) using a 3 (genericity: generics vs. "most" vs. "some"; between-subject) x 2 (concordance: stereotypes – e.g. “Women sew” – vs. counter-stereotypes – e.g. “Men sew”; within-subject) design. 242 French participants aged 18–35 provided stereotype endorsement ratings (1–7), with justifications coded for inherent reasoning. Mixed-effects linear regressions analyzed endorsement scores.
RESULTS
Stereotypes received significantly higher endorsement than counter-stereotypes for activities, particularly when justified with inherent properties. Generic statements elicited more inherent justifications than "most" statements. These findings demonstrate that generics and the inherence heuristic influence common activities stereotype endorsement, since they increase overgeneralizations of internal characteristics, often perceived as unchangeable. However, food-related stereotypes showed a ceiling effect on endorsement (e.g., "It is normal that men/women eat meat"), limiting observable differences and likely stemming from the repetitive and survival-driven nature of eating.
CONCLUSIONS
Our findings highlight the role of inherent justifications and generalizing language in reinforcing gender stereotypes for activities but underscore challenges in capturing similar effects for food choices. The methodology for a follow-up study to address these limitations will be discussed, to inform educational initiatives and public health strategies and interventions to reduce gendered food stereotypes and promote balanced diets (e.g. Markman and Bian's, 2020, successful American breakfast interventions).

EFFICACY OF ZINC BIOFORTIFIED STAPLES IN IMPROVING BIOMARKERS OF ZINC STATUS: A SYSTEMATIC REVIEW

Prasenjit Mondal[1, 2]; Satyajit Kundu,[1]; Hai N. Phung,[1]; Sabuktagin Rahman,[3]; Malay Kanti Mridha,[2]; Faruk Ahmed[1]

[1]Department of Public Health, Griffith University, Gold Coast Campus, Southport, Australia; [2]BRAC James P Grant School of Public Health, BRAC University, Dhaka, Bangladesh; [3]Faculty of Arts and Sciences, American International University - Bangladesh (AIUB), Dhaka, Bangladesh

BACKGROUND AND OBJECTIVES

Zinc biofortified staple crops (ZBSC) are low-cost and sustainable solutions to zinc deficiency (ZD) in low- and middle-income countries (LMICs). Several ZBSCs have been developed and released around the world and their efficacy in improving different biomarkers of zinc status has been assessed. Since these studies have reported inconsistent RESULTS, the present study is being conducted with the objective of assessing the efficacy of ZBSCs in improving zinc status through a systematic exploration of literature.

METHODS

Literature search was done in five electronic databases, SCOPUS, Medline, CINAHL, Embase, and Web of Science for randomized controlled trials (RCTs) reporting the efficacy of ZBSCs, such as rice, wheat, maize, pearl millet etc. in improving zinc status reported as any of plasma or serum zinc concentration (PZC/SZC), proportion of ZD, stunting/linear growth, immune function markers, immune status, history of morbidity, zinc intake, or other putative markers such as zinc-dependent enzyme activity, hair/nail zinc content etc. After title and abstract screening, full-text review was conducted, and data was extracted from the included articles.

RESULTS

A total of 1625 articles were initially identified from five databases, out of which seven studies were included in the analysis. Only one study out of six reported a positive change in PZC between intervention and control arms, but only in the midpoint [mean (SD) of difference 41.5 (109.7); p=0.02] which was abolished at the endpoint[p=0.45]. Among two studies that measured morbidity, one study reported improvement in selected morbidities among children and women in the intervention arm while the other found higher morbidities in children receiving ZBSC. No impact on anthropometry was observed in any included study. Putative markers such as enzyme activity for essential fatty acid metabolism (fatty acid desaturases and elongases) and DNA strand break did not show any statistically significant difference. However, there were significant improvements in the hair zinc count in the intervention arm between baseline and endline [mean (SEM) 50 (1.3) vs 59 (1.5), p<0.001], which was not observed in the control arm [mean (SEM) 51(1.9) vs 54 (1.9), p=0.07]. This paper also discussed several methodological or analytical limitations in the included studies.

CONCLUSIONS

PZC, the most reliable biomarker of zinc status at the population level, remains largely unaffected by the consumption of ZBSCs. Future studies addressing various limitations are required to determine the efficacy of ZBSCs in improving zinc status.

URINE SWEETENERS AND SUGARS IN RELATION TO CHILDHOOD OBESITY: THE DUTCH LIFELINES COHORT STUDY

Xinyi Cai[1]; Elske Brouwer-Brolsma[1]; Michiel Balvers,[1]; Edith Feskens[1]
[1]Human Nutrition and Health, Wageningen University and Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES
The roles of low- and no-calorie sweeteners (LNCS) and sugars in childhood obesity remain debated, partly due to limitations in self-reported dietary assessments. This study, part of the EU Horizon 2020 SWEET project, employed a newly developed laboratory method to examine associations of urinary LNCS and sugar excretion with obesity prevalence in Dutch children.
METHODS
This cross-sectional study included a random sample of 500 children aged 8-17 years from the Lifelines cohort. Urinary LNCS and sugars were measured from timed overnight urine using UPLC-MS/MS and summed for total concentrations. Body mass index (BMI) z-score and waist-to-height ratio (WHtR) z-score were derived from anthropometric measurements. Linear regression models assessed associations of urinary LNCS and sugars (expressed as mg/ml or log-transformed urinary biomarker-to-creatinine ratio [UBCR]) with obesity outcomes, adjusting for age, sex, screen time hours, and fruit and vegetable consumption frequency.
RESULTS
Among participants, 50% were female, 46% were aged 8-12 years, with a mean BMI z-score of 0.10 (SD: 1.0) and a mean WHtR z-score of 0.16 (SD: 1.0). Urinary saccharin was independently associated with BMI z-score (βmg/ml: 51.59 [95% CI: 7.96, 95.21]), and urinary sucralose with both BMI z-score (βmg/ml: 291.29 [95% CI: 98.01, 484.58]) and WHtR z-score (βmg/ml: 238.75 [95% CI: 44.53, 432.98]). Total urinary sugar (βLog-UBCR: -0.24 [95% CI: -0.37, -0.11]), fructose (βLog-UBCR: -0.15 [95% CI: -0.24, -0.061]), and glucose (βLog-UBCR: -0.29 [95% CI: -0.50, -0.083]) were inversely associated with BMI z-score. Inverse associations with WHtR z-score were also observed for total urinary sugar (βLog-UBCR: -0.18 [95% CI: -0.31, -0.041]), fructose (βLog-UBCR: -0.11 [95% CI: -0.21, -0.022]) and glucose (βmg/ml: -1.59 [95% CI: -3.15, -0.023]). No associations were found for total urinary LNCS, acesulfame, cyclamate, steviol, or sucrose with any outcomes.
CONCLUSIONS
Children with higher BMI z-score or WHtR z-score had higher urinary saccharin and sucralose concentrations but lower total urinary sugar, glucose, and fructose concentrations. These findings likely reflect differences in food and beverage consumption patterns among children and emphasize the value of biomarkers for more objective dietary assessment.

UNDERSTANDING FOOD CHOICES IMPACT ON NUTRITIONAL STATUS IN BREEDE VALLEY MUNICIPALITY, SOUTH AFRICA

Vhushavhelo Nedzingahe[1]; Xikombiso Mbhenyane[2]; Mthokozisi Kwazi Zuma[3]
[1]Division of Human Nutrition, Department of Global Health,Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa; [2]Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch university,, Cape Town, South Africa, South Africa; [3]Research, Agricultural Research Council , Pretoria, South Africa

BACKGROUND AND OBJECTIVES

Background

The consumption of unhealthy foods including excessive intake of ultra-processed foods are of public health concern and has grown globally in recent decades and rapidly in low-middle-income countries (Reardon et al., 2021). Consequently, it is linked to broader changes in the globalised food systems, resulting in an increase in non-communicable diseases (Waage et al., 2022). The study investigated the impact of food choices on nutritional status in Breede Valley district, South Africa.

Objectives

To determine the socio-demographic profile of households, food choices and assess the health risk.

METHODS

A descriptive cross-sectional study with a quantitative approach. Three-hundred and sixty-five households were systematically selected.

RESULTS

Over half of the participants were aged 36-55 years. Over a third of the households earned 1 000 to 3 000 ZAR. Dietary diversity revealed that staple foods were available in most households (88.8%), and in more than half of households, vegetables, meat and milk products and processed foods were available. Spices, condiments, beverages, cereals and other vegetables were the three most consumed food groups. Most households had a medium score of 8 to 11 food groups were 44.1%. The most common factor reported to influence food choices was food prices. More than half were obese ($\bar{x}$ = 35.15 kg/m2). The mean blood glucose was 6.34 ± 2.95 mmol/L and blood cholesterol was 5.39 ± 4.23 mmol/L. Monthly household income (r = 0.187, p = 0.002) was positively correlated with dietary diversity.

CONCLUSIONS

It is evident that financial considerations drive food choices. Consequently, making consumers to purchase foods that are cheaper and mostly non-nutritive.

CONFLICTS OF INTERESTS

RELATIONSHIP BETWEEN PROTEIN AND AMINO ACID INTAKE AND MORTALITY RISK IN KOREAN ADULTS

Sumin Kim[1]; Hyunji Ham[1]; Kyungho Ha[1]
[1]Food science and Nutrition, Jeju National University, Ara Campus, jeju, Korea, Republic of

BACKGROUND AND OBJECTIVES
Recent studies have reported that protein quality, including food sources and amino acid (AA) composition, as well as protein quantity is associated with longevity and metabolic health. However, evidence regarding the relationship between protein, AA intake and mortality risk remains inconsistent. Thus, this study aimed to investigate the association between protein and AA intake and mortality risk among Korean adults.
METHODS
Based on 2007–2015 Korea National Health and Nutrition Examination Survey data linked with the Cause of Death data, 37,391 participants aged ≥30 years were included. Protein and AA intake was estimated using a 1-day 24-hour dietary recall linked with an expanded AA database. Associations between quintiles of protein and AA intake and mortality from all-causes, cardiovascular diseases (CVD), and cancer were analyzed using a Cox proportional hazard regression analysis and expressed as hazard ratios (HRs) and 95% confidence intervals (CIs) for mortality.
RESULTS
During a mean follow-up of 8.1 years, 1,921 deaths occurred. After adjusting for confounders, the participants in the highest quintile of plant protein (PP) intake had a lower risk of all-cause mortality compared to those in the lowest quintile (HR 0.96, 95% Cl 0.89-0.99, Ptrend = 0.027). Total protein intake was inversely associated with all-cause mortality in men (HRQ5 vs. Q1 0.93, 95% CI 0.87-0.99, Ptrend = 0.264). These inverse associations remained significant after additional adjustment of fat intake. After adjusting for confounders including fat intake, men in the highest quintile of essential and non-essential AA intakes had a lower risk of CVD mortality compared to those in the lowest quintiles (essential HR 0.56, 95% CI 0.32-0.97, Ptrend = 0.073, non-essential HR 0.55, 95% CI 0.33-0.93, Ptrend = 0.011). There was no significant association between cancer mortality and protein and AA intake.
CONCLUSIONS
Higher PP and AA intakes were associated with reduced risk of all-cause and CVD mortality in Korean adults. Further studies are needed to elucidate the role of dietary protein and AAs in longevity are required.
CONFLICTS OF INTERESTS

THE INTERACTION BETWEEN CIRCADIAN TYPES AND ULTRA-PROCESSED FOOD (UPF) CONSUMPTION ON THE TYG (TRIGLYCERIDE-GLUCOSE) INDEX: A NEW PERSPECTIVE ON METABOLIC DISEASE PREVENTION

Sarang Jeong[1]; Eunjin Jang[2]; Sukyoung Jung[3]; Kim Jinhyun[2]; Minjeong Jeong[2]; Dahye Han[2]; Sohyun Park[2]
[1]Clinical Nutrition and Epidemiology, The Korean Institute of Nutrition, Chuncheon-si, Korea, Republic of; [2]Food and Nutrition, The Korean Institute of Nutrition, Chuncheon-si, Korea, Republic of; [3]Health Care Policy Research, Korea Institute for Health and Social Affairs, Sejong-si, Korea, Republic of

BACKGROUND AND OBJECTIVES
Circadian types, classified as morning-type, intermediate-type, and evening-type, reflect variations in activity and physiological functions. While Ultra-Processed Food (UPF) consumption and circadian types are linked to metabolic diseases, their interaction with the triglyceride-glucose (TyG) index in Koreans remains understudied. This study explored the interaction between circadian types and UPF consumption with the TyG index.
METHODS
Data from 542 adults aged 20–69 years in the Gangwon Obesity and Metabolic Syndrome Cohort were analyzed. Circadian types were classified using rank-based clustering of Horne-Östberg questionnaire scores. Dietary data from a food frequency questionnaire were categorized using the NOVA classification. The TyG index was calculated as Ln [fasting glucose (mg/dL) × fasting triglycerides (mg/dL) / 2]. General linear models analyzed interactions, adjusting for age, sex, body mass index, education, smoking, physical activity, energy intake, dyslipidemia, and hypertension.
RESULTS
The morning-type group was older, had lower UPF consumption ($P = 0.001$), and showed significant differences in TyG index quartiles ($P = 0.005$) compared to the other groups. The TyG index was the highest in Q4 of UPF ($P = 0.046$). A significant interaction between circadian type and UPF consumption regarding the TyG index was observed in the evening-type group ($P = 0.043$). Diabetes risk was highest in Q4 of the TyG index (OR: 5.41, $P < 0.01$).
CONCLUSIONS
The interaction between evening-types and UPF consumption was significantly associated with the TyG index. These findings highlight tailored strategies considering circadian types and diets for metabolic disease prevention in Koreans.

ASSOCIATION OF CHOLESTEROL LEVELS WITH LOW ENERGY AVAILABILITY AND EATING DISORDER SYMPTOMS IN ENDURANCE ATHLETES

Julia Silvennoinen[1, 2]; Pyry Sipilä[1]; Maarit Valtonen[3]; Leon Hirvelä[1]; Katja Mjøsund[4]; Ville Kinnula[5]; Laura Mierlahti[2]; Johanna Ihalainen[2]
[1]Medicine / Public health, University of Helsinki, Helsinki, Finland; [2]Faculty of Sport and Health Sciences, University of Jyväskylä, Jyväskylän yliopisto, Finland; [3]Olympiakomitea, Huippu-urheilun instituutti KIHU, Jyväskylä, Finland; [4]Paavo Nurmi Centre and Unit for Health and Physical Activity, University of Turku, Turku, Finland; [5]Biostatistics Unit, University of Helsinki, Helsinki, Finland

BACKGROUND AND OBJECTIVES
Problematic low energy availability (LEA) occurs when an athlete's energy intake chronically fails to meet the energy demands of physical activity and basic physiology leading to disturbances in different physiological systems (1). This condition is prevalent among active and athletic populations (2) and can arise from disordered eating (DE) or unintentional behavior (3). Both problematic LEA and DE can lead to disturbances in cholesterol metabolism (4), which may elevate the risk of future cardiovascular diseases. Our study explored the relationship between LEA, DE symptoms, and cholesterol levels in Finnish endurance athletes across different phases of the athletic year.
METHODS
Endurance athletes (male n=31, female n=24) were assessed twice during an athletic year: at the beginning of their training season and at the start of their competition season. The Relative Energy Deficiency in Sport Clinical Assessment Tool, version 2 (REDsCAT2 (5)) was used to evaluate their risk of LEA. REDsCAT2 categorizes athletes into risk groups based on markers of LEA, including free triiodothyronine (T3), menstrual status (female), testosterone (male), bone mineral density, history of bone stress injuries, and DE behavior (Eating Disorder Examination Questionnaire Short [EDE-QS]). Serum cholesterol concentrations were measured from venous blood samples. Low-density lipoprotein (LDL) cholesterol is part of the REDsCAT2 but was excluded from the LEA assessment in the present study, because it was the outcome variable of interest. Multilevel model, Pearson's r, and linear regression were used to analyze the relationships between the variables.
RESULTS
Overall, most athletes were classified as being at risk of LEA. Of the female athletes, 75% were classified as being at risk of LEA in the training season and 67% in the competition season (p=0.18 for difference between seasons), and of the male athletes, 71% and 84%, respectively (p=0.63 for difference between seasons). We found no associations of LEA risk or symptoms of DE behavior with cholesterol levels during any season. In female athletes, an increase in LEA risk between seasons was associated with a decrease in LDL cholesterol (beta adjusted for age -0.40, 95% CI -0.66–(-0.14), p=0.0044).
CONCLUSIONS
Contrary to expectations, we found no association between LEA risk scores or DE behavior and LDL levels. Also, an increase in LEA risk was associated with a decrease rather than an increase in LDL cholesterol levels in female athletes. Further research is needed to evaluate whether elevated LDL cholesterol should remain part of the LEA risk assessment criteria.

SOCIOCULTURAL INFLUENCES ON EATING PRACTICES AMONG ADOLESCENTS (15 TO 17 YEARS OLD): A SCOPING REVIEW

Mairin Saito[1]; Caroline Gallo,[1]; Ramiro Unsain,[2]; Patrícia Jaime,[3]
[1]Postgraduate Program in Public Health Nutrition, Faculdade de Saúde Pública USP, São Paulo, Brazil; [2]Public Health Post-Graduation Department, Catholic University of Santos, Santos, Brazil; [3]Department of Nutrition of the Faculty of Public Health, University of, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
Food and eating practices are strongly related to the increasing prevalence of obesity and non-communicable diseases, affecting the world´s population, including adolescents. Since eating is a modifiable risk factor, it is crucial to understand its main determinants and how changes can be made. Adolescence is an important transition phase as adolescents strive to become increasingly independent and make their own choices. During this phase, new habits are adopted, and they are also highly vulnerable to social influence. Sociocultural factors account for relevant influences on diet and eating practices, with major health impacts, especially concerning adolescents. However, there is a lack of knowledge regarding those factors and how they shape eating practices. The aim of this scoping review is to map information concerning sociocultural factors that shape adolescents' eating practices from primary studies in four scientific databases - PubMed, Lilacs/Scielo, PsycINFO, and Scopus. Sociocultural factors considered in this review correspond to values, beliefs, social rules, and social life dynamics, such as daily work or study routine, identity buildup, and group belonging. The targeted adolescent population in this review is 15 to 17 years old.
METHODS
This scoping review was conducted according to a protocol previously registered in the Open Science Framework. It was mainly developed following the Joanna Briggs Institute (JBI) guidance for conducting scoping reviews. It sought to answer the question, "Which sociocultural factors affect adolescents' eating practices, and how do those factors shape their eating practices?" A total of 17 articles were included for data extraction and analysis.
RESULTS
The qualitative method prevailed in the included studies. The most commonly studied eating practice is food choice. As for sociocultural factors, the most prevalent values are taste preference for non-healthy food and body image. Family, school, peers, and social media are the leading influencers. A singular finding refers to the belief that "only small children take food from home to school," indicating that issues about the passage from adolescence to adulthood affect eating behavior. Lack of time due to the busy routines of parents or adolescents leads to the consumption of quick and easy food and breakfast skipping.
CONCLUSIONS
Adolescents enjoy increasing independence and favor food taste and body image, but they are usually unhealthy when dealing with food choices. In order to bring about healthy changes to adolescents' eating practices, sociocultural factors should be carefully considered in public policies for this population.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

ADHERENCE TO HEALTH BEHAVIOR RECOMMENDATIONS AND CHILDHOOD WEIGHT: A LONGITUDINAL STUDY

Reetta Lehto[1]; Henna Vepsäläinen,[2]; Anna M Abdollahi[2]; Josefine Björkqvist[1]; Henna Launistola[1]; Mirkka Maukonen[3, 1]; Jenna Rahkola[1]; Ilse Tillman[2]; Carola Ray,[1]; Maijaliisa Erkkola[2]; Eva Roos,[1]
[1]Public health research program, Folkhälsan Research Centre, Helsinki, Finland; [2]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland; [3]Department of Public Health and Welfare, THL - Finnish Institute for Health and Welfare - Natural Protection for Finnish people, Helsinki, Finland

BACKGROUND AND OBJECTIVES
Many studies have shown the beneficial effect of healthy lifestyles on weight outcomes. However, less is studied whether adherence of health behavior recommendations can predict weight outcomes over a long follow-up period during childhood. The aim of this study was to investigate whether adherence to 4 health behavior recommendations in early childhood predicts BMI z-score 7 years later.
METHODS
The baseline study sample consists of 864 Finnish preschoolers, aged 3-6, participating in the DAGIS study in 2015-2016. Data on physical activity (PA), sleep duration, screen time, and dietary intake were collected using actigraphy, screen time logbooks, and 3-day food records. Anthropometrics were measured by research staff. Adherence to recommendations was defined as 1) less than 1 h of screen time per day, 2) at least 3 h of PA per day, including at least 1 hour of moderate-to-vigorous PA, 3) 10–13 hours of sleep per night, and 4) consuming at least 250 g of fruits and vegetables per day. Follow-up data (n=210) on parent-reported anthropometrics was collected in 2023 when participants were 10–14 years. Linear regression analyses were conducted to predict follow-up BMI z-score with adherence to health behavior recommendations at baseline, controlling for age, gender, baseline BMI z-score, and duration of follow-up.
RESULTS
Adherence to the chosen recommendations varied between 35% to 53%, while only 4% adhered to all of them. The RESULTS indicated no significant associations; neither the total number of adhered recommendations nor adherence of individual recommendations were predictive of follow-up BMI z-score.
CONCLUSIONS
Despite the established positive health effects of following health behavior recommendations, we found no evidence that adherence to these recommendations during preschool years influences weight outcomes in later childhood. However, the non-significant findings may be attributable to the small sample size or selection bias.

[1]Nutritional Epidemiology Observatory, Institute of Nutrition Josue de Castro, Federal University of Rio de Janeiro, Rio de Janeiro, Brazil; [2]Federal University of Pará, Institute of Health Sciences - ICS / UFPA, Belém, Brazil; [3]Institute of Nutrition Josue de Castro, Federal University of Rio de Janeiro, Rio de Janeiro, Brazil; [4]Federal University of Goiás, Faculty of Nutrition, Goiás, Brazil; [5]Institute of Nutrition, State university of Rio de Janeiro, Rio de Janeiro, Brazil; [6]Josué de Castro Nutrition Institute, Observatory of Nutritional Epidemiology, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil

BACKGROUND AND OBJECTIVES
The relationship between how breastfeeding can affect early childhood development (ECD) is not fully understood. This study investigated the association between breastfeeding practices and ECD in Brazilian children.
METHODS
Data were collected from 5,766 children aged 1-23 months as part of the Brazilian National Survey on Child Nutrition (ENANI-2019). Breastfeeding indicators followed WHO guidelines: for infants aged 1-5 months: 1) exclusive breastfeeding (EBF); 2) predominant breastfeeding; 3) mixed breastfeeding; 4) complementary feeding; and 5) no breastfeeding; and for children aged 6-23 months: breastmilk consumption (yes/no) and baby bottle use (yes/no). ECD was assessed using the Brazilian version of the Survey of Well-being of Young Children (SWYC-BR). Developmental age was estimated through graded response models, and the developmental quotient (DQ) was calculated as developmental age divided by chronological age, with DQ=1 indicating that a milestone was achieved. Multiple linear regression models examined the association between breastfeeding and DQ. Directed Acyclic Graphs determined the minimum set of adjustments needed.
RESULTS
The prevalence of breastmilk consumption did not differ according to any selected variables. However, a lower prevalence was observed among those who used a baby bottle (41.1% [37.6; 44.5]) compared to those who did not (83.2% [79.8; 86.6]). The prevalence EBF was also lower among those who used a baby bottle (2.1 [0.4; 3.8]) compared to those that did not use (60.0 [53.8; 66.1]). The mean DQ was higher for EBF infants aged 1-5 months (1.94; 95%CI 1.72-2.16) compared to those on complementary feeding (1.56 [1.46-1.67]). Among children aged 1-23 months, higher DQ scores were observed in those receiving breastmilk (yes: 1.29 [1.24;1.34] vs. no: 0.99 [0.97-1.00]) and in those not using a baby bottle (no: 1.38 [1.31;1.45] vs. yes: 1.21 [1.17-1.25]). Multivariate analysis confirmed that for infants aged 1-5 months, EBF was directly associated to DQ (β= 0.295; 95% CI: 0.087-0.503; p=0.006). For 1-23 months, breastmilk intake (β= 0.193; 95% CI: 0.135-0.251; p<0.001) and avoiding baby bottles (β= 0.164; 95% CI: 0.092-0.236; p<0.001) were also directly associated with DQ.
CONCLUSIONS
WHO-recommended breastfeeding practices, such as EBF, continued breastfeeding, and avoiding baby bottles, are directly associated with DQ.

HEALTH SCORE: UNVEILING LIFESTYLE INSIGHTS FROM HEALTH APP USERS

Carolina Pimentel[1]; Livia Barbosa,[2]; Fernanda Lancelotti,[2]; Pamella Torres[2]; Marcio Mundim,[2]; Patricia Caldeira,[2]; Alexandre Tarifa,[2]
[1]Health , Vitat, São Paulo, Brazil; [2]Health, Vitat, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
Presenting a health score to users is a patient engagement strategy. Apps that aim to promote health can follow different methodologies. Lifestyle Medicine is an interdisciplinary approach, based on scientific evidence, which is grounded on pillars of health care. Objetive: Describe the RESULTS of a lifestyle questionnaire answered using a chatbot in a health app.
METHODS
The survey is based on lifestyle medicine and is subdivided into five pillars: general habits, nutrition, movement, sleep and balance. Each pillar is derived from a more extensive and already validated instrument that measures the same construct. The final result is a score referring to the adequacy of self-care, ranging from 0 to 100 points. A validation study of this methodology was carried out and showed that the measure is comparable to the original instruments. Analyses aim to describe users' health behavior.
RESULTS
72,137 people responded to the questionnaire from January 2024 until mid-September. Of the people who added gender and age data, the public was mostly women (79.8%) aged 25-29 (22.4%). The most challenging pillar was nutrition, with only 23% of users reporting that they ate fruit, 27% vegetables, 36% legumes and only 3% nuts and seeds on a daily basis. In the mental health pillar (i.e. Balance), women had a lower average score (M = 61.14; SD = 15.66) than men (M = 66.05; SD = 14.99). Movement showed the best central tendency indices (M = 67; SD = 40; Med = 100), but women had a lower average score (M = 69; SD = 39) than men (M = 76; SD = 36). Data obtained on diet reflects a previously described Brazilian dietary pattern, where in recent years there has been a decrease in the consumption of fresh and minimally processed foods. There were also difficulties in caring for mental health and lower indicators of physical activity among women, which is also observed in epidemiological data
CONCLUSIONS
The RESULTS obtained from filling in a validated questionnaire via chatbot showed that the average health score was 61.3. This data is essential for creating health engagement strategies.

ENHANCING LARGE-SCALE FOOD FORTIFICATION PROGRAMS: INSIGHTS FROM A DECADE OF MARKET ASSESSMENTS ON PRODUCT FORTIFICATION QUALITY, AVAILABILITY, AND MARKET SHARE

Svenja Jungjohann[1, 2]; Valerie Friesen,[3]; Mduduzi Mbuya[4]; Frank T. Wieringa[5]
[1]Knowledge Leadership, Global Alliance for Improved Nutrition (GAIN), Genève, Switzerland; [2]UMR QualiSud, Institut de Recherche pour le développment/Université Montpellier/SupAgo, Montpellier, France; [3]Knowledge Leadership, GAIN, London, United Kingdom; [4]Director, Knowledge Leadership, Global Alliance for Improved Nutrition (GAIN), Washington, United States of America; [5]UMR QualiSud, Institut de Recherche pour le développment/Université Montpellier/SupAgo, French National Research Institute for Sustainable Development (IRD), Montpellier, Montpellier, France

BACKGROUND AND OBJECTIVES
Large-scale food fortification (LSFF) programs aim to improve public health by increasing micronutrient intakes, but their effectiveness relies on accurate and actionable data for programmatic decision making. To support this, the Global Alliance for Improved Nutrition developed a market assessment methodology in 2015 to assess product fortification quality, availability, and market share. Between 2015 and 2024, 24 assessments were conducted across 12 countries and nine food vehicles. We reviewed the strengths and limitations of these market assessments with the aim to make recommendations on good practices to take forward.
METHODS
We summarized the commonalities and implementation evolution in terms of the objectives, methodologies, and RESULTS obtained across the 24 market assessments.
RESULTS
All market assessments maintained the same objectives, putting the product central to combine product characteristics (including origin, fortification labelling and fortification status and meeting fortification standards) with product availability and market share. Assessments included edible oil (21), wheat flour (19), salt (17), maize flour (12), sugar (6), milk (4), margarine (4), rice (4), and bouillon cubes (1). Methods to extrapolate to the market share evolved from using secondary data to inclusion of the retail penetration. Assessment RESULTS identify two key indicator groups for decision makers: (A) product count and proportions and (B) market share by product characteristics. Apparent discrepancies exist in proportions reported between these key groups of indicators. E.g., in Tamil Nadu, India (2023), 56% of 117 oil products were labelled as fortified, of which 62% were analyzed, of which 88% were fortified, and of which 29% met fortifications standards. However, in market share 91% were labelled as fortified, of which 87% were analyzed, of which 97% were fortified, and of which 19% met fortifications standards. In general, market share was higher than the proportion of products, showing that dominant products were more likely to be fortified.
CONCLUSIONS
The review highlights the value of market assessments for LSFF design and performance monitoring. Key indicators serve different roles: product proportion primarily informs regulators, while market share helps public health actors assess food and micronutrient delivery to the population. Indicators are best presented in a cascade, with the denominators adjusted at each level to enhance interpretation and pinpoint key gaps.

EVALUATING A FOOD SAFETY AND WATER, SANITATION AND HYGIENE (WASH) CURRICULUM TARGETING LOW-LITERATE FISHERS/PROCESSORS IN ZAMBIA TO INFORM TWO PUBLIC HEALTH- AND NUTRITION-ORIENTED OPEN-ACCESS COURSES

Terezie Tolar-Peterson[1]; Kathleen Ragsdale[2]; Madeline Burdine[2]; Harleen Kaur Maroak[1]; Samantha Rios,[1]; Katie Roman[3]

[1]Health Science and Human Ecology, California State University, San Bernardino, San Bernardino, United States of America; [2]Social Science Research Center, Mississippi State University, Starkville, United States of America; [3]College of Agriculture and Life Sciences, Mississippi State University, Starkville, United States of America

BACKGROUND AND OBJECTIVES

Reduced nutrition, food waste, and foodborne illness that are linked to inadequate cold chains and unsanitary practices during fish processing are serious public health threats in low- and middle-income countries (LMIC) throughout sub-Saharan Africa where the poor rely on fish as an affordable/accessible animal source food (ASF). Such is the case in Zambia, where >50% of the population can afford only 1-2 meals per day and the most commonly consumed ASF is locally sourced fish [1]. As fish is highly perishable without proper cold chains, most fish are processed at point-of-catch using traditional methods (e.g., smoking, sun-drying), and low-literate women predominate in this economic activity. As most fish processors lack adequate training in food safety and water, sanitation and hygiene (WASH), traditional processing methods can expose fish/fish-products to biological and environmental contaminants that reduce nutrition, increase spoilage, and/or generate foodborne illness.

METHODS

To help address these critical knowledge gaps among low-literate processors in rural Zambia, we implemented a three-hour curriculum on fish processing, food safety and WASH tailored for low-literate fishers and processors in Siavonga (N=53; n=33 women). We discuss how this curriculum built directly upon successful implementation activities among low-literate fishers and processors during two separate USAID Feed the Future Fish Innovation Lab projects, *FishFirst! Zambia* (2020-2023) and *Nourishing Nations–Nigeria* (2020-2023) [2-4]. We review the ComFA+Fish Fish Processing/WASH Training modules, which focus on enhancing knowledge of safe fish processing, storage, and WASH to improve food safety, increase the quality of fish/fish-products, reduce spoilage/post-harvest loss, and reduce pressure on fisheries.

RESULTS

We present the pre-test/post-test evaluation RESULTS and how they are being used to directly inform the content of two self-paced open-access online courses we are developing for dissemination via mobile phones to global audiences.

CONCLUSIONS

The first open-access course focuses on fish for human nutrition, early infant feeding, and WASH, and targets caregivers, nurses, nutritionists, extensionists, and community health workers. The second open-access course focuses on fish processing, food safety, and WASH and targets fishers, processors, nurses, nutritionists, extensionists, and community health workers.

PERCEPTION OF MULTIPLE MICRONUTRIENT SUPPLEMENTATION (MMS) AND IRON-FOLIC ACID (IFA) SUPPLEMENTS AMONG PREGNANT AND POSTPARTUM WOMEN: A STUDY IN, INDONESIA

Nurzakiah Nurzakiah[1, 2]; Amir Safrullah[3]; Hidayanty Healthy[4]
[1]Department of Nutrition Science, Public Health Faculty, Hasanuddin University, Makassar, Indonesia; [2](ICONS), Indonesian Centre for Nutrition Studies, South Sulawesi, Indonesia; [3]Department of Nutrition Science, Public Health Faculty, Hasanuddin University, Perintis Kemerdekaan Street, Km. 10, Makassar, South Sulawesi, Indonesia; [4]Department of Nutrition Science, Public Healthy Faculty, Hasanuddin University, Makassar, Indonesia

BACKGROUND AND OBJECTIVES
Multiple Micronutrient Supplementation (MMS) has been officially recognized by the World Health Organization (WHO) as an essential supplement for pregnant women, aimed at addressing micronutrient deficiencies that can impact the health of both the mother and the fetus. The acceptance of MMS has been implemented in various regions. In Indonesia, MMS has begun to be distributed in several districts as part of the maternal and child health program. This study aims to assess the perceptions of MMS and iron-folic acid supplements (IFA) among pregnant women and postpartum women in Indonesia
METHODS
The cross-sectional study was conducted in Takalar District from March to October 2022, utilizing a two-stage cluster sampling technique. For this analysis, we included only pregnant women (144) and postpartum women (77) who received either MMS or iron-folic acid supplements (IFA) exclusively. Data were collected using a validated questionnaire administered by trained enumerators
RESULTS
Five domains of perception were analyzed, including affective attitude, perceived burden, perceived effectiveness, cost likelihood, and self-efficacy in consumption. Among pregnant women, the affective attitude domain showed a significant difference between MMS and IFA (P<0,05); however, for postpartum women, no significant difference was found. For the other domains, no significant differences were observed between the group receiving only MMS and the group receiving only IFA
CONCLUSIONS
These RESULTS indicate that the acceptance of MMS as a new supplement is similar to that of IFA. Despite the distribution of MMS without specific education or socialization efforts for healthcare providers and pregnant women, it was well accepted. The findings suggest that MMS can be effectively integrated into maternal health programs, as there were no significant differences in most perception domains between the MMS and IFA groups. This highlights the potential for MMS to be successfully adopted without substantial barriers, though further educational initiatives could improve its acceptance and understanding.

AN AB LIBITUM MEDITERRANEAN DIET INTERVENTION FOR WOMEN WITH PCOS: A MIXED METHODS EXPLORATION OF ACCEPTABILITY, ADHERENCE AND LIVED EXPERIENCE

Nicole Scannell[1]; Anthony Villani[1]; Evangeline Mantzioris[2]; Lisa Moran[3]; Stephanie Cowan[3]
[1]School of Health, UniSC University of the Sunshine Coast, Sippy Downs, Australia; [2]Clinical and Health Sciences, University of South Australia City East Campus, Adelaide, Australia; [3]Monash Centre for Health Research and Implementation, Monash University Clayton Campus, Clayton, Australia

BACKGROUND AND OBJECTIVES
A healthy lifestyle, including diet, is crucial for managing polycystic ovary syndrome (PCOS), yet optimal dietary recommendations remain unclear. Alternative dietary interventions are needed to meet the unique needs of women with PCOS. While the Mediterranean diet (MedDiet) is known to support cardiometabolic health and weight management, little is known about adherence challenges in this population. Therefore, this study explores the acceptability and lived experiences of an ad libitum MedDiet intervention in women with PCOS and provides theory-informed recommendations for dietary implementation.
METHODS
A 12-week MedDiet intervention was conducted with women aged 18–45 years, diagnosed with PCOS and a BMI ≥25 kg/m² (n=12). Adherence was assessed using the Mediterranean Diet Adherence Screener. Surveys and semi-structured interviews, guided by the Capability, Opportunity, Motivation-Behaviour (COM-B) model, explored participants' experiences. Thematic analysis identified barriers and facilitators, which were mapped to the COM-B model and Theoretical Domains Framework (TDF). All findings were subsequently mapped against the Behaviour Change Wheel to guide implementation strategies.
RESULTS
MedDiet adherence significantly improved from baseline to week 12 (4.1±1.85 to 8.3±2.31; P=0.001). Participants reported significant improvements in MedDiet knowledge (Z= -2.88, P=0.004), cooking confidence (Z= -2.55, P=0.01), and time management (Z= -2.59, P=0.01). Adherence factors were identified across the COM-B domains and mapped to 12 TDF domains. Key facilitators included perceived health benefits, reduced weight-related pressure, educational resources, and the simplicity of guidelines. Barriers included challenges related to organization, food availability, external influences, and stress. Effective dietary implementation should incorporate MedDiet education, behavior change support, practical resources and cooking classes. Additional strategies include professional training for dietitians to support MedDiet prescription, and education for healthcare professionals to encourage and support referral pathways to trained nutrition professionals, and to support weight-neutral approaches for PCOS dietary management.
CONCLUSIONS
This study demonstrates the short-term acceptability of an ad libitum MedDiet for women with PCOS. Over 12 weeks, participants significantly improved their adherence, knowledge, and confidence. Ongoing education and training on the MedDiet for patients and healthcare providers should be prioritised to support dietary adherence and acceptability.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

DETECTION OF DIETARY PLANT MICRORNAS IN HUMAN BREAST MILK AND POTENTIAL IMPLICATIONS FOR INFANT DEVELOPMENT: INSIGHTS FROM THE BULGARIAN POPULATION

Elena Kuzova[1]; Donka Dimbareva,[1]; Krasimira Vasileva,[1]; Stanimira Arsova,[1]; Ekaterina Chikova-Iscener,[2]; Iliyana Rasheva[3]; Tzveta Georgieva,[1]; Vesselka Duleva[4]
[1]Applied Genomics and GMO Department, National Center of Public Health and Analyses, Sofia, Bulgaria; [2]Food and Nutrition, National Center of Public Health and Analyses, Blvd. Ivan geshov 15, Sofia, Bulgaria, Sofia, Bulgaria; [3]Faculty of Biology, Sofia University, Sofia, Bulgaria; [4]Department Food and Nutrition, National Center of Public Health and Analyses, Blvd. Ivan Geshov 15, Sofia, Bulgaria, Sofia, Bulgaria

BACKGROUND AND OBJECTIVES
Plant-derived microRNAs (miRNAs) found in human breast milk have gained attention in nutritional biology due to their potential roles in infant development. These small RNA molecules regulate gene expression and influence various biological pathways. This study investigates the presence, dietary origins, and biological implications of plant-derived miRNAs in breast milk, with a focus on their relationship to maternal diet and infant health outcomes.
METHODS
A comprehensive literature review was performed to integrate findings on the stability, dietary sources, and functional roles of plant miRNAs in human milk. Key studies analysing milk miRNA profiles and their associations with maternal dietary patterns and bioactive molecules were examined. Additionally, primary data were collected from 22 clinically healthy breastfeeding mothers in Bulgaria. Participants provided informed consent, completed socio-demographic surveys, and underwent dietary assessments via a food frequency questionnaire (FFQ). Breast milk samples were collected during two lactation periods (2–4 weeks and 12–16 weeks postpartum). Analysis focused on specific plant miRNAs, including miR166a, miR156a, miR157a, miR172a, and miR168a, using next-generation sequencing (NGS) followed by bioinformatics analysis.
RESULTS
This study is the first of its kind in Bulgaria, uniquely aiming to explore the relationship between maternal diet, plant-derived microRNAs (miRNAs) in breast milk, and their impact on infant development and microbiome composition. Maternal dietary patterns, may significantly influence the expression of specific miRNAs, potentially modulating the milk's bioactive profile. These miRNAs, in synergy with molecules like leptin and adiponectin, could play a pivotal role in supporting metabolic adaptation and brain development in infants, as well as influencing their microbiome. However, the lack of localized data highlights the importance of this pioneering research in the Bulgarian context
CONCLUSIONS
The identification of plant-derived miRNAs in human breast milk highlights a novel and emerging area in nutritional biology with potential implications for infant development and metabolic regulation. Understanding the dynamic interplay between maternal diet, breast milk composition, and infant health could inform tailored dietary recommendations for lactating mothers and support future nutritional interventions. Further research is vital to uncover the mechanisms behind these associations and their impact on infant well-being.

Macro- and micronutrients according to the energy share of ultra-processed foods among Brazilian children 6-59 months old: RESULTS from the Brazilian National Survey on Child Nutrition (ENANI-2019)

Natalia Oliveira[1]; Raquel Schincaglia[2]; Leticia Barroso Vertulli Carneiro[3]; Elisa Lacerda[4]; Sandra Patricia Crispim[5]; Talita Lelis Berti[1]; Isbael Dos Santos Nascimento[1]; Jaqueline Lepsch[1]; Nadya Alves-Santos[6]; Paula Normando[7]; Inês Rugani Ribeiro De Castro[8]; Gilberto Kac[1]

[1]Josué de Castro Nutrition Institute, Observatory of Nutritional Epidemiology, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil; [2]Federal University of Goiás, Faculty of Nutrition, Goiás, Brazil; [3]Public Health Studies Institute, UFRJ, rio, Brazil; [4]Institute of Nutrition Josue de Castro, Federal University of Rio de Janeiro, Rio de Janeiro, Brazil; [5]Department of Nutrition, UFPR, Curitiba, Brazil; [6]Federal University of Pará, Institute of Health Sciences - ICS / UFPA, Belém, Brazil; [7]Nutritional Epidemiology Observatory, Institute of Nutrition Josue de Castro, Federal University of Rio de Janeiro, Rio de Janeiro, Brazil; [8]Nutrition Institute, UERJ, rio de Brazil

BACKGROUND AND OBJECTIVES

The consumption of ultra-processed foods (UPF) is increasing, especially for children. The objective is to describe the intake of macro- and micronutrients of Brazilian children 6-59 mo old according to energy participation of UPF in the diet.

METHODS

We used data from ENANI-2019, a household survey with a complex probabilistic sample. A single 24-hour dietary recall, using the multiple-pass method, was administered in 14,505 Brazilian children. Food composition analysis used the Brazilian Food Composition Table (v. 7.2). Nutrient estimates for culinary preparations were based on ingredient-level breakdowns using standard recipes, and, for some food products, the manufacturer's 2020 nutritional information was used. Foods and ingredients were classified according to Nova's classification. The relative energy participation of food groups was estimated, considering the total energy consumed. The mean and 95% CI of energy share from UPF subgroups were described by age group (6-23 and 24-59 mo). Linear regression models, with each nutrient intake per 1,000 kcal as an outcome, were adjusted for income to verify the change in nutrient consumption per quintile of energy participation of UPF in the diet. β coefficients and p-values were estimated. R programming language was used.

RESULTS

The most consumed UPF subgroups were infant cereal flours (energy participation: 6.7%, 95%CI 6.0; 7.5), sweet cookies (3.4%, 95%CI 3.0; 3.8), and infant formulas (2.9%, 95%CI 2.1; 3.7), for 6–23 mo; and sweet cookies (6.0%, 95%CI 5.4; 6.7), chocolates, ice cream and other industrialized desserts (5.2%, 95%CI 4.8; 5.7) and dairy drinks (3.3%, 95%CI 3.0; 3.6), for 24–59 mo. In 6–23 mo, a significant negative consumption was observed with increasing quintiles of UPF for fat, potassium, and vitamin A RAE [β: -3.1; -52.0; -112.3, respectively]. Furthermore, a significant positive consumption for total energy (β: 73.69), carbohydrates (β:7.4), calcium (β: 78.8), iron (β: 2.9), phosphorus (β: 39.0), vitamin A RE (β: 108.4), vitamin C (β: 9.0) and folate (β: 16.0) was found. In 24–59 mo, a significant negative consumption was observed the greater of UPF, while the increase in energy and carbohydrate consumption was maintained (β: 92.97 and 2.4).

CONCLUSIONS

Among children aged 6–23 mo, there was an increase in the consumption of calcium, iron, phosphorus, vitamin A RE, vitamin C, and folate, as well as energy and carbohydrates, according to UPF increase. For 24-59 mo, there was a decrease in most micronutrients and an increase in total energy and carbohydrates.

CONFLICTS OF INTERESTS

DETERMINANTS OF CHRONONUTRITION PATTERNS IN FINNISH PRESCHOOLERS: THE ROLE OF CHRONOTYPE, PARENTAL WORK HOURS, AND SOCIOECONOMIC STATUS

Ilse Tillman[1]; Mirkka Maukonen[2, 3]; Anna M Abdollahi[1]; Henna Vepsäläinen[1]; Carola Ray[2, 1]; Jenna Rahkola[2]; Eva Roos[2, 4, 5]; Maijaliisa Erkkola[1]; Reetta Lehto[1, 2]
[1]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland; [2]Research Center, Folkhälsan, Helsinki, Finland; [3]Finnish Institute for Health and Welfare, THL, Helsinki, Finland; [4]Department of Public Health, University of Helsinki, Helsinki, Finland; [5]Department of Food Studies, Nutrition and Dietetics, Uppsala University, Uppsala, Sweden

BACKGROUND AND OBJECTIVES
Early childhood is crucial for establishing lifelong eating patterns. Chrononutrition, which encompasses the timing and regularity of food intake, impacts metabolic health and the risk of chronic diseases. This study aimed to investigate the associations between chronotype, parental work hours, and socioeconomic status (SES) with the timing of food intake among Finnish preschoolers.
METHODS
677 children aged 3 to 6 years from the DAGIS survey participated in this cross-sectional study. Data were collected through 3-day food records and 7-day actigraphy-based sleep measurements. The chrononutrition variables examined included morning latency (the interval between waking and the first eating occasion), evening latency (the duration from the last eating occasion to sleep onset), fasting window (the period between the last meal of one day and the first meal the following day), and energy midpoint (the clock time at which 50% of daily caloric intake is consumed). To examine associations between the determinants and chrononutrition variables, analysis of variance (ANOVA) and covariance (ANCOVA), along with univariate and multivariate linear regression, were conducted for overall mean values and separately for weekdays and weekends.
RESULTS
Children with a morning chronotype exhibited longer morning latency (79 minutes vs. 52 minutes) and shorter evening latency (61 minutes vs. 108 minutes) compared to children with an evening chronotype ($p < 0.001$). The timing of the energy midpoint was earlier for children with a morning chronotype (13:25) than for those with an evening chronotype (14:11) ($p < 0.001$). Children from lower SES backgrounds reached their energy midpoint earlier (13:45) than those from higher SES backgrounds (13:57) ($p < 0.001$). On weekdays, children whose mothers worked regular hours had a shorter fasting window of 11 hours and 45 minutes compared to those whose mothers worked shifts (12 hours and 15 minutes) ($p = 0.009$). On weekends, children of fathers with regular work hours exhibited longer morning latency, averaging 1 hour and 41 minutes compared to 1 hour and 15 minutes for those with unemployed fathers ($p = 0.04$).
CONCLUSIONS
This study found chronotype, parental work hours, and SES to be associated with the timing of eating in Finnish preschool-aged children. Parental influence varies between weekdays and weekends, highlighting the need for tailored parenting strategies and supportive policies to promote healthier eating habits aligned with children's biological rhythms.

RECOGNITION OF A “HEALTHY DIET” AMONG YOUNG WOMEN

REIKO ARAMAKI[1]
[1]Faculty of Nutrition, Kobe Gakuin University Arise Campus, Kobe, Japan

BACKGROUND AND OBJECTIVES
According to the World Health Organization, eating a variety of foods, combined with reduced salt and sugar intake, is essential for a “healthy diet”. Although a “healthy diet” consists of a combination of different foods, for many people, the exact definition remains unclear. Therefore, the aims of the present study were to clarify the definition of a “healthy diet” and identify associated problems for young women**.**
METHODS
We conducted a questionnaire survey on young women. The questionnaire included pictures of 91 kinds of food selected from common dishes for younger people. The respondents were asked to choose dishes for dinner that they considered to be “healthy eating”. In addition to the survey responses, we asked which points were important when choosing the food items. Based on the responses, the respondents were classified into two groups: chooser and non-chooser. Finally, we conducted a comparative review regarding the intake of vegetables and nutrients for each group.
RESULTS
A total of 236 young women (age range, 17–22 years) responded to the survey. The nutritional contents of the respondents’ selected dinner items were as follows: energy, 776±189 kcal; protein, 31.4±8.5 g; calcium, 200±95 mg; iron, 3.2±1.1 mg; sodium chloride equivalent, 4.4±1.1 g; vegetable intake, 157±69 g; and fat energy ratio, 34%. Regarding the important points when choosing food items, more than half of the respondents selected “vegetable intake” (choosers); these women consumed significantly more vegetables than the non-choosers ($p<0.001$).
CONCLUSIONS
The RESULTS of the present study suggest that young women recognize the importance of “eating more than 350 g of vegetables every day”. However, the findings also revealed problems in terms of excess (fat and sodium chloride equivalent) or deficient (iron and calcium) nutrient intake. Therefore, a clearer definition and better recognition of what constitutes a “healthy diet” are needed.

EPO5_167

PREVALENCE OF IRON DEFICIENCY AND ASSOCIATED RISK FACTORS IN MONGOLIAN CHILDREN AGED 6-59 MONTHS: FINDINGS FROM MONGOLIA'S VI NATIONAL NUTRITION SURVEY, 2023

Bayasgalan Jambaldorj,[1]; Amarsanaa Byambadorj[1]; Bolormaa Norov,[1]; Oyundelger Dechinjamts[1]; Delgermaa Dashzeveg[1]; Tuvshinbayar Bayaraa[1]; Tuul Bayarmagnai[1]; Ganzorig Tumurkhuyag[1]; Batjargal Jamiyan,[1]
[1]Department of Nutrition and Food Safety, National Center for Public Health, Ulaanbaatar, Mongolia

BACKGROUND AND OBJECTIVES
Iron is vital for physical and cognitive development, and its deficiency is a leading cause of anemia, characterized by low red blood cell levels and reduced oxygen-carrying capacity (1). This study aimed to determine the prevalence of iron deficiency among Mongolian children aged 6-59 months, as well as the risk factors associated with the prevalance.
METHODS
This cross-sectional study was part of the Sixth National Nutrition Survey conducted across all 21 provinces and 8 districts of Ulaanbaatar, Mongolia, in 2023. The cluster sampling method was used and random sampling unit was household with 5 years-old child. Serum Ferritin (SF) levels below 12 µg/L and soluble transferrin receptor (sTfR) levels above 8.3 mg/L were used as a biomarker for iron deficiency. A national representive of 1,271 children aged 6-59 months participated the blood test to determine iron defiecency. Logistic regression (univariate and multivariable) and descriptive statistics were used for data analysis.
RESULTS
The adjusted mean serum ferritin and soluble transferrin receptor levels were 42.6 µg/L and 6.2 mg/L, respectively. The prevalence of iron deficiency was 14.1% (SF) and 10.8% (sTfR), both lower than global estimates but comparable to Asia-Pacific countries (2,3). Children aged 6–23 months were at higher risk of iron deficiency by SF (AOR 3.769) and sTfR (AOR 4.123). Male children (SF: AOR 1.774; sTfR: AOR 1.511), those with mothers with primary or no education (SF: AOR 1.941; sTfR: AOR 2.355), and Kazakh ethnic children (SF: AOR 4.248; sTfR: AOR 4.995) were also more likely to be iron-deficient.
CONCLUSIONS
Iron related nutrition interventions targeting children aged 6-23 months old is needed to be implemented in Mongolia. Strengthening the capacity of health workers to provide nutrition-related advice and implementing culturally appropriate education programs for mothers and families are critical. Further research and tailored interventions are required to address the higher prevalence of iron deficiency in the Kazakh ethnic population.

CHIA SEEDS FED TO OBESE PREGNANT RAT INCREASE DHA AVAILABILITY IN MATERNAL LIVER, PLACENTA AND BRAIN OF OFFSPRING

Garance Dalix[1]; Chloé Cloteau[2]; Khadija Ouguerram[1]; Blandine Castellano[1]; Agnès David-Sochard[1]; Norbert Winer[3, 1]; Clair-Yves Boquien[4]; Veronique Ferchaud-Roucher[1]
[1]UMR 1280 PhAN, Nantes University - INRAE -CHU Nantes, Nantes, France; [2]Mshark, Biocore, Nantes Université-CRNH Ouest, Nantes, France; [3]Service Obstétrique et Gynécologie, Nantes université - CHU Nantes, Nantes, France; [4]UMR 1280 PhAN, Nantes University - INRAE -CHU Nantes-CRNH OUEST, Nantes, France

BACKGROUND AND OBJECTIVES
Maternal obesity increases obstetric complications and affects fetal growth leading to a higher risk of developing mental and cardiometabolic disorders later in life (DOHAD concept). Alterations in fetal developmental programming may be due in part to deficiencies in the delivery of n-3 long-chain polyunsaturated fatty acids (n-3 LCPUFA) to the fetus, resulting to an imbalanced n-6/n-3 LCPUFA ratio. Alpha-linolenic acid (ALA), an essential fatty acid, is a precursor of docosahexaenoic acid (DHA, n-3LCPUFA), which is thought to play a critical role in fetal brain development. There is growing evidences that ALA supplementation early in pregnancy reduces obstetric complications and improves birth weight. However, according to the ELFE study, more than 75% of women consume less than the recommended 2g/d of ALA during pregnancy (ANSES, 2017). Chia seeds are an important source of ALA, with 64% of ALA in the lipid fraction and may be a good plant source for reducing n-3 LCPUFA deficiencies. In an obese rat model, we investigated the effect of chia seed supplementation during pregnancy on the maternal liver's capacity to produce DHA and transfer it across the placenta to the fetal brain.
METHODS
Female pregnant rats were fed a high fat high sugar (HFHS) diet or HFHS+chia seeds (4g/kg/d) during pregnancy and the RESULTS of lipid metabolism in maternal liver, placenta and fetal brain were measured at gestation day G15 and G20, at metabolite level by LC-MS/MS, at gene level by RT-qPCR and at protein level by WB. Significant differences were assessed by multiple t-test, Mann-Whitney or Kruskal-Wallis test with p-value < 0.05.
RESULTS
Chia seed supplementation during pregnancy significantly increased ALA, eicosapentaenoic acid (EPA) and DHA levels and gene expression of ELOVL5 and FADS1/2 in rat liver, at G15 and G20, in HFHS+chia compared to HFHS group. Increased incorporation of DHA into TG and phosphatidylcholines (PC) was observed in liver and maternal circulation, while n-6 LCPUFA were decreased. In addition, DHA accumulation in PC was observed in placenta and fetal brain at G15 and G20 of pregnancy.
CONCLUSIONS
Our RESULTS show that chia seeds fed to obese rats during pregnancy **1)** increase the conversion of ALA to DHA which, in turn is incorporated into the *de novo* synthesis of complex lipids, i.e. TG and phospholipids; **2)** increase DHA-containing lipids in the maternal circulation, in placenta and fetal brain, suggesting an increased capacity for transfer of n-3 LCPUFA across the placental and brain barriers in obese rat.

BACKGROUND AND OBJECTIVES
Population ageing, a global trend driven by advancements in public health and development, presents challenges like ensuring healthy lives, social protection, and active participation of older adults. This study explored dietary patterns and examined the relationship between nutritional determinants and healthy ageing, offering insights to enhance sustainable health and well-being.
METHODS
The study employed a concurrent mixed-methods design targeting individuals aged 60 years or older from five districts with strong elderly networks and the highest proportions of individuals aged 90 years or older. Data were collected using demographic questionnaires, a semi-food frequency questionnaire, and in-depth interviews, and analyzed using regression to determine odds ratios (OR) and adjusted odds ratios (AOR), with significance at $p < 0.05$.
RESULTS
The study involved 265 participants with an average age of 70.4 years, of whom 72.1% were female and 27.9% male. Among the participants, 95.3% exhibited healthy ageing characteristics. Majority of them lived with family members (79.6%), had primary education (63.2%), and sufficient income (63.9%). Regarding nutritional status, 41.2% were classified as obese, with an average body mass index of 23.98 kg/m² (SD = 5.25). Several factors were significantly associated with healthy ageing, including the absence of hypertension (OR = 15.12; P = 0.03), asthma (OR = 73.08; P < 0.01), musculoskeletal diseases (OR = 9.31; P = 0.01), and community engagement (OR = 13.24; P = 0.03), with community engagement remaining significant after adjustment (AOR = 14.43; 95% CI: 1.91–109.21, P = 0.01). Additionally, 41.7% of participants with healthy ageing demonstrated higher scores for good dietary behaviors, which were strongly associated with greater nutrition knowledge (AOR = 1.50, P = 0.03), positive attitudes (AOR = 3.37, P < 0.01), and food security (AOR = 2.42, P < 0.01). The qualitative findings revealed that older adults with healthy ageing traits prepared their own meals, and grew vegetables at home, and followed a balanced diet emphasizing rice (white and brown), local vegetables, low-sugar fruits, fish (≥3 times weekly), and whole eggs (1–3 times weekly), while avoiding processed foods and alcohol.
CONCLUSIONS
This study underscores the importance of national nutrition policies in preventing chronic diseases, enhancing food security, and promoting balanced diets aligned with food-based dietary guidelines. Community engagement significantly contributes, emphasizing the need for integrated approaches to achieve sustainable health among older adults.

BACKGROUND AND OBJECTIVES
Nearly half of child deaths result from undernutrition, with infants under six months [u6m] and children with disabilities particularly at risk. The management of small and nutritionally at-risk infants u6m and their mothers [MAMI] Care Pathway guides this care, and has been implemented in various low- and middle-income countries. However, gaps remain in making these services disability-inclusive and ensuring appropriate support for infants and mothers with disabilities. This case study from Somaliland highlights lessons learned and key recommendations from a training pilot with frontline healthcare workers in disability-inclusive MAMI, advocating for the broader dissemination of the training package to similar programs.
METHODS
A four-day disability-inclusive MAMI training was created and piloted with 17 frontline healthcare workers in Hargeisa, Somaliland. The interactive sessions focused on core competencies, including understanding disability inclusion, communicating with mothers with disabilities, identifying and managing feeding difficulties in infants with disabilities, and integrating inclusive practices into services for infants u6m and their mothers. Participants' feedback included pre/post tests, an evaluation, and a final discussion.
RESULTS
The training received a 4.9/5 satisfaction score indicating adequate transfer of knowledge, with participants improving test scores by an average of 50% (range 12%-160%). Frontline healthcare workers valued improving their knowledge and skills to deliver appropriate nutrition and feeding care and support for infants and mothers with disabilities. Feedback included the need for more training, hands-on practice, on-the-job mentorship, the integration of localized feeding videos for infants and mothers with disabilities in the training, promoting the biopsychosocial model of disability, integration of disability inclusion into nutrition and health programs, and strengthening disability inclusion policies.
CONCLUSIONS
The disability-inclusive MAMI training can strengthen the capacity of frontline healthcare workers, empowering them to provide adequate and inclusive services for infants and mothers with disabilities. Policymakers and program implementers should take concrete action to strengthen national capacity in disability-inclusive MAMI and nutrition services, support ongoing mentorship for healthcare workers, integrate disability into health and development programs, and foster an enabling policy environment.

MAIN FACTORS INFLUENCING CONSUMER ACCEPTANCE OF HEALTHY EATING SUPPORTING POLICIES?

Arturo Turillazzi[1]; Federico Perez-Cueto[1]; Eva Palmquist[1]; Sofia Lundberg[2]
[1]Research Group Sustainable Food Transitions, Department of Food, Nutrition & Culinary Science, University of Umea, Umea, Sweden; [2]School of Business and Economics at Umeå University, University of Umea, Umeå, Sweden

BACKGROUND AND OBJECTIVES
The transition to plant-based farming is a key strategy to promote healthier diets and achieve sustainable food systems while reducing pressure on water, land, and biodiversity (1,2). This transition requires behavioral and systemic changes, including policy actions supporting and incentivizing farmers who want to transition their production to plant-based agriculture (2). However, the success of such a shift depends heavily on consumer acceptance, as citizens' support influences politicians and market demand for plant-based products (3,4). This study aims to identify determinants of consumer acceptance towards policies supporting farmers in transitioning plant-based farming.
METHODS
Data Collection: A cross-sectional survey was conducted online by Enkätfabriken AB between November and December, 2024 in DE, EE, FI, LT, NO, PL and SE, (n=5250, 50% women). The questionnaire included sociodemographic characteristics and questions related to consumers' values, attitudes, and the level of acceptance on policies supporting a plant-based transition, (7-point Likert scale from 'Strongly Disagree' to 'Strongly Agree').
Data analysis: Linear regression was conducted using the policy proposition to support farmers transitioning to plant-based farming as outcome variable, and consumer attitudes, and values as explanatory variables, controlling for sociodemographic characteristics. Statistical significance was defined as $p < 0.05$
RESULTS
RESULTS: Consumer values Stimulation, Universalism, and Benevolence and attitudes towards plant-based foods (all $p < .001$) were positively associated with agreeing with policies supporting farmers who want to transition their production to plant-based farming ($p < .001$).
CONCLUSIONS
Conclusion: Individuals who prioritize excitement, broad-mindedness, and helping others, as well as those with favorable perceptions of plant-based foods, support policies facilitating plant-based transitions more. Therefore, advocating for a more sustainable diet requires targeted communication that addresses people's attitudes and values.

EPO5_176

ASSESSING THE NUTRITIONAL STATUS AND MICRONUTRIENT GAPS IN SIERRA LEONE: A SCOPING REVIEW OF WOMEN, CHILDREN, AND ADOLESCENTS

Oluchi Ezekannagha[1]; Edikan Uwatt,[2]; Busie Maziya-Dixon,[3]
[1]Program Performance Unit, CGIAR System Organization, Montpellier, France; [2]N/A, Independent Consultant, Abuja, Nigeria, Federal Republic of; [3]Food and Science Lab, IITA, Ibadan, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
Objectives: This scoping review aimed to map and analyze the breadth of quantitative studies on nutrition conducted in Sierra Leone, with a particular focus on children, adolescents and women of reproductive age. It highlights research gaps and identifies key findings on malnutrition, micronutrient deficiencies, and associated health outcomes in the country.
METHODS
A scoping literature review was conducted to identify quantitative studies published between January 1, 2000, and May 1, 2024. The review included peer-reviewed articles and reports, excluding qualitative studies, that assessed nutrition-related outcomes such as anthropometric indicators, micronutrient status, and feeding practices in Sierra Leone among, children under five years, adolescents and women of reproductive age (15 - 49 years).
RESULTS
The review included 39 studies. Most studies employed cross-sectional designs (n=25), with fewer using secondary data analysis (n=9), randomized controlled trials (n=3), or quasi-experimental designs (n=2). Studies predominantly addressed acute malnutrition, stunting, anemia, and micronutrient deficiencies. Prevalence estimates for wasting ranged from 4.8% to 30% in children, while stunting ranged from 29.1% to 41.8%, with disparities across regions. Anemia prevalence exceeded 60% in children under five and 76.3% in some populations. Few studies explored comprehensive micronutrient panels, with most focusing on hemoglobin, ferritin, and iodine status. Data on adolescent nutrition were scarce, with only two studies disaggregating RESULTS for this group. Research gaps were identified in dietary diversity, zinc deficiency, riboflavin, and vitamin D status. Overweight and obesity, particularly among women (27%–30%), emerged as an additional public health concern.
CONCLUSIONS
CONCLUSIONS: This scoping review underscores the urgent need for nationally representative, age-disaggregated nutritional surveys in Sierra Leone. These should assess comprehensive micronutrient status and dietary practices while addressing the double burden of malnutrition.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

ONGOING NUTRITION TRANSITION IN URBAN AFRICA, EXPLORING THE LIVED EXPERIENCES AND POLICY LANDSCAPE TO MANAGE THE TRANSITIONS: A QUALITATIVE INQUIRY IN URBAN ZAMBIA

Peter Yiga[1]; Whitfield Stephen[2]; Pui Yee Tan[1]; Chomba Christian[3]; Shannon Caitlin[4]; Mfune Tabita[5]; Patrick Kalenga[6]; Yun Yun Gong[1]
[1]School of Food Science and Nutrition, University of Leeds, Leeds, United Kingdom; [2]School of Earth and Environment, University of Leeds, Leeds, United Kingdom; [3]Agricultural Consultative Forum, Lusaka, Zambia, Agricultural Consultative Forum, Lusaka, Zambia; [4]Care International USA, Care International USA, New York, United States of America; [5]Food Science and Nutrition, University of Zambia, Lusaka, Zambia; [6]Care International, Care International Zambia, Lusaka, Zambia

BACKGROUND AND OBJECTIVES
Zambia is experiencing a nutrition transition, due to fast changing food environment but there are limited insights of the ongoing transformations. The study aimed to understand the food environment transitions based on people's lived experience and policy landscape to manage the transitions.
METHODS
A 2-step research design applying a photovoice technique (n=24) and key informant interviews with policy makers (n=18) was utilised. Purposive quota sampling based on; age (18 to 59 years), sex (n=12 per sex), and socio-economic status (urban poor vs middle class neighbourhoods) was applied to recruit photovoice participants. Photovoice included three sessions, 1) introduction, 2) 6-day photo taking exercise and 3) focus group discussions of photos (in groups of three). Photo-list/topical guide design were based on food environment framework. Data was transcribed verbatim and analysed thematically.
RESULTS
Experienced transitions include a dwindling diversity of healthy foods, alongside an increased availability and marketing of unhealthy foods due to mushrooming fast food chains, and emergence of supermarket and digital advertisement. Compounded by the desire for physiological satiety and convenience, and inadequate food knowledge and skills, the transitions are propagating a monotonous refined maize-based diet and fast-food culture. Due to food safety concerns in wet markets, supermarkets and home gardens have emerged as key trusted food sources. However, wet markets remain an important source for fresh foods. The aggressive unhealthy food marketing through social media, billboards, and strategic periodic promotions is perpetuating higher social status norms, out of home eating trend and dependence on unhealthy foods. The public perceived that, food labels and the marketing information need to give more information with regards to potential risk factors. Policy-wise, focus is on bottom-up approaches, as structural strategies are viewed as complex due to intricacy of balancing economy and public health priorities. Nevertheless, policy makers see opportunities in public-private partnerships incentivising agricultural diversification, wet markets improvements, reformulation strategies, labelling innovations, healthy food placement nudging guidelines in retail chains and schools.
CONCLUSIONS
The food environment is increasingly perpetuating obesogenic behaviours. Current policy landscape is focused on bottom-up approaches. However, a combination with structural approaches encompassing public-private partnerships is needed.

ASSOCIATION BETWEEN MEALTIME TELEVISION VIEWING, LIFESTYLE AND SEVERE CHILDHOOD OBESITY IN THE ENPIMAD STUDY

África Peral-Suárez[1, 2]; María Dolores Salas-González[1, 2]; Esther Cuadrado-Soto[2, 1]; Liliana G. González-Rodríguez[1, 2]; Laura M Bermejo[1, 2, 3]; María Del Carmen Lozano-Estevan[1, 2]; Adrián Cervera-Muñoz[2]; Sofía Perea-Tajuelo[2]; Ana Cecilia Maawad-Villavicencio[2]; Manuel Díaz-Olalla[4]; Ana María López-Sobaler[1, 3, 2]
[1]Research Group VALORNUT-UCM (920030), Universidad Complutense de Madrid, Madrid, Spain; [2]Department of Nutrition and Food Science, Universidad Complutense de Madrid, Madrid, Spain; [3]San Carlos Health Research Institute, (IdISSC), Madrid, Spain; [4]Madrid Salud, Ayuntamiento de Madrid, Madrid, Spain

BACKGROUND AND OBJECTIVES
There is growing evidence associating TV watching during meals with poorer diet quality and weight outcomes. However, little is known about the relationship of lifestyle factors with the risk of severe obesity. Therefore, the aim of the present study is to analyse the associations between TV watching during meals and the risk of severe obesity and poor lifestyle behaviours.
METHODS
A cross-sectional study was conducted on a representative sample of schoolchildren from Madrid (Spain). TV during mealtime, sleep duration (SD), screen time (ST), adherence to Mediterranean Diet (AMD), and socio-economic status (SES) were collected via questionnaires. Height and weight were measured. Severe obesity was defined as BMI above +3SD of WHO BMI-for-age z-scores. Clusters of lifestyle behaviours were identified by K-means cluster analysis, and multinomial logistic regressions adjusted by sex, age and SES were used to explore associations between severe obesity, eating at least one meal in front of TV, and lifestyle clusters.
RESULTS
Three lifestyle clusters were identified: 1. Healthy Cluster (HC) characterized by high SD and AMD and low ST; 2. Mixed cluster (MC) characterized by low SD, ST, and AMD; 3. Unhealthy cluster (UC), characterized by low SD and AMD and high ST. Almost 5% of the sample presented severe obesity and 69% of the sample made at least one meal in front of TV. Children who made at least one meal in front of TV were 4.2 times more likely to be in the UC. Children in the UC were more likely to present severe obesity (OR: 2.00; 95%CI: 1.30, 3.01), as were those who made at least one meal in front of TV (OR: 1.68; 95%CI: 1.13, 2.49). After including lifestyle clusters as a covariate this association persisted but the OR was lower (OR: 1.54; 95%CI: 1.03, 2.29).
CONCLUSIONS
Watching TV during mealtime increases the probability of having poorer lifestyle behaviours and presenting severe obesity. The associations between TV watching during mealtimes and severe obesity may be partially mediated by lifestyle behaviours.

DETERMINANTS OF THE NUTRITIONAL STATUS AMONG SCHOOL AGE CHILDREN (6-12) YEARS; A QUASI EXPERIMENTAL STUDY

Bongkiynuy Nancy[1, 2]; Betrand Tambe Ayuk[3, 1]; Ebot Walter Ojong[4]; Gilbert Ngwaneh Miki[2, 5]; Achidi Aduni Ufuan[6]

[1]Faculty of Health Science Department of Public Health and Hygiene, University of Buea,, Buea, Cameroon; [2]School Health and Nurtrition, Community Vision Group(CVG), Bamenda, Cameroon; [3]Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch university,, Cape Town, South Africa, South Africa; [4]Chemical Pathologist, Faculty of Health Sciences, University of Buea, Buea, Cameroon, Bue, Cameroon; [5]Faculty of Epidemiology & Population Health, London School of Hygiene and Tropical Medicine, Research Consortium for School Health and Nutrition, London, United Kingdom; [6]Department of Biochemistry and Molecular Biology, University of Buea, Buea, Cameroon

BACKGROUND AND OBJECTIVES

School age is a dynamic period of physical growth as well as the mental development of the child. The physical and mental/cognitive development of school-aged children is greatly a reflection of their nutritional status[1]. Malnutrition continues to be a major public health problem among school-aged children in developing countries, affecting a significant number of school-age children influencing their health, growth, development, and academic school performance[2]. In Cameroon, there is not much documented data on the nutritional status of this category of children. The aim of the study was to investigate the determinants of Nutritional status among school-aged children

METHODS

A quasi experiment was conducted with 294 primary school age pupils, comprising 139 males and 155 females in a rural setting. These pupils were randomly selected from three mission schools in 2 villages with similar socioeconomic characteristics in the North West Region of Cameroon. Anthropometric measurements and a 24-hour dietary recall for mothers were collected at baseline and same will be done after six months of intervention. Data were analyzed using SPSS and WHO athro-plus.

RESULTS

The RESULTS of the study revealed majority of the participants were female in the intervention and control arms with 53.9%, 51.8% respectively. The prevalence of underweight was 15% in the control group and 18% in the intervention group. Stunting rates were 20% for control group and 25% for the intervention group. Rates of overweight and obesity were low in both groups. Maternal knowledge of malnutrition was significantly associated with nutritional status, showing 42.2% awareness in the intervention group compared to 28.9% in the control group ($p<0.05$). It is worth noting that the Dietary Diversity Scores (DDS) was very poor with 100% of children in the intervention group compared to 82% in the control group.

CONCLUSIONS

RESULTS highlight that factor such as household income, education level of parents, household conditions and frequency of meals; fruits and vegetables significantly affect children's nutritional outcomes, suggesting a need for targeted interventions to improve child health in rural settings.

RELATION OF A LIFESTYLE RISK INDEX WITH VISCERAL ADIPOSE TISSUE IN THE GERMAN NATIONAL COHORT (NAKO): EFFECT MODIFICATION BY SEX AND BODY MASS INDEX

Gertraud Maskarinec[1]; Rebecca Klapp[2]; Ute Nöthlings[3]; Matthias Schulze[4]; Anja Sedlmeier[5]; Michael Leitzmann[5]; Patricia Bohmann[5]; Fabian Bamberg[6]; Jürgen Machann[7]; Tobias Haueise[8]; Katharina Nimptsch[2]; Tobias Pischon[2]
[1]Population Sciences in the Pacific, University of Hawai'i Cancer Center, Honolulu, United States of America; [2]Molecular Epidemiology Research Group, Max Delbrück Center for Molecular Medicine in the Helmholtz Association (MDC), Berlin, Germany; [3]Department of Nutrition and Food Science, Nutritional Epidemiology, University of Bonn, Bonn, Germany; [4]Molecular Epidemiology, German Institute of Human Nutrition, Nuthetal, Germany; [5]Epidemiology and Preventive Medicine, University Hospital Regensburg, Regensburg, Germany; [6]Radiologie, Universitätsklinikum Freiburg, Freiburg, Germany; [7]Institut für Diabetes-Forschung und Metabolische Erkrankungen, Universitätsklinikum Tübingen, Tübingen Germany; [8]Institut für Diabetes-Forschung und Metabolische Erkrankungen, Universitätsklinikum Tübingen, Tübingen, Germany

BACKGROUND AND OBJECTIVES
Visceral adipose tissue (VAT) accumulation confers additional chronic disease risk beyond high body mass index (BMI) and is associated with common lifestyle behaviors. As sex and/or BMI may modify this relation, we examined differences in the relation of a Lifestyle Risk Factor Index (LSRI) with VAT among participants of the German National Cohort (NAKO) who had undergone magnetic resonance imaging (MRI).
METHODS
Based on questionnaires completed at cohort entry, LSRI scores were assigned (1 point each for consuming <1 (women)/<2 (men) alcoholic drinks/day, ≥150 minutes/week of physical activity, not smoking, and adhering to ≥3/7 dietary recommendations). A food frequency questionnaire allowed estimation of dietary intakes. BMI categories (healthy weight: <25; overweight: 25-<30; obese: ≥30 kg/m2) were assigned. VAT volumes were obtained from standardized 3T MRI images and analyzed using deep learning-based image segmentation. We applied general linear models to estimate the association of LSRI with VAT, to perform trend tests with the continuous LSRI variable, to assess effect modification using interaction terms, and to compute age-adjusted VAT levels by LSRI according to sex and BMI.
RESULTS
Of 18,508 participants with complete information, the respective proportions for 0/1, 2, 3, and 4 LSRI points were 7%, 24%, 51%, and 18%. Overall, 44% of the participants reported normal weight, 38% overweight and 18% obesity. The geometric mean for VAT was 2.70 liters (95% CI 2.67, 2.73 liters; Q1-Q3: 1.60-4.75 liters) with higher mean volumes for men (3.71, 95%CI 3.66, 3.75 liters; Q1-Q3: 2.49-5.85 liters) than women (1.81, 95%CI 1.78, 1.83 liters; Q1-Q3: 1.11-2.99 liters). In multivariable models, participants with LSRI scores of 4 vs. 0/1 had lower mean volumes of VAT (2.3; 95%CI 2.2, 2.3 vs. 3.0; 95%CI 2.9, 3.1 liters). Adding BMI to the model slightly attenuated the difference across categories: (2.4; 95%CI 2.4, 2.4 vs. 2.9; 95%CI 2.8, 3.0) liters. Each individual lifestyle factor was inversely associated with VAT levels. As indicated by higher regression coefficients, the associations between LSRI and VAT were stronger among individuals with normal weight or overweight than people with obesity (p for interaction=0.001), but they were statistically significant across all BMI subgroups. No significant interaction of LSRI with VAT by sex was detected.
CONCLUSIONS
The RESULTS support the hypothesis that a composite LSRI is associated with lower VAT levels independent of BMI. The stronger association in participants with normal than elevated BMI suggests a greater influence of excess body weight on VAT than lifestyle behaviors alone.

PARENTING FACTORS AND PHYSICAL GROWTH STATUS IN JAPANESE CHILDREN AND ADOLESCENTS

Chisa Shinsugi[1]
[1]Department of Empirical Social Security Research, National Institute of Population and Social Security Research, Tokyo, Japan

BACKGROUND AND OBJECTIVES
Child stunting and obesity are serious public health concerns in Japan. Parental attitudes towards food choices, lifestyle, and socioeconomic status play crucial roles in healthy child growth and development. However, studies exploring these relationships are limited. This study aimed to examine the association between physical growth status and child-rearing factors.
METHODS
Children and adolescents aged 5-19 years (n = 678) who participated in the 2018 National Health and Nutrition Survey were included in this analysis. Body mass index for age z-score (BAZ) and height-for-age z-score (HAZ) were calculated using WHO growth standards. Parental attitudes towards food choices, parental health behaviors (smoking status, alcohol consumption, body mass index, regular exercise, and sleep status), parental work status, household income, number of household members, and municipality of residence were considered as child-rearing factors.
RESULTS
Multiple logistic regression analyses showed that children whose parents did not prioritize nutritional value in food choices were marginally more likely to be stunted (adjusted odds ratio (aOR) 2.81, 95% confidence interval (CI): [0.95 – 8.32]). Children from high-income households were less likely to be thin compared to those from middle-income families (aOR 0.23, 95%CI: 0.07 – 0.84). Children of parents who smoked or were overweight or obese (BMI 25 or more) were more likely to be overweight or obese (smoking - aOR 2.04, 95%CI: 1.14 – 3.64; obesity - aOR 1.96, 95%CI: 1.14 – 3.37), while children of parents with a BMI less than 18.5 were less likely to be overweight or obese (aOR 0.13, 95%CI: 0.02 – 0.94).
CONCLUSIONS
This study found that child undernutrition was associated with parental nutrition knowledge and household income, while child overweight including obesity was related to parental smoking and BMI. Further research is warranted to develop targeted interventions that support families facing child-rearing challenges, particularly those at risk of malnutrition.

FOOD INSECURITY WAS ASSOCIATED WITH UNHEALTHY LIFESTYLE PATTERN IN MEXICAN UNIVERSITY STUDENTS: ACCUMULATED CHALLENGES THAT UNIVERSITIES CAN ADDRESS

Alejandra Betancourt Núñez[1]; Pablo Alejandro Nava Amante[2]; María Fernanda Bernal Orozco[2]; José Gerardo Mora Almanza[2]; Bárbara Vizmanos Lamotte[1, 2]
[1]Centro de Investigación Educativa y Bienestar Universitario, Centro Universitario de Ciencias de la Salud; Universidad de Guadalajara, Guadalajara, Mexico; [2]Doctorado en Ciencias de la Nutrición Traslacional, Centro Universitario de Ciencias de la Salud; Universidad de Guadalajara, Guadalajara, Mexico

BACKGROUND AND OBJECTIVES
An unhealthy lifestyle has been positively associated with adverse health situations. Several sociodemographic factors have been associated with adherence to an unhealthy lifestyle. However, few studies analyze the association between food insecurity (FI) and lifestyle in university students; none exist in the Mexican population. The objective was to analyze the association between food insecurity and lifestyle clusters in Mexican university students.
METHODS
Cross-sectional study (macroproject on food insecurity; registered opinion: CI-02322). We evaluate online demographics (age, sex, study program, employment situation, etc.), alcohol/tobacco consumption, food insecurity (ELCSA), sleep quality (Pittsburgh), physical activity (IPAQ), diet quality (Mini-Ecca, v2), and symptoms of stress, anxiety, depression (DASS-21). The lifestyle clusters were generated using hierarchical analysis, Ward's method, and Euclidean distance. The associations were analyzed with logistic regression.
RESULTS
Four hundred twenty-nine participants were included; 71.8% were women, 23.3% were nutrition students, 24% had mild-FI, and 21.9% had moderate/severe-FI. Three lifestyle clusters were identified. Cluster-1 “Healthy-lifestyle” (n= 156): most were characterized by performing moderate to vigorous physical activity (64.7%), their diet quality was healthy (62.2%), they never or rarely consumed alcoholic beverages (85.9%), only 3.8% reported smoking and 25% had good sleep quality. Cluster-2 “Unhealthy lifestyle, no alcohol/tobacco consumption” (n= 147): 51% practice low physical activity, 100% have poor diet quality, 81% have poor sleep quality; however, 100% had never or rarely consumed alcoholic beverages, and only 1.4% reported smoking. Cluster-3 “Unhealthy” (n= 126): 55.6% performed low physical activity, 85.7% had an unhealthy diet quality, 98.4% consumed alcoholic beverages more than 2 times/month, 19% reported smoking, and 86.5% had poor sleep quality. Presenting moderate/severe FI (OR: 1.96; 95%CI: 1.08, 3.56) was positively associated with cluster-2-“Unhealthy lifestyle, no alcohol/tobacco consumption,” after adjusting for age, sex, study program, and employment situation. This association remains significant after additionally adjusting for anxiety (OR: 1.91; 95%CI: 1.05, 3.48), depression (OR: 1.91; 95%CI: 1.05, 3.47) and stress (OR: 1.90; 95%CI: 1.04, 3.46).
CONCLUSIONS
FI in Mexican university students is positively associated with a lifestyle characterized by low physical activity, poor diet quality, and poor quality sleep without tobacco and alcohol consumption.

Preliminary Sensory Panel RESULTS to Evaluate Acceptability of Four Flavors of a Dried Fish Powder-Fortified Complementary Instant Porridge Among Infants and Young Children in Zambia

Kathleen Ragsdale[1]; Terezie Tolar-Peterson[2]; Slyvia Banda[3]; Netsayi Mudege[4]; Madeline Burdine[1]; Lizzy Muzungaire[4]; Katie Roman[5]; Harleen Kaur Maroak[2]; Samantha Rios,[2]
[1]Social Science Research Center, Mississippi State University, Starkville, United States of America; [2]Health Science and Human Ecology, California State University, San Bernardino, San Bernardino, United States of America; [3]African Women Entrepreneurs Program (AWEP), Sylva Foods Solutions, Lusaka, Zambia; [4]Aquatic Foods Systems - Inclusive Market Systems, WorldFish, Lusaka, Zambia; [5]College of Agriculture and Life Sciences, Mississippi State University, Starkville, United States of America

BACKGROUND AND OBJECTIVES
Zambia has made significant progress in reducing infant and young child (IYC) malnutrition in the last two decades, yet rates of stunting and wasting remain high (particularly in rural areas) [1]. Among Zambian children under 5 years, 35% are stunted and 4% are wasted [1]. In order to help fill protein and nutrient gaps among vulnerable IYC, we conducted sensory panels of different flavors of Complementary Food for Africa+Dried Fish Powder (ComFA+Fish) Instant Porridge, which we fortified with dried fish powder (DFP) made from locally sourced whole pelagic small fish from Zambia's Lake Kariba.
METHODS
During four sensory panels conducted over two days, caregivers evaluated whether their IYC found four flavors of ComFA+Fish Instant Porridge acceptable. These all-naturally flavored porridges included: 1) Plain; 2) Vanilla; 3) Vanilla+Extra DFP; 4) Strawberry. The protocol was informed by Madrelle et al. and others [2-5] and successfully implemented by the researchers during three sets of panels [6,7]. Caregivers were instructed to feed each instant porridge to their child during three consecutive tasting intervals. Each serving size was 50 g (~8 oz), and all IYC were fed their portion of porridge using identical infant spoons and identical 8 oz. BPA-free bowls. For each panel, caregivers fed the porridge to their child during 3 consecutive tasting intervals of Time 1 (T1)–Time 3 (T3). Caregivers assessed their child's global liking of each porridge at T1–T3 using a set of 5 descriptors of positive/negative behaviors exhibited by their child that correlated with a five-point hedonic scale where 1=extremely disliked and 5=extremely liked. We dichotomize the RESULTS into: disliked/extremely disliked, neutral, liked/extremely liked. The purposive sample included 33 IYC who ranged in age from 6-23 months.
RESULTS
Just over 42% of the IYC were aged 6-11 months and 63.6% were female. Porridge RESULTS: Plain: T1) 81.8% liked/extremely liked; T2) 81.8% liked/extremely liked; T3) 71.9% liked/extremely liked. Vanilla: T1) 84.9% liked/extremely liked; T2) 87.9% liked/extremely liked; T3) 90.3% liked/extremely liked. Vanilla+Extra DFP: T1) 70% liked/extremely liked; T2) 65.5% liked/extremely liked; T3) 62.1% liked/extremely liked. Strawberry: T1) 96.5% liked/extremely liked; T2) 96.5% liked/extremely liked; T3) 96.2% liked/extremely liked.
CONCLUSIONS
When T1-T3 were averaged, overall scores were ranked as follows: Strawberry=96.4% liked/extremely liked; Vanilla=87.7% liked/extremely liked; Plain=78.5% liked/extremely liked; Vanilla+Extra DFP=65.9% liked/extremely liked.

IMPORTANCE AND CHARACTERISTICS OF BREAST MILK COMPOSITION IN BULGARIAN NURSING MOTHERS FOR INFANT DEVELOPMENT

Desislava Gyurova[1]; Antoaneta Lazarova[1]; Sonya Mladenova[1]; Kuzova Elena[1]; Donka Dimbareva[1]; Tzveta Georgieva[1]; Iliyana Rasheva[2]
[1]Analytical and Laboratory Activities, National Center of Public Health and Analyses, Sofia, Bulgaria; [2]Faculty of Biology, Sofia University "St. Kliment Ohridski", Sofia, Bulgaria

BACKGROUND AND OBJECTIVES
Breast milk provides essential nutrients, including proteins, carbohydrates, vitamins, minerals, and trace elements, in amounts tailored to meet the specific needs of infants at different stages of growth. This study aims to analyze the chemical composition of 30 breast milk samples (both fresh and frozen) in two breastfeeding periods, collected from 15 volunteer mothers who provided informed consent.
METHODS
GC, spectrophotometric, HPLC, volumetric, weight and computational methods were used to determine: fatty acids, fructan, vitamins A, E, B2, lactose, moisture, protein, ash, fats, carbohydrates, and energy
RESULTS
The proportion of saturated fatty acids (SFAs) and monounsaturated fatty acids (MUFAs) in breast milk is relatively constant. In 85% of the samples at the first time point analyzed, which corresponds to 2-4 weeks of lactation, the content of fructooligosaccharides is higher compared to the second time point analyzed at 14-16 weeks. These findings confirm the role of oligosaccharides in the initial stages of the formation of the intestinal microbiome, mainly associated with colonization by bifidobacteria.
CONCLUSIONS
It is found that the nutritional composition of breast milk is influenced by certain factors related to the mother (dietary regimen, age and food intake, stages and duration of breastfeeding, behavioral habits (smoking and alcohol), concomitant diseases (hypertension, diabetes mellitus, etc.). These factors account for the significant variations observed in the values of the various indicators in the experimental samples, which outline individual-specific profiles.

CONSUMER AWARENESS, USAGE AND ATTITUDE TOWARDS FOOD LABELLING: A STUDY IN TWO SUBURBS IN SANDTON, GAUTENG, SOUTH AFRICA

Shakun Naicker[1]; Ashika Naicker[2]; Grobbelaar Heleen[3]
[1]Applied Sciences Food & Nutrition, Durban Technology of University , Sandton, South Africa; [2]Food and Nutrition , Durban University of Technology, Durban, South Africa; [3]Food and Nutrition, Durban University of Technology Research & Postgraduate Support, Berea, South Africa

BACKGROUND AND OBJECTIVES
In South Africa, overweight and obesity are pressing public health concerns. The Department of Health has proposed a front-of-pack nutrition labelling (FOPNL) tool as part of efforts to strengthen the national strategic health plan and address obesity, diabetes, hypertension, and heart disease. However, there is limited confidence that South Africans fully understand existing food labelling or consistently use labels to inform their food choices. This study aimed to determine the level of awareness, attitude, and utilisation of food labels by consumers in two targeted suburbs in Sandton, Gauteng.
METHODS
This study employed a cross-sectional design, with a sample size of 385 South African participants aged 18 years and older, representing all racial groups focusing on two locations in Gauteng, South Africa: Sunninghill, a high-income area, and Alexandra, a low-income area in Sandton.
RESULTS
Many participants lacked an understanding of key labelling information such as ingredients, nutritional content, and warning labels. Despite recognising the importance of food labels, their actual use in making informed purchasing decisions was low. The result for consumer usage of labels indicated that labels about expiry dates (mean = 3.25) are used significantly more often than labels regarding the product or general information (mean = 2.19), $t(384) = -18.716$, $p<0.001$. Education level positively correlated with the usage of labels for both general and specific product information, rho = .356, $p<0.001$. Those with a higher education level in the higher income suburb showed greater use and engagement with labels. The RESULTS also indicated that females (mean = 3.59) have a more favourable attitude toward food labels than males (mean = 3.37), $p=0.020$. A significant correlation between awareness and understanding of general food labels showed a positive correlation with attitude towards food labels, $r = .418$, $p<0.001$. Labels with general information were regarded as significantly important (mean = 3.82, $p<0.001$); while labels regarding the specific product were regarded as neither important nor unimportant (mean = 3.07, $p=0.240$).
CONCLUSIONS
Consumers are not very aware or knowledgeable about food labels despite location, education, or income profile in awareness, usage and attitude towards food labelling. The findings underscore the need for enhanced consumer education and awareness programmes to improve the interpretation and use of food labels, crucial for informed dietary choices.

CHANGES IN NUTRITION QUOTIENT ITEMS FOR ASSESSING DIET QUALITY AND EATING BEHAVIORS AMONG KOREAN CHILDREN

Jung-Sug Lee,[1]; Hye-Young Kim[2]
[1]Food and Nutrition, Kookmin University, Seoul, Korea, Republic of; [2]Food and Nutrition, Yongin University, Yongin-si, Korea, Republic of

BACKGROUND AND OBJECTIVES
This study aims to present updates to the Nutrition Quotient for Children (NQ-C), a tool designed to assess diet quality and eating behaviors among Korean children.
METHODS
The NQ-C is revised every 4 to 5 years through a systematic process. The first step involves selecting candidate items via a literature review of children's nutrition, along with an analysis of food and nutritional status using data from the Korea National Health and Nutrition Examination Survey (KNHANES). The second step involves selecting checklist items through a validity assessment conducted with pilot survey data from primary school students. The third step entails developing the NQ model and calculating weights for each factor and item through confirmatory factor analysis using nationwide survey data.
RESULTS
The original NQ-C, developed in 2012, consisted of 19 items across 5 factors. The revised version in 2016 included 20 items across 5 factors, while the most recent 2021 revision consisted of 19 items grouped into 3 factors: balance (0.15), moderation (0.20), and practice (0.65). The 2016 revision added 9 items and removed 7 compared to the 2012 NQ-C, while the 2021 revision added 3 items and removed 4 compared to the 2016 version.
CONCLUSIONS
The NQ-C has been continuously updated to reflect changes in the dietary environment and behaviors of children. It has been widely utilized to assess the dietary quality and eating behaviors among Korean children, as well as evaluating the effectiveness of nutrition policies and education.

HEALTHCARE SERVICES AND HOME ENTERAL NUTRITION PRACTICES IN A BRAZILIAN REGION

Rubia Thieme[1]; Isabelle De Paula[1]; Giuliane Wrobel,[1]; Maria Eliana Schieferdecker,[1]
[1]Nutrition Department, Universidade Federal do Paraná - Jardim Botânico, Curitiba, Brazil

BACKGROUND AND OBJECTIVES
Health Information Systems (HIS) are essential for recording and collecting data and planning actions in health systems. In the Brazilian Unified Health System (UHS), one HIS is the National Registry of Health Establishments/Services (NRHE) (Rocha et al., 2018). However, the NRHE does not present a specific record for Home Enteral Nutrition (HEN) in the different UHS services. The study's objectives were to propose a strategy for collecting data regarding HEN in HIS and describe HEN in healthcare services in a Brazilian region.
METHODS
Observational, cross-sectional, and descriptive study carried out with information obtained from the NRHE between May and August 2024. The available NRHE codes were checked to define a data search strategy on HEN. After the definition, the types of establishments with HEN and their distribution in the states of the Southeast Region of Brazil were verified. Data were analyzed using descriptive statistics.
RESULTS
The proposal for data collection was the use of codes for specialized services, “Home Care (HC)” and/or “Nutritional Support (NS).” When the establishment/service had specialized HC and NS services together, it was considered that the service had HEN. Regarding the number of health establishments with HEN, the Southeast region had 126, of which 52.4% (n=66) were located in the state of São Paulo, 22.3% (n=28) in Minas Gerais, 21.4 % (n=27) in Rio de Janeiro and 3.9% (n=5) in Espírito Santo. Regarding the type of service, 79.4% (n=100) of Specialized Hospital Care, 9.5% (n=12) of Primary Health Care, 7.2% (n=9) of Specialized Care Outpatient, 3.9% (n=5) from Home Care Service and none from Health Management Center.
CONCLUSIONS
It was possible to propose a data search strategy on HEN based on existing codes in the NRHE. São Paulo had a more considerable number of healthcare services with HEN, and the biggest number of HEN records were observed in Specialized Hospital Care. However, it is essential to create a specific code for HEN in the NRHE to enable more accurate recording and collection of information.

THE ROLE OF SOCIAL JETLAG IN THE ASSOCIATION BETWEEN EATING JETLAG AND BMI Z-SCORE IN CHILDREN

Mirkka Maukonen[1, 2]; Anna M Abdollahi[3]; Josefine Björkqvist[1]; Henna Launistola[1]; Jenna Rahkola[1]; Ilse Tillman[3]; Henna Vepsäläinen[3]; Carola Ray[3, 1]; Maijaliisa Erkkola[3]; Reetta Lehto[1]
[1]Public health research program, Folkhälsan Research Center, Helsinki, Finland; [2]Public Health and Welfare Department, Finnish Institute for Health and Welfare, Helsinki, Finland; [3]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland

BACKGROUND AND OBJECTIVES
Emerging evidence suggests that high variability in meal timing between weekdays and weekends, termed "eating jetlag," may be associated with an increased risk of obesity in adults. However, studies in children are lacking. Additionally, social jetlag—a mismatch between biological sleep-wake rhythms and social schedules—may play a moderating role in these associations. We studied whether eating jetlag is associated with BMI z-score among preschool-aged children in Finland and whether social jetlag moderates this association.
METHODS
This cross-sectional study included 639 Finnish children (3-6 years, 48% females) from the DAGIS survey conducted in 2015-16. Eating jetlag was calculated as the absolute difference between the eating midpoint on weekends and weekdays, based on 3-day food records. Social jetlag was determined as the sleep debt corrected absolute difference between the sleep midpoint on weekends and weekdays based on hip-worn actigraphy data. BMI z-score, based on Finnish growth references, was calculated from researcher-measured height and weight. We conducted analyses using linear regression models and moderation was tested by including an interaction term between eating jetlag and social jetlag. Analyses were adjusted for age, sex, chronotype, sleep duration, parental educational level, physical activity, and energy intake.
RESULTS
Social jetlag moderated the association between eating jetlag and BMI z-score (*p*interaction= 0.008). Among children with greater social jetlag (≥ 1 hour), eating jetlag was negatively associated with BMI z-score (β=-0.85, 95%CI: -1.33, -0.37, *p*= 0.001). In contrast, no significant association was observed among children with less than 1 hour of social jetlag (β=0.05, 95%CI: -0.11, 0.22, *p*= 0.53).
CONCLUSIONS
These findings suggest that social jetlag may influence the relationship between eating jetlag and BMI in young children, as we found that greater variability in meal timing was associated with lower BMI among children with greater social jetlag. While previous studies on adults have linked eating jetlag to higher BMI, they have not examined the potential moderating role of social jetlag. Our findings highlight the importance of considering biological rhythm factors when studying meal timing-obesity associations. Further studies are needed to confirm these RESULTS and explore the underlying mechanisms.

ADIPOSITY AND PHASES OF STRESS IN PUBLIC SAFETY WORKERS

Daniella Messa Kubit[1]; Míriam Carmo R. Barbosa[1, 2]; Heloisa Vitoria M. De Moraes[2]; Monica Cattafesta[1]; Adriana Madeira A. Da Silva[3]; Valdete Regina Guadalini[1, 2]; Jose Luiz Marques-Rocha[2, 1]
[1]Postgraduate Program in Nutrition and Health, Health Sciences Center, Federal University of Espirito Santo (UFES), Vitória, Brazil; [2]Department of Integrated Education - Health Sciences Center, Universidade Federal do Espírito Santo - UFES (Maruípe), Vitoria, Brazil; [3]Biotechnology Postgraduate Program/RENORBIO; Department of Morphology, Federal University of Espirito Santo, Vitoria, Brazil

BACKGROUND AND OBJECTIVES
Stress, a state of tension that disrupts the body's balance, may be classified into tree phases: alert, resistance, and exhaustion. However, the literature does not present a consensus about phases of stress and changes in body composition. In this context, public security servers are more vulnerable to stress due to the demands of their profession. Thus, the main objective os this study was to evaluate the association between the phases stress and adiposity indices of public security servers.
METHODS
A cross-sectional observational study was conducted from March to August 2023 with active security servers public from a state in southeastern Brazil, which are the municipal guards; firemen; servers of security sector with administrative/management activities, civil, military, federal and road. The sample calculation was carried out considering the total number of active servers (n=4.767), a stress prevalence of 52%, acceptable margin error of 5% and confidence level of 90%. In this way, a target sample of 256 individuals in which body composition was assessed using bioelectrical impedance analysis, and at the same moment stress phases were evaluated through the Adult Stress Symptom Inventory (ISSL) validated for the Brazilian population (Lipp; Guevara, 1994). For statistical analysis, sample characterization, variable description, and adjusted linear regression analysis were performed.
RESULTS
The final sample (n=264) was predominantly composed by male (73.6%), with a median age of 40 years, self-identified as brown color (49.0%), worked in the metropolitan region of the state (81.9%), with indoor job duties (59.2%), and had completed high school or technical education (65.4%). The RESULTS indicated that 48.1% of the officers were identified as stressed, with a higher proportion among women (60.3%) ($p=0.017$). Analyzing the stress phases, the resistance phase showed a positive association with body fat percentage ($\beta=0.149$; IC95%: 0.236 – 5.859), central body fat ($\beta=0.188$; IC95%: 0.327 – 4.128), total body fat ($\beta=0.165$; IC95%: 0.153 – 7.210), and visceral fat ($\beta=0.181$; IC95%: 0.273 – 3.862), even after adjusting for confounding variables ($p<0.05$ for all).
CONCLUSIONS
The RESULTS revealed a high percentage of stress, especially in women, and a positive relationship between the resistance phase and adiposity. These findings highlight the need for changes in working conditions and lifestyle among officers, given the direct influences of stress and body composition on their professional performance.

FOOD CONSUMPTION AND EATING BEHAVIOURS OF CHILDREN AGED 6 TO 36 MONTHS LIVING IN URBAN ABIDJAN, CÔTE D'IVOIRE: THE VICTORY STUDY

Jeanne Bottin[1]; Coulibaly Amed[2]; Parfait Stéphane Sable[2]; Julie Derrien[1]; Peggy Drouillet-Pinard[1]; Sassor Odile Purifine Aké-Tano[2]
[1]Nutrition Team, Danone Research & Innovation - Daniel Carasso Center - Paris-Saclay, France, Gif-sur-Yvette, France; [2]Service de Nutrition, Institut National de Santé Publique, Abidjan, Ivory Coast

BACKGROUND AND OBJECTIVES
Micronutrient deficiencies, often resulting from the consumption of diets with low nutritional value and diversity, remain a major public health concern for children of low-income countries. Understanding food consumption practices is crucial to provide evidence-based foundation for the design and implementation of effective intervention strategies to address micronutrient deficiencies in vulnerable geographies and populations.
The objective was to collect food consumption data in 6 to 36-month-old healthy children from Abidjan, Côte d'Ivoire.

METHODS
Food and beverage intake of healthy 6- to 36-month-old children was collected by their mother using an interview-based 24-hour dietary intake questionnaire. A baseline questionnaire including medical history, feeding practices, and anthropometric measurement were collected. Dietary intake was assessed after classification based on foods groups and subgroups defined by the FAO/WHO, adjusted to reflect Ivorian food specificities. Dietary quality was evaluated through dietary diversity scores.
RESULTS
407 children were included (6- to 11-month-old: n=213; 12- to 23-month-old: n= 135; 24- to 36-month-old: n=59; 53% female). Exclusive breastfeeding prevalence between 0 and 6 months was 37%. Breastfeeding continuation rates were 85%, 38%, and 3% in the 6- to 11-, 12- to 23- and 24- to 36-month-old group, respectively. The most consumed food groups were dairy (92% of the sample), cereals (88%), roots, tubers and starchy foods (38%), fish (49%), and vegetables (41%), while meat (11%), fruits (15%), eggs (15%), pulses (3%) and seeds and nuts (2%) were seldom consumed. Milk intake decreased with age while cereal and starchy food consumption increased. Dietary diversity was low (3,3 ± 1.4), increasing with age. The proportion of children not meeting the minimum dietary diversity was 74%.
CONCLUSIONS
Our study provides dietary intake data in 6- to 36-month-old children from Côte d'Ivoire, supporting the renewal of nutritional recommendations and policies. Increasing the intake of nutrient-dense foods such as fruits, meats, eggs, and pulses is essential for children to meet the minimum dietary diversity and ensure nutritional adequacy.

IDENTIFICATION OF THE ROLE AND COMPETENCIES OF STAKEHOLDERS INVOLVED IN THE IMPLEMENTATION AND MONITORING OF THE BRAZILIAN NUTRITIONAL FOOD LABELING REGULATION

Daniela Do Carmo Lopes[1]; Lais Amaral Mais[2]; Camila Aparecida Borges[3, 4, 5]; Ana Paula Bortoletto Martins[6, 5]; Neha Khandpur[7, 5]
[1]Nutrition, Faculdade de Saúde Pública USP, São Paulo, Brazil; [2]Idec, Idec - Instituto de Defesa de Consumidores, São Paulo, Brazil; [3]Food Science and Technology, University of Sao Paulo, São Paulo, Brazil; [4]Department of Food Science and Technology, University of São Paulo, São Paulo, Brazil; [5]Center for Epidemiological Research in Nutrition and Health (Nupens/USP), University of Sao Paulo, Sao Paulo, Brazil; [6]Department of Nutrition of the Faculty of Public Health, University of Sao Paulo, São Paulo, Brazil; [7]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES
The Brazilian nutritional labeling regulation of packaged foods, which includes requirements for front-of-package nutritional labeling on certain products, was enforced in October 2022. Studying the implementation and monitoring of compliance with the norms of a regulatory public policy allows identifying existing facilitators and barriers and highlights the need for improvements in the process. This study aimed to identify the stakeholders involved with the regulation, their roles regarding the implementation and monitoring of compliance with the standards, and to verify whether these roles are being fulfilled.
METHODS
A literature review of secondary data was conducted to identify the stakeholders and their roles. Questionnaires were sent to the Brazilian Health Surveillance Agency (Anvisa), Central Public Health Laboratories (Lacen), and municipal and state health surveillance agencies (VISA) based on the Access to Information Law (LAI) to investigate the fulfillment of their responsibilities. The data obtained were qualitatively analyzed using thematic content analysis.
RESULTS
The stakeholders identified included Anvisa, VISA, Lacen, the private sector, and non-governmental organizations. Most of the roles assigned to the implementation of the new standards - preparation of guidance materials, provision of training, and actual monitoring of the regulated sector - are being fulfilled by public agencies. However, the procedures related to monitoring are still deficient compared to what is expected.
CONCLUSIONS
The data demonstrated a need for greater investment and strengthening of health inspection actions and the development of implementation and monitoring protocols for nutritional labeling standards of packaged food. These protocols should connect the actions of all operational levels of the National Health Surveillance System (SNVS) and enable timely work aligned with the objectives of public food and nutrition policies.
CONFLICTS OF INTERESTS

EPO5_199

NOVEL HIGH-DIMENSIONAL MEDIATION APPROACH TO ASSESS PORK CONSUMPTION'S EFFECTS ON LIPID PROFILES

Cecilia Dente[1]; Dario Gregori[1]; Giulia Lorenzoni[1]
[1]Department of Cardiac, Thoracic, Vascular Sciences and Public Health, University of Padua, Padova, Italy

BACKGROUND AND OBJECTIVES
Nutritional epidemiology faces the critical challenge of accounting for the complex interplay of multiple confounding factors when evaluating dietary impacts on health outcomes. This study aims to clarify the effects of pork consumption on lipid profiles by applying a high-dimensional mediation analysis. This innovative approach distinguishes direct effects from those mediated by socio-demographic, dietary, and lifestyle factors, providing more reliable estimates and addressing the limitations of traditional methods.
METHODS
The analysis will use data from the National Health and Nutrition Examination Survey (NHANES) 2007–2018, focusing on adults with complete dietary and laboratory data. Pork consumption, classified into fresh and processed pork, will be assessed using 24-hour dietary recall data. Lipid profiles, including total cholesterol, HDL, LDL, and triglycerides, will serve as outcomes. The methodology uses machine-learning techniques for dimensionality reduction to handle correlations among multiple mediators, such as socioeconomic status, dietary patterns, and health behaviors. This process reduces high-dimensional data into latent variables, which are then incorporated into a traditional mediation model to estimate direct and indirect effects. The robustness of the findings will be ensured through rigorous validation procedures.
RESULTS
Analyses are currently ongoing to define and evaluate the intake of food groups and validating the high-dimensional mediation framework.
CONCLUSIONS
This study addresses a key limitation in nutritional epidemiology by applying advanced analytical techniques to untangle the complex relationships between pork consumption and lipid profiles. The findings are expected to provide clearer, evidence-based insights into how dietary and lifestyle factors influence these associations, ultimately informing public health recommendations and dietary guidelines.

Funding sources: The study received an unrestricted grant from The National Pork Board

EXPLORING MATERNAL DIETARY PATTERNS DURING THE COVID-19 PANDEMIC AND THEIR RELATIONSHIP TO HEALTH LITERACY

Ruthfirst E. A. Ayande[1]; Gloria Ethel Otoo,[2]; Sarah Gonzalez-Nahm[3]; Jessica Pearlman[4]; Sarah N. Taylor[1]; Elena T. Carbone[3]

[1]Pediatrics, Yale School of Medicine, New Haven, United States of America; [2]Nutrition and Food Science, University of Ghana, Accra, Ghana; [3]Nutrition, University of Massachusetts Amherst, Amherst, United States of America; [4]Institute for Social Science Research, University of Massachusetts Amherst, Amherst, United States of America

BACKGROUND AND OBJECTIVES

Pre-COVID-19 pandemic studies have shown sub-optimal dietary diversity in Ghanaian pregnant women based on the WHO minimum dietary diversity for women (MDD-W). Additionally, no published studies have examined maternal diet quality during the pandemic in Ghana. This analysis aimed to assess the relationship between health literacy (HL) and a posteriori-derived dietary patterns of women pregnant during the pandemic.

METHODS

Data was obtained from an online survey of mothers between July 2021 and January 2022. Mothers were eligible if they had an infant between 0-12 months (July-Nov 2021) and up to 15 months (Dec 2021-January 2022) to capture pregnancies carried in 2020. Dietary intake during pregnancy was retrospectively assessed using a 30-item semi-quantitative food frequency questionnaire (FFQ) designed for the study and based on pre-existing knowledge of local Ghanaian foods, FAO dietary guidelines, and relevance to the WHO MDD-W food groups. Maternal energy and protein intakes were assessed using all 30 items of the FFQ. A total of 221 mothers had complete dietary data, out of which three were excluded for daily Calorie values <500 kcal or > 5000 kcal (final N=218). Dietary patterns were obtained using hierarchical cluster analysis of 14 food groups derived from 22 food items on the FFQ. HL was assessed using the All Aspects of Health Literacy (AAHL) scale. A multinomial logistic regression was used to assess the association between health literacy and the identified dietary patterns, adjusting for maternal age and total caloric intake.

RESULTS

Mean±SD age, daily energy and protein intakes were 29.4±5 years, 2010±816kcal, and 78±33g, respectively. Mean HL scores were 7.5±1.6 (total possible=9). Four dietary patterns were identified: low-diversity carnivorous (N=34), low-diversity egg-based (N=68), moderate-diversity plant-based (N=83), and high-diversity omnivorous (N=33). In the adjusted model, for every unit increase in AAHL scores mothers had significantly higher odds of having a moderate-diversity plant-based diet [aOR=2.00 CI: 1.43;2.81 p<.001] and a low-diversity egg-based diet [aOR=1.70 CI: 1.27;2.26 p=0.0003] compared to mothers with a low-diversity carnivorous diet. No statistically significant associations were observed between HL and a high-diversity omnivorous diet.

CONCLUSIONS

Assessments of “post-pandemic” diet quality using similar techniques may provide insights into whether the patterns identified in this analysis represent typical patterns of pregnant women.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

EPO5_202

UNEQUAL PATTERNS AND TRENDS IN REDUCING STUNTING PREVALENCE IN UNDER 5-YEAR BRAZILIAN CHILDREN BETWEEN 1996 AND 2019

Talita Lelis Berti[1]; Gilberto Kac[1]; Paulo Neves[2]
[1]Josué de Castro Nutrition Institute, Observatory of Nutritional Epidemiology, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil; [2]Centre for Global Child Health, The Hospital for Sick Children, Toronto, Canada

BACKGROUND AND OBJECTIVES
Brazil has significantly reduced the prevalence of stunting in children under 5 years since 1990. However, the prevalence of stunting remained almost unchanged at roughly 7% between 2006 and 2019. We explored the prevalence of stunting in Brazil in the last two decades by child age groups and macro-regions of the country to identify gaps in progress.
METHODS
Data from three nationally representative surveys in Brazil were used: the National Survey on Demography and Health of Women and Children (PNDS-1996/2006) and the National Survey on Child Nutrition (ENANI-2019). Stunting was defined as height-for-age z-scores below -2 standard deviations from the WHO growth standard. We estimated the prevalence (95%CI) of stunting for each survey by age groups (0-11, 12-23, 24-59, 0-59 months) and macro-regions, using the survey and svyglm packages in R. Significant differences were examined by analyzing the overlap of the 95%CI. We calculated the relative change over time as a percentage difference in stunting prevalence between each survey.
RESULTS
Final samples included 3979, 4408, and 14553 children under 59 months of age in PNDS 1996, 2006, and ENANI-2019, respectively. The prevalence of stunting in children under 5 years was 13% in 1996, 7.3% in 2006, and 7.0% in 2019, a 47% reduction between 1996 and 2019, but only 4% between 2006 and 2019. The reduction in stunting prevalence was higher in children >24 months and varied according to macro-regions. The highest reduction was in the Northeast region in all age groups, particularly among children aged 24–59 months (23.1% [20.0-26.3] 1996 *vs* 3.9% [1.9-5.8] 2019). Reductions in the North region were statistically significant only among children > 24 months (19.0% [13.7-24.3] 1996 *vs* 8.2% [3.3-13.0] 2019. In the Southeast and Mid-West regions, reductions were only observed among children > 24 months between (6.7% [4.3; 9.1] 1996 *vs* 2.3% [0.7-3.9] 2006; 10.6% [5.8-15.4] 1996 *vs* 4.0% [3.0-5.0] 2019). There was no statistically significant change in stunting in the Southern region.
CONCLUSIONS
Stunting reductions in Brazil did not follow the same pattern by different age groups and macro-regions. While the most substantial progress in stunting under 59 months has been observed in the Northeast, progress was slow in other macro-regions. Therefore, continued attention to appropriately address regional and age-related differences is necessary to increase progress toward further reducing stunting and preventing its consequences.

BREASTFEEDING RATES AND FACTORS ASSOCIATED WITH INFANT DIETARY DIVERSITY AMONG GHANAIAN MOTHERS DURING THE COVID-19 PANDEMIC

Ruthfirst E. A. Ayande[1]; Gloria Ethel Otoo,[2]; Sarah Gonzalez-Nahm[3]; Jessica Pearlman[4]; Sarah N. Taylor[1]; Elena T. Carbone[3]

[1]Pediatrics, Yale School of Medicine, New Haven, United States of America; [2]Nutrition and Food Science, University of Ghana, Accra, Ghana; [3]Nutrition, University of Massachusetts Amherst, Amherst, United States of America; [4]Institute for Social Science Research, University of Massachusetts Amherst, Amherst, United States of America

BACKGROUND AND OBJECTIVES

Psychosocial impacts of the COVID-19 pandemic include increasing rates of maternal anxiety and depression. Effects on infant feeding, such as exclusive breastfeeding, have also been documented. The aim of this study was to examine predictive factors associated with maternal COVID-related anxiety and infant dietary diversity among Ghanian mothers.

METHODS

An online survey was administered to Ghanaian mothers with children 0-15 months old from June 2021 to January 2022. The Coronavirus Anxiety Scale (CAS) and the Obsession with Coronavirus scale (OCS), were used to assess maternal anxiety levels during the pandemic. Using the WHO Infant and Young Child Feeding (IYCF) Questionnaire (Q), mothers were asked questions about the initiation of and exclusive breastfeeding. For infants 6 months and older, dietary diversity (DD) was assessed using a structured qualitative 24-hr recall adapted from the WHO IYCF Q. Infant minimum DD (MDD) was based on consumption of at least 4 out of 7 food groups. Multivariate logistic regression was used to determine predictors of MDD. CAS and OCS were the main exposures of interest to capture maternal psychosocial wellbeing during the pandemic. We adjusted for covariates based on *a priori* criteria.

RESULTS

A total of 221 mother-infant dyads were analyzed. Ninety-five mothers had infants less than 6 months. For infants 6 months and older, a total of 126 mother-infant pairs were analyzed. The rates of probable dysfunctional coronavirus-related anxiety (CAS score ≥9) and probable dysfunctional thinking about COVID-19 (OCS score ≥7) were 11% and 33%, respectively. Fifty-eight percent (58%) of mothers with infants <6 months were not exclusively breastfeeding. The mean DD score among infants was 4.2 ±1.6food groups, with 36% not meeting the MDD. We did not observe statistically significant associations between CAS and OCS scores, and MDD ([aOR for CAS 0.974 CI 0.817-1.162] and [aOR for OCS=1.105 CI 0.935-1.306), social. S support was the only covariate independently and positively associated with MDD. Infants of mothers who reported that they had social support had a statistically significant 5.59 higher odds of meeting the MDD compared to mothers who reported no social support [aOR=5.590 CI 1.573-19.865].

CONCLUSIONS

Given the high proportion of infants not meeting the MDD, interventions aimed at improving DD for Ghanaian infants are needed. More elaborate social network analysis studies examining the most effective social support structures for mothers are also warranted.

HOUSEHOLD WATER SECURITY, DIETARY DIVERSITY, AND NUTRITIONAL STATUS OF 6- TO 23-MONTH-OLD CHILDREN

Khrystal Mae Velasco,[1]; Angelina Bustos[2]; Aileen De Juras[2]; Nelson Jose Vincent Querijero,[3]
[1]Supplementary Feeding Program, Department of Social Welfare and Development Field Office CALABARZON, Muntinlupa City 1770, Philippines; [2]Institute of Human Nutrition and Food, College of Human Ecology, University of the Philippines Los Baños, Los Baños, Laguna, Philippines; [3]Institute of Governance and Rural Development, College of Public Affairs and Development, University of the Philippines Los Baños, Los Baños, Philippines

BACKGROUND AND OBJECTIVES
Household water security is an emerging concept in the study of child nutrition, particularly its role in the food preparation of complementary foods. This study aimed to assess the association of water security to diet diversity and nutritional status of 6- to 23-month-old children. Contextualizing the role of water in households provided an additional determinant in understanding child nutrition during the crucial first 1000 days.
METHODS
A cross-sectional study design was employed and a total of 149 households with children aged 6-to 23-months were randomly sampled. Data collection involved administering adapted versions of the Household Water Insecurity Scale and Minimum Dietary Diversity (MDD) questionnaires; and measuring children's weight and length using standard anthropometric methods. Associations between household water security, dietary diversity, and nutritional status were analyzed using Chi-square tests of independence and Cramer's V coefficient.
RESULTS
The study findings showed that 90% of the households were water secure; and 64% of children not meeting MDD with mean score of 3.93. Stunting was recorded at 26%, underweight at 9% and wasting at 7%. The findings revealed a significant association between household water security and weight-for-age and length-for-age. This suggests that access, use, and water reliability in households have an impact on underweight and stunting among children. On the other hand, there was no direct association observed between water insecurity and MDD. Additionally, having a dual-sourcing strategy for consumptive and non-consumptive purposes of water was observed as coping strategy of households in dealing with water interruption. Food preparation remained a priority, preserving consumptive purposes of water despite water stress in water-insecure households.
CONCLUSIONS
This study emphasized that water experiences at household level have substantial role on the nutritional outcomes of children. Further studies are warranted to widen the current knowledge on factors affecting household water security and its pathways to child nutrition.

NUTRITIONAL ENHANCEMENT OF COMPOSITE JAM VARIETIES, FORMULATED FROM LOCALLY SOURCED INGREDIENTS : A HEALTHIER ALTERNATIVE TO CONVENTIONAL OPTIONS

Nkeiruka Oly-Alawuba[1]; Maryann Ibe-Omogbemi[2]
[1]Nutrition and Dietetics , Imo State University (IMSU), Owerri, Owerri, Nigeria, Federal Republic of; [2]Nutrition and Dietetics, Imo State University (IMSU), Owerri, Owerri, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
The study investigates the Nutritional Enhancement of jam formulations created from composite ratios of zobo extract (Hibiscus sabdariffa), Gorontula (azanza garckeana) beetroot (beta vulgaris, African star apple(chrysophyllum albidum) and lemon (Citrus x limon in relation to a popular conventional jam sold in the market.
METHODS
Two kilograms of zobo calyces were sorted, washed, and boiled to create a clear extract. This was combined with one kilogram each of beetroot and gorontula, which were also sorted, washed, soaked, peeled, and blended to create a pulp. Additionally, half a kilogram of unripe lemon and one kilogram of African star apple were prepared for pectin extraction. The ingredients were heated to achieve a jelly consistency, yielding three composite jam samples (A, B, C) for analysis, alongside a conventional control sample (D). Proximate composition, micronutrient levels, and phytochemical content were determined using AOAC standard methods (2020).
RESULTS
Sample B exhibited a moisture content of 19.72%, indicating better shelf stability compared to control sample D (32.49%). Sample C had a high ash content (18.72%), suggesting it is mineral-rich and nutrient-dense, while sample D had only 10.34%. Sample C also contained lower carbohydrates (33.96%) compared to sample D (45.03%), making it a low-calorie option. Micronutrient analysis showed that the composite jams had higher magnesium (A: 8.77%, B: 6.84%, C: 6.30%, D: 2.80%), beta-carotene (A: 12.34%, B: 9.63%, C: 10.25%, D: 4.26%), and vitamin C (A: 6.72%, B: 6.83%, C: 7.84%, D: 2.84%), which are beneficial for muscle function and iron absorption. Phytochemical content was also elevated in the composite jams, particularly flavonoids (C: 8.68%) and phenols (A: 5.24%), compared to lower levels in sample D.
CONCLUSIONS
The study confirmed the composite jam made from zobo calyces and the locally sourced fruits to be nutrient-dense and thus, a healthy alternative to conventional jams.

ASSOCIATION OF ANEMIA AND OBESITY AMONG FEMALE FACTORY WORKERS IN THAILAND

Yaowalak Rooppat,[1]; Pornpan Sukboon[1]; Pattanee Winichagoon[1]; Sangsom Sinawat[2]; Nattapol Tangsuphoom[1]; Nicole Stoffel[3]; Sueppong Gowachirapant[1]
[1]Institute of Nutrition, Mahidol University, Salaya, Nakhon Pathom, Thailand; [2]Department of Health, Ministry of Public Health, Nonthaburi, Thailand; [3]St Hilda's College, University of Oxford, Oxford, United Kingdom

BACKGROUND AND OBJECTIVES
Anemia and iron deficiency anemia (IDA) are still a prevalent health concern globally, particularly among women of reproductive age (WRA). However, the updated information on these problems in Thailand are scarce. This study aimed to determine the prevalence of anemia, iron deficiency (ID), and IDA among WRA working in factories in Thailand, and to investigate the association between anemia and body mass index (BMI).
METHODS
This cross-sectional study recruited Thai women aged 24–49 years old from eight factories between 2022 and 2025. Blood samples were collected for complete blood count and iron status analysis. Anemia was defined as hemoglobin concentrations <12 g/dL, while ID was identified using a zinc protoporphyrin (ZPP) level >40 µmol/mol or serum ferritin (SF) level <30 µg/L. Weight and height were measured, and BMI was calculated according to WHO international standards. Binary regression analysis was performed to investigate the association between anemia and BMI.
RESULTS
In total, 1,450 female Thai workers aged 37.5±7.7 years were recruited into the study. The overall prevalence of anemia was 31.4%. Based on ZPP or SF cutoff, 12.1 % of ID and 11.7% of IDA were reported, respectively. Among 302 women with available BMI data, almost half of participants (45.7%) are being overweight or having obesity. There is no significant relationship between anemia and BMI among these women (OR=0.96; 95% CI: 0.61–1.51, P=0.86).
CONCLUSIONS
Anemia and obesity are still prevalent among WRA in Thailand. Although, there is no significant association between anemia and obesity in these populations, effective policies including the practical guidelines are required for combating both anemia and obesity problems.

RELATIONSHIP BETWEEN SKIN AGES LEVELS AND LIFESTYLE HABITS OF HEALTHY PEOPLE LIVING IN MIYAZAKI PREFECTURE

Hisae Shinohara[1]; Keisuke Shiose[1]; Ikue Hamaguchi[2]
[1]Faculty of Education, University of Miyazaki, Miyazaki, Japan; [2]Faculty of Human Sciences, Konan Women's University, Kobe, Japan

BACKGROUND AND OBJECTIVES
Extending healthy life expectancy is a major issue in Japan. Advanced glycation end products (AGEs) are thought to be one of the factors involved in the onset and progression of lifestyle-related diseases. Notably, one-third of the AGEs in the body are derived from food, and to control these AGEs, it is important to cultivate good eating habits from childhood. Carotenoids are antioxidants, but in recent years, vegetable intake has been insufficient, affecting anti-glycation and anti-oxidation. This study aimed to clarify the relationship between skin AGE levels, skin carotenoid levels, and eating habits.
METHODS
From September 2023 to November 2024, we examined 106 men (aged 5–54) and 205 women (aged 5–58) living in Miyazaki. Skin AGE levels were determined by evaluating skin auto-fluorescence with an AGE Reader (DiagnOptics). We also measured optical skin carotenoid levels with Veggie Meter® (Longevity Link Corporation) and conducted a self-administered food frequency questionnaire survey. Lifestyle and dietary surveys were also conducted for junior high school students (aged 12–13).
RESULTS
Skin AGEs levels were significantly and positively correlated with age and body mass index for both men and women. For women, a significant negative correlation was found with veggie score. Regarding skin AGEs levels and dietary intake, a positive and significant correlation was found with sugar and sweetener intake for both men and women. For women, a positive correlation was also noted with legume intake. However, significant and negative correlations were found with milk and confectionery intake for both men and women. Fruit intake also showed a significant, negative correlation among women. Junior high school students (12–13 years old) were divided into low and high AGEs groups, with the former going to bed earlier and sleeping longer on weekdays. In terms of dietary habits, the low AGEs group was more satisfied with their meals, ate breakfast more often with their families, and had a higher sense of self-efficacy in being able to eat healthier food.
CONCLUSIONS
The RESULTS suggest that dietary habits and lifestyle guidance that do not raise AGE levels from childhood are important for extending healthy life expectancy.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

PREVALENCE OF EATING DISORDERS AND ASSOCIATED COMORBIDITIES: PREVALENCE SURVERY IN MOROCCO

Lamyae Borghos[1, 2]; Rachida Chabir[3]; Nada Benajiba[4]
[1]Nutritionniste and Psycho-nutritionniste, CABINET DE NUTRITION & DIETETIQUE, Kénitra, Morocco; [2]Laboratoire pathologie humaine, Biomédecine et environnement, Faculty of Medicine and Pharmacy, Fes, Morocco; [3]Laboratoire pathologie humaine, Biomédecine et environnement, Faculty of Medicine and Pharmacy Fez, Fès, Morocco; [4]Centre de nutrition, Centre de Nutrition, tangier, Morocco, Tangier, Morocco

BACKGROUND AND OBJECTIVES
Eating Disorders (ED) are a significant public health issue, as recognized by the World Health Organization (WHO). While initially reported in Western populations, recent studies have shown that ED also affects non-Western countries, including Morocco. These disorders can severely impact an individual's physical and mental health, yet they often remain hidden from family members and are rarely addressed with healthcare providers. Objective: To assess the prevalence of ED among patients attending various medical consultations in private practices in Morocco and to identify associated factors.
METHODS
This study included 59 patients from three private clinics (Endocrinology, General Medicine, and Nutrition) in Morocco. Participants completed anonymous self-report questionnaires that collected sociodemographic, medical, and dietary information. Three validated ED screening tools were used: SCOFF, EAT-40, and Test-Bulit. Data collection took place between January and April 2017. Statistical analysis was conducted using SPSS and XL STAT software, with a p-value of <0.05 considered statistically significant.
RESULTS
The study found that more than 50% of the participants showed signs of ED. Prevalence was higher in patients with medical conditions, with 32.15% identified by EAT-40 and 48.04% by Test-Bulit. Among diabetic patients, 32.03% showed signs of ED.
CONCLUSIONS
This study highlights the significant prevalence of ED in the patient sample, particularly among those with pre-existing conditions like diabetes. The findings underscore the need for multidisciplinary care and further research to improve prevention and early intervention strategies for ED in Morocco.
CONFLICTS OF INTERESTS

NUTRITION AND PUBLIC HEALTH INDICATORS ASSOCIATED WITH EARLY CHILDHOOD DEVELOPMENT AMONG CHILDREN AGED 19-36 MONTHS: A SECONDARY ANALYSIS OF THE 2022 DEMOGRAPHIC AND HEALTH SURVEY

Edilson Soldevilla-Huanca[1, 2, 3]; Paul Hinojosa-Mamani,[2]; Gabriela Santos-Antonio,[2]; Carmen Magali Meléndez-Jara[4]; Gilmer Solis-Sánchez,[2]; Haydee Cárdenas-Quintana[1, 3]; Juan Pablo Aparco,[2]
[1]Doctorado en Nutricion, Universidad Nacional Agraria La Molina, Lima, Peru; [2]Centro Nacional de Alimentacion, Nutricion y Vida Saludable, Instituto Nacional de Salud, Lima, Peru; [3]Instituto de Seguridad Alimentaria Nutricional, Universidad Nacional Agraria La Molina, Lima, Peru; [4]Facultad de Psicología, Universidad Nacional Mayor de San Marcos, Lima, Peru

BACKGROUND AND OBJECTIVES
More than 50% of children in the country fail to achieve developmental milestones. However, the available information has not been integrated to measure early childhood development (ECD) and its associated indicators, making it challenging to guide nutrition and public health interventions. This study aimed to determine the association between nutritional and public health indicators with ECD among children aged 19-36 months.
METHODS
A cross-sectional analytical study with data from 4024 children among 19-36 months, obtained from the 2022 Demographic and Family Health Survey (ENDES), conducted at the national level. ECD was evaluated according to the achievement of at least 3 development components: literacy or cognitive language, physical development, socio-emotional development, and learning. Nutrition and public health indicators are included in four groups: maternal health, child health and nutrition, child care and life conditions, considering the nurturing care framework. A generalized linear model with a Poisson family was used to report associations through prevalence ratios.
RESULTS
The prevalence of inadequate ECD was 49.6% among children aged 19-23 months and 10.6% among those aged 24-36 months. Adequate dietary diversity reduced the probability of inadequate ECD among children aged 19-23 months (*aPR: 0.81, 95%CI : 0.67-0.97*). In contrast, factors such as the absence of skin-to-skin contact (*aPR: 1.19, 95%CI: 1.03-1.38)*, living in a household inadequate flooring material (*aPR: 1.21, 95%CI: 1.05-1.39)*, and the mother approving some form of violence against women (*aPR: 1.51, 95%CI: 1.11-2.05)* increased the probability of inadequate ECD. Among children aged 24-36 inadequate ECD was associated with the mother expressing a desire to delay pregnancy (*aPR: 1.41, 95%CI: 1.05-1.88*) and not receiving iron supplements during pregnancy (*aPR: 2.18, 95%CI : 1.33-3.60*).https://qr.link/Wkxd6a
CONCLUSIONS
There are nutritional and public health indicators associated with ECD among children aged 19-36 months in the country; therefore, it is essential to address these and leverage opportunities to strengthen protective, thereby supporting the achieving of the objectives outlined in the national ECD policy.

A CASE STUDY FOR CHANGE: ARE WE LEAVING BEHIND RURAL INDIGENOUS CHILDREN IN SOUTH AMERICA?

Angeline Gonyea[1]; Krysty Sharon Meza Carbajal[2]; Reyna Liria[2]; Malena Martinez[1]
[1]Scientific and Social Projects, Mater Iniciativa, Barranco, Peru; [2]Research and Social Projects, Instituto de Investigación Nutricional, La Molina, Peru

BACKGROUND AND OBJECTIVES
This descriptive, cross-sectional case study brings awareness to the critical data gaps in the nutritional health of children in remote indigenous communities of Peru, where access to healthcare and government resources is scarce. We assessed the nutritional status, feeding practices, and food environment of a small group of children aged 3-6 years attending a public pre-kindergarten program (PRONOEI) in the Maras District of Cusco. While malnutrition and anemia surveillance programs exist in Latin America, their reach is limited in remote regions. Even within rural departments, data collection and resources are concentrated in 'the urban areas of rural departments' (Mujica-Coopman et al., 2015). Despite limited data, the risks are significant: children with multiple forms of malnutrition face a 4 to 12 times higher risk of mortality (McDonald et al., 2013). Peru also has one of the highest rates of childhood anemia in Latin America, with national prevalence unchanged in the last decade, from 32.9% in 2012 to 33.6% in 2022 (INEI).
METHODS
Study assessed hemoglobin levels for anemia adjusted for altitude, collected anthropometric data, conducted dietary surveys, and observed local food environments.
RESULTS
A significant coexistence of nutritional deficiencies and excesses was observed, with 58% of children being anemic (71.4% boys, 40% girls), one-third experiencing stunting (predominantly girls) and another third showing excess weight. Limited iron intake, insufficient nutrient-dense foods, and a lack of dietary diversity was observed.
CONCLUSIONS
The issue and gravity of malnutrition among children in rural and indigenous communities are complex and remain largely underexplored. Our study examines a range of cultural and environmental factors, as well as the coexistence of multiple forms of malnutrition. There is a clear need for more detailed, context-specific research to complement national and international surveys. Building on this work, we plan to conduct follow-up research focused on improving water access in these communities, with the aim of improving health, food security, and income generation. We emphasize the critical need for inclusive, representative data collection and for policies that address the unique challenges faced by remote indigenous populations. Even if surveyors reached the 'rural areas of rural districts,' they may encounter region-specific challenges, such as high illiteracy rates. Alternative approaches--such as descriptive case studies or fingerprint identification for data collection--could be explored to help overcome barriers to engagement and effective intervention.

STUDY OF THE RELATIONSHIP BETWEEN PERCEPTION OF THE NATIONAL PLAN OF ACTION ON NUTRITION PHASE 1 (B.E. 2566 – 2570) AND THE PLAN IMPLEMENTATION BY ORGANIZATION RESPONSIBLE FOR KEY PROJECTS

Kunlanant Senkham[1]; Saipin Chotivichien; Narttaya Ungkanavin[1]; Passakorn Suraphad[1]; Onwara Dejsakulkrai[1]
[1]Bureau of Nutrition, Department of Health, Ministry of Public Health, Nonthaburi, Thailand

BACKGROUND AND OBJECTIVES
This study aims to assess the level of perception and implementation of the The National Plan of Action on Nutrition Phase 1 (B.E. 2566 – 2570) (NPAN) among agencies responsible for key projects and analyze the relationship between the perception of the plan and its implementation.
METHODS
A mixed-methods approach comprising quantitative research through questionnaires completed by 59 participants and qualitative research through in-depth interviews with seven representatives from agencies responsible for implementing key projects.
RESULTS
The study sample predominantly comprised officers from government agencies (88.1%), with the majority being civil servants (64.4%) and operational staff (52.5%). Most respondents had 1–5 years of work experience (37.3%). The overall perception of the NPAN was rated as high ($\bar{x}$=3.707, SD=0.470), while the overall implementation was assessed at a moderate level ($\bar{x}$=3.450, SD=0.836). A significant positive correlation was found between the perception and implementation of the NPAN (r=0.456, p=0.000). However, further analysis revealed an inverse relationship between the perception of nutritional problems and the adequacy of resources for implementation. This observation aligns with the 'issue attention cycle,' which posits that public interest in a given issue tends to peak initially but gradually declines over time due to the complexity of the problem. As a result, resources are often reallocated to address emerging priorities over time. Implementation challenges were also identified, including insufficient communication, limited budgets, and a shortage of dedicated nutrition personnel at the local level. To address these challenges and improve the NPAN, the study recommends proactive communication strategies utilizing diverse media. Building cross-sectoral partnerships with private sectors, educational institutions, and community networks is essential to fostering collaboration. Awareness-raising activities should be organized to deepen understanding and encourage active participation. Lastly, disseminating information and training for practitioners should leverage digital media and online platforms to ensure effective communication.
CONCLUSIONS
This study emphasizes the importance of improving communication strategies and allocating resources more effectively to strengthen the implementation of the NPAN. The findings provide a foundation for revising and enhancing the plan during the latter half of its period (B.E.2569–2570).

ASSOCIATION BETWEEN DIETARY FACTORS AND OVERWEIGHT/OBESITY AMONG MOTHERS AND THEIR CHILDREN IN URBAN AND RURAL MALAWI

Ai Yasudomi[1, 2]; Aubrey Mankhaka-Banda[3]; Mayamiko Munthali Khomba[4]; Miki Miyoshi[1]
[1]Graduate School of Health Sciences, Aomori University of Health and Welfare, Aomori, Japan; [2]Nutrition Department, Tokyo Metropolitan Tama-Hokubu Medical Center, Higashimurayama, Tokyo, Japan; [3]Mzuzu Central Hospital, Ministry of Health, Mzuzu, Malawi; [4]Kamuzu Central Hospital, Ministry of Health, Lilongwe, Malawi

BACKGROUND AND OBJECTIVES
To prevent increasing childhood obesity and non-communicable diseases (NCDs) among women in sub-Saharan Africa, as well as to understand the factors of food consumption in the population, this study aimed to identify the relationship between overweight/obesity and dietary intake among children and mothers in urban and rural Malawi.
METHODS
We conducted anthropometric measurements (height, weight and MUAC) for children and mothers, blood pressure measurements for mothers, questionnaire interview with mothers with children aged 2-4.9 years in Lilongwe City (an urban area) and Mzimba District North (a rural area). Dietary survey was consisted of the 24-hour recall method and food frequency questionnaires. Participants' mothers were classified as overweight/obese (BMI≥25) and normal weight (18.5≦BMI<25) and children were classified into two groups; “high weight” and “low weight”. Nutrients, food consumption, food frequency questionnaires, MDDW, MDD, and questions at $p<0.01$ in the t-test for independent samples were performed a logistic regression analysis.
RESULTS
Of 229 pairs, 200 pairs mother and children were analyzed in this study. Consequently, 37.5% (urban 34.0% and rural 40.2%) of mothers were classified as obese (BMI≥25), and 4.5% (urban 8.0% and rural 1.8%) of children were classified as overweight (WHZ≥3). According to our logistic regression analyses, fats and egg intake were positively associated with obesity in urban mothers, while carbohydrates (nsima) intake, number of deliveries, family history of NCDs, and increased income were positively associated with obesity in rural mothers. On the other hand, meat and fish intake were negatively associated with obesity in urban mothers, while rice, fats, and egg intake, and children’s diverse food intake (MDD>5) were negatively associated with obesity in rural mothers. As for the children, those who were classified as wasting (WHZ<-2) were excluded. It was found that green leafy vegetable intake were positively associated with child weight gain both mothers and children in urban area.
CONCLUSIONS
The dietary factors related to the mother’s obesity differed in urban and rural areas. In rural area, the dietary diversity of children was a determinant to prevent obesity among mothers. To prevent childhood obesity and NCDs in Malawi, they are necessary to through the life course appropriate approach considering the areas and targets, and child nutrition education for mothers may prevent mothers' NCDs as well as child growth and health.

CURRENT STATE OF NORMAL WEIGHT OBESITY IN WOMEN AND DIETARY LIFESTYLE RECOMMENDATIONS

Yoshiko Hattori[1]; Masashi Hattori[2]; Kazuhisa Sugiyama[3]; Takayoshi Tsukahara[4]
[1]Nutrition Department, Yamashita Hospital, Ichinomiya, Japan; [2]Gastroenterology, Yamashita Hospital, Ichinomiya, Japan; [3]Health evaluation and promotion center, Yamashita Hospital, Ichinomiya, Japan; [4]Graduate School of Nutritional Sciences, Nagoya University of Arts and Sciences, Nisshin, Japan

BACKGROUND AND OBJECTIVES
Many women with high body fat percentages, referred to as Normal Weight Obesity（NWO）, are not classified as obese based on BMI or waist circumference and are often excluded from lifestyle improvement guidance. This study aimed to investigate the prevalence of NWO and its associated dietary challenges to support the prevention of cardiovascular diseases.
METHODS
A total of 471 women aged 40–74 years who underwent health checkups and body composition measurements in 2023 were divided into two groups: the normal group (BMI 18.5–<25, body fat <30%) and the NWO group (BMI 18.5–<25, body fat ≥30%). Anthropometric data, blood tests, body composition (InBody 470), dietary awareness, and food frequency surveys were analyzed.
RESULTS
Among the participants, 54.6% were classified as having NWO. Compared to the normal group, the NWO group exhibited higher body fat, visceral fat, waist-to-hip ratio, triglycerides (TG), and LDL cholesterol (LDL-C), as well as lower HDL cholesterol (HDL-C). They consumed more bread, noodles, beverages, pickled foods, vitamin B1, and salt. Despite recognizing themselves as “slightly overweight,” participants prioritized food preferences over health awareness and demonstrated limited knowledge about maintaining physical activity, with no significant differences in exercise habits. NWO individuals showed fat accumulation in the abdomen and hips, reduced lower limb muscle mass, and increased visceral fat, suggesting a pre-metabolic syndrome state. Weight control efforts often relied on dietary adjustments, highlighting concerns about imbalanced diets and inadequate health knowledge.
CONCLUSIONS
Early lifestyle intervention targeting NWO is essential to prevent metabolic syndrome, sarcopenic obesity, and cardiovascular diseases. Expanding health guidance to include individuals with NWO can enhance health literacy, promote proactive health behaviors, and support healthy aging.

INTEGRATING NUTRITION EDUCATION IN PHARMACY CURRICULA: INSIGHTS FROM A STUDY ON KNOWLEDGE, ATTITUDES, AND CONSUMPTION OF NUTS AMONG SERBIAN STUDENTS

Nevena Ivanović[1]; Margarita Dodevska[2]
[1]Department of Bromatology, University of Belgrade Faculty of Pharmacy, Beograd, Serbia; [2]., Institute for Public Health "Dr. Milan Jovanović Batut", Belgrade, Serbia

BACKGROUND AND OBJECTIVES
Nuts are known for their health benefits, including reducing the risk of chronic diseases such as cardiovascular disease and diabetes. Nevertheless, their consumption remains below recommended levels worldwide. This study aimed to investigate the attitudes, knowledge and consumption habits of pharmacy and non-pharmacy students in Serbia regarding nuts, with a particular focus on the influence of nutrition education, which is an integral part of the pharmacy curriculum in Serbia, on the promotion of positive attitudes and dietary habits.
METHODS
A cross-sectional study was conducted using an online questionnaire distributed to pharmacy and non-pharmacy students in Serbia. The survey collected sociodemographic characteristics, attitudes, knowledge and consumption habits related to nuts. Statistical analyzes, including chi-square tests, were used to examine differences between pharmacy and non-pharmacy students and the influence of nutrition-related courses on responses.
RESULTS
Of the 509 respondents (382 pharmacy students and 127 non-pharmacy students), pharmacy students showed significantly higher knowledge of the health benefits of nuts, with a mean of 4.89 ± 2.4 (R: 0–11, Mdn: 5) for the group of students who successfully passed the exam, compared to the total sample 3.9 ± 2.5 (R: 0–11, Mdn: 4). For the 10 statements about the health benefits and nutritional importance of nuts, there was a statistically significant difference in attitudes between pharmacy students and non-pharmacy students. More than half of the respondents (57.8%) expressed a strong interest in additional information about nuts, with 27.5% of pharmacy students indicating that this topic is not adequately covered in nutrition-related courses. 81.7 of the students included nuts in their diet, with walnuts, almonds and hazelnuts being the most commonly consumed nuts. More than half of respondents (57.8%) expressed a strong interest in additional information about nuts, with 27.5% of pharmacy students stating that this topic is not adequately covered in nutrition-related courses.
CONCLUSIONS
Integrating comprehensive nutrition education into pharmacy curricula can potentially improve future pharmacists' ability to promote healthy dietary behaviours, including increased nut consumption. This study emphasises the need for targeted educational interventions to address existing knowledge gaps and strengthen the role of pharmacists in promoting healthy eating in the population.

ECONOMIC BURDEN OF OBESITY IN HUNGARY ESTIMATION ABOUT OBESITY RELATED PUBLIC HEALTH CARE EXPENDITURES AND OUT OF POCKET PAYMENTS IN 2019 AND 2022

Imre RURIK[1]; Emese Antal[2]
[1]Semmelweis University, Hungarian Society of Nutrition, Budapest, Hungary; [2]Nutrition, ESSRG, Budapest, Hungary

BACKGROUND AND OBJECTIVES
Background. Obesity is an important threat to national and global public health in terms of prevalence and economic burden due to the obesity-related complications (ORCs) and morbidities.
Aim of this study is to calculate the obesity related public expenditures in Hungary, to estimate the expenses and contribution of patients in 2019 (before) and in 2022 (after) the covid-pandemic.
METHODS
Method. The National Health Insurance Fund is the only health-care financing agency in a single-payer social-insurance system in Hungary, managing all of the public payments. Expenditures related to the patients with obesity and more frequent co-morbidities were requested from the national database. Financing of the inpatient (hospital) and the outpatient (secondary or ambulatory care) providers, reimbursement for prescription of medicines and healing aids were collected. Lower and upper thresholds were estimated, representing the prevalence of the respective morbidities among obese persons. The upper values were used in the final estimation, because many of other obesity related morbidities and treatments were not included in the calculation.
RESULTS
RESULTS. Obesity-related morbidities represent 10-12 % of all cases in the public health care system. National public health care expenses could be about 144 Billion HUF (444 Million EUR) for 2019 and 133 Billion HUF (339 Million EUR). These sums represent 7-11% of the national spending for health care provision, without sick leave expenditures. The co-payment of patients was estimated 34 Billion HUF (104 Million EUR) and 43 Billion HUF (109 Million EUR), respectively. The public and individual expenditures together represents 0.3-0.4% of the Hungarian GDP.
This study presents whole national database which is appropriate for reliable calculation.
CONCLUSIONS
Reducing of high expenses could be possible by weight maintenance, preferable as early prevention, and weight reduction among persons living with obesity at individual level. Beside these, more efforts are needed in the education and public health policy.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

ADULT'S PRACTICES AND PERCEPTIONS ABOUT THE ORGANIZATIONAL FOOD ENVIRONMENT

Ana Beatriz Azevedo[1]; Daniel Egaña[2]; Lorena Rodriguez,[3]; Maggiolo, Carolina Franch[4]; Daniela Canella[5]; Patricia Gálvez Espinoza[6]

[1]Instituto de Nutrição, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil; [2]Department of Primary Care and Family Health, University of Chile, Santiago, Chile; [3]Depto Salud Pública, Depto Salud Pública, Facultad de medicina UC, Santiago, Chile; [4]Antropology, Universidad de Chile - Campus Juan Gómez Millas, Ñuñoa, Chile; [5]Nutrição Aplicada, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil; [6]Nutrition, University of Chile, Santiago, Chile

BACKGROUND AND OBJECTIVES

The global prevalence of obesity among adults has been increasing at an alarming rate in recent decades. The same is true in Chile, which faces a major problem related to the high prevalence of malnutrition and other non-communicable diseases. Considering that adults spend a large part of their day in the workplace or educational institutions, the Organizational Food Environment can play a strategic role in the health of adults, therefore, it is necessary to understand these environments. To describe the practices and perceptions of adults regarding the organizational food environment in their workplace or place of study.

METHODS

A non-experimental, cross-sectional study was conducted. Adults over 18 from randomly selected households in two districts of Santiago, Chile, participated. A short version of the NEMS-P questionnaire for Chile (NEMS-PCh) was applied, which included an assessment of the Organizational Food Environment. Items were reported using relative frequency and a weighted score was calculated to assess the obesogenicity of this environment. The more negative the score, the more obesogenic the environment. Software Stata v. 18.0 was used for the analyses.

RESULTS

400 participants answered the Organizational Food Environment section. Of these, 53.3% bring food from home and 46.7% buy their meals at or near their place of study or work. 73.3% believe that it is easy to find places to eat. 20.7% perceive that they can never find places with several menu options or healthy foods and 22.5% responded that it is always difficult to find healthy eating options. 18% believe that it is never easy to find fresh fruits and vegetables and 33.5% believe it is always more expensive to buy healthy options. The median score of the Organizational Food Environment was 2.39 points, 31% of the participants scored less than 0 (more obesogenic).

CONCLUSIONS

For a considerable part of the participants, the organizational food environment would not allow them to follow healthy eating patterns. Public policies aimed at improving access to and availability of healthy foods in work environments are necessary.

ASSESSING DIETARY INTAKE AND NUTRITIONAL STATUS IN HUNGARIAN CHILDREN: PRELIMINARY FINDINGS AND FUTURE DIRECTIONS USING THE HEALTHY EATING INDEX

Diana Sarga[1]; Biró Lajos[2]; Veresné Dr. Bálint Márta[2]
[1]Doctoral College of Semmelweis University, Health Sciences Division, Semmelweis University, Budapest, Hungary; [2]Faculty of Health Sciences, Department of Dietetics and Nutritional Sciences, Semmelweis University, Budapest, Hungary

BACKGROUND AND OBJECTIVES
The growing prevalence of childhood obesity is a major public health issue, posing serious risks to physical and psychological well-being. In Hungary, 23% of children aged 4–10 years are overweight or obese. This study aims to identify the economic, educational, regional determinants influencing nutritional status and dietary intake in children. It aims to use the Healthy Eating Index (HEI) to benchmark dietary quality against global standards and explore its associations to socioeconomic factors. No HEI data exists for Hungarian children, which could enhance global comparability and guide targeted interventions.The analysis of HEI data is ongoing and will be completed in time for presentation at the conference.
METHODS
Representative survey was conducted among 733 children aged 4–10 years in Hungary. Data collection included three-day dietary records, anthropometric measurements, questionnaires assessing physical activity, parental attitudes, socioeconomic status. Statistical analyses (ANOVA, Pearson correlation) were used to examine relationships between Body Mass Index (BMI), nutrient intake, physical activity, and socioeconomic variables. Ongoing HEI analyses will assess overall diet quality and its link to socioeconomic factors.
RESULTS
Preliminary findings indicate a higher prevalence of overweight and obesity in economically advantaged western regions and the capital. Children from higher-income households are significantly more likely to be overweight or obese. There is a positive correlation between BMI and energy intake. Obese children consumed more nutrients across food groups and engaged in 4.5 fewer hours of physical activity weekly compared to their peers. Maternal education level showed no significant association with BMI. Regional disparities were observed in some food group consumption, although overall nutrient intake was consistent nationally, including excessive fat and sugar, low dietary fiber, fruit, vegetable intake. Dietary awareness and level of education influenced food choices irrespective of income.
CONCLUSIONS
Findings emphasize the need to address regional, economic, educational inequalities in dietary behaviours and obesity rates among Hungarian children. The ongoing HEI will provide a comprehensive assessment of overall dietary quality. The country represents a unique intersection of Western and Eastern dietary patterns, and it offers a valuable perspective for understanding the role of socioeconomic and cultural factors in shaping dietary habits. This can contribute to the broader international dialogue on effective strategies for improving diet quality and preventing childhood obesity.

EPO5_225

QUALITY OF NUTRITION EDUCATION/COUNSELLING TOWARDS ANAEMIA PREVENTION AND CONTROL DURING PREGNANCY IN ETHIOPIA

Melaku Engidaw[1]; Lee Patricia[1]; Ahmed Faruk[2]
[1]Public Health, Griffith University, Gold Coast, Australia; [2]Public Health, School of Medicine and Dentistry, Griffith University, Gold Coast, Australia

BACKGROUND AND OBJECTIVES
Anaemia during pregnancy was a major public health issue globally, especially in low- and middle-income countries like Ethiopia, despite the availability of preventive interventions. This highlighted potential gaps in implementation, particularly in the quality of nutrition counselling services. So, this study aimed to assess the quality of nutrition education services during pregnancy in relation to anaemia prevention and control in Ethiopia.
METHODS
The study was conducted from September 1 to 30, 2024, at public health facilities in the South Gondar districts and Debre Tabor Town Administration in Northwest Ethiopia. A total of 791 pregnant women were included in the study. Data were collected at the end of ANC services through exit interviews using a structured service quality (SERVQUAL) questionnaire administered via the Qualtrics survey tool (v2.57). The collected data were imported into Stata 17/MP for analysis. Descriptive analysis was performed, followed by multilevel linear regression to determine associations between independent variables and the quality of nutrition education or counselling. A p-value of ≤ 0.05 was used to determine statistical significance.
RESULTS
In this study, 791 pregnant women data were included into this study. Overall, the the quality of nutrition counselling for anaemia prevention was found to be low. Ordinal logistic regression analysis showed that healthcare providers' years of service (AOR = 0.89, 95% CI: 0.82, 0.97), effective communication with pregnant women (AOR = 3.87, 95% CI: 2.67, 5.63), use of visual aids (AOR = 3.99, 95% CI: 2.51, 6.38), and administrative roles were associated with the quality of nutrition counselling for anaemia prevention. Additionally, travel time to antenatal care facilities (AOR = 0.99, 95% CI: 0.98, 0.99) and quality nutrition services during pregnancy (AOR = 3.42, 95% CI: 2.35, 4.97) were significant factors.
CONCLUSIONS
The quality of nutrition education counselling services was low across all healthcare facilities. Factors related to pregnant women, infrastructure, and healthcare providers were linked to the quality of these services. Interventions targeting these factors are essential to mitigate the prevalence and impact of anaemia during pregnancy.

FACTORS ASSOCIATED WITH THE PRESENCE OF HEALTH AND NUTRITION CLAIMS ON FOOD AND BEVERAGE PACKAGING SOLD IN THE BRAZILIAN FOOD RETAIL

Camila Aparecida Borges[1]; Natalia Isadora Rebolledo Fuentealba,[2]; Ana Clara Duran[3]
[1]Food Science and Technology, University of Sao Paulo, São Paulo, Brazil; [2]Institute of Nutrition and Food Technology (INTA), Institute of Nutrition and Food Technology (INTA), Santiago, Chile; [3]Center for Food Studies and Research, Center for Epidemiological Research in Nutrition and Health, Campinas, Brazil

BACKGROUND AND OBJECTIVES
Aggressive and widespread marketing of unhealthy foods and beverages is recognized as a health risk factor, especially for children. Nutrition and health claims on food labeling can produce a “halo” effect, encouraging the purchase of products with excessive sugars, fats, and sodium. This study aimed to estimate the proportion of foods with health and nutrition claims, examine the association between claims and food categories, prices, brands, and critical nutrients, and assess compliance with Brazilian labeling legislation.
METHODS
This cross-sectional study used data from Mintel’s Global New Products Database. A total of 7,057 foods and beverages between 2018-2021 were analyzed. Health and nutrition claims on packaging were coded using protocols developed by The International Network for Food and Obesity/Noncommunicable Diseases Research, Monitoring and Action Support (INFORMAS). Associations between health and nutrition claims and price, brand, nutrition composition and food processing were examined using Poisson regression ($p < 0.05$).
RESULTS
Seventy-seven percent of the sample were ultra-processed foods (UPFs), which had a higher proportion of nutrition and health claims on their packaging. Non-carbonated sweetened beverages and dairy beverages had the highest proportions of packages featuring two or more health or nutrition claims on their labels (~20%). Among products with health claims, 10.7% were high in added sugars, 7.4% were high in sodium, and 7.8% were high in saturated fats. For products with nutrition claims, 32.1% were high in added sugars, 23.3% high in sodium, and 23.1% high in saturated fats. Private label products, which account for up to 80% of market sales, were significantly associated with a higher prevalence of health claims (adjusted PR 4.03, 95% CI 2.58; 6.29) and nutrition claims (adjusted PR 1.55, 95% CI 1.23; 1.96) in the food groups studied, regardless of the amounts of critical nutrients in excess, price, or degree of food processing.
CONCLUSIONS
Private label products and UPFs were associated with a high prevalence of the health and nutrition claims on packaging. A high proportion of products that exceed critical nutrients and still carry these claims, raising the question of whether in the future the presence of front-of-pack nutrition labelling could discourage the purchase of these products or whether these claims highlighting isolated nutrients will prevail.

A RANDOMIZED CONTROL TRIAL TO ASSESS THE EFFECT OF COOKED MILLET-DIET ON HEMOGLOBIN AND OTHER MICRONUTRIENT STATUS AMONG ANEMIC WOMEN OF REPRODUCTIVE AGE

JP Devraj[1]; Santosh Kumar Banjara[1]; Jj Babu Geddam[2]; Radhika Ms[3]; Rajender Ananthan[4]; Hemant Mahajan,[5]; Karthikeyan Ramanujam[6]; Vijayalaxmi G[1]; Aruna Reddy V[1]; Samarasimha Reddy[6]; Sourav Sen Gupta[7]; Swarnalaksmi J[1]

[1]Clinical Epidemiology Division, ICMR-National Institute of Nutrition, Hyderabad, Telangana, India, India; [2]Clinical Epidemiology Division, ICMR - National Institute of Nutrition, Hyderabad, India; [3]Dept of Dietetics, ICMR - National Institute of Nutrition, Hyderabad, India; [4]Food Chemistry and Nutrient Analysis, ICMR-National Institute of Nutrition, Hyderabad, India; [5]Maternal and Child Health Division, ICMR - National Institute of Nutrition, Hyderabad, India; [6]Clinical Epidemiology Division, ICMR-NIN, Hyderabad, India; [7]Pathology and Laboratory Medicine, Emory university school, Atla, United States of America

BACKGROUND AND OBJECTIVES

Background: Iron deficiency Anemia and other micronutrient deficiencies among women of reproductive age is a significant public health concern in India with the prevalence exceeding 50%. The inclusion of micronutrient-rich millets in their habitual diet presents a sustainable strategy to improve micronutrient intake. This study aimed to evaluate the impact of millet-based recipes on hemoglobin levels and the overall micronutrient status of anemic women of reproductive age residing in Hyderabad, India.

METHODS

A cluster-randomized controlled trial was conducted on 822 women aged 17 to 22 years (diagnosed with mild to moderate anemia), enrolled in Government welfare residential degree colleges. Participants were randomly assigned to either the intervention or control group. The intervention group consumed millet-based meals incorporating pearl millet, finger millet, and foxtail millet for 4–5 months, while the control group continued their habitual diet. Venous blood samples were collected and Hemoglobin levels were assessed at three time points using a hematology autoanalyzer. Micronutrient levels were analyzed at both baseline and endpoint using the Abbott i-STAT 1000 autoanalyzer.

RESULTS

The baseline characteristics were comparable between the two groups. The mean duration of intervention was 128 ± 11 days and the average millet intake was 50 g/day. Hemoglobin levels showed a significant improvement in the intervention group (10.37 to 10.48 g/dL), whereas a decline was observed in the control group (10.45 to 10.29 g/dL), resulting in a statistically significant difference between the groups. The trajectory of mean hemoglobin levels over time demonstrated a significantly favorable trend in the intervention group compared to the control group ($p < 0.044$). Additionally, mean changes from baseline for folate and vitamin B12 levels were greater in the intervention group than in the control group. However, changes in other micronutrients such as ferritin, zinc, calcium, vitamin D, were comparable between the two groups from baseline to endline.

CONCLUSIONS

The Millet-based dietary intervention significantly improved hemoglobin, folate, and vitamin B12 levels among anemic women of reproductive age. However, no substantial changes were observed in other micronutrients. These findings highlight the potential of millets as a sustainable dietary strategy for anemia management. Further research is needed to explore long-term benefits and integration into public health programs.

PARENTS' PERCEPTIONS OF SCHOOL MEAL PROVISION AND THE SCHOOL CANTEEN ENVIRONMENT IN NORTHERN IRELAND: THE CANTEEN STUDY

Christina O'Neill[1]; Charlotte Neville[1]; Lesley Hamill[1]; Desiree Mc Ilwee[1]; Sarah Moore[1]; Cara Mc Connell[1]; Miranda Pallan[2]; Marie Murphy[2]; Estera Sevel[2]; Emma Louise Alving-Jessep[2]; Ellie Ansell[2]; Jayne Woodside[1]
[1]Centre for Public Health, School of Medicine, Dentistry and Biomedical Sciences, Queen's University Belfast, Belfast, United Kingdom; [2]Department of Applied Health Sciences, University of Birmingham, Birmingham, United Kingdom

BACKGROUND AND OBJECTIVES
School meals play a crucial role in promoting healthy eating habits among secondary school pupils. Understanding parents' perceptions of school meal provision and the wider school environment is important to consider when investigating school meal uptake and school food policy. This research explored parents' perceptions of secondary school pupils towards school meal provision and the canteen environment.
METHODS
The research used online survey responses completed by 327 parents of Year 8 & Year 11 pupils, recruited from 17 secondary schools in Northern Ireland, as part of the CANTEEN study. CANTEEN is an ongoing cross-sectional study investigating Free School Meals, diet quality and food insecurity in UK secondary schools. The online parent survey included questions about perceptions of school food and the canteen environment, with responses measured using a 5-point Likert scale. Descriptive statistics were used for data analysis.
RESULTS
Overall, the majority of parents perceived school food and the canteen environment positively. Over half (55%) of parents agreed or strongly agreed, that buying food at school was the most convenient and easiest option for their child, with 73% of parents agreeing/ strongly agreeing, that the way their child bought their lunch was straightforward and efficient. Despite this, less than a quarter of parents (23%) felt that pupils were given enough time to buy their lunch without feeling rushed. Regarding the canteen environment, most parents considered the dining areas to be clean (57% agreed or strongly agreed), provided adequate space to eat (62%) and that their child was able to eat with their friends in the dining area (81%). Few parents (23%) perceived their child's friends to influence their food choices at school. Parents held less favourable views regarding the canteen menu and food pricing. Less than one third (27%) of parents agreed or strongly agreed that the food offered in the canteen was clearly priced, and that the school menu was easily available for pupils to view in advance of going to the canteen (31%) while just over one third (34%) viewed the food and drinks offered to be good value for money. Over half of parents (60%) agreed or strongly agreed that pupils had easy access to free drinking water.
CONCLUSIONS
It is important to explore parents' perceptions of school food and the canteen environment to understand what factors affect school meal uptake and to enable school policy makers to make informed decisions towards improving food provision for secondary school pupils.

SCHOOL HEALTH SERVICES, HEALTHFUL SCHOOL ENVIRONMENT, AND DIETARY DIVERSITY AMONG CHILDREN WITH AND WITHOUT SCHOOL FEEDING PROGRAMS IN OSOGBO AND OGBOMOSO, NIGERIA

Tomilola Dorcas Makinde[1]; Oluwatosin Emmanuel Maborukoje[1]; Moyinoluwa Juliet Oyabiyi[1]; Jonah Peter Oche[2]; Nkechinyere Nwokedi[2]; Akorede Jelili Quadri[1]; Omobolaji Olawale Adewuyi[2]
[1]Nutrition and Dietetics, Ladoke Akintola University of Technology, Ogbomoso, Nigeria, Federal Republic of; [2]Department of Clinical Trials, Mathematics and Science Clinic, Ihunsa, Opic Estate, Ogun State, Ogun, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
School-age children spend approximately 6–7 hours in school daily, making the quality of school health services (SHS) and the healthful school environment (HSE) critical to their overall health and well-being. Regular monitoring and evaluation of these factors are essential to prevent infections, malnutrition, and other health issues. Dietary diversity (DD) is crucial for balanced nutrition, preventing malnutrition, and supporting children's learning, cognition, and physical development, enabling full participation in education. The study investigated SHS, HSE and DD of school children with and without school feeding programs.
METHODS
This study employed a comparative cross-sectional design to examine schools participating in school feeding program (Osogbo) and schools not participating (Ogbomoso North). A total of 350 students were selected using convenience sampling. Data were collected through the School Health Evaluation Questionnaire to assess SHS, HSE and the Minimum Dietary Diversity Score (MDDS) questionnaire to evaluate dietary diversity among school children.
RESULTS
350 schoolchildren (mean age 10.17 ± 2.17 years; 51.14% male, 48.86% female) participated in the study. Banana consumption was higher in Ogbomoso (30.40%) than Osogbo (11.00%), with 75.14% overall not consuming bananas (p=0.000). Mango consumption was very low (1.14%) but differed significantly (p=0.039). Egg consumption was similar (15.43%, p=0.640), while fish (p=0.000) and soft drink consumption (p=0.009) were significantly higher in Ogbomoso, highlighting differences in dietary habits across locations.
Our investigation into school health and hygiene facilities highlighted significant gaps, with most schools lacking health committees, though Osogbo showed a slight advantage (p=0.147). First aid box contents varied, with ORS availability notably lower in Ogbomoso (20%) than Osogbo (100%) (p=0.147). Boreholes were the main water source in both locations (p=0.495). Osogbo schools had significantly better toilet facilities (p=0.030), while waste disposal methods were comparable (p=0.103). Anthropometric data revealed a mean BMI of 15.50 ± 1.88, height of 1.33 ± 0.12 m, and weight of 27.63 ± 6.66 kg. These findings underscore the need for improved school health interventions.
CONCLUSIONS
Osogbo, with a school feeding program, had better health environments, including more health committees, improved toilets, and 100% ORS availability, compared to Ogbomoso. Addressing gaps in dietary diversity, enhance school facilities, and sanitation is crucial.

ASSOCIATION BETWEEN THE FOOD ENVIRONMENT OF BRAZILIAN PUBLIC AND PRIVATE SCHOOLS AND THE CONSUMPTION OF ULTRA-PROCESSED FOODS: ANALYSIS OF THE NATIONAL STUDENT HEALTH SURVEY (PENSE) 2019

Rosevane Cunha,[1]; Ariene Carmo,; Uriel Silva,[2]; Ana Beatriz Azevedo[3]; Daniela Canella[4]
[1]Applied Nutrition, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil; [2]Departamento de Estatística, UFMG, Belo Horizonte, Brazil; [3]Instituto de Nutrição, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil; [4]Nutrição Aplicada, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil

BACKGROUND AND OBJECTIVES
The school food environment can influence the eating habits, dietary practices and nutritional status of adolescents in a positive or negative manner depending on the foods available in this context. The presence of canteens and alternative points of sale of food items has been associated with a worse quality of food for students, represented by the highest consumption of unhealthy foods which are associated with obesity. Thus, this study aims to assess the association between the school food environment and the consumption of ultra-processed foods by Brazilian adolescents.
METHODS
Data from Brazil's 2019 National Student Health Survey, a school-based survey, were used. The sample consisted of 158,816 students aged 13 to 17 years enrolled in public and private schools. Food consumption (outcome) was assessed by self-reported consumption of 13 ultra-processed foods on the previous day **(1)**. The sum of the reported items generated a score. The school food environment (exposure) was assessed by the adapted indicator “Food and beverages availability” in the school food environment, which considers the presence of the canteen and alternative points of sale and the availability of eight food items in each of these places, which also generated a score **(2)**. Multilevel Logistic Regression Models stratified by type of school (private or public) adjusted by sociodemographic variables were used to assess the association between high consumption of ultra-processed foods (score ≥ 5) and the school environment score.
RESULTS
As for the consumption of ultra-processed foods, adolescents reported an average consumption on the previous day of approximately 4.3 food items, with no significant differences between public and private school students. About 45% of the students showed high consumption of ultra-processed food (score equal to or greater than 5). Students from public schools (OR: 0.93; 95% CI 0.90; 0.96) and private schools (OR: 0.94; 95% CI 0.90; 0.98) enrolled in schools that are in the highest quartile for the food and beverage availability score (≥score 14) showed lower odds of high consumption of ultra-processed foods.
CONCLUSIONS
A healthier school food environment, with a greater presence of fresh or minimally processed foods and a lower supply of ultra-processed foods, increases the quality of food, reduces the consumption of ultra-processed foods, and can contribute to an adequate nutritional status.

EPO5_233

WHAT IS IN PERUVIAN PRESCHOOLERS' LUNCHBOXES AND HOW DOES IT ASSOCIATE TO NUTRITIONAL STATUS?

Karina Flores-Chavesta[1]; Lita Palomares-Estrada[2, 1]
[1]Faculty of Sciences and Engineering, School of Nutrition, Universidad Peruana Cayetano Heredia, Lima, Peru; [2]Faculty of Medicine, Universität Basel, Basel, Switzerland

BACKGROUND AND OBJECTIVES
The school lunch box is a key opportunity to promote healthy eating habits and should provide between 10-15% of the Estimated Energy Requirement (EER). Excessive caloric intake from school lunches could be associated with overweight and obesity. This study evaluated the association between the caloric intake of the lunch box and the nutritional status in Peruvian preschoolers.
METHODS
A random sample of 67 preschoolers' lunchboxes from a kindergarten in Lima city were collected to evaluate the foods contained. The foods were weighed and classified according to the NOVA food classification system and by food group. We also use the nutritional labeling to evaluate the calories in the ultra-processed foods. Caloric intake was estimated by calculating each child's EER. To assess the nutritional status, we used the World Health Organization (WHO) Toolkit for Child Growth Standards. We evaluated Body Mass Index for Age (BMI for age) and Height for Age. A descriptive and bivariate analysis with Chi-square was conducted to evaluate the association between caloric intake and nutritional status, using STATA 16.
RESULTS
According to caloric intake, 62.7% of the lunchboxes provided more than 15% of the EER; 23.9% provided less than 10%, and 13.4% provided between 10-15%. According to the NOVA system, 74.6% contained minimally processed foods, 49.3% processed foods, and 52.2% ultraprocessed foods. Regarding food groups, fruits, especially bananas, tangerines, and apples, were the most commonly reported, followed by cereals, with bread being the most common within this group. Only one lunchbox included vegetables (broccoli). Among ultraprocessed foods, the most common were sweetened yogurt, fruit nectar, sweetened cereals, potato chips, and cookies. 92.5% of the children had normal height, and 7.5% had short stature. Based on BMI, 59.7% had a normal nutritional status, 19.4% were at risk of overweight, 13.4% were overweight, and 7.5% were obese. No association was found between the caloric intake of the lunchboxes and nutritional status.
CONCLUSIONS
No association was found between the caloric intake of the lunchbox and nutritional status. The presence of more than half of the lunchboxes containing ultraprocessed foods highlights the need to implement nutritional education programs on healthy lunchboxes and eating habits, aimed at parents and teachers.

BACKGROUND AND OBJECTIVES

Bariatric surgery (BS) is mostly performed in women of childbearing age. This study examines maternal and neonatal outcomes of post-BS pregnancies and their influencing factors.

METHODS

We included all post-BS pregnancies in France from 2013 to 2022, using a nationwide database. We compared maternal and neonatal outcomes of 55,941 post-BS pregnancies with controls matched on delivery date, parity, age, obesity, hypertension, diabetes and socio-economic status. Additionally, we compared 11,777 post-BS pregnancies with pre-BS pregnancy.

RESULTS

Post-BS pregnancies showed reduced risks of gestational hypertension (OR 0.57 [0.53-0.62]), preeclampsia (OR 0.59 [0.55-0.64]), and gestational diabetes (OR 0.64 [0.62-0.66]) compared with controls and with pre-BS pregnancies. Small-for-gestational age (SGA) was increased (OR 1.74 [1.68-1.79] compared to controls). Prematurity was increased (OR 1.27 [1.22-1.31]) compared to controls, but not compared to pre-BS pregnancies (OR 0.95 [0.85-1.06]). There was an increased risk of stillbirth (OR 1.2 [1.06-1.35]) mediated by SGA and of perinatal death (OR 1.5 [1.13-1.99]) mediated by both prematurity and SGA. SGA risk was higher if the interval between BS and pregnancy was under 12 months, with gastric bypass and malnutrition. Prematurity risk was higher with pregnancy occurring under 12 months post-BS and malnutrition. Greater protection against gestational hypertension and preeclampsia was observed with gastric bypass, pre-BS BMI over 50 kg/m², and intervals under 5 years between BS and pregnancy.

CONCLUSIONS

BS is associated with reduced risk of maternal adverse outcomes during pregnancy but increased risk of neonatal adverse events. Post-BS pregnancies should be considered high-risk, requiring close nutritional and obstetrical monitoring.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

BACKGROUND AND OBJECTIVES
Ghana Health Service, one Japanese public foundation, the Ajinomoto Foundation/the KOKO Plus Foundation, and two private companies, NEC and Sysmex, implemented a Public-Private Partnership and multisectoral project for nutrition improvement in collaboration with the World Food Programme in Ghana (the Project) in line with the initiative of the African Health and Wellbeing Initiative between Ghanian and Japanese governments. The Project introduced information and communication technology (ICT) to health facilities in a target district. A job-aid application has been developed to facilitate maternal and child health and nutrition service delivery, especially supporting the nutrition counseling service provision by showing standardized questions, basic records, and alarming risk cases in line with the algorithm of nutrition counseling. This study aims to assess the impact of the application introduction in delivering standardized nutrition counseling.
METHODS
The study used a quasi-experimental approach called difference-in-differences to compare outcome changes over time between an intervention district and a control district. The study collected data from cross sectional surveys conducted before and after the intervention in both the intervention and control districts. To assess whether standardized nutrition counseling was provided with the job-aid application, the records of the nutrition counseling component in the Maternal and Child Health Record Book were checked. Additionally, health workers were asked whether they were confident in providing nutrition counseling to clients and using the nutrition counseling algorithm.
RESULTS
The recording of the nutrition counseling significantly improved in the intervention district. Each component of the nutrition counseling, assessment, analysis, and action was appropriately recorded. Also, the health workers were more confident in using the algorithm of nutrition counseling in the intervention district than in the control district.
CONCLUSIONS
The study shows that the introduction of the job-aid application improved the provision of standardized nutrition counseling.
CONFLICTS OF INTERESTS
The Project was funded by the World Food Program and all the authors are the Project member.

INFANT PASSIVE PROTECTION AGAINST CORONAVIRUS THROUGH EXCLUSIVE BREASTFEEDING: A CROSS-SECTIONAL STUDY

Yasmin Amaral; Maria Elisabeth Moreira[1]; Ana Carolina Cota[1]; Mazzoli Fernanda[1]; Marano Daniele[1]
[1]Pesquisa Clínica, Fiocruz, Rio de Janeiro, Brazil

BACKGROUND AND OBJECTIVES
Vaccination against COVID-19 is essential to protect the population's health, preventing severe complications and hospitalizations and reducing morbimortality rates associated with the disease. The prevalence of vaccination against COVID-19 among pregnant women varied between countries.
Studies and guidelines from health organizations, such as the World Health Organization and the Centers for Disease Control and Prevention, highlighted the importance of maintaining breastfeeding even amid the health crisis. Furthermore, some studies have indicated that vaccination against COVID-19 elicits an effective immune response, manifested by the presence of anti-SARS-CoV-2 neutralizing antibodies in human milk.
However, no studies on this topic evaluated the percentage of antibodies generated by different vaccine technologies based on their potential neutralizing effects and COVID-19 variants. Therefore, the present study aims to determine the percentage and duration of neutralizing antibodies against the Omicron variant in human milk after vaccination against SARS-CoV-2, considering the three different vaccine technologies approved by the National Health Surveillance Agency (ANVISA) used in Brazil.

METHODS
A cross-sectional study was conducted with lactating women who completed the full vaccination schedule with available vaccines (AstraZeneca, Pfizer, CoronaVac, and Janssen). The participants were residents of Rio de Janeiro, and samples were collected between April and October 2022. Breast milk was analyzed to detect the presence of neutralizing antibodies using assays specific to the Omicron variant.
RESULTS
The RESULTS showed that, regardless of the vaccine technology used, all types of vaccines were effective in inducing neutralizing antibodies in breast milk. There was no significant difference between women who received two doses or three or more doses. Exclusive breastfeeding was a significant factor, showing higher percentages of neutralizing antibodies compared to women who did not exclusively breastfeed.
CONCLUSIONS
These findings reinforce the importance of breastfeeding as a strategy to provide passive protection to infants, especially in contexts where vaccination for children under six months is not recommended.

HEALTH AND SUSTAINABILITY ASPECTS IN SCHOOL MEAL PROGRAMMES WORLDWIDE: A STATUS QUO ANALYSIS

Eve Chakacha[1]; Lilliana Stefanovic[2]; Carola Strassner[3]
[1]Nutritional Sciences, Justus-Liebig-Universität, Gießen, Germany; [2]Department of Organic Food Quality, University of Kassel,, Kassel, Germany; [3]Food - Nutrition - Facilities, FH Münster, Münster, Germany

BACKGROUND AND OBJECTIVES
School meal programmes (SMP) contribute to various Sustainable Development Goals (SDGs), especially SDGs 2,3,4 and 5. However, they face various challenges that threaten their sustainability. This systematic review aimed to determine the health and sustainability aspects incorporated in SMP and compare disparities between the Global North and Global South.
METHODS
Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA 2020) and PROSPERO [CRD42023394523] were used. Specific search strategies for Web of Science and PubMed were developed. The terms of health and sustainability aspects (economic, social, environmental) were defined based on the FAO School Food and Nutrition Framework. The health aspect included nutrition education, dietary guidelines, deworming, prohibition of ultra-processed food, food safety, uptake of vegetables and fruits, and micronutrient supplementation. The economic aspect entailed job creation and Government budget allocation The social aspect entailed goals of the SMP, existence of government policies, coverage of SMP and parent involvement. The environmental aspect entailed locally-sourced food, school gardens, practising organic meals on some days, promoting seasonal food and fruits, plant-based menu, food wastage and Green House Gas Emissions. Only open access articles written in English and published between 1st January 2013 to 1st January 2023 were included.
RESULTS
A total of 227 studies were selected for a full reading. Of these, 94 met the eligibility criteria and were reviewed. Health and sustainability aspects were present in SMP in 32 countries worldwide. Most studies were recorded on the social aspect (n=76) covered by 27 countries. Sixty-three studies were recorded on health aspect covered in 30 countries. Seventeen studies were recorded under the economic aspect covered in 7 countries. The least studies were recorded under the environmental aspect (n=12) covered in 9 countries.
CONCLUSIONS
Variations in SMP among countries make comparison slightly difficult. Therefore, it will be easy to understand status quo of health and sustainability aspects of SMP if comparison is made based on continents, assuming that the names used for the SMP can be predicted and that they are implemented almost in a similar manner in the different countries. More research is needed on the environmental aspect in relation to the SMP. There is need for dialogue among stakeholders to improve SMP environmental and economic sustainability

PRE-GESTATIONAL OVERWEIGHT AND POLYUNSATURATED FATTY ACIDS IN HUMAN MILK: THEORETICAL CAUSALITY MODEL

Yasmin Amaral[1]; Marano Daniele[2]; Maria Elisabeth Moreira[2]
[1]Pesquisa Clínica, Fiocruz, Niterói, Brazil; [2]Pesquisa Clínica, Fiocruz, Rio de Janeiro, Brazil

BACKGROUND AND OBJECTIVES
A number of studies have focused on the evaluation of the relationship between pre-pregnancy overweight and polyunsaturated fatty acids content in human milk. However, given the complexity of potentially confounding risk factors, the use of graphical tools is recommended to identify possible biases. This article aims to propose a theoretical model of causality using the Directed Acyclic Graph between pre-pregnancy overweight and polyunsaturated fatty acids content in human milk.
METHODS
An extensive literature review was performed to identify variables with causal relationships with exposure and/or outcome. The choice of variables for adjustment followed the graphic algorithm that comprises six criteria for selecting a minimum set of potentially confounding variables.
RESULTS
Socioeconomic conditions, interpartum interval, maternal age and food consumption pattern were the variables that would have to be adjusted in order to estimate the total effect of pre-pregnancy overweight on polyunsaturated fatty acids content in human milk. The minimum set of variables found in the present study can be used in the analysis of other studies that evaluate this association.
CONCLUSIONS
It is worth highlighting that the findings of this causal diagram are extremely important so that it can be used in other studies to evaluate the causal relationship between pre-gestational overweight and the omega6/omega3 ratio in human milk.

INVESTIGATING NUTRITIONAL INTERVENTIONS FOR MUSCULOSKELETAL HEALTH IN OLDER ADULTS: WHOLE FOODS AND NOVEL PROTEIN SOLUTIONS

Lisa ARVIEU[1]; Jolieke Van Der Pols[1]; Smita Nambiar-Mann[1]; Gabriel S Trajano[1]
[1]School of Exercise and Nutrition Sciences, Faculty of Health, QUT Kelvin Grove Campus, Brisbane, Australia

BACKGROUND AND OBJECTIVES
In middle age, musculoskeletal health is commonly impacted by anabolic resistance, which RESULTS in loss of muscle mass (MM) and muscle strength (MS). Indeed, older adults need to consume higher protein intake to stimulate muscle protein synthesis (MPS) at the same level as younger adults. Milk protein supplementation has been well-studied in the last 25 years with a general conclusion on whey protein's effectiveness on MM and MS. Other types of interventions such as micronutrients or whole foods, have been investigated and positive impacts on muscular outcomes are identified. However, the combination of whole foods with added macronutrients or micronutrients has been relatively less explored in relation to muscular outcomes. We therefore carried out a scoping review to summarise current evidence of intervention studies using such foods or novel protein sources for muscle health.
METHODS
A scoping review was conducted to answer the following question: Does nutrient fortification of dairy (D) or plant-based dairy alternative (DA) products deliver additional benefits when compared with no nutrient addition to muscular outcomes in the elderly? Inclusion criteria were; Human study with mean population age > 45 years old; Healthy population or with sarcopenia diagnosed; D or DA products fortified with at least one nutrient; Muscular and/or inflammatory outcomes; Studies published between 2000-2024, available in English. In addition, a literature review was conducted to assess the impact of novel sources of protein, such as plant-based protein, or protein blends (animal/plant-based) on muscular outcomes in older adults.
RESULTS
The scoping review identified 14 interventional studies for inclusion. 12 studies were randomised controlled trials and 2 were studies without randomisation. Regarding the intervention, 6 studies had a food and exercise intervention, whereas 8 studies had a food-based intervention only. Detailed RESULTS and interpretation will be presented. Regarding intervention studies using new protein sources, current evidence indicates that mycoprotein has greater effect on the MPS rate when compared with milk protein. A protein blend of soy and whey has similar effects on MM and MS when compared with whey alone.
CONCLUSIONS
Current evidence indicates encouraging food-based solutions sed to improve muscular outcomes in older adults, but new types of protein supplementation (such as mycoproteins, protein blends) needs further research to identify optimal dose, frequency and mechanisms in the musculoskeletal system.

RELATIONSHIP BETWEEN FOOD ENVIRONMENT, DIETARY DIVERSITY OF INFANT AND YOUNG CHILDREN IN RURAL AREA OF SENEGAL: THE IIMAANJE STUDY

Ndèye Ndambao SARR[1]; Adama Diouf[2]; Shauna Downs[3]; Daouda Gueye[4]; Joachim Sackey[5]
[1]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Universite Cheikh Anta Diop de Dakar (UCAD), Dakar, Senegal; [2]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Universite Cheikh Anta Diop (UCAD), Dakar, Senegal; [3]Department of Health Behavior, Society and Policy, Rutgers School of Public Health, Newark, United States of America; [4]Institut de Recherche en Santé, de Surveillance Epidémiologique et de Formation (IRESSEF), Dakar, Institut de Recherche en Santé, de Surveillance Epidémiologique et de Formation (IRESSEF), Dakar, Senegal; [5]School of Health Professions, Rutgers University, Newark, NJ, United States, School of Health Professions, Rutgers University, Newark, NJ, United States, Newark, NJ 07101, United States of America

BACKGROUND AND OBJECTIVES
Child undernutrition continues to persist in sub-Saharan Africa, particularly among farming communities, despite the implementation of nutritional interventions in these communities. Poor quality diets among children is one of the key factors contributing to undernutrition and is driven by low food availability and access. In Senegal, farming communities rely mainly on home production and informal built food environments characterized by wet markets, street vendors, and small village stores. While access to these different food environments have important implication for infant and young child feeding, little is known about the relationship between food environments and dietary diversity in rural area in Senegal. This study aimed to assess the relation between food environment and dietary diversity among children in rural area of Senegal.

METHODS
This study combines data collected in a cluster randomized controlled trial conducted as part of the IIMAANJE study targeting children aged 6 to 23 months from 488 farm households in 3 regions (Thiès, Diourbel and Fatick) of Senegal and those from food environment. Sociodemographic and socioeconomic data were collected. Dietary diversity (DD) was assessed using 24-hour dietary recall. Data on food availability were collected in 85 informal food markets (IFM) (74 stores and 11 wet markets) through a mapping of the food environments. Seven food categories were established to form the Dietary Diversity of the Informal Market score (DDIMS), in accordance with the children's dietary diversity score.
RESULTS
The mean DDIMS was 6 ±2.7 food groups and the most common food groups sold were dairy products (100%), ultra-processed foods (100%) followed by starchy (95%) and legumes/nut (89%). Among children, 21% met DD and the most consumed food group were starchy staple (97%), while only 35% consumed vitamin A rich fruit/vegetables and 26% consumed foods of animal origin. Alongside, a high consumption of ultra-processed foods (61%) was observed. Furthermore, the consumption of nutrient-rich foods among children was positively associated with the two wealthiest quintiles ($p < 0.05$). The DDMIS is positively associated with the consumption of vitamin A-rich fruit and vegetables ($b=0.28$; $p < 0.05$) but not with DD due to production for own consumption by households.
CONCLUSIONS
Infant and young child feeding is inappropriate in this rural area. There is an urgent need to implement interventions to improve the affordability of healthy food in local markets.

EPO5_248

TIME SCARCITY AND ITS ASSOCIATION WITH DIETARY INTAKE: A SCOPING REVIEW

Osborne Angela[1]; Lucy Stuthridge[1]; Caroline Schurmann,[1]; Claire Smith[1]
[1]Department of Human Nutrition, University of Otago, Dunedin, New Zealand

BACKGROUND AND OBJECTIVES
The price of food is a key factor in food choices, but time also influences decisions (1,2). Time scarcity, the perception of insufficient time for daily tasks, may shape eating behaviours. This scoping review aimed to investigate the link between time scarcity and dietary intake, including nutrient intake, diet quality, food choices, and dietary patterns.
METHODS
A comprehensive literature search was conducted in Medline, Scopus, Embase and through manual searches up to December 2024. Eligible studies measured time scarcity (via questionnaires or working hours) and diet. Extracted data included study location, sample size, age range, and methods for assessing time scarcity and diet. The review adhered to PRISMA guidelines.
RESULTS
From the literature search, 13 studies were included (11 cross-sectional and 2 longitudinal). Diet outcomes encompassed fruit/vegetable intake (7 studies), out-of-home food purchases (7 studies), highly processed food consumption (4 studies), diet quality indices (4 studies), meal quality (3), and nutrient intake (3 studies). Dietary assessment methods included food frequency questionnaires (4 studies), diet recalls (2 studies), food records/diaries (2), food expenditure diaries (1), and other self-report questionnaires (4 studies). Time scarcity was assessed using working hours as a proxy measure in 8 studies. Increased time scarcity was associated with modest reductions in fruit and vegetable intake (6 out of 7 studies) and greater out-of-home food purchases (6 out of 7 studies). All studies examining diet quality (n=4) reported negative associations with longer working hours. Findings on nutrient intakes were inconsistent. Few studies detailed specific food items.
CONCLUSIONS
Time scarcity negatively influences dietary behaviors, including reduced fruit/vegetable intake and increased consumption of out-of-home and processed foods. However, most studies were cross-sectional, with limited evidence on nutrient intakes. Future research should employ validated dietary assessment tools and standardised measures of time scarcity, and explore the mediating role of income.

HIGHER CONSUMPTION OF BURGERS AND/OR PROCESSED MEATS DURING CHILDHOOD INCREASES THE RISK OF OBESITY IN BRAZILIAN ADOLESCENTS

Mariana De Santis Filgueiras[1]; Érica Priulli[1]; Guilherme José Silva Ribeiro[1]; Bruna Clemente Cota[1]; Nalva De Paula Dias[1]; Rafaela Nogueira Gomes De Morais[1]; Rafaela Mara Silva Fonseca[1]; Maíra Dos Santos Garcia[1]; Juliana Farias de Novaes[1]
[1]Nutrition and Health Department, Universidade Federal de Viçosa, Viçosa, Brazil

BACKGROUND AND OBJECTIVES
Obesity has been rising globally, driven by factors such as increased consumption of ultra-processed foods [UPF]. Few longitudinal studies have assessed this relationship in pediatric populations. Therefore, we aimed to evaluate the long-term effect of UPF consumption and its subgroups during childhood on the risk of obesity in Brazilian adolescents.
METHODS
This prospective cohort study included children aged 8–9 years from Viçosa, Minas Gerais, Brazil, assessed at baseline (2015/2016; n=319) and followed up between 15- and 18-year-old (2022/2024). Obesity was defined as BMI-for-age z-scores ≥2 (de Onis et al., 2007). UPF consumption, assessed according to the NOVA classification (Monteiro et al., 2019), was also analyzed in subgroups: 1. burgers and/or processed meats (ham, mortadella, salami, sausage, and hot dogs); 2. sugar-sweetened beverages; 3. instant noodles, packaged snacks, or crackers; and 4. stuffed cookies, sweets, or treats (Brazilian Ministry of Health, 2015). The caloric contributions of UPF and its subgroups (%) were estimated using three 24-hour dietary recalls. Poisson regression with robust variance estimated the relative risk [RR] with 95% CI, adjusted for age, sex, per capita income, and screen time, with α=0.05. This study was approved by the Human Research Ethics Committee.
RESULTS
After 7.8 ± 0.5 years of follow-up, 234 adolescents (53.9% female, 16.3 ± 0.8 years old) were evaluated, with a 26.6% loss (n=85). The obesity incidence in adolescence was 3% (7 new cases). In childhood, the caloric contribution was 44.9 ± 14.5% for UPF; 11.4 ± 10.8% for stuffed cookies, sweets, or treats; 4.6 ± 3.9% for sugar-sweetened beverages; 4.0 ± 6.0% for instant noodles, packaged snacks, or crackers; and 2.9 ± 4.0% for burgers and/or processed meats. Higher consumption of burgers and/or processed meats during childhood increased the risk of obesity in adolescence by 12% (RR: 1.12; 95% CI: 1.01; 1.25). No associations were found for other UPF subgroups or overall UPF.
CONCLUSIONS
Burgers and processed meats have shown long-term effects on increased obesity risk in Brazilian adolescents and should be monitored from an early age by health professionals and families.

NUTRIMETRY TO COMPARE PREVALENCE OF SHORT STATURE IN CHILDREN FROM 0 TO 36 MONTHS IN RURAL AND URBAN LOCATIONS IN THE STATE OF CAMPECHE, MEXICO

Jorge Enrique Selem Solís[1]; María Carolina Selem Villanueva[2]; Fernando Sandoval Castellanos[3]; Rosa De La Cruz Ovando[4]; Fransisco Góngora Ek[4]; Leticia Elizabeth Gámez Gutierrez[5]; Jiannyle Paola Chuc Mas[5]; Emir Rodrigo Selem Villanueva[6]

[1]President, Public Health Society from Campeche , Campeche Mexico; [2]President´s Assistant, Public Health Society from Campeche , Campeche Mexico; [3]Endocrinology, Faculty of Medicine of the Autonomous University of Campeche, Campeche, Mexico; [4]Research Coordination, Faculty of Nursing Autonomous University of Campeche, Campeche, Mexico; [5]Investigation, Faculty of Nursing Autonomous University of Campeche, Campeche, Mexico; [6]Dentistry, Vizcaya University of the Americas of Campeche, Campeche, Mexico

BACKGROUND AND OBJECTIVES

Based on WHA 65.6, whose goal is to reduce stunting by 40% by 2025, Nutrimetry allows us to compare prevalence by risk group in rural and urban locations in Campeche, Mexico.

The objective is to show with Nutrimetry the differences between prevalence of short stature in urban and rural locations.

METHODS

Nutrimetry crossing variables length/age and weight/height/age with z score provides risk groups to construct the prevalence of short stature. 150 children measured in Tenabo rural community with 2014 prevalences at ages 0 to 36 months, compared to 107 children in Sascalum urban community in Campeche, Mexico with 2024 prevalences

RESULTS

In 2014 in Tenabo risk group 1(2.66%), 4(8%), 7(0%). Prevalence 10.66%.

In 2024 in Sascalum, Campeche the risk group 1(3.74%), 4(4%), 7(4%). Prevalence 10.66%.

The prevalence of short stature in Tenabo 2014 was 10.66% and was below the national average, which was 13.6% in ENSANUT 2012. The prevalence of short stature in Sascalum Campeche 2024 was 10.66% and was also below the national average which was 14.2% in the ENSANUT 2018-19.

CONCLUSIONS

There are no statistical differences between both prevalences in 2014 rural compared to 2024 urban, although both were below the national average presented in the ENSANUT 2012, 2018-19. Lack of attention to actions aimed at the first 1000 days of life puts all the achievements achieved at risk.

EPO5_251

ASSESSING CO-COVERAGE OF MULTI-SECTORAL NUTRITION INTERVENTIONS: A SCOPING REVIEW OF ANALYTICAL APPROACHES AND EVIDENCE-BASED INDICATOR SELECTION

Phuong Nguyen[1]; Swetha Manohar[1]; Grounds Samantha[2]; Pandya Niharika[3]; Akseer Nadia[4]; Kim Sunny[1]
[1]Nutrition, Diets & Health, International Food Policy Research Institute, Washington, United States of America; [2]Consultant, Independent, Washington, United States of America; [3]Nutrition, Diets & Health, International Food Policy Research Institute, New Delhi, India; [4]Bloomberg School of Public Health, Johns Hopkins University, Baltimore, United States of America

BACKGROUND AND OBJECTIVES
Multi-sectoral nutrition approaches have gained prominence over the past two decades, emphasizing coordinated actions to combat malnutrition in low- and middle-income countries. However, there is a lack of clarify and consensus on how to measure co-coverage - the clustering of multiple interventions – across different types of target population groups and sectors. This paper examined existing methodologies and applications for assessing co-coverage of multiple nutrition interventions.
METHODS
A scoping review was conducted via literature search across Web of Science Core Collection, Medline, and EBSCOhost databases, focusing on three themes: coverage and co-coverage, methods for calculation and estimation, and nutrition and health interventions. Titles and abstracts were screened by two independent reviewers using Covidence software, followed by full-text screening based on pre-defined inclusion and exclusion criteria. Data extraction template was used to ensure high interrater reliability. Data extraction and summaries included key study characteristics and specific details on co-coverage methodologies and outcomes.
RESULTS
This review analyzed 80 articles on co-coverage of multisectoral nutrition interventions, extracted from an initial pool of 4478 abstracts. Most studies were observational (90%), with a growing number published over the past decade, and Sub-Saharan Africa and South Asia were the most represented regions. Data was primarily collected from household surveys (94%), particularly Demographic and Health Surveys (58%). Common interventions in co-coverage indices included antenatal care (ANC, 73 studies) or intervention components received in ANC, child immunizations (53 studies), and skilled birth attendance (46 studies). The selection of interventions was often guided by established global or national frameworks or guidelines. Coverage indices were calculated using methods such as simple counts, weighted averages, and scoring systems. While some studies validated their indices (using Cronbach’s alpha or sensitivity analyses), most relied on previously used methods without specific validation.
CONCLUSIONS
The review highlights the diversity of approaches in calculating co-coverage, the challenges of harmonizing methodologies, and considerations for multi-sectoral nutrition intervention coverage estimation across different contexts.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

BACKGROUND AND OBJECTIVES

Currently in the U.S. high poverty schools nationwide are eligible to provide universal free school meals through a policy called the Community Eligibility Provision (CEP). The goal of universal free meals through this provision is to improve food security and child health outcomes. School lunch has been shown to be of higher diet quality compared to alternatives. Therefore, providing universal free lunch has potential to decrease high body mass index in childhood, but studies so far are limited and findings are mixed.

METHODS

We used children's residential address from electronic health records combined with child age, date of visit, school catchment boundaries, and school enrollment status to assign each child to the age-appropriate neighborhood school. We created a balanced panel of schools that were observed every year between school year (SY) 2013-14 and SY 2018-19 to have at least one child who attended an OCHIN clinic and had their height and weight measured during a given school year. We used modern difference-in-difference techniques to compare child-level average BMI z-scores from schools that adopted CEP to those that were eligible to adopt but did not do so.

RESULTS

The sample consisted of 164,108 observations from children who attended the 1260 unique schools distributed across 8 U.S. States. The sample was 49% male, mean age of 10.9 years, with 45.9% Hispanic, 25.3% White, 12.6% Black, 4.3% Asian, 0.4% Native American or Alaska Native, 0.7% Native Hawaiian or Other Pacific Islander, 1.5% Multiple racial identities, and 9.3% with unknown racial identity. After policy adoption, children attending schools that adopted CEP gained less in BMI z-score compared to children who attended schools that did not adopt the policy (difference-in-difference: -0.02 (95% CI: -0.04, -0.004)). The estimates for time since policy adoption suggest the impact of the policy on BMI z-score becomes larger over the first five years of the policy. However, we do also find some heterogeneity in effects by the year of adoption, whereby some adoption cohorts experience gains in BMI z-score.

CONCLUSIONS

Universal free school meals policies offer a promising population-level approach for slowing childhood BMI z-score gains. At the same time, evidence thus far suggests there may be heterogeneity in impacts, which deserves careful monitoring and continued evaluation.

CHILD HEMOGLOBIN TRAJECTORIES ACROSS THE FIRST 10 YEARS OF LIFE AND ASSOCIATION WITH CHILD DEVELOPMENT AND ACADEMIC ACHIEVEMENT AT 10-11 YEARS

Melissa Young[1]; Lan Tran[2]; Phuong Nguyen[3, 4]; Md Abul Kalam[5]; Long Quynh Khuong[6]; Reynaldo Martorell[1]; Usha Ramakrishnan[1]

[1]Hubert Department of Global Health, Rollins School of Public Health, Emory University, Atlanta, United States of America; [2]Nutrition and Health Sciences Program, Laney Graduate School,, Emory University, Atlanta, United States of America; [3]Nutrition, Diets, and Health Unit, International Food Policy Research Institute, Washington DC, United States of America; [4]Department of Scientific Research and International Relations, Thai Nguyen University of Medicine and Pharmacy, Thai Nguyen, Vietnam; [5]Global Health and Develpment, Laney Graduate School, Emory University, Atlanta, United States of America; [6]Epidemiology, University of Pennsylvania, Philadelphia, United States of America

BACKGROUND AND OBJECTIVES

Anemia is a global public health concern, associated with increased risk of infections, impaired growth and cognitive delays. However, less is known about the significance of changes in hemoglobin (Hb) and cognitive outcomes in middle childhood. We examined the association between child Hb trajectories and cognitive development and academic achievement at 10-11 y.

METHODS

We used prospectively collected data from children born to women who participated in a micronutrient supplementation randomized controlled trial (PRECONCEPT) in Vietnam. The analytical sample included children (n=831) with Hb values at 3mo, 6mo, 1y, 2y and 10-11y and cognitive development (full scale intelligence quotient-FSIQ), and academic achievement (mathematics and reading language tests) at 10-11 y. Multivariable linear regression models were used to assess the association between Hb trajectories and cognitive development and academic achievement, adjusting for maternal (education/age/mentalhealth), child (age/sex/diet), home environment, socioeconomic status and intervention group.

RESULTS

Three distinct child Hb trajectories were identified (low-6.4%;middle-52.2%;high-41.4%). Children in the low trajectory started with lower Hb levels at 3 months (mean Hb: 9.7 g/dL) that remained lower through age 10-11 y (11.2g/dl). Those in the high trajectory had higher Hb levels from 3 months (11.1 g/dL) through age 10-11 y (13.7 g/dl). Children in the low Hb trajectory had significantly lower FSIQ (mean ± standard deviation: 89.8 ± 15.2) compared to those in the high Hb trajectory (93.2 ± 13.4). Likewise, math (12.1 ± 4.4 vs 13.5 ± 4.4) and reading (17.8 ± 6.1 vs 19.0 ± 5.0) scores were lower among children in the low Hb trajectory compared to high Hb trajectory, respectively ($p<0.05$). However, these differences were largely attenuated in the adjusted models. Compared to children in the high trajectory, those in the low (-0.63; 95% CI: [-4.30,3.04]) and middle (-1.21 [-3.00,0.59]) trajectories had non-significantly lower FSIQ at 10-11 y. Similarly, math and reading scores were mainly not significantly different among children in the low (0.07 [-1.29,1.43]; -0.62 [-1.80,0.56]) and middle (-0.49 [-1.17,0.18]; (-0.61 [-1.20, -0.03]) trajectories at 10-11y.

CONCLUSIONS

Child hemoglobin trajectories across the first 10 years of life were largely established early in life and had weak associations with child cognition and academic achievement at 10-11 y. Further path analyses may be valuable to unpack the complex and interacting drivers of child hemoglobin and child development.

STRENGTHENING ROUTINE VITAMIN A SUPPLEMENTATION IN KENYA AND MOZAMBIQUE: PROGRESS TOWARDS ACHIEVING 100% COVERAGE AMONG CHILDREN AGED 6–59 MONTHS

Fridah Mutea,[1]; Caleb Ombati[2]; Caroline Chebet[1]; Fortunato Guilima[3]; Sarmento Armando[4]; Melissa Baker[5]; Doledec David[6]

[1]Vitamin A Supplementation, Helen Keller INTL, Nairobi, Kenya; [2]Health & Nutrition, Helen Keller Intl-Kenya, Nairobi, Kenya; [3]Monitoring and Evaluation, Helen Keller, Nairobi, Kenya; [4]Vitamin A supplementation, Helen Keller International, Mozambique, Maputo, Mozambique; [5]Vitamin A Supplementation, Helen Keller International, Nairobi, Kenya; [6]Helen Keller Intl, Helen Keller Intl Kenya, Nairobi, Kenya

BACKGROUND AND OBJECTIVES

Vitamin A is essential for child survival, reducing mortality by up to 24% in children aged 6–59 months. Despite its effectiveness, biannual Vitamin A Supplementation (VAS) campaigns are unsustainable in the long term. This study explores efforts and strategies in Kenya and Mozambique to integrate VAS into routine health services to achieve sustained coverage.

METHODS

In four counties of Kenya, 498,886 children were targeted in the second round of 2023 and 494,887 in the first round of 2024 through health facilities (6–11 months), community referrals (12–36 months), and ECD centres (37–59 months). In Mozambique, 708,260 children were reached in two provinces in the second round of 2023 and 723,768 in the first round of 2024 either via health centres, outreach programs, or community health workers depending on proximity. Both countries strengthened VAS delivery through supervision, capacity building and data audits. Monthly administrative coverage was monitored and feedback given to drive continuous improvement

RESULTS

In Kenya, Semester coverage across four counties averaged 91% in 2023, increasing to 95% in 2024. Monthly coverage varied significantly, ranging from 32% to 296% (2023), and 55% to 146% (2024). The first round of 2024 achieved a more consistent monthly coverage through improved routine service delivery compared to the large spikes and contrast during the campaign-driven second round of 2023. In Mozambique, VAS coverage across two provinces was 86% in the second round of 2023, slightly declining to 82% in the first round of 2024. Monthly coverage during the second round of 2023 ranged from 70% to 89%, and between 72% and 89% in first round of 2024.

CONCLUSIONS

Routine VAS delivery demonstrates significant potential for sustained coverage, providing stability and resilience compared to short-term campaigns. The experiences in Kenya and Mozambique underscore the importance of integrating VAS into national health systems to achieve consistent and long-term child health outcomes.

TIME TRENDS IN SOCIAL JETLAG, CHRONOTYPE AND BODY FAT COMPOSITION IN UNIVERSITY STUDENTS BEFORE, DURING AND AFTER THE COVID-19 PANDEMIC

Bettina Krueger[1]; Carina Micheel[1]; Bianca Stutz[1]; Anette Buyken[1]
[1]Institute of Nutrition, Consumption and Health, Faculty of Natural Sciences, Paderborn University, Paderborn, Germany

BACKGROUND AND OBJECTIVES
Previous studies suggest that the Covid-19 related lockdown favoured a reduction in social jetlag (SJL) due to a better alignment of daily routines with the internal clock and the chronotype. So far, studies analysing the development of the SJL after the lockdown are missing. On the other hand, it is discussed that the pandemic favoured an increase of body fat mass. This study investigates the hypothesis that i) the SJL increased again after the lockdown ii), the lockdown favoured an increase of body fat mass, iii) chronotype as a biological construct changed only in an age-related manner.
METHODS
Of the 320 university students (18 to 25 y, 57% female) recruited before the lockdown within the ChroNu study 156 took part in an online survey in June 2020 and 110 participated in a follow-up examination in autumn 2022. Time trend analysis of chronotype and SJL were based on data from 192 participants, while pre-post comparison in body fat was based on data from 52 students participating in both examinations. Chronotype and SJL were estimated using the Munich Chronotype Questionnaire. Body composition was assessed by bioelectrical impedance analysis. Questionnaires provided information on the frequency and duration of physical activity and screen time. Time trends in SJL, chronotype and visceral fat mass were analysed by mixed-model analyses over the three and two time points, respectively.
RESULTS
SJL showed a U-shaped curve that was not explained by age, high screen time or physical activity ($p=0.0001$). Changes in chronotype and visceral fat mass were explained by age ($p=0.15$ and $p=0.3$).
CONCLUSIONS
The RESULTS of this study suggest that the lockdown-related decrease in SJL was transient only, yet that the lockdown did not adversely affect visceral fat mass development among students.

UNIVERSITY STUDENT' BODY WEIGHT STATUS AND ITS RELATED DIETARY PATTERNS: A COMPARATIVE ANALYSIS BETWEEN UNIVERSITY RESIDENTS AND NON-UNIVERSITY RESIDENTS

Shoo Thien Lee[1]; Lim Choy Har[1]; Supparau Thanusha[1]; Wan Hashim Wan Irdina Batrisyia[1]
[1]Faculty of Health and Life Sciences, Management & Science University (MSU), Shah Alam, Malaysia

BACKGROUND AND OBJECTIVES
Unhealthy dietary patterns are associated with an increased risk of obesity among university students. This study aims to examine the association between dietary patterns with body weight status among university students.
METHODS
This cross-sectional study involved 271 university students aged 18 to 29 years from Klang Valley, Malaysia. A validated questionnaire was used to assess sociodemographic characteristics and dietary patterns. Body weight status was determined by body mass index classification.
RESULTS
One-third of the university students were overweight or obese. Only one-sixth of students (17.0%) consumed all three main meals regularly on a daily basis. Three out of four university students (75.6%) skipped breakfast daily. Lunch and dinner skippers accounted for 27.7% and 41.0%, respectively. Daily consumption of both fruits and vegetables was notably low at 6.8%. A higher percentage of university residents ate out at least three times per week compared to non-university residents (70.4% vs. 58.9%, p=0.018). When preparing home-cooked meal, majority of students (74.2%) prepared imbalanced meals. Instant food consumption was significantly higher among university residents compared to their counterparts (61.3% vs. 48.1%, p=0.029). Multinomial logistic regression reported university students who ate out at least three times per week were twice more likely (OR: 2.11, 95% CI: 1.08-4.12, p=0.030) to be overweight or obese. Main meal consumption frequency was not significantly associated with obesity.
CONCLUSIONS
Frequency of eating-out was positively associated with obesity among university students. Continuing programs and interventions to promote healthy eating within university environment are essential to address the issue of obesity among university students.

DOES HEALTH SERVICE USE AND PEER SUPPORT MEDIATE THE RELATIONSHIP BETWEEN MATERNAL ORIGIN AND BREASTFEEDING OUTCOMES?

Idil Muhumed[1]; Jelena Meinilä[1]; Reija Klemetti[2]; Folasade Adebayo[1]; Suvi Virtanen[3]; Aku-Ville Lehtimäki[4]; Maijaliisa Erkkola[1]

[1]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland; [2]Child Health, THL - Finnish Institute for Health and Welfare - Natural Protection for Finnish people, Helsinki, Finland; [3]Nutrition Team, Finnish Institute for Health and Welfare, Helsinki, Finland; [4]Statistics, Folkhälsans Huvudbyggnad, Helsinki, Finland

BACKGROUND AND OBJECTIVES

The association of higher maternal health service utilization and increased duration of breastfeeding is well established. However, immigrant women often face challenges in accessing these services. We examined differences in maternal and child health service utilization between immigrant and Finnish-speaking mothers, exploring the potential mediating roles of breastfeeding peer support, postpartum nurse home visit, and utilization of child health clinic.

METHODS

We analyzed data from the nationwide FinChildren 2020 survey, comparing Somali (n=29), Arabic (n=81), and Russian-speaking (n=181) parents and their infants with native Finnish speakers (n=5145). We conducted a causal mediation analysis to investigate the mediating effects.

RESULTS

Child health clinic attendance varied significantly: 23% of the infants born to Somali-/Arabic-speaking missed visits compared to 0.4% for infants born to Finnish-speaking and 1.65% for Russian-speaking mothers ($p<0.001$). Additionally, 22% of Somali- and Arabic-speaking mothers and 0.6% of Finnish-speaking mothers reported not utilizing child health clinic services in general ($p<0.001$). Somali-/Arabic-speaking mothers received the least breastfeeding support from peers. Peer support attenuated the negative association between maternal origin and exclusive breastfeeding (OR 1.02, 95% CI -0.01, 0.00 p= 0.04), whereas postpartum nurse home visits had the opposite effect (OR 0.99, 95% CI 0.008, 0.01p= 0.002).

CONCLUSIONS

This study reveals significant disparities in health service use, with Somali and Arabic-speaking mothers utilizing child health clinic services less frequently compared to native-born mothers. Although immigrant mothers received breastfeeding peer support the least, this service effectively mitigated the negative impact of maternal origin on exclusive breastfeeding. Further research is warranted to understand barriers that immigrant mothers face in accessing child health services and in receiving breastfeeding peer support, to better address these disparities.

BACKGROUND AND OBJECTIVES
Selenium (Se) is a micronutrient crucial for human health and the developing brain. A few studies have shown positive associations between maternal Se and child neurodevelopment. We aimed to describe Se status in pregnant Nepalese women and explore the association between maternal Se concentration in early pregnancy and child neurodevelopment in Nepalese children.
METHODS
The cohort study included 800 mother-infant dyads from Nepal. Se concentration was analyzed by inductively coupled plasma mass spectrometry. Child neurodevelopment was assessed at 8-12 weeks using Test for Infants motor performance (TIMP) and at 6, 12, and 24 months with the Bayley Scales of Infants and Toddler Development, 3rd edition (Bayley-3). The association between the TIMP total score, and maternal Se concentration was estimated by using multiple linear regression. We used linear mixed models to examine the association between maternal Se and Bayley-3 scores adjusted for maternal age and socioeconomic status.
RESULTS
The mean (SD) maternal Se concentration was 74.8 µg/L (10.4 µg/L), and 290 (36.3%) pregnant women had Se concentration indicating deficiency (< 71.1 µg/L). We found no significant association between maternal Se and the TIMP total scores (Coeff. -0.035 (95% CI: -0.105, 0.036) and the Bayley-3 total z-score (Coeff. 0.002 (95% CI: -0.007, 0.011) and no associations between Se concentration and any of the Bayley-3 composite and subscale scores.
CONCLUSIONS
Despite a substantial proportion of pregnant women with Se deficiency, maternal Se concentration was not associated with early childhood neurodevelopment in our study cohort of healthy pregnant women.

[1]Centre for Healthy Ageing and Wellness, Faculty of Health Sciences, Malaysia National University Kuala Lumpur Campus, Kuala Lumpur, Malaysia; [2]Dietetic Programme, Centre for Healthy Ageing and Wellness (H-Care), Faculty of Health Sciences, Universiti Kebangsaan Malaysia, Kuala Lumpur, Malaysia; [3]Dietetics Program, School of Health Sciences, Health Campus, Universiti Sains Malaysia, Kubang Kerian, Malaysia; [4]Institute of Visual Informatics (IVI), Universiti Kebangsaan Malaysia, Bangi, Malaysia; [5]Center for Artificial Intelligence Technology (CAIT), Faculty of Information Science and Technol, Universiti Kebangsaan Malaysia, Bangi, Malaysia

BACKGROUND AND OBJECTIVES
Cognitive Impairment (CI) or frailty are precursors of dementia risk. Little is known about multi-domain telehealth intervention conducted among community-dwelling older adults. Thus, a 6-month quasi-experimental study was conducted among 50 community-dwelling older adults at risk of CF to determine its feasibility.
METHODS
Respondents were allocated into the intervention group (n = 26) or the control group receiving a self-guided web-based educational module (n = 24). The intervention module consists of online consultation with multi-disciplinary healthcare providers and structured digital multi-domain intervention, where a telehealth system supports in-person activities. The primary outcomes were retention, satisfaction, and completion of an online module. Meanwhile, secondary outcomes included assessment of cognitive, frailty, depression, physical fitness, anthropometry, dietary intake, management of metabolic risk, and vascular and quality of life (sleep). Data were assessed at baseline, 12th, and 24th weeks. Data was analysed descriptively, while intervention effects were analysed using repeated measure Analysis of Varience (ANOVA). The overall mean differences (MD) were evaluated by an independent sample t-test.
RESULTS
The intervention group demonstrated a high retention rate of 94.3% (Intervention: 92.9%; Control: 96%), and satisfaction rates were favourable. Completing the online modules and consultation with healthcare providers was almost 100%. Significant interaction effects were observed for quality of life (sleep) ($p < 0.05$). The intervention group demonstrated a favourable MD in a 10-second one-leg stand, subjective sleep quality, High-Density Lipoprotein Cholesterol (HDL-C), and niacin intake ($p < 0.05$ for all parameters)
CONCLUSIONS
The WE CARE iAGELESS multi-domain telehealth intervention was feasible for community-dwelling older adults with CI or frailty. Therefore, the module can potentially increase physical function, quality of life (sleep), vascular health, and dietary intake

ASSESSING CHILD FOOD INSECURITY IN SELECTED DISTRICTS OF ZIMBABWE: INSIGHTS FROM THE CHILD FOOD INSECURITY EXPERIENCE SCALE METHODOLOGY EXPLORATORY SURVEY

George Kembo[1]; Nyawo Mara[2]; Mangwiro Innocent[3]; Dembedza Mavis[4]
[1]Directorate, Food and Nutrition of Zimbabwe, Harare, Zimbabwe; [2]Nutrition and Child Health, UNICEF, Harare, Zimbabwe; [3]Assessment, Research, Monitoring and Evaluation, Food and Nutrition Council of Zimbabwe, Harare, Zimbabwe; [4]Food and Nutrition Advisory, Food and Nutrition Council of Zimbabwe, Harare, Zimbabwe

BACKGROUND AND OBJECTIVES
Food insecurity is a critical public health issue affecting millions of children globally, with significant implications for their growth and development. In Zimbabwe, economic challenges, climate variability, and socioeconomic factors exacerbate child food insecurity. This study utilized the Child Food Insecurity Experience Scale (CFIES) to explore the prevalence and determinants of food insecurity among school-age children in Zimbabwe. The study aimed to establish baseline data on child food insecurity prevalence in selected districts and identify associated factors within the target population.
METHODS
An exploratory school-based cross-sectional survey was conducted across three districts; Mutoko, Murewa, and Mudzi in Zimbabwe. A total of 620 children aged 10 to 17 years from 12 schools were included in the study. Data were collected through structured questionnaires covering demographic information, food insecurity experiences and access to water, sanitation and hygiene. Statistical analyses were performed using SPSS and STATA. Regression and inferential analyses were employed to identify and validated factors associated with child food insecurity experience.
RESULTS
The mean CFIES score was 10.01, range 8.01 - 11.52, while the prevalence of many experiences of food insecurity ranged from 44.8% to 47.7%. Younger children, being female and residing in Murewa district had increased risk of experiencing food insecurity while residing with both biological parents was associated with a reduced likelihood. In cross-contextual equivalence analysis, the most frequently affirmed food insecurity experiences were: worries about food scarcity and the inability to obtain desired food. The range of variance of the CFIES model was 0.90 - 1.38 validating effectiveness of the methodology in capturing experiences of food insecurity among children.
CONCLUSIONS
The findings revealed that child food insecurity is high in the selected districts. The social and behavioral impacts of food insecurity among children were highlighted underscoring the need for interventions that not only improve access to nutritious food but also enhance the social and psychological well-being of the affected children. Moreover, the importance of stable family structures and access to clean water in alleviating food insecurity emerged as critical components influencing food security. Future research should continue to explore these dynamics for comprehensive policy development aimed at supporting vulnerable children.

DETERMINANTS OF FOOD INSECURITY AMONG URBAN POOR HOUSEHOLDS IN KUALA LUMPUR

Yit Siew Chin[1]; Nur Amalin Juhari[2]; Poh Ying Lim[3]; Juju Nakasha Jaafar[4]; Nurzalinda Zalbahar@zabaha[2]; Sukanya Sereenonchai[5]; Norhasmah Sulaiman[2]; Yoke Mun Chan[6]
[1]Department of Nutrition, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Serdang, Malaysia; [2]Department of Nutrition, Universiti Putra Malaysia, Serdang, Malaysia; [3]Department of Community Health, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Serd, Malaysia; [4]Department of Crop Science, Universiti Putra Malaysia, Serdang, Malaysia; [5]Faculty of Environment and Resource Studies, Mahidol University, Bangkok, Thailand; [6]Department of Dietetics, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia, Serdang, Malaysia

BACKGROUND AND OBJECTIVES
Household food insecurity, defined as limited or uncertain access to adequate, safe, and nutritious food, remains a critical issue among urban poor communities. While previous research in Malaysia has identified low-income households as vulnerable to food insecurity, limited evidence exists on the specific determinants affecting urban poor populations living in low-cost flats. This study aimed to determine factors associated with food insecurity, providing targeted insights for interventions addressing urban poverty and food security challenges.
METHODS
A cross-sectional survey was conducted among 156 households from 10 selected low-cost flats in Kuala Lumpur. Mothers completed a self-administered questionnaire assessing socioeconomic status, psychological well-being, and dietary intake using a 24-hour dietary recall. Anthropometric measurements and blood samples for biochemical analysis of the mothers were also collected. Binary logistic regression was used to analyse factors significantly associated with food insecurity.
RESULTS
In this study, 45.5% of households were identified as food insecure, with the majority (91.0%) from the low-income category and 9.0% from the middle-income category. However, household income was not significantly associated with food security. Significant factors associated with food insecurity included higher maternal stress (OR = 2.5, 95% CI: 1.8–3.5), higher maternal depression (OR = 1.9, 95% CI: 1.3–2.8), elevated triglycerides (OR = 1.4, 95% CI: 1.1–1.8), and higher carbohydrate intake (OR = 1.6, 95% CI: 1.2–2.2). Protective factors included higher maternal education (OR = 0.6, 95% CI: 0.4–0.8), better diet quality (OR = 0.5, 95% CI: 0.3–0.7), and greater fruit and vegetable intake (OR = 0.7, 95% CI: 0.5–0.9).
CONCLUSIONS
Maternal education, mental health, and diet quality emerged as critical determinants of household food insecurity. Addressing higher maternal stress and depression, improving maternal education, and promoting healthier diets can significantly mitigate food insecurity and its associated consequences. These findings emphasize the importance of developing targeted, evidence-based policies and interventions to improve maternal mental health, education, and diet quality to enhance household food security and reduce its public health burden among urban poor populations.

HOW CAN I PREPARE MY CHILD TO EAT AT SCHOOL? A MIXED METHODS SYSTEMATIC REVIEW ON THE AVAILABILITY AND CONTENT OF RESOURCES TO SUPPORT THE TRANSITION OF CHILDREN FROM PRE-SCHOOL TO PRIMARY SCHOOLING

Tiffany Patterson Norrie[1]; Catharine Fleming,[1]; Pilar Navarro,[2]; James Patterson,[3]
[1]School of Health Sciences, Western Sydney University Campbelltown Campus, Campbelltown, Australia; [2]Faculty of Health, University of Technology Sydney, Ultimo, Australia; [3]Digital Health, Central Eastern sydney PHN, Sydney, Australia

BACKGROUND AND OBJECTIVES
Nutrition in the early years is crucial to support learning and development. Pre-school aged children will experience a significant transition when they move from the pre-school or childcare based mealtimes to a school-based mealtime environment. The significant changes experienced during this transition such as differing food availability choices, increased independence to manage food packaging and food intake can impact overall nutritional intake for young children. Continued compromised oral intake during the transition to school period can impact current and future learning and growth potential. This systematic review aims to identify the availability of resources and review the content of nutrition-based resources for supporting the transition/preparation skills of pre-school children and their family to the primary school mealtime environment.
METHODS
This mixed methods systematic review was guided by the JBI mixed methods systematic review principles. This review was conducted using six databases and a review of the grey literature. The search yielded a total of 3000 articles. The screening process is currently in process and we anticipate the RESULTS soon. Additionally, a review of grey literature will also be completed to identify resources that are currently available to support children and their caregivers. The findings will be reported following a narrative analysis. This systematic review was registered with PROSPERO.
RESULTS
Briefly the findings indicate that there is very limited empirical evidence that target the practical skills that children require for transitioning to the school mealtime environment. However, there is a variety of grey literature sources that specifically target skills such as introducing lunch boxes early, educating children about mealtimes and practicing school mealtime skills prior to commencing primary schooling. The complete analysis will be available shortly.
CONCLUSIONS
The findings of this systematic review will be used to guide the larger study that will include qualitative interviews and a national survey with parents of children commencing primary schooling, early childhood educators and teachers. Specifically, the systematic review findings which will be available shortly will help guide questioning for the qualitative phase and as well as identify underserved areas or skills for both parents and children in currently available resources.
CONFLICTS OF INTERESTS

IRON AND VITAMIN D STATUS IN CHILDREN AND ADOLESCENTS AND THE INFLAMMATORY BACKGROUND

Predro Antonio Souza Almeida[1]; Polyana Romano Oliosa Oliosa[2]; Letícia Batista Azevedo Letícia[1]; Jose Luiz Marques-Rocha[3]; José Geraldo Mill José[4]; Míriam Carmo R. Barbosa[1]
[1]Postgraduate Program in Nutrition and Health, Health Sciences Center, Federal University of Espirito Santo (UFES), Vitória, Brazil; [2]Postgraduate Program in Public Health, Federal University of Espirito Santo (UFES), Postgraduate Program in Public Health, Federal University of Espirito Santo (UFES), Vitoria, Brazil; [3]Department of Integrated Education - Health Sciences Center, Universidade Federal do Espírito Santo - UFES (Maruípe), Vitoria, Brazil; [4]Postgraduate Program in Physiological Sciences, Federal University of Espirito Santo (UFES), Postgraduate Program in Physiological Sciences, Federal University of Espirito Santo (UFES), Vitoria, Brazil

BACKGROUND AND OBJECTIVES

Iron (Fe) and vitamin D deficiency are two of the most common in the world[1,2]. It is an urgent matter to investigate if there is a relationship between these two major factors in children's development. Our study aims to see if there is an association of Fe status and 25(OH)D levels in children and adolescents.

METHODS

This is a cross-sectional study with children and adolescents aged six to 17 years old. Blood was collected after 12 hours of fasting, 25-hydroxyvitamin D (25(OH)D) levels were assessed using a chemiluminescence method, blood cells were analyzed using the counting method by impedance, and the cell analysis were performed by continuous flow cytometry. In total, 670 children and adolescents aged six to 17 years old registered in a social project called “Estação do Conhecimento” in Serra - Espírito Santo, a metropolitan city in Southeast Brazil.

RESULTS

A high prevalence of 25(OH)D deficiency and insufficiency, there was no connection found with Fe indices. There was a significant correlation between 25(OH)D and serum transferrin (r=0.116; p=0.003), while no positive correlation was found between ferritin, total iron, hemoglobin and hematocrit with 25(OH)D. When stratifying vitamin D levels, a significant association was observed with serum transferrin (p=0.018) using the ANOVA test. After performing the Tukey test, a significant difference was found between the insufficient and deficient groups. It can also be highlighted the different aspects in 25(OH)D among sex, it was found a higher prevalence of both deficiency and insufficiency in boys. In this specific population, it was not found a high prevalence of low Hb levels.

CONCLUSIONS

The role of vitamin D in inflammation seems to be a key factor in its relationship with many casualties this peculiar vitamin is being linked to, more studies are needed to fully understand this role of vitamin D in inflammation so we can better comprehend so many correlations found with this vitamin.

BACKGROUND AND OBJECTIVES
Malnutrition is a widespread global health challenge. India faces significant child undernutrition despite ongoing efforts of government nutrition programs. Finger millet (Ragi), known for its rich nutrient profile, offers the highest calcium (364mg/100g), balanced amino acids & high dietary fibre with polyphenols and flavonoids which help to modulate gut microbiota into beneficial way. Improving nutrition status through gut microbiome serves as a sustainable diet approach in treating malnutrition. This study focuses on the use of Finger millet-based supplement with dates powder(FMD) in comparison to existing wheat and rice based Balamrutham with dates powder (BMD) to assess its impact on MAM children's anthropometry and body composition status.
METHODS
A randomized controlled intervention was conducted in Anganwadi centres of Hyderabad, Telangana, India, among 136 MAM children (24-59 mnths) (WHZ -2 to -3). Subjects were randomly assigned to two groups to receive either FMD, or existing BMD Ready to use therapeutic food for 8 weeks intervention. Nutrient adequacy (24h diet recall), growth indicators (weight, height, MUAC), body composition were assessed at baseline and endpoint.
RESULTS
Both FMD(n=71) and BMD(n=65) groups showed improvements in weight and MUAC after the 8-week intervention ($p<0.05$) with 80% consumption. An average weight gain of 1.80 and 1.33g/kg/d was observed in FMD (7.4%) & BMD (5.5%) respectively. WHZ scores significantly improved in FMD (from -2.39 to -1.98) and in BMD (from -2.38 to -2.23) ($p<0.05$). FMD showed great improvements in mineral mass (78%), Skeletal Muscle Mass (28%), body cell mass (7%) and bone mineral content (~226%) ($p>0.05$) while BMD subjects exhibited increase in Inter Cellular Water (12.3%), protein mass (~15%), Skeleton Lean Mass (10.0%), Fat Free Mass (11%) and Basal Metabolic Rate (2%). However, 90% of MAM subjects were found to be micronutrient inadequate (MPA<0.5) and did not meet the AMDR criteria.
CONCLUSIONS
Replacement of wheat and rice based diet with Ragi & date powder in the existing supplementary Program improved anthropometry and body composition parameters among MAM children. Thus, finger millet can combat undernutrition as nutritious as well as sustainable option. Further studies are warranted to confirm these observation to include in food supplementary programs.

STUDY ON MICRONUTRIENT INTAKE AMONG TAIWANESE CHILD-BEARING AGE WOMEN AND THEIR ADHERENCE TO THE PLANT-BASED DIET

Yu-Ching Lu[1]; Feili Lo Yang[1]; Jia-Yau Doong[1]; Chao-Chun Wu[2]; Shu-Li Chia[2]; Yang-Jiun Mai[2]; Yi-Hua Chin[2]
[1]Department of Nutritional Sciences, Fu Jen Catholic University, Taipei, Taiwan; [2]Health Promotion Administration, Ministry of Health and Welfare, Taipei, Taiwan

BACKGROUND AND OBJECTIVES
Child-bearing age is a critical period for storing nutrients for pregnancy, which affects fetal growth and long-term health. The nutrition status of Taiwanese child-bearing age women is suboptimal, and information on food sources for key nutrients is pending. Plant-based diet has recently been advocated domestically. However, specific dietary recommendations for various caloric levels and life stages are needed. The objectives are to investigate the micronutrient intake status of child-bearing age women in Taiwan, and to provide recommendations on food portions and choices based on a plant-based diet design, and to verify if the nutritional needs of these people can be satisfied.
METHODS
The micronutrient intake of 16- to 49-year-old women was analyzed using 2017-2020 National Nutrition and Health Survey database. Based on the plant-based diet handbook, recommended portions of food categories for different calorie levels were designed. We summarized dietary principles and established a Plant-Based Diet Index (PBDI) for evaluating dietary adherence.
RESULTS
Women aged 25 to 29 years had the highest intake of calories and macronutrients, but their micronutrient intake was worse than those of other groups. Over 50% of child-bearing age women had insufficient intake of calcium, iron, magnesium, zinc, potassium, vitamin D, and vitamin E. Ensuring adequate intake of unrefined whole grains and vegetables to meet their needs of nutrients that are easily deficient is important. Out of PBDI range of 0–100, the average scores for child-bearing age women was 41.4 ± 0.6. PBDI analysis showed that better diet quality in older ($p < 0.0001$) and cohabiting/married women ($p = 0.0093$). Overall, child-bearing women had higher adherence to seafoods and eggs, fatty acid ratios, refined grains, and saturated fatty acids; lower adherence to whole grains, soy products, mushrooms and kelp, and nuts and seeds consumption. PBDI had significant positive correlations with blood folate and vitamin D concentration.
CONCLUSIONS
There exists a problem of high prevalence of insufficient intake of calcium, iron, magnesium, zinc, potassium, vitamin D, and vitamin E among Taiwanese child-bearing age women. Increasing consumption of unrefined grains, soy products, vegetables, and nuts and seeds must be emphasized when advocating plant-based diet for Taiwanese child-bearing age women. INFLUENCE OF MATERNAL DIET AND GESTATIONAL AGE ON THE MACRONUTRIENT AND LIPID COMPOSITION OF HUMAN MILK

Celia Sintes[1]; Marianela Rodríguez Rey[2]; Lucía Toledo,[3]; Melissa Romero,[3]; Ignacio Vieitez,[3]
[1]Nutrición Básica, School Nutrition - University of the Republic, Montevideo, Uruguay; [2]Neonatología Hospital de Clínicas, Faculty of Medicine | FMED-UDELAR, Montevideo, Uruguay; [3]Department of Food Science and Technology, Faculty of Chemistry, Montevideo, Uruguay

BACKGROUND AND OBJECTIVES
Breast milk provides nutrients and essential bioactive compounds for maternal and infant health, and its composition varies according to factors such as maternal diet. The aim of this study was to describe the macronutrients composition, the lipid profile of human milk and its relationship with maternal diet and gestational age.
METHODS
Descriptive, cross-sectional study, with non-probabilistic, convenience sampling. The sociodemographic characteristics, human milk (Lactoscan, Rose-Gottlieb method and gas chromatography) and diet (food consumption frequency, analysis with EVALFINUT 2.0) of 30 women aged 18 to 45 years, mothers of newborns admitted to intensive care, were analyzed. One sample per mother was obtained, colostrum, transitional or mature milk (September 2023 - July 2024). For quantitative variables, the mean, standard deviation (SD) and analysis with T test or Mann-Whitney (significance $p \leq 0.05$) were used.
RESULTS
Among the 30 mothers, 24 had premature babies, with respect to the pre-pregnancy body mass index (BMI), 4 were underweight, 11 were overweight or obese. The fat content of colostrum (2.66 g/100 mL) and transitional milk (2.68 g/100 mL) was significantly lower ($p \leq 0.05$) than in mature milk (4.58 g/100 mL). The average lipid profile was: 45.78% saturated fatty acids (SFA), 34.79% monounsaturated fatty acids (MUFA), 15.97% polyunsaturated fatty acids (PUFA), omega 3 PUFA (ω3 PUFA) 1.32%, omega 6 PUFA (ω6 PUFA) 14.34%. Capric, lauric and myristic SFAs were significantly higher in transitional and mature milk and PUFAs were higher in colostrum. The higher dietary SFA content (4.72 - 18.91% of total caloric value) was significantly associated with a decrease in milk PUFAs (9.04 - 21.66 g/100 g of lipids). Dietary SFAs and MUFAs (4.62 - 18.15% of total caloric value) were positively correlated with the milk AA/(EPA+DHA) ratio (AA: arachidonic acid, EPA: eicosapentaenoic acid and DHA: docosahexaenoic acid). We found a positive correlation between gestational age (29-40 weeks) and the PUFAω3 content (0.720 - 2.788 g/100g of lipids) and a negative correlation for the AL/ALA ratio (AL: linoleic acid, ALA: alpha linolenic acid) of milk.
CONCLUSIONS
Lipid content is significantly higher in mature milk and the type of FA varies according to the type of milk. Dietary SFA and MFA modify the lipid profile of milk. At lower gestational ages, a lower content of ω3 PUFA and a significant increase in the LA/ALA ratio are observed.

EARLY RETIREMENT PENSIONERS DIAGNOSED WITH OBESITY OF OTHER HYPERALIMENTATION IN GERMANY - AMORTIZATION OF GRANTED MEDICAL REHABILITATION MEASURES DEPENDING ON THE INCOME STATUS OF GERMAN PENSION INSURANCE SCHEME (DRV) INSURES

Maria Weyermann[1]
[1]Department of Health Care, Niederrhein University of Applied Sciences, Krefeld, Germany

BACKGROUND AND OBJECTIVES
In order to avoid early retirement (ER) the German statutory pension insurance fund covers the cost of rehabilitation for employees whose working capacity is endangered due to health problems. However, the granting of medical rehabilitation must adhere to the principles of economic efficiency and frugality (§ 13 (1) SGB VI, Federal Ministry of Justice 2022). We aimed to describe the use of medical rehabilitation among insured persons received a disability pension due to obesity or other hyperalimentation (ICD E65-E68) with special consideration of sociodemographic determinants.Furthermore, amortization of rehabilitation was estimated stratified according to different income groups.
METHODS
Analysis based on 20% random samples of administrative pension records from the Research Data Centre of the German Federal Pension Insurance, which include all new cases of early retirement (ER) from 2001 to 2020 (DRV FDZ 2022).We estimated risk of non-utilization of medical rehabilitation using logistic regression models. Amortization of rehabilitation was calculated according to Schneider (1989).
RESULTS
The data set contains 681,189 insured persons aged up to 64 years who were granted an EM pension for the first time between 2001 and 2020. After exclusion of persons who received occupational rehabilitation, 661,227 persons are left, of whom 371,180 (56.5%) did not receive medical rehabilitation in the five years before the granting of ER pension. Among them, 3,233 (0.5 %) persons received a ER pension due to obesity or other hyperalimenation. 1,958 out of these 3,233 (60.6%) did not receive medical rehabilitation. Risk factors for not receiving medical rehabilitation are male gender, foreign nationality, low or unknown education, low or unknown job requirement profile, low income as well as low pension payment amount. For example, adjusted risk (Odds Ratio [95%-CI]) among persons with low income (1st quartile vs. 4th quartile), was 3.4 [2.6;4.4]. The duration of employment after rehabilitation for amortization the costs of rehabilitation increases with lower income (lowest quartile of income: 18 months, 2nd quartile: eight months, 3rd quartile: five months, upper income quartile: four months).
CONCLUSIONS
One reason for the social inequality in the implementation of the principle "rehabilitation before pension" could be the difficulty of complying with the economic efficiency and frugality requirement when granting medical rehabilitation measures for economic disadvantaged persons.

DEVELOPMENT OF A MOBILE HEALTH APPLICATION FOR PROMOTING THE RECOMMENDATIONS OF THE DIETARY GUIDELINES FOR THE BRAZILIAN POPULATION

Laura Claro[1]; Kamila Gabe[1]; Amanda Jesus[1]; Juliana Jesus[2]; Rosane Santana[3]; Maria Laura Louzada[4]
[1]Departamento de Nutrição, Faculdade de Saúde Pública USP, São Paulo, Brazil; [2]Departamento de Nutrição, Faculdade de Saúde, São P, Brazil; [3]Departamento de Nutrição, Universidade Paulista, São Paulo, Brazil; [4]Department of Nutrition, Universidade de São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
Health apps are tools for food education and self-care[1], contributing to the improvement of healthy eating behaviors[2]. In Brazil, the Dietary Guidelines for the Brazilian Population promote habits aligned with traditional dietary patterns[3]. This study describes the development of a mobile application aimed at promoting healthy eating and increasing adherence to the Brazilian dietary pattern recommended by the Guidelines.
METHODS
This methodological study was based on the development of a mobile application for smartphones. The process followed the design thinking4 methodology and was led by a committee of experts in the Guidelines, digital health, and eating behavior change. It involved three steps: 1) literature review and theoretical framework definition; 2) app ideation, including benchmarking5, interviewing potential users to explore perceptions and needs regarding changing eating habits, and creating a persona; and 3) content development and app design.
RESULTS
1) The Dietary Guidelines for the Brazilian Population and the transtheoretical model of behavior change were defined as the theoretical basis. 2) We interviewed 8 individuals (average age: 38 years, 87.5% women). Challenges for changing eating habits included exposure to unhealthy food environments, lack of time, motivation, and information. 3) Based on this diagnosis, the app was conceptualized as a 6-month self-instructional program with five progressive levels: beginner, intermediate, advanced, expert, and specialist, each divided into two modules with seven sessions. Sessions will deliver trusty information and strategies to overcome barriers such as limited culinary skills and time. Interactive features include quizzes, matching and completing sentence challenges, true or false activities, and a question bank for evaluative content at the end of each session. Additional features include a main menu, tutorial, interactive avatar, and gamification strategies like rewards to unlock premium content, aimed at increasing engagement.
CONCLUSIONS
The app is currently under development and parallel usability tests. Collaboration with experts guided research methodology and design. It is expected to enhance adherence to the Brazilian dietary pattern, promote self-care, and expand technological resources, supporting Brazil's Digital Health Strategy and public health system.

HOW CAN WE SUPPORT DUTCH OLDER CONSUMERS TOWARDS AN OPTIMAL AND SUSTAINABLE PROTEIN INTAKE – OUTCOMES OF THE "DUURZAAM EIWITWIJS" PROJECT

Joost Linschooten[1]; Anastasia Vugts[1]; Annemarie Nijhof[2]; Marleen Manders[2]; Jos Borkent[2]; Marian De Van Der Schueren[2]; Annet JC Roodenburg[1]
[1]Nutrition & Health, HAS university of applied sciences, 's-Hertogenbosch, Netherlands; [2]Department of Nutrition, Dietetics, and Lifestyle, HAN University of Applied Sciences, Nijmegen, Netherlands

BACKGROUND AND OBJECTIVES
A diet with sufficient protein is important for maintaining muscle mass, muscle strength and self-reliance in community-dwelling older adults ≥ 65 years (CDOA). It is known that many of them do not consume enough protein, and that they are often unaware of this. Furthermore, most older adults still consume an omnivorous diet. Climate goals require a shift towards a more sustainable diet, optimally with 60% of proteins being plant-based. Our aim was to define how we can support CDOA, dietitians and food small and medium-sized enterprises (SMEs) with knowledge and products to achieve an optimal protein intake.
METHODS
In this project several studies were carried out to identify key behavioural aspects of optimal protein intake, the development of new food product concepts that fit the needs, and evaluate and optimise dietary information material to be used by dietitians. A consumer panel was formally set up to recruit participants, and connections with community centres were established to reach elderly with low socio-economic positions.
RESULTS
Qualitative research into consumer behaviour showed that still many participants had low consciousness of current protein intake. Despite several opportunities to guide them in the shift towards more plant-based protein (e.g. just to try it), barriers were also identified (e.g. routines, inflexibility). Our modelling study showed that eating more plant-based does not severely impact protein quality, but shifting towards a fully vegan diet does. However, with careful meal planning, it is possible to compose meals with high protein quality [1]. Outcomes were used to develop new food products and redesign a ready-made meal sequence towards sustainable, high protein quality meals by participating food SMEs. Current Dutch dietary advisory material was evaluated and showed that limited information on plant-based diets was available. Requirements were identified and new material was developed and evaluated, that may support dietitians in providing adequate dietary counselling. A masterclass was developed for dietitians focusing on sustainable nutrition, with an emphasis on the protein transition and the practical dilemmas in dietary counselling for CDOA. In addition, a workbook has been created for CDOA who consult a dietitian, which may support clients in achieving sustainable nutrition with sufficient protein (quality).
CONCLUSIONS
Altogether these data exposed barriers and promotors in current dietary behaviour of CDOA, that can be deployed in order to support the target population towards an optimal and sustainable protein intake. Next, these outcomes could be put into practice.

FOOD INSECURITY AND NUTRITIONAL INADEQUACY IN CHILDREN AND ADOLESCENTS OF BASIC EDUCATION SCHOOLS OF CANTAGALO DISTRICT IN SÃO TOMÉ AND PRÍNCIPE, CENTRAL AFRICA

Francisca Ferreira[1]; Maria Tavares[2]; Rita Morais,[1]; Cláudia Camila Dias[3, 4]; Madalena Ortigão,[2]; Renata Barros,[1]; Mónica Rodrigues,; Patrícia Padrão,[1]; Pedro Moreira,
[1]Faculty of Nutrition and Food Sciences, University of Porto, Porto, Portugal; [2]Nutrition, Associação Helpo - O Nosso Mundo é Humano, Cascais, Portugal; [3]Community Medicine, Information and Health Decision, CINTESIS@RISE - Centro de Investigação em Tecnologias e Serviços de Saúde, Porto, Portugal; [4]Knowledge Management Unit, Faculty of Medicine, Porto, Portugal

BACKGROUND AND OBJECTIVES
Food insecurity (FI) is a critical socioeconomic and public health problem globally, particularly affecting children's nutritional status and development. This cross-sectional study aimed to assess the prevalence of nutritional inadequacy among children and adolescents in the Cantagalo district of São Tomé and Príncipe, in Central Africa. It also assessed their households' FI situation and examined sociodemographic, anthropometric, and nutritional characteristics associated with severe FI.
METHODS
Data included 546 children/adolescents (51.8% males, aged 9-15 years) from the eight public basic education schools. A structured questionnaire provided sociodemographic data, while anthropometric measurements assessed nutritional status. Dietary intake data were gathered using a single 24 h dietary recall, and the adjusted prevalences of nutritional inadequacy were obtained using version 2.0 of the PC-Software for Intake Distribution Estimation (PC-SIDE®). The Household Food Insecurity Access Scale was used to assess FI, and households were classified as severely or non-severely food insecure. Multivariable binary logistic regression models adjusted for potential confounders identified factors related to FI.
RESULTS
Children's/adolescents' thinness was exhibited in 34.1% of participants, and over 95% had inadequate intake of essential micronutrients, including iron. Notably, 73.7% were severely food insecure.
CONCLUSIONS
It is noteworthy that higher severity of FI was positively associated with a lower intake of iron and certain household head characteristics, such as being female or older, and negatively associated with having a home garden.

BIOMONITORING OF TRACE ELEMENTS IN PLASMA OF OBESE CHILDREN IN BRAZIL: RELATIONSHIP WITH ENVIRONMENTAL AND DIETARY FACTORS

Francisco Luan Fonsêca da Silva[1]; Matheus Firmino[1]; Thaynan Dias[1]; Luiz Oliveira[1]; Maria Nogueira; Ana Bárbara Araújo[1]; Carla Soraya Costa Maia[1]
[1]Programa de Pós-Graduação em Nutrição e Saúde, Universidade Estadual do Ceará - Campus do Itaperi, Fortaleza, Brazil

BACKGROUND AND OBJECTIVES
The prevalence of childhood and adolescent obesity is increasing worldwide with an estimation of 124 million people in 2016. Due to its multifactorial nature, obesity requires a multidisciplinary approach to its treatment. Factors such as diet, genetic components, lifestyle, environmental factors, and other exposures are extremely important to be studied. The objective of this study was to conduct a biomonitoring of obese adolescents from municipal schools in Fortaleza, CE, Brazil.
METHODS
This is a cross-sectional study involving approximately 114 adolescents aged between 10 and 14 years, who are part of the third phase of the Estudo de Nutrição e Saúde de Crianças e Adolescentes de Fortaleza (ENSCA-FOR) and attend municipal schools in Fortaleza. Initial data (T0) were collected: sociodemographic data, through interviews and specially designed forms; anthropometric data, through the collection of weight, height, and waist circumference. Inorganic trace elements were also evaluated from blood plasma samples using inductively coupled plasma mass spectrometry (ICP-MS). Additionally, environmental factors such as the Human Development Index (HDI), safety, and diet-related factors such as the degree of food processing, were analyzed. Data analysis was performed using the SPSS 22.0 program, with p-values less than the significance level of 5% considered significant. Variables with normal distribution were tested using the t-test for independent samples and expressed as mean and standard deviation, while those not normally distributed were tested using the Mann-Whitney test
RESULTS
Arsenic, Hg, and Ni average values were 8.48 μg L-1, 6.78 μg L-1, and 7.55 μg L-1, respectively. Furthermore, Fe, Hg, and Zn are positively associated with the HDI, and the elements As, Co, and Hg are positively related to the degree of food processing. The sample of obese adolescents studied showed a profile of high plasma concentrations of As, Hg, and Ni with a clear difference between regions of the municipality.
CONCLUSIONS
Environmental and dietary factors are associated with high levels of toxic elements in obese children from Fortaleza, Brazil. There are few studies with this population, so the risk of contamination has not been completely elucidated yet, requiring further studies that reference average safety values, with more exposure variables to identify existing associations and more studies with this population and other age groups.

EXPLORATORY ANALYSIS OF DIETARY FAT INTAKE AND BLOOD LIPID BIOMARKERS IN NURSING HOME RESIDENTS AND COMMUNITY-DWELLING OLDER ADULTS

Neža Hren[1, 2]; Hristo Hristov[1, 3]; Igor Pravst[1, 2, 4]; ŽIva Lavriša[1, 2]
[1]Public Health, Institute for Nutrition, Ljubljana, Slovenia; [2]Department of Nutrition, Biotechnical Faculty, University of Ljubljana, Ljubljana, Slovenia; [3]Public health, National Institute of Public Health, Ljubljana, Slovenia; [4]Research, VIST-Faculty of Applied Sciences, Ljubljana, Slovenia

BACKGROUND AND OBJECTIVES
Lipid profiles and dietary fat intake are associated with cardiovascular health. Understanding these factors in older adults, especially those in vulnerable groups like NH residents, is crucial due to their potential impact on overall health and disease risk. This study aims to compare dietary fat intake and blood lipid biomarkers between nursing home (NH) residents and community-dwelling (CD) older adults, while exploring the role of physical activity in influencing blood lipid profiles. Understanding these variations is crucial for improving health outcomes and tailoring interventions for vulnerable populations.
METHODS
The data for the comparative study include CD elderly aged 64–74 years (NutriHealth study; n = 128), and NH residents aged 65-101 years (NutriCare study; n = 257). Individuals with diagnosed hypercholesterolemia were excluded. In both populations fasting blood samples were collected to evaluate the lipid profile. Physical activity was assessed using the International Physical Activity Questionnaire (IPAQ). Usual dietary intake was assessed by a multiple-source method from two 24-h dietary recalls and food frequency questionnaires. Descriptive analysis was used and differences in means using t-test statistics were tested for significance.
RESULTS
Mean usual total dietary fat intake was higher in NH residents (36.1 % vs. 33.25 % of total energy intake), as well as mean usual daily saturated fat intake (13.3 % vs. 9.0 % of total energy intake). Mean S-cholesterol (4.77 vs. 5.45 mmol/L) and HDL cholesterol (1.2 vs. 1.5 mmol/L) were significantly lower in NH residents compared to CD elderly. Greater variability in lipid profile parameters was observed in NH residents. S-HDL levels in NH residents significantly increased with higher IPAQ score but not in CD. A trend of lower S-triglycerides was observed in both populations in those with high IPAQ scores compared to subjects with low IPAQ.
CONCLUSIONS
This exploratory analysis showed that NH residents had higher dietary fat and saturated fat intake compared to CD older adults, yet exhibited lower S-cholesterol and S-HDL cholesterol levels. The association between physical activity and lipid profile in NH residents highlights the role of lifestyle factors. Further research is needed to confirm these findings and explore the interactions between diet, physical activity, and lipid profiles in vulnerable older adults.

INTAKE OF SIMPLE SUGARS FROM FLAVORED AND CARBONATED BEVERAGES, SUBCUTANEOUS ADIPOSITY IN YOUNG PEOPLE AND ASSOCIATED FACTORS

Hally Ruth Huillca Maldonado[1]; Tania Laura Barra Quispe[2]; Miguel Angel Castro Mattos[3]
[1]Nutrición, National Major University of San Marcos, Lima, Peru; [2]Nutrition, Universidad Nacional del Altiplano de Puno, Puno, Peru; [3]Nutrition, Universidad nacional de ed, Lima, Peru

BACKGROUND AND OBJECTIVES
Flavored and carbonated beverages are constituted by large amounts of sugars and their intake in adults is very frequent, they represent a high source of simple sugars. Their excessive consumption generates an accelerated intake of calories that can displace the intake of other macronutrients and contribute to the development of adiposity, which potentially increases cardiometabolic risk. Given the relevance of this background, the aim of this study was to analyze the association between the intake of simple sugars from flavored and carbonated beverages on subcutaneous adiposity in young Peruvians, considering sociodemographic factors and the average time spent in sedentary activities.
METHODS
A cross-sectional correlational study was conducted with a sample of 382 students from public universities. The consumption of sugar-sweetened beverages was assessed by means of a previously validated food consumption frequency questionnaire, complemented with the 24-hour recall technique. A univariate and bivariate analysis was performed in the SPSS program (version 26). Spearman's Rho coefficient was used to evaluate correlations. Statistically significant values were interpreted in terms of magnitude and direction (positive or negative) to identify general patterns and highlight the most relevant findings in the overall context of the study.
RESULTS
The prevalence of overweight was 69.6 % (according to body fat percentage), the median age of those evaluated ranged from 20 to 23 years, the average sitting time of students was 8 hours on a weekday, the intake of carbonated beverages was higher, 405.4 ml/day (average), which represents 8.2% of simple sugars based on a 2000kcal diet. However, only the fruit-flavored beverage presented significant negative correlations in specific contexts: moderate physical activity, less time sitting, residence in Lima and non-poor socioeconomic level.
CONCLUSIONS
The RESULTS suggest that fruit-flavored drinks are associated with less healthy lifestyles and may be more popular among people with sedentary lifestyles, in lower socioeconomic contexts and living outside Lima.

EPO5_281

THE IMPACT OF A NUTRITIONAL EDUCATIONAL INTERVENTION ON NUTRITIONAL KNOWLEDGE AND DIETARY INTAKE IN FEMALE HANDBALL ATHLETES

Macarena Veloso[1, 2]; Andreu Farran Codina[1, 2]
[1]Department of Nutrition, Food Science and Gastronomy, Universitat de Barcelona, Barcelona, Spain; [2]INSA-UB, Nutrition and Food Safety Research Institute, Universitat de Barcelona, Barcelona, Spain

BACKGROUND AND OBJECTIVES
Proper nutrition enhances athletes' performance and recovery during sports activities (1). Various factors affect the athlete's diet, including nutritional knowledge (2). Specifically, the level of nutritional knowledge attained by an athlete positively affects their dietary behavior (3). Studies report that female athletes have low levels of nutritional knowledge and insufficient dietary intake to meet their nutritional requirements (3-5). The objective of this study was to evaluate the effects of a nutritional education program on nutritional knowledge and dietary intake among female handball players..
METHODS
A quasi-experimental intervention design with pre- and post-intervention assessments was implemented. The intervention consisted of a nutritional education program included 6 in-person group sessions, each lasting 15 minutes, over a 3-week period. Forty-seven female handball players (mean age 17.5 ± 2.1) participated. Nutritional knowledge (NUKYA questionnaire), dietary intake (3-day record) and adherence to the Mediterranean diet (Kidmed Index) were assessed.
RESULTS
Forty-one players completed the NUKYA questionnaire, and an increase in the score before (22.0 ± 16.1) and after the educational intervention (42.7 ± 16.4) of 20.7 points was observed, which was statistically significant ($p<0.001$). The effect size assessed with Hedges' g indicates that the effect was substantial (>0.8). It is noteworthy that the four items assessed in the questionnaire (macronutrients, micronutrients, hydration and periodicity) registered a significant increase in their scores. Thirty-seven female players completed the dietary record and it was observed that at the beginning of the study, most of the players were at risk of not meeting their needs for calcium, zinc, vitamin C, D and E, according to the average requirement published by the EFSA or DRIs. In the follow-up phase, a significant increase in calcium intake was observed ($p=0.0095$). A total of 83% of the players needed to improve their adherence to the MD.
CONCLUSIONS
Therefore, we recommend the implementation of nutritional educational interventions in sports clubs as a strategy to improve nutritional knowledge and nutrition of athletes. However, it is essential to continue researching and evaluating innovative educational methodologies that allow increasing the consumption of all critical micronutrients that are usually deficient in this population, thus contributing to a more comprehensive and adequate nutrition for sports performance.

THE REGULATION OF THE WORKFORCE QUALIFICATION BY THE BRAZILIAN NATIONAL FOOD AND NUTRITION POLICY: CHALLENGES FOR UNDERGRADUATE COURSES IN NUTRITION

Joana Indjaian Cruz[1]; Maria Lucia Indjaian,[2]
[1]Law School, Universidade NOVA de Lisboa, Lisbon, Portugal; [2]Revista E-currículo, PUC-SP - Campus Monte Alegre, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
The Brazilian National Food and Nutrition Policy (PNAN), published in 1999, is part of a set of actions, laws, policies, plans, programs, projects, information systems and research that emphasize health and food as a right for all Brazilians. The PNAN is part of the the the Brazilian Unified Health System (SUS) and has a guideline regarding the qualification of the national health and nutrition workforce. The objective of this work is to explore how the Brazilian National Food and Nutrition Policy (PNAN), as a health and nutrition public policy, is being contemplated in the academic training of nutritionists, especially in the Undergraduate Nutrition Courses.

METHODS
An exploratory and qualitative research was carried out with the specific objectives of (a) identifying and systematizing the legal arrangement for the regulation of the qualification of the health workforce in the areas of food and nutrition; (b) identify and describe the regulation of the Undergraduate Nutrition Courses, as well as how they are articulated with the PNAN.
RESULTS
There is a relevant legal arrangement to regulate the qualification of health and nutrition workforce in the e Brazilian Unified Health System (SUS) through a set of several tipes of norms and legislation. There is little literature on the assessment of the presence of the PNAN and of food and nutrition security in the undergraduate nutrition courses. These courses still have a curriculum with a predominantly biological approach of nutrition, that does not harmonize with the approach to health and nutrition from a biological, psychological and social perspective that is the foundation of the PNAN, the Brazilian Unified Health System (SUS) and the National Food and Nutritional Security System (SISAN).
CONCLUSIONS
Graduation in nutrition becomes increasingly complex and challenging as it has to contemplate the population's health needs and the Unified Health System (SUS) demands to perform on different fronts of the food system, including food and nutritional security. The intersectoral approach and institutional articulation are essential for the consecution of the PNAN's strategic lines, especially fot the guideline of qualification of the workforce to be reflected in undergraduate nutrition courses.

BODY FAT AND MEDITERRANEAN DIET ADHERENCE AMONG NATIVE AND IMMIGRANT CHILDREN: THE ASOMAD STUDY

Asmaa Nehari[1]; Alicia Portals-Riomao[1, 2, 3]; Eva Gesteiro[1, 2]; Carlos Quesada-González[1, 4]; Augusto Garcia Zapico[1, 2]; Marcela Gonzalez Gross[1, 2, 5]
[1]ImFINE Research Group, Department of Health and Human Performance, Universidad Politécnica de Madrid, Madrid, Spain; [2]Physical Exercise and Health Research Network, EXERNET, Madrid, Spain; [3]Department of Language, Arts and Physical Education, Universidad Complutense de Madrid, Madrid, Spain; [4]Department of Mathematics Applied to Information and Communication Technologies, Universidad Politécnica de Madrid,, Madrdi, Spain; [5]Biomedical Research Center of Pathophysiology of Obesity and Nutrition-CIBERobn, Carlos III Health Institute, Madr, Spain

BACKGROUND AND OBJECTIVES
The rising prevalence of childhood obesity is a major public health concern influenced by dietary habits and cultural factors(1). This study aimed to assess body fat percentage (%BF) in children and examine the impact of sex, age, origin, and adherence to the Mediterranean Diet (MDA), with a particular focus on immigrant children.
METHODS
A cross-sectional study was conducted in the fall-winter of 2020, 2021, and 2022. The study employed a cluster random sampling method to obtain a representative sample of school-aged children aged 8 and 12 years. %BF was measured using bio-impedance analysis. MDA was assessed using the KIDMED questionnaire(2). Parental origin was considered (birthplace in Spain or elsewhere "specified"). High %BF was defined as BF> 90th percentiles (3). Obesity and overweight (OW/OB) were classified according to the International Obesity Task Force (IOTF) guidelines(4). Statistical analysis involved t-test to compare %BF and KIDMED score among groups, employing Chi-square tests to evaluate differences in obesity prevalence, and utilizing a logistic regression to determine risk factors for the high BF, all with a 95% confidence interval (CI).
RESULTS
The sample consisted of 578 children (54% boys, mean age 9.54±1.19 y). One third of the participants were of immigrant origin, with at least one parent born outside Spain. %BF of the overall sample was 20.82±7.23. The threshold for %BF at the 90th was 31.3%, logistic regression revealed significant associations between sex, age, origin of parents and high %BF. Parental origin was strongly associated OR=3.631, 95% CI [1.983 - 6.647], p<0.001, suggesting an increased risk in children of immigrant origin. Children aged 10y OR = 3.047, 95% CI [1.407 - 6.599], p = 0.005, and 11y OR = 2.915, 95% CI [1.283 - 6.623], p=0.011 groups also presented increased risk. Sex showed a trend toward association OR=1.728, 95% CI [0.945-3.160], p=0.076, although not statistically significant. Immigrant children exhibited significantly higher mean %BF compared to Spanish children (23.65±8.05 and 19.42±6.34 respectively, p<0.001). Furthermore, the prevalence of excess weight was significantly higher among immigrant children 38.5% vs 17.9%, p<0.001. Interestingly, no significant differences were observed in KIDMED scores between both groups, suggesting similar MDA.
CONCLUSIONS
The study highlights the complex interplay of factors influencing childhood obesity, emphasizing the need for culturally tailored interventions, particularly for immigrant.

Preventive Medicine and Public Health, University of Navarra, Pamplona, Spain; [2]Department of Preventive Medicine and Public Health, University of Navarra, Pamplona, Spain; [3]CIBERobn, Carlos III Health Institute, Madrid, Spain; [4]Diet and Lifestyles, Instituto de Investigación Sanitaria de Navarra (IdiSNA), Pamplona, Spain

BACKGROUND AND OBJECTIVES
The “X” project is an open-enrolment cohort in “X”, consisting of 23 321 university graduates, 61.5% women. It was originally set up in December 1999 to investigate the association between the Mediterranean dietary pattern and other lifestyle-related factors in relationship with the risk of chronic diseases. Retention rate is 90.6%. Several new areas of research have been developed: mortality, well-being, validations and confirmations of different diseases, SARS-CoV-2, and development of diverse several scores (lifestyle, oxidative, macronutrient quality, Paleo-Diet, sustainable diet, dietary obesity-prevention and diabetes prevention and dietary-based diabetes-risk).
METHODS
Participants are university graduates from the X and other X universities, as well as members of different professional associations. Biological collection samples began in 2008. Saliva samples are requested from a subpopulation of participants aged 55 years and over, for a sub-study on dementia (n=1827). The baseline questionnaire collects information on participants’ sociodemographics, anthropometrics, diet (through a previous validated food frequency questionnaire (FFQ), eating behaviors, lifestyles, clinical data, preventive measures, medications, and personality traits. Follow-up questionnaires are sent to participants every two years. They focus on changes in food habits, diagnosis of new diseases, quality of life, drugs, personality test, and Psychological Well-Being (Ryff scale). Some of the items were repeated over time, like the FFQ assessed at baseline, at 10-year and 20-year follow-up.
RESULTS
The more relevant findings to date are the following: a high MedDiet adherence is associated with a reduced incidence of all-cause mortality, fatal and non-fatal major cardiovascular disease (CVD), type 2 diabetes, weight gain, metabolic syndrome, depression, cognitive decline, and nephrolithiasis. An inverse dose-response relationship was found for many of these associations. By contrast, a higher consumption of ultra-processed foods was independently associated with a relatively increased hazard for all-cause mortality.
CONCLUSIONS
Up to date 312 publications with data from de SUN project have been published. These publications support our initial hypothesis that the adherence to a Mediterranean dietary pattern, rich in virgin olive oil, fruits, vegetables, whole-grains, fish, and poor in ultra-processed foods, red meats, binge drinking, sedentary life could protect against suffering from different diseases.

EXPLORING PUPILS' PERCEPTIONS OF SCHOOL MEAL PROVISION AND THE SCHOOL CANTEEN ENVIRONMENT IN NORTHERN IRELAND: THE CANTEEN STUDY

Charlotte Neville[1]; Lesley Hamill[1]; Desiree Mc Ilwee[1]; Sarah Moore[1]; Christina O' Neill[1]; Cara Mc Connell[1]; Miranda Pallan[2]; Marie Murphy[2]; Emma Louise Alving-Jessep[2]; Estera Sevel[2]; Ellie Ansell[2]; Jayne Woodside[1]
[1]Centre for Public Health, School of Medicine, Dentistry and Biomedical Sciences, Queen's University Belfast, Belfast, United Kingdom; [2]Department of Applied Health Sciences, University of Birmingham, Birmingham, United Kingdom

BACKGROUND AND OBJECTIVES
Schools provide a convenient, accessible eating environment for pupils, which can help facilitate healthier eating habits. Beyond the nutritional benefits, school meals may have a positive impact on pupil wellbeing, learning, concentration and academic outcome.(1) However, despite the benefits, encouraging school food uptake remains a challenge. To further understand the factors affecting uptake, this research assessed the perceptions of secondary school pupils towards both school food provision and the canteen environment.
METHODS
The research is based on data collected from 820 pupils (12yr olds n=428; 15yr olds n=392) recruited from 17 secondary schools in Northern Ireland, as part of the CANTEEN study, an ongoing cross-sectional study which aims to evaluate the effectiveness and cost-effectiveness of the means-tested Free School Meal policy in UK secondary schools (England and Northern Ireland) on diet and food insecurity and the factors associated with uptake. Pupils completed an online survey, which included statements about perceptions of school food and the canteen. Responses were measured on a 5-point Likert scale (rated from strongly agree to strongly disagree). Data were analysed using descriptive statistics.
RESULTS
In general, perceptions about the canteen were more positive than negative. From a social aspect, 92% of pupils agreed or strongly agreed that they were able to eat with their friends. More than twice as many girls (19%) than boys (8%) agreed/strongly agreed that friends influenced what they ate ($p<0.001$). More boys than girls were positive (agreed/strongly agreed) about the taste (57% vs. 40%) and variety of foods (61% vs. 45%) (both $p<0.01$). Over half (58%) agreed/strongly agreed that the canteen catered for the dietary needs of all pupils. Perceptions about the canteen environment and the staff were positive, with more than half viewing the canteen as a clean (58% agreed/strongly agreed), happy place (56%) with adequate seating (82%) and helpful staff (76%). Perceptions regarding the menu and costs were less favourable with less than half agreeing/strongly agreeing that foods were clearly priced (37%), that the menu was available in advance (44%) and that foods offered were good value for money (41%). Most pupils (69%) queued for <10 minutes for food however, almost half of the girls (47%) and one third of boys (35%) felt rushed when buying food. Despite this, most pupils (60%) felt that they had enough time to eat their meal.
CONCLUSIONS
Understanding pupils' perceptions of school food and the canteen is important for informing school food policy and for improving the delivery, acceptability and uptake of school food.

EFFECTIVENESS OF MULTI-MICRONUTRIENT POWDERS AND HEALTH EDUCATION COMMUNICATION ON NUTRITIONAL STATUS OF VIETNAMESE CHILDREN 6-11 MONTHS OLD

Nga Thuy Tran[1]; Thi Minh Nguyet Tran[2]; Anh Hoa Le[3]; Thi Lan Phuong Nguyen[1]; Tran Thanh Duong[4]
[1]Department of Micronutrients, National Institute of Nutrition, Hanoi, Vietnam; [2]Center of Nutrition Counseling, Rehabilitation and Obesity Control, National Nutrition of Nutrition, Hanoi, Vietnam; [3]Department of Nutrition Surveillance and Policy, National Institute of Nutrition, Hanoi, Vietnam; [4]Director, National Institute of Nutrition, Hanoi, Vietnam

BACKGROUND AND OBJECTIVES
Infants from 6 to 11 months old are noted with high prevalence of malnutrition, related to the fact that complementary diets provided not adequate child's needs of nutrients that might be seen popular in rural areas with limited economic conditions, knowledge, health care and nutrition practices. This study was conducted to evaluate the effect of multiple micronutrient powders (MNPs) and health education communication on micronutrient status in Vietnamese infants 6-11 months old.
METHODS
360 infants 6-11 months old participated in the intervention, divided into 2 groups according to anthropometric indicators, age in months and gender. The intervention group supplemented the multi-micronutrient package MNPs Bibomix, 1 package/1 day; 5 packages/1 week, consisting of 15 vitamins and minerals, combined with nutrition communication, the control group used a placebo package and nutrition communication, for 12 months. Anemia and iron deficiency are identified following World Health Organization guidelines. Low serum zinc concentration is defined by a serum zinc concentration <9,9µmol/L.
RESULTS
After controlling for confounding factors, the intervention clearly showed the effect of the intervention in children on hemoglobin, ferritin, and serum zinc concentrations ($p<0.05$). The mean hemoglobin concentration after 12 months of the intervention group increased by 4.36 (g/L) ($p < 0.001$) compared to the control group; The prevention effect on anemia in children was 6.7% (95%CI: 2.2; 11.2) ($p < 0.01$); The average ferritin concentration after 12 months in the intervention group was 7.44 (µg/L) higher than the control group ($p < 0.001$). The effectiveness of preventing iron deficiency in children was 7.8% (95%CI: 3.1; 12.4) ($p < 0.001$). The average zinc concentration after 12 months in the intervention group was 0.38 (µmol/L) higher than the control group ($p < 0.01$); The effectiveness of preventing low serum zinc concentrations in children was 18.5% (95%CI: 6.2; 30.8), ($p < 0.05$).
CONCLUSIONS
Fortification of multi-micronutrient powders into complementary foods at households combined with counseling on child feeding and health care have remarkable improved the iron and zinc status and reduced prevalence of anemia among children after 12 months of the intervention. It should be replicated in areas with high risk of childhood micronutrient deficiencies.

FISH CONSUMPTION AND BODY COMPOSITION IN CHILDREN IN A MEDITERRANEAN DIET FRAMEWORK: THE ASOMAD STUDY

Asmaa Nehari[1]; Alicia Portals-Riomao[1, 2, 3]; Eva Gesteiro[1, 2]; Carlos Quesada-González[1, 4]; Augusto Garcia Zapico[1, 2]; Marcela Gonzalez Gross[1, 2, 5]

[1]ImFINE Research Group, Department of Health and Human Performance, Universidad Politécnica de Madrid, Madrid, Spain; [2]Physical Exercise and Health Research Network, EXERNET, Madrid, Spain; [3]Department of Language, Arts and Physical Education, Universidad Complutense de Madrid, Madrid, Spain; [4]Department of Mathematics Applied to Information and Communication Technologies, Universidad Politécnica de Madrid,, Madrdi, Spain; [5]Biomedical Research Center of Pathophysiology of Obesity and Nutrition-CIBERobn, Carlos III Health Institute, Madr, Spain

BACKGROUND AND OBJECTIVES

The Mediterranean Diet (MD) is recognized as one of the healthier dietary patterns worldwide (1-3). The objective of this study was to evaluate the relationship between fish intake, an essential element of the MD, and body composition in school-aged children.

METHODS

A cross-sectional study was conducted during the academic years 2020-2022. The sampling was randomized in clusters to obtain a representative sample of children aged 8 to 12 years. Anthropometric indices for body composition including body mass index adapted by age and sex (BMI-z), waist circumference (WC), waist to height ratio (WHtR), and body fat percentage (BF%) were measured following standard guidelines. Overweight and obesity (OW/OB) were determined according to the International Obesity Task Force (IOTF (4). Adherence to the MD was assessed using the KIDMED questionnaire (5), focusing on fish consumption item. For statistical analysis, Students-t was utilized to compare anthropometric indices between two groups based on fish consumption (consumers vs. non-consumers), and Chi-square tests were conducted to examine the association between fish consumption and OW/OB prevalence.

RESULTS

578 children were recruited (mean age 9.54±.19; 46% females). Those consuming fish at least 2-3 times a week 68% showed significantly lower BMI z-scores, WC, WHtR, and %BF compared to those who did not (mean = 0.416 ± 1.015 vs 0.77±1.13 ; 60.75 ± 8.32 vs 64.11±10.28 cm; 0.44 ± 0.05vs 0.46 ± 0.06; 20.14 ± 6.96 vs 22.29 ± 7.59%, respectively; all $p<0.001$). Significant differences were found in all anthropometric measurements in boys ($p<0.05$), while among girls only WC was different ($p<0.05$). A significant association between fish consumption and OW/OB prevalence was found ($\chi^2 = 15.820$, df = 2, $p<0.001$). The prevalence of OW/OB was higher in the group that did not consume fish regularly compared to the group that did (24.3% and 10.8% vs 13.5% and 6.4%, respectively).

CONCLUSIONS

These findings suggest that the regular consumption of fish at least 2-3 times per week could contribute to healthier body composition among children, potentially contributing to the prevention of OW/OB in this population.

ARE THE GLOBAL SODIUM BENCHMARKS ACHIEVABLE FOR VARIOUS FOOD PRODUCT CATEGORIES AVAILABLE ON THE LOCAL MARKET IN VOJVODINA, SERBIA?

Milka Popović[1, 2]; Radmila Velicki[1, 2]; Ljilja Torović[3]; Sanja Bijelovic[1, 2]
[1]Department of Hygiene, Faculty of Medicine, University of Novi Sad, Novi Sad, Serbia; [2]Center for Hygiene and Human Ecology, Institute of Public Health of Vojvodina, Novi Sad, Serbia; [3]Department of Pharmacy, Faculty of Medicine, University of Novi Sad, Novi Sad, Serbia

BACKGROUND AND OBJECTIVES
Reducing salt intake is a critical global public health objective due to its role in preventing cardiovascular diseases and hypertension. In alignment with efforts to address these concerns, the World Health Organization (WHO) emphasizes the importance of establishing global sodium benchmarks (GSB) and promoting food reformulation across diverse food categories. The overarching goal is to mitigate the burden of diet- and nutrition-related noncommunicable diseases (NCDs) and to achieve a 30% relative reduction in average population salt intake, ultimately aiming for a daily intake of less than 5 g of salt (equivalent to <2 g of sodium). This study addresses the sodium content in food available on the local market in Novi Sad, Serbia.
METHODS
The analytically determined sodium content of 2,349 food samples from 10 food categories divided into 43 subcategories was used to assess their compliance with established sodium reduction standards.
RESULTS
The assessment revealed that, within the range of established minimum values across a total of 43 subcategories, 31 (72%) subcategories achieved global sodium benchmark (GSB) values, while the remaining 12 (28%) subcategories did not meet the GSB. These included pizzas, various types of bread, dry instant soups, ripened cheeses, and the majority of processed deli meat subcategories. In 11 subcategories, the average sodium content met the GSB, including 5 subcategories within the sweet products category, specifically biscuits and similar items.
CONCLUSIONS
The majority of the categories and subcategories evaluated did not meet the target values, highlighting significant challenges in reducing salt content across diverse food products. While some categories showed progress, others remained well above the recommended levels. These findings underscore the need for sustained industry commitment, public health initiatives, and mandatory measures to further reduce salt intake and achieve global health objectives, as part of national and regional efforts to decrease population salt consumption.

IMPACT OF A DIETARY GUIDELINES BOOKLET FOR INFANTS AT COMPLEMENTARY FEEDING AGE ON THEIR NUTRITIONAL STATUS

Namalie Thakshila Adikari[1]; Ramiah Sivakanesan[2]
[1]Department of Nutrition and Dietetics, Wayamba University of Sri Lanka, Makandura, Sri Lanka; [2]Department of Biochemistry, University of Peradeniya, Peradeniya, Sri Lanka

BACKGROUND AND OBJECTIVES
Inadequate nutritional quality of complementary feeding (CF) is one of the most highlighted reasons for infant undernutrition in Sri Lanka. Hence, this study was conducted to evaluate the impact of a developed dietary guidelines booklet for infants at complementary feeding ages of 6 to 12 months on their nutritional status.
METHODS
A developed dietary guidelines booklet for infants includes appropriate food and CF mixes with nutritionally adequate menus. The impact of the booklet on the nutritional status of infants at CF age was assessed through pre- and post-intervention assessments. For the CF intervention, 42 infants from each Maternal and Child Health (MCH) clinic at Pannala and Kuliyapitiya were recruited. Baseline data on socio-demographics, birth weight, length, and feeding information were collected. The intervention group received the developed CF booklet, while the control group received routine information from MCH clinics. Anthropometric and dietary intake data, excluding socio-demographic data, were collected when the infants were at 9 months and 12 months old. Weight-for-age, length-for-age, and weight-for-height z-scores were computed using WHO Anthro Plus, and dietary intake from CFs was analyzed at baseline and the end of the intervention. The nutrient intake was identified using Food-Base 2000 software. Statistical analysis was performed using SPSS version 23.0 at $p < 0.05$ significance. At the end of the interventions, the differences within groups and between two groups were calculated using dependent and independent t-tests, respectively.
RESULTS
At baseline, there were no statistically significant differences in socio-demographic and nutritional status between infants in the intervention and control groups ($p < 0.05$). The mean difference of z-scores for length-for-age ($p = 0.01$), weight-for-age ($p = 0.042$), and weight-for-height ($p = 0.000$) was significantly higher in the intervention group at the end of the intervention. The prevalence of stunting decreased from 7.5% to 5%, wasting from 12.5% to 5%, and underweight from 11.5% to 7.5% in the intervention group at the end. The energy, protein, calcium, iron, thiamine, folate, vitamin A, and iodine intake of the infants in the intervention group were significantly improved in the middle (9 months) and end (12 months) of the intervention compared with infants in the control group.
CONCLUSIONS
This study concluded that the CF guidelines booklet impacted the improvement of the nutritional status of infants with CF aged 6–12 months in Sri Lanka.

ASSESSING THE IMPACT OF SOCIAL NEEDS ON DIETARY HABITS AND PHYSICAL ACTIVITY AMONG LATINO FARMWORKERS

Benjamin Aceves[1]; Torres Vanessa[2]
[1]School of Public Health, San Diego State University, San Diego, United States of America; [2]Biomedical Sciences, Cedars-Sinai Medical Center, Los Angeles, United States of America

BACKGROUND AND OBJECTIVES
In the United States Latino farmworkers large number of social needs (food insecurity, housing instability, transportation issues) that lead to a host of cardiometabolic dsparities. To evaluate the impact of social needs on dietary habits and leisure-time physical activity (LTPA) among Latino farmworkers in a rural community.
METHODS
This study analyzed data from a cross-sectional study leveraging a community engaged approach, where participants completed surveys assessing their LTPA and dietary habits. Three psychosocial factors were examined as predictors: social risk scores, acculturation level, and PHQ-4 scores. Social risk scores were assigned based on survey responses. Acculturation levels were categorized as ‘No acculturation’ or ‘Some acculturation,’ and PHQ-4 levels were classified as ‘Normal’ or ‘Mild-Moderate.’ Logistic regression was used to explore the relationships between these psychosocial predictors and participants' dietary and physical activity behaviors. The study was conducted in the US-Mexico border region. The analysis focused on survey responding who were 18 years of age or older, not pregnant, and currently engaging in agricultural labor.
RESULTS
In total 100 participants were enrolled in the study and assessed for measures, with over 90% being of Mexican-origin, 70% female, and over 60% reporting at least one social need. One significant result with a p-value of 0.011 ($p < 0.05$), indicated that having three or four social risks increased the odds of reporting a ‘Good’ perceived dietary rating by six times (OR 6.000, 95% CI 1.501 – 23.991) compared to those with zero social risks.
CONCLUSIONS
These RESULTS indicate that resiliency among farmworkers is a large factors to continuous engaging in good dietary habits. This is also rooted in socioeconomics in having to engage in healthier eating, given that for several participants getting "fast food" is a luxury, which is rooted in the Latin American where fast food chains are more expensive then cooking more nutritious foods at home.

THEORETICAL MODELS OF SELF-REGULATION APPLIED IN THE CONTEXT OF EATING BEHAVIOUR

Gabriela Aparecida Maçaneiro[1]; Patricia Faria Di Pietro[1]; Cândice Laís Knöner Copetti[1]; Jaqueline Schroeder de Souza[1]; Lilian Vieira[1]; Nathalie Kliemann[2]
[1]PPGN, UFSC, Florianópolis, Brazil; [2]Research, CEPON, Florianópolis, Brazil

BACKGROUND AND OBJECTIVES
Behavioural skills, such as eating self-regulation, are suggested to help achieving and maintaining healthy eating habits in obesogenic environments. The mechanisms of self-regulation vary across models. This study aims to analyse self-regulation models, focusing on their mechanisms and components to understand how they influence eating behaviour.
METHODS
Six descriptors from the MeSH were selected: theoretical models, anthropometry, self-regulation, and eating behaviour. The search was conducted in the PubMed, SciELO, and Scopus databases without restrictions regarding the publication period and languages.
RESULTS
This review found 4 theoretical models extensively cited on the literature. The Feedback Loop Model, proposed by Carver and Scheier (1990), is one of the leading theories conceptualizing self-regulatory skills as a process of establishing goals and adjusting patterns of behaviours to attain those goals, using informational feedback as a guide. Bandura's (2005) Social-Cognitive Theory emphasizes that the main self-regulatory mechanisms are the adoption of goals and planning a course of action, self-monitoring the behaviour, and self-reaction influences. Schwarzer's (2008) Health Action Process Approach model suggests self-regulatory skills are required in the post-volitional stage to achieve the intended health behaviour, involving three phases: planning; action control and maintenance. It addresses aspects of self-regulation not covered by the previous models, such as how people determine their plans to achieve their intentions and strategies to deal with barriers along the way. Although these models are relevant, none fully captures all the self-regulation processes and skills specifically related to eating behaviour. Based on this, Kliemann et al. (2017) proposed a model of self-regulation of eating behaviour, which integrates existing theoretical models and emphasizes self-regulation as a continual reflective and/or automatic and multi-level process of self-monitoring; appraising progress and attempting to approach or maintain the desired eating goal, making adjustments to it when necessary or giving up. It may also involve the capacity to control thoughts, attention, behaviour and emotion to overcome dietary barriers and temptations along the way.
CONCLUSIONS
The general self-regulation models analysed provide valuable perspectives but do not specifically address eating behaviour. The model by Kliemann et al. (2017) fills this gap by integrating existing theoretical elements, facilitating the understanding of self-regulation process in the context of nutrition.

PROTECTIVE FACTORS OF BREASTFEEDING OF INFANTS BORN IN A MATERNITY OF DOURADOS/MS

Emilia Balthazar[1]; Maria Antônia Baltazar Medeiros[2]; Gabriella Machado De Souza[2]; Rita De Cássia Dorácio Mendes[3]
[1]UFGD FCS, Dourados, Brazil; [2]Residence program in Maternal and child health, Hu UFGD, Dourados, Brazil; [3]Nutritionist of HU UFGD, Hu UFGD, Dourados, Brazil

BACKGROUND AND OBJECTIVES
Breastfeeding is a worldwide disseminated and encouraged practice through various policies, initially promoted by the World Health Organization (WHO) and the United Nations Children's Fund (UNICEF) with the aim of reducing the “weaning epidemic” that is consolidating in a global context and is impacting the children's health and infant mortality.This research aimed to investigate the factors associated with the protection of breastfeeding up to six months postpartum in women treated at a Maternity Hospital in Dourados/MS.
METHODS
This is a quantitative and observational descriptive study that evaluated data from interviews carried out with postpartum women and their children born in the Women's Unit of the University Hospital of the Federal University of Grande Dourados. This Study occurred between the months of August to December 2023. The evaluation form It was structured in an online format and sent to the volunteers via Whatsapp. Statistical analysis was performed using the G Test, associated with Williams and Yates correction. Multiple logistic regression analysis was performed to infer the effect on the association between the variables. The sample included the participation of 121 binomials, the RESULTS were obtained from the comparison between two groups, one that breastfed for a period equal to or less than six months and the other that breastfed for more than six months.
RESULTS
The comparison between the two groups showed statistical significance in the variables of breastfeeding in the hospital and use of formula during hospital (p=0.0307; p=0.0018), Exclusive Breastfeeding (EBF) in the first six months (p=0.0028) and use of bottles and pacifiers (p=0.0048; p=0.0004). When analyzed in logistic regression, the variables that remained a protective factor for breastfeeding up to six months were not using formula during hospitalization (OR 4.95; p=0.0160) and not using a pacifier (OR 3.26; p=0.0082).The guidance on breastfeeding during the hospitalization did not present significant statistical differences in the breastfeeding maintenance (0.8808).
CONCLUSIONS
Although receiving breastfeeding guidance during hospitalization did not related with the protection of breastfeeding, it must be acknowledged that the aspects that negatively impact the practice of breastfeeding are modifiable, therefore, attempts to manage these factors must be applied throughout the pregnancy-puerperal period, starting as early as possible.

BACKGROUND AND OBJECTIVES

Obesity is considered a public health problem worldwide, leading to severe health consequences and generating high costs for the government and society. Schools are where children and adolescents spend a significant part of their day, and therefore, the school food environment can play a crucial role in preventing obesity and promoting public health. The aim of this study was to evaluate the association between the perceived school food environment and physical activity, and overweight among adolescents.

METHODS

This is a quantitative cross-sectional study conducted with 828 adolescents from public schools in a capital city in northeastern Brazil. The perceived school food environment (AAEp) was based on the translated version of the Nutrition Environment Measures Survey in Stores (NEMS-P) tool, which assesses consumer-focused aspects of the food environment and identifies barriers and facilitators for acquiring healthy foods. All questions were contextualized for the school environment, creating an integrated tool to assess the AAEp. Responses were presented according to the presence or absence of overweight, using the chi-square test to compare the groups, with a 5% significance level.

RESULTS

The participants were aged between 11 and 18 years, predominantly female (53.9%), and of mixed race (55.3%). Overweight was present in 38.2% of the adolescents, with 16.3% of them being obese. Only 3.5% of the students were underweight, and 58.3% were of normal weight. Most adolescents considered the school food environment to be unhealthy, as they disagreed with the statements: it is easy to buy fresh fruits and vegetables (62.4%); fresh fruits, vegetables, and legumes are of good quality (72.8%); there are many options of fresh fruits and vegetables (69.2%); it is easy to buy low-fat products (76.6%); low-fat products are of high quality (82.2%); and there are many options of low-fat products (82.1%). No significant differences were found between adolescents with and without overweight.

CONCLUSIONS

Despite this, it was concluded that adolescents mostly had an unfavorable perception of the school food environment, which was linked to a high proportion of overweight, emphasizing the need for a better understanding of this relationship and its health-related outcomes.

BACKGROUND AND OBJECTIVES

An inadequate intake of food groups is a determining factor in the rise of obesity in adolescents. In this context, the Food and Agriculture Organization of the United Nations (FAO) recommends using the Household Dietary Diversity Score (HDDS) as an indicator of dietary diversity and quality. The aim of this study was to assess dietary diversity in adolescents with obesity and its association with sex.

METHODS

This was a quantitative cross-sectional study including 142 adolescents, aged beteween 10 and 14 years, diagnosed with obesity, from public schools in Brazil. Weight and height were measured to calculate Body Mass Index (BMI)-for-age, and a 24-hour food recall was collected to evaluate dietary diversity using the HDDS. The score consists of a count of 12 food groups, with 1 point being scored for each group present in the diet. The final score was classified as low dietary diversity (≤5), medium dietary diversity (6-8) or high dietary diversity (≥9). Sex-based comparisons were performed using the Student's T-test or Mann-Whitney, according to the distribution of the data, and the association was assessed using Pearson's chi-square test.

RESULTS

The participants had a mean age of 12.4 years, with a slight majority being male (53,5%). When assessing intake by food groups, males had a higher percentage of consumption of legumes, nuts and seeds (**p=0,006**); and milk and dairy products (**p=0,042**).

Table 1. Evaluation of HDDS between the sexes in adolescents from public schools.

Variables	Total (n=142)	Males (n=76)	Female (n=66)	p-value
BMI, kg/m², medium (SD)	29,14 (3,76)	28,66 (3,93)	29,68 (3,52)	**0,029**[a]
HDDS, medium (SD)	6,46 (1,82)	6,67 (1,93)	6,21 (1,67)	0,206[a]
Low diversity, n (%)	44 (31,0)	22 (50,0)	22 (50,0)	
Medium diversity, n (%)	80 (56,3)	38 (47,5)	42 (52,5)	**0,005b**
High diversity, n (%)	18 (12,7)	16 (88,9)	2 (11,1)	

Significative p-value <5%. a- Mann-Whitney Test. b- Pearson's chi-square test. BMI: Body Mass Index; HDDS: Household Dietary Diversity Score; SD: standard deviation.

CONCLUSIONS

Adolescents with obesity exhibited a greater prevalence of medium dietary diversity. Male adolescents demonstrated higher dietary diversity compared to female adolescents, with greater consumption of legumes, nuts and seeds, and milk and dairy products.

EPO5_302

VALIDATION OF SENTINEL FOODS FROM CHILE'S DIET QUALITY QUESTIONNAIRE (DQQ) IN PREGNANT WOMEN

Angela Martínez-Arroyo[1]; Giannella Barisione[1]; Acevedo Camila[2]; Natalia Isadora Rebolledo Fuentealba,[3]; Maria Luisa Garmendia[3]
[1]Faculty of Pharmacy, School of Nutrition and Dietetics, University of Valparaiso, Santiago, Chile; [2]Nutrición Pública, Instituto de Nutrición y Tecnología de los Alimentos de la Universidad de Chile, Santiago, Chile; [3]Nutrición Pública, Instituto de Nutrición y Tecnología de los Alimentos de la Universidad de Chile, Macul, Chile

BACKGROUND AND OBJECTIVES
The Diet Quality Questionnaire (DQQ) was developed as an easy and quick international tool for assessing diet through 29 sentinel food groups. However, this tool has not yet been validated for Chile, and sentinel food groups may need some adaptation. This study aimed to identify and propose adaptations for the sentinel foods in the Chilean version of the DQQ.
METHODS
Dietary data from 1,418 pregnant women was collected via 24-hour dietary recall (24HR) in 2020-2021 as part of the CHIMINCs-II cohort. First, we examined 36,625 foods and beverages consumed (>15 g) reported in the 24HR (reference method). We categorized each food and beverage into the 29 food groups of DQQ. To determine the most commonly consumed foods in each food group, foods were ranked in descending order according to their frequency of consumption, and cumulative frequencies were calculated to identify items contributing to 90% or more consumption within each group. Then, we compared the identified groups to the proposed sentinel foods of the DQQ.
RESULTS
Pregnant had a mean age of 28.5 years (sd 5.8), 53% having completed secondary education, and 38.9% having obese weight status. Seven of twenty-nine sentinel food groups did not achieve a 90% of consumption contribution. These food groups included whole grains (82.5%), legumes (88.8%), other sweets (51.4%), processed meats (85.1%), packaged ultra-processed salty snacks (46.9%), deep-fried foods (79.2%), and fast foods (43.5%). Proposed adaptations to improve the contribution to the groups include adding whole grain breakfast cereals to the whole grains group, broad beans to the legumes group, jam, jelly, and ready-to-eat pudding in other sweets, pâté to the processed meats, crackers to the ultra-processed salty snacks, fried chicken and handrolls to the deep fried foods, and include other fast food companies to expand the fast food group.
CONCLUSIONS
The Chilean DQQ was effective for identifying sentinel foods in Chilean pregnant women, but some adaptations might improve this tool. Further testing in other age groups, including children, adolescents, and adults, is necessary before using it to monitor diet at the national level.

EXPLORING THE RELATIONSHIP BETWEEN NUTRITION, ZEARALENONE METABOLITES, AND MALE REPRODUCTIVE BIOMARKERS

Anna Danielewicz[1]; Katarzyna Przybylowicz[1]; ŁUkasz Zielonka[2]; Magdalena Gajęcka[2]
[1]Department of Human Nutrition, University of Warmia and Mazury in Olsztyn, Olsztyn, Poland; [2]Department of Veterinary Prevention and Feed Hygiene, University of Warmia and Mazury in Olsztyn, Olsztyn, Poland

BACKGROUND AND OBJECTIVES
Zearalenone (ZEA) is primarily produced by *Fusarium* species and is mainly present in grains, as well as in animal feed and food products. ZEA has immunotoxic, genotoxic, and carcinogenic effects, and disrupts gastrointestinal and hormonal functions. As a non-steroidal estrogenic mycotoxin, it negatively impacts reproductive capacity by inhibiting the hypothalamic-pituitary-gonadal axis, which is essential for normal sex hormone synthesis and the regulation of spermatogenesis. The study aimed to evaluate the relationship between food consumption and selected biomarkers of male reproductive health in relation to ZEA levels in the plasma of men under study.
METHODS
A cross-sectional study was conducted in 2022, involving 90 men aged 18-49. Food intake was assessed using a validated semi-quantitative food frequency questionnaire (FFQ) covering the intake frequency of 145 food items. Evaluating reproductive biomarkers were seminogram and hormones such as total testosterone, FH, FSH and SHGB. ZEA presence and concentration in blood serum were determined through immunoaffinity column separation and high-performance liquid chromatography with mass spectrometry.
RESULTS
The serum ZEA levels in the men studied (N=51) averaged 1.728 ± 3.657 ng/mL, showing no correlation with analyzed semen parameters and a negative correlation with LH (r=-0.235). In men with abnormal sperm morphology, ZEA levels were positively correlated with the consumption of high-fat dairy products, fish and seafood, potatoes, fruits, nuts, legumes, refined cereal products, oils, sauces, pizza, salty snacks, and alcohol (r: 0.726-0.974, $p<0.05$). Cluster analysis extracted four main clusters. The cluster that contained ZEA also consisted of testosterone, LH, FSH, semen volume, non-progressive motility, and food products such as legumes, nuts, animal fats, vegetable oils and sauces.
CONCLUSIONS
The observed associations suggest that excessive ZEA exposure from specific food groups may adversely affect semen quality, particularly its morphology. These findings highlight the potential role of diet as a modifiable factor influencing ZEA's effects on reproductive function and underscore the need for further research to understand this relationship better.

HIGH LEVELS OF GLYCAEMIA AND BLOOD PRESSURE IN ADULTS ARE RELATED TO OVERWEIGHT IN ADOLESCENCE

Ariane Ribeiro de Freitas Rocha[1]; Nubia De Souza De Morais[1]; Silvia Eloiza Priore[1]; Dayane De Castro De Morais[1]; Sylvia Do Carmo Castro Franceschini[1]; Pedro Paulo Prado Junior[2]; Jackson Martins Rodrigues; Renata Maria Souza De Oliveira E Silva[3]; Eliane Rodrigues De Faria[3]

[1]Programa de Pós Graduação em Ciência da Nutrição - Departamento de Nutrição e Saúde, Universidade Federal de Viçosa, Viçosa, Brazil; [2]Departamento de Enfermagem e Medicina, Universidade Federal de Viçosa, Viçosa, Brazil; [3]Departamento de Nutrição e Saúde, Universidade Federal de Juiz de Fora, Juiz de Fora, Brazil

BACKGROUND AND OBJECTIVES

Obesity among adolescents is considered a global health problem and can lead to the development of metabolic disorders that tend to persist or worsen in adulthood. Our aim was to verify the association between nutritional status in adolescence and blood pressure and glycaemic levels in adulthood.

METHODS

This was a longitudinal study approved by the Human Research Ethics Committee of the Federal University of Viçosa (6.104.415). A total of 365 individuals were assessed in adolescence and fifteen years later in adulthood. Anthropometric assessment, electrical bioimpedance (Inbody270) and biochemical tests were carried out at both times, following a 12-hour fasting protocol. The BMI Z-score was calculated for age and sex in adolescence, and BMI in adults, classified according to the WHO, 2007 and 1998, respectively. Blood pressure was measured using an automatic inflation meter. Fasting glycaemia was measured by collecting 12 mL of blood by venipuncture. The Mann-Whitney test was applied to assess the relationship between nutritional status in adolescence and blood pressure and glycaemia in adulthood, using SPSS software (20.0), with a significance level of 5%.

RESULTS

The majority of individuals were female (68.5%; n=250), 21.9% (n=80) were overweight 9% (n=33) had changes in blood pressure and 1.1% (n=4) in glycaemia. The correlation test showed that the higher the BMI in adolescence, the higher the systolic blood pressure ($r=0.195$; $p<0.01$) and glycaemia ($r=0.151$; $p<0.01$) in adulthood. The Mann-Whitney ($p<0.01$) test indicated that overweight adolescents had higher median systolic blood pressure (Md: 120 mmHg; Min: 94 - Max: 152; $p=0.003$) and glycaemia (Md: 81 mg/dL; Min: 68 - Max: 104; $p=0.001$) in adulthood compared to normal weight adolescents (Md: 115 mmHg; Min: 82 - Max: 153 and Md: 80; Min: 60 - Max: 103, respectively).

CONCLUSIONS

The RESULTS of the study indicate that excess weight in adolescence is associated with higher levels of blood pressure and glycaemia in adulthood. These findings reinforce the importance of early interventions during adolescence to prevent lifelong metabolic and cardiovascular complications.

[1]FCS , Nutrition, Federal University of Grande Dourados - Unit II, Dourados, Brazil; [2]Nutritionist of HU UFGD, Hu UFGD, Dourados, Brazil; [3]Centro de Estudos em Recursos Naturais (CERNA), UEMS, Dourados, Brazil; [4]FCS Nutrition, UFGD, Dourados, Brazil; [5]UFGD FCS, Dourados, Brazil

BACKGROUND AND OBJECTIVES
Breast milk is a complex matrix of macronutrients and micronutrients that play crucial role in the multifaceted development of a Infant. The nursing mother's diet emerges as an intrinsic element, having a direct impact on the quality and composition of breast milk. Therefore, the objective of this study is to analyze the human milk nutritional composition , comparing it if with the nutritional status and composition of the diet of nursing mothers
METHODS
This is a cross-sectional study.The research took place in partnership with the Human Milk Bank from Dourados. The inclusion criteria were nursing mothers over 18 years old and between the 5th and 20th week of lactation. Data collection took place in 2023 through an interview, anthropometric assessment and a 24-hour recall and two food records. Milk should be collected after the first feeding in the morning, containing at least 50 ml of human milk sample. The samples were analyzed for energy content, macronutrients (carbohydrates, total lipids and total proteins), fatty acids and minerals (sodium, magnesium, potassium, calcium, iron, zinc and selenium. Statistical tests were carried out using SPSS software. To compare different groups, the Student's t test was used. The level of statistical significance will be 5% ($p<0.05$) in all analyzes performed.
RESULTS
In total, 25 milk donors agreed to participate in the research, 64% of the participants were between 30-39 years old.. A high percentage of overweight and obese women was observed (64%), as well as excessive weight gain during pregnancy (80%). Independent of body weight and diet consumption, nursing mothers presented a greater inadequacy of food consumption and, in general, breast milk presented a low amount of macronutrients and micronutrients, when compared to the literature (Lawrence e Lawrence,Holland et al, 1992). The relationship between nutritional status and diet with the macro and micronutrient composition of milk was not verified ($p>0,05$)
CONCLUSIONS
Although the relationship between nutritional status and food consumption with the nutritional composition of breast milk has not been verified, nursing mothers must be nutritionally oriented, as inadequate nutrition affects health and may affect milk donation.

THE LEVEL OF SOCIAL MEDIA INFLUENCE IS ASSOCIATED WITH DISORDERED EATING ATTITUDES, BODY DISSATISFACTION, AND LOW SELF-ESTEEM

Soraia Machado[1]; Kamila Rebouças,[2]; Viviane Tabosa,[2]; Emanuele Domingos,[2]; Maria Yasmin Martins,[3]; Bianca Farias,[4]; Rosiane Herculano,[4]; Sara Soares,[4]; Larissa Mendes,[5]; Larissa Araújo,[6]; Raquel Canuto,[7]; Carla Soraya Costa Maia[8]

BACKGROUND AND OBJECTIVES

Adolescents are more susceptible to media influences in shaping body image and internalizing ideal appearance standards, which can affect body satisfaction, self-esteem levels, and the adoption of risk behaviors related to eating disorders. The aim of this study was to assess the association between the level of media influence, including social media, and body satisfaction, self-esteem, and eating attitudes in adolescents.

METHODS

This cross-sectional study was conducted with 828 Brazilian adolescents attending public schools in a city in northeastern Brazil. Media influence was assessed using the Sociocultural Attitudes Toward Appearance Questionnaire (SATAQ-3), classified as: Low (≤77), Moderate (78–94), and High (≥95 points). Self-esteem was measured by the Rosenberg Self-Esteem Scale, body satisfaction was evaluated using the Brazilian Silhouette Scale, and eating attitudes were assessed with the Disordered Eating Attitudes Scale. Poisson regression analysis was performed to evaluate the association between media influence levels and the outcomes (low self-esteem, body dissatisfaction, and disordered eating attitudes), adjusting for confounding variables (sex, age, socioeconomic status, and overweight).

RESULTS

Most of the adolescents were female (53.9%) and mixed-race (55.3%), aged 11 to 18 years. The higher the media influence (moderate and high, respectively), the greater the prevalence of low self-esteem (PR 1.54: 95% CI 1.20 – 1.98; PR 2.14: 95% CI 1.70 – 2.70), body dissatisfaction (PR 1.09: 95% CI 1.04 – 1.15; PR 1.15: 95% CI 1.09 – 1.21), and disordered eating attitudes (PR 1.11: 95% CI 1.05 – 1.18; PR 1.22: 95% CI 1.15 – 1.30), even after adjusting for confounding variables.

CONCLUSIONS

Higher levels of media influence are associated with lower self-esteem, body dissatisfaction, and disordered eating attitudes in adolescents. Our findings highlight the importance of preventive, educational actions, and conscious media use within public health frameworks, considering the effects of media influence on psychosocial and behavioral aspects during adolescence.

PROMOTIONAL OFFERS OF A MEAL DELIVERY APP: A LOGITUDINAL STUDY IN BRAZIL

Ilana Bezerra[1]; Jamile Tahim[2]; Camila Abdala[3]; João Vitor Oliveira[3]
[1]Graduate Program in Nutriton and Health, Ceará State University, Fortaleza, Brazil; [2]Graduate Program in Public Health, Ceará State University, Fortaleza, Brazil; [3]Nutrition Course, Ceará State University, Fortaleza, Brazil

BACKGROUND AND OBJECTIVES
Considering the widespread use of technology and the increase in the amount of time individuals spend online, the growing phenomenon of meal delivery apps (MDAs) has become part of the practice of purchasing food prepared outside the home in recent years This study aims to evaluate changes in the food offers of a delivery application for food prepared outside the home between 2021 and 2023, in a Brazilian metropolis.
METHODS
This is a longitudinal study that evaluated promotional offers of a food delivery app, in three time intervals and for seven consecutive days, in two periods: during the social isolation of the COVID-19 pandemic (2021) and at the end of the pandemic (2023). 14,363 promotional offers (6,021 in 2021 and 8,342 in 2023) in a food delivery app were evaluated.
RESULTS
The fast-food combo category represented the majority of offers in both 2021 and 2023, being offered more often at night. Sugar-sweetened beverages increased in 2023 (from 0.8% to 14.4%), although fast-food combos decreased (from 50.9% to 39.6%). There was an increase in the frequency of promotions of sweets and cookies and a decrease in the frequency of main meals and alcoholic beverages. The frequency of main meals was concentrated in the morning and afternoon in both years and, in 2023, on weekdays. The chance of offering ultra-processed food was 1.47 times higher on weekends and evenings compared to other days of the week and times of day.
CONCLUSIONS
There was an increase in the total number of promotional offers and, despite the reduction in fast-food combos, there was an increase in the offers of sugar-sweetened beverages and sweets and cookies, confirming that the digital food environment of delivery apps for food prepared outside the home resembles an obesogenic food environment.

BASELINE AND QUALITATIVE EVALUATION OF A HEALTHY LIFESTYLE PROGRAM FOR A GROUP OF FAMILIES IN MEXICALI, BAJA CALIFORNIA

Alva Nidia Laprada Villegas[1]; María Isabel Oretga-Vélez[2]; Noé Crespo,[3]; Carlos Olvera[4]; Diana Reyes Pavón[4]; Daniela Gonzalez-Valencia,[4]
[1]PhD student in Nutritional Sciences, Faculty Of Medicine UABC, Mexicali, Mexico; [2]Nutrición publica y salud, CIAD, Hermosillo, Mexico; [3]School of Public Health, San Diego State University, San Diego, United States of America; [4]Facultad de Medicina Mexicali, Autonomous University of Baja California, Mexicali, Mexico

BACKGROUND AND OBJECTIVES
Childhood obesity is a public health problem in Mexico, with disadvantaged families being the most vulnerable, so addressing it requires realistic and sustainable efforts. The purpose of this study was to evaluate the baseline parameters to characterize families at the beginning of the program, as well as to evaluate acceptability after the first stage of implementation.
METHODS
Four dyads of parents and children participated and underwent the following evaluations at the beginning of the program: anthropometry (e.g. weight, height and waist circumference); blood pressure and evaluation of biochemical parameters (e.g. glucose, total cholesterol, LDL, HDL and triglycerides). Likewise, 4 focus groups were conducted with the participants to evaluate the acceptability of the program after 10 weeks of intervention. Descriptive statistics were used for quantitative data, while qualitative information was processed by categories and themes.
RESULTS
Four female tutors and four children (50% female) participated in the measurements and focus groups. BMI values reported that three out of four female tutors were obese, while half (n=2) of the children were overweight or obese. 75% of the participants had an at-risk waist circumference; and 37% had an at-risk blood pressure reading. The total number of children (n=4) presented normal glucose values, but not cholesterol and triglycerides. Qualitative information from this first stage of the program shows good acceptance by the participants: “I feel that the program went beyond expectations. It exceeded them”. However, more practical activities are proposed: “it is preferable something more practical, like when we talked about sugar portions, the amount or how the percentage of sodium was taken out”. The participants would like to continue in the next stage of the program.
CONCLUSIONS
The need for programs to improve the quality of diet and physical activity in families is evident. The inclusion of parents in these programs will allow the adoption and maintenance of healthy behaviors.

TITLE: IMPACT OF SUPPLEMENTATION WITH FORTIFIED BALANCED ENERGY–PROTEIN DURING PREGNANCY AND LACTATION ON INFANT GROWTH OUTCOMES IN SOUTHERN NEPAL: A COMMUNITY-BASED 2×2 FACTORIAL RANDOMIZED TRIAL

Parul Christian[1]; Tsering P. Lama[2, 1]; Yunhee Kang[1]; Eleonor Zavala[1]; Subarna K. Khatry[2]; Joanne Katz[1]; Steven C. Leclerq[2]; Luke Mullany,[3]; James M. Tielsch[4]; Daniel Erchick[5]

BACKGROUND AND OBJECTIVES
Small size at birth and infant linear growth failure in the first 3-6 months of life are prevalent in South Asia where maternal undernutrition exists. Currently, the WHO recommendation is to provide balanced energy protein (BEP) supplements during pregnancy in settings with high (>20%) prevalence of low maternal body mass index (BMI). However, whether BEP supplementation during lactation in these settings can support women who breastfeed or benefit growth among infants who are exclusively breastfed for the first 6 months of life remains unknown.
METHODS
In rural Nepal, where the prevalence of low BMI is close to 30%, we recently completed an efficacy trial to test the impact of a fortified BEP supplement during pregnancy and lactation on birth outcomes and infant growth. The study was a 2X2 factorial, unblinded, household randomized efficacy trial in which 1,944 women were enrolled in early pregnancy and randomized to either daily fortified BEP supplementation or no supplementation (with all women receiving antenatal standard of care), and following a live birth at delivery, re-randomized (n=1,555) within each of the pregnancy arms to BEP vs. no BEP until 6 months postpartum. Birth anthropometry was conducted within 72 hours and subsequently infant anthropometry (length, weight, head, and mid-upper arm circumference) was assessed monthly until 6 months of age. The primary outcome of interest was infant growth at 6 months. Longitudinal data analysis will be conducted using mixed effects models to examine the independent and combined effects of pregnancy and lactation BEP supplementation on linear and ponderal growth in the first six months of life and to examine lactation effects independent of the pregnancy BEP supplementation effect on birth anthropometry.
RESULTS
The mean (SD) length and weight at 6 months of age was 64.6 (2.7) cm and 6604 (862) g in the control (unsupplemented arm). Length-for-age Z-scores (LAZ) improved in a small but incremental way in the first 6 months of life whereas weight-for-length z scores (WLZ) worsened, indicating increased wasting over the course of the six months. Stunting, wasting, and underweight prevalence at 6 months of age was 10.3%, 14.0% and 17.2%, respectively in the control group. Treatment effects of pregnancy and lactation BEP supplementation will be presented.
CONCLUSIONS
Our trial will show the impact of daily fortified BEP supplementation during pregnancy and lactation on growth in the first 6 months of life, informing policy and programs.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

FINDINGS FROM THE LEEDS SCHOOL BREAKFAST SURVEY

Eloise Tann[1]; Neil Boyle,[2]; Louise Dye[3]; Fiona Croden[4]
[1]School of Psychology , University of Sheffield, Sheffield, United Kingdom; [2]School of Psychology, University of Sheffield, Sheffield, United Kingdom; [3]Institute for Sustainable Food, The University of Sheffield, Sheffield, United Kingdom; [4]School of Psychology, The University of Leeds, Leeds, United Kingdom

BACKGROUND AND OBJECTIVES
Regularly eating a good quality breakfast during childhood and adolescence is consistently associated with increased diet quality and improved physical health outcomes, academic perfomance, and wellbeing(1,2,3). In Leeds, 25% of secondary, and 8% of primary school pupils report rarely, or never eating breakfast(4). School breakfast programmes present a practical means to overcome morning hunger in schools.
The objectives of the study were to i) map school breakfast provision across the city of Leeds; ii) evaluate the healthfulness of this provision; and iii) understand the motivators and barriers to providing a school breakfast.
METHODS
Data was collected using an online survey. Of the 292 schools approached, 170 completed the survey. The sample comprised: 139 primary schools, 23 secondary schools and 8 alternative provisions.
RESULTS
Breakfast was offered at 89% of schools. Primary schools emphasised offering breakfast to provide childcare, whereas secondary schools prioritised combatting hunger. Only 30% of schools provided their breakfast free of charge to all. Free breakfasts attracted a higher proportion of free school meal eligible pupils than paid-for provision. Findings also suggesed that current funding opportunities (e.g., National School Breakfast Programme(5)) are underutilised and do not fully cover schools' costs.
Around three-quarters of school breakfasts sdid not align with UK School Food Standards(6), despite most believing that they did. Primary reasons for this included not offering fruit and offering high-sugar items. Over 40% of schools reported that they would like more support on what foods to offer and how to increase uptake.
CONCLUSIONS
There is considerable scope to improve the healthfulness and accessibility of school breakfasts in Leeds.

IMPACT OF THE PROMOTION OF RESPONSIVE FEEDING ASSOCIATED TO THE CONSUMPTION OF A FORTIFIED INFANT FLOUR ON THE FOOD AND ENERGY INTAKES OF YOUNG CHILDREN IN THE RURAL DISTRICT OF AMPARAFARAVOLA IN MADAGASCAR: A CLUSTER RANDOMISED TRIAL

Yannick Razafindratsima,[1]; Sonia Fortin[2]; Andry Razakandrainy,[1]; Charlotte Ralison Raharintsoa[3]; Rindra Randremanana[4]; Frank T. Wieringa[5]; Claire Mouquet-Rivier[6]
[1]Madagascar, GRET, Antananarivo, Madagascar; [2]UMR QualiSud, Institut de Recherche pour le Développement (IRD), Montpellier, France; [3]Food and Nutrition Sciences, University of Antananarivo, Antananarivo, Madagascar; [4]Epidemiology, Pasteur, Antan, Madagascar; [5]UMR-204, Institut de Recherche pour le développment/Université Montpellier/SupAgo, IRD, Montpellier, France; [6]UMR QualiSud, Equipe 6 - Aliments, Nutrition et Santé, Institut de Recherche pour le Développement (IRD), Montpellier, France

BACKGROUND AND OBJECTIVES
Insufficient intakes of energy and essential nutrients due to poor appetite will lead to growth faltering and stunting. Typically, intakes well below 30g/kg body weight/meal, the reference value for gastric capacity, are observed in young children living in regions with a high prevalence of stunting. We aimed to assess effects of responsive feeding promotion and the consumption of an energy-dense fortified complementary food, alone or combined, on meal intakes in young children.
METHODS
A four-arm cluster randomised controlled trial in infants, aged 6-7 months (n = 706) at recruitment, was conducted in a rural area of Madagascar. One group of infants (control) received only information on water sanitation and hygiene (WASH). In the other groups, additionally, infants received a daily portion of a fortified infant flour (FIF), or caregivers received repeatedly awareness of six key messages promoting responsive feeding (RF), or both (FIF+RF). Meal and energy intakes from a meal (either fortified porridge or a traditional dish) were measured at home in a subsample of 60 subjects per group, by weighing plate before and after consumption at recruitment (T0), and after 3, 6 and 9 months (T3, T6 T9).
RESULTS
Meal intakes were low (<15 g/kg BW/meal) in all groups and at all study times, even though they increased continuously with age. Meal intakes at T3 and T6 differed between groups ($p<0.01$ for both) when compared to control, with higher intakes at T3 in FIF+RF group and higher intakes at T6 in the RF group. At T9, the difference in intake between groups was no longer significant. Thanks to a higher energy density in FIF porridges than in traditional foods, energy intakes from FIF porridge were significantly higher at T3 and T6 compared to the control. However, the percentage of energy requirements from complementary foods remained below 20% at all study times in the intervention groups, indicating the need for at least 5 meals a day for 100% of requirements to be met.
CONCLUSIONS
Promoting responsive feeding increased intakes in children aged 9-10 months, but this effect diminished in children aged 12-13 months and was no longer noticeable in those aged 15-16 months. The higher energy density of FIF mitigated some negative effects of low intakes. Key messages on RF need to be adapted to age, taking into account changing food habits of older children whom seem less interested in porridges. Diversifying the range of fortified products could improve their utilisation.

EPO5_316

ASSESSING COMPLETENESS OF 24-HOUR URINE COLLECTION FOR ESTIMATION OF SODIUM INTAKE IN THE UK

Kerry Jones[1]; David Collins[1]; Sarah Meadows[1]; Damon Parkington[1]; Albert Koulman[1]; Polly Page[1]
[1]MRC Epidemiology Unit, Cambridge University, Cambridge, United Kingdom

BACKGROUND AND OBJECTIVES
The measurement of sodium excretion in 24-h urine samples is the recommended method to assess dietary sodium intake necessary to establish population sodium intake and to monitor sodium-related public health policies to reduce cardiovascular disease. Ensuring complete collection of 24-h urine samples is important for the accurate assessment of sodium intake. Here, we compare the use of the objective biomarker, recovery of p-aminobenzoic acid (PABA), to self-reported 24-h urine completeness.
METHODS
Analysis was performed on data collected during the 2018/19 sodium survey as part of the UK National Diet and Nutrition Survey (NDNS). Data were available from 868 men and women aged 19 to 64 years. Self-reported 24-h urine completeness was based on collection duration between 23 and 25 h and no missed collections, together with a urine volume of $\geq$0.4 L.
RESULTS
The PABA protocol was adhered to by 812 participants of which 561 (69%) were deemed to have provided a complete 24-h urine collection. For the assessment of urine completeness by self-report, 619 (74%) provided a complete 24-h urine collection. Nine participants had a urine volume of less than 0.4 L and the remaining excluded participants were split between duration out of range and missed urine collections. Sodium excretion was 127 mmol/24 h with PABA and 126 mmol/24 h by self-report; salt intake was 7.40 g/d and 7.38 g/d, respectively. The proportion of participants above the WHO recommended salt intake of 5 g/d was 83.2% and 83.5% by PABA and self-report, respectively. Overall agreement was 66%. Of samples judged complete by PABA, 75% were also complete by self-report. Of samples incomplete by PABA, 43% were also designated incomplete by self-report.
CONCLUSIONS
Using data from a national survey, estimates of sodium intake in complete 24-h urine collections were similar whether 24-h urine collection completeness was assessed by PABA recovery or by participant self-report. Estimates of salt intake were not biased by self-reported 24-h completeness and this study therefore supports the use of self-reported urine collection in surveys of population sodium intake.

BACKGROUND AND OBJECTIVES
Exposures during critical periods of early life, such as the first 1,000 days, can disrupt organ development and long-term health outcomes. The NEPTOX study, conducted within a longitudinal cohort framework, seeks to evaluate environmental pollutant exposures during pregnancy and infancy and their interplay with nutritional, inflammatory, and genetic factors on child health and development. This study aims to generate evidence to inform risk assessments, policies, and interventions for vulnerable populations in low- and lower-middle-income countries (LLMICs).
METHODS
The study utilizes data from 800 mother-infant pairs in Bhaktapur, Nepal, nested within a randomized controlled trial (RCT) of daily vitamin B12 supplementation from 15 weeks of pregnancy to 6 months postpartum (NCT03071666). Children are now of school age, allowing for assessment of long-term outcomes, including neurodevelopment, vaccine response, thyroid function, growth and body composition, markers of non-communicable diseases (NCDs), and lung function. Biochemical analyses will include targeted metabolomics, vitaminomics, and trace element analysis, alongside measurements of environmental pollutants, epigenetic modifications, and telomere dynamics.
RESULTS
This study will generate high-quality longitudinal data integrating repeated biological samples (blood, breastmilk, and urine) with health, growth, and neurodevelopmental outcomes. Metabolic profiling will specifically assess the impact of micronutrients and metabolism on health trajectories, enabling a deeper understanding of the interplay between pollutantsand nutrition. Preliminary findings indicate that environmental and nutritional factors synergistically influence child health outcomes, highlighting key areas for targeted interventions.
CONCLUSIONS
The NEPTOX study provides a unique opportunity to advance the understanding of the interaction between environmental pollutants, nutrition, and child health in LLMIC settings. By leveraging transdisciplinary approaches and cross-sectoral collaboration, this project aims to inform guidelines and develop interventions to protect marginalized populations, contributing to UN Sustainable Development Goals 3, 4, 5, 9, 11, and 12.

DAIRY PRODUCT CONSUMPTION AND ITS ASSOCIATION WITH MALE REPRODUCTIVE BIOMARKERS

Anna Danielewicz[1]; Katarzyna Przybylowicz[1]
[1]Department of Human Nutrition, University of Warmia and Mazury in Olsztyn, Olsztyn, Poland

BACKGROUND AND OBJECTIVES
Dairy products are one of the main foods that provide the body with essential nutrients. However, their impact on reproductive health is still unclear. Studies confirm the beneficial association of low-fat dairy product consumption. However, further research is still needed to clarify the impact of full-fat dairy products. Therefore, the purpose of this study was to evaluate the association between dairy product consumption and biomarkers of male reproductive status.
METHODS
A cross-sectional study was conducted in 2022, involving 90 men aged 18-49. Food intake was assessed using a validated semi-quantitative food frequency questionnaire (FFQ) covering the intake frequency of 145 food items. Dairy products were grouped as low- and high-fat and low- and high-lactose ones. Evaluating reproductive biomarkers were seminogram in sperm and hormones such as total testosterone, FH, FSH and SHGB in blood serum.
RESULTS
The average total dairy product consumption was 352.9±230.3 g/day, with low-fat dairy products at 221.6±188.9 g/day and high-fat dairy products at 131.3±124.8 g/day. The average intake of low-lactose dairy products was 31.7±38.7 g/day, while high-lactose dairy product consumption was 316.7±225.7 g/day. No differences in dairy product consumption were observed between men with normal and abnormal semen parameters. A positive correlation was noted between the consumption of high-fat dairy products (r=0.271) and high-lactose dairy products (r=0.304) with progressive motility.
CONCLUSIONS
While no direct effect from dairy intake was observed, high-fat and high-lactose dairy products might be selectively beneficial for improving certain aspects of sperm quality. The observed correlations may suggest that certain components of high-fat and high-lactose dairy products, such as fatty acids, lactose, or micronutrients (e.g., calcium or vitamin D), could contribute positively to sperm motility. More studies are needed to confirm the observed correlations and explore the mechanisms behind the positive effects of high-fat and high-lactose dairy on progressive motility.
This study was funded by the National Science Centre (grant no. 2021/05/X/NZ7/01309), co-financed by the Minister of Science under the “Regional Initiative of Excellence Program” and "The Research Network of Life Sciences Universities for the Development of the Polish Dairy Industry–Research Project” of the Minister of Science Republic of Poland.

INSIGHTS FROM COMMUNITY HEALTH WORKERS ON BARRIERS AND FACILITATORS TO IMPROVING MATERNAL NUTRITION IN RURAL BANGLADESH

Gargi Wable Grandner[1]; Katherine Dickin,[2]; Kathleen Maher Rasmussen[1]; Purnima Menon[3]; John Hoddinott[4]
[1]Division of Nutritional Sciences, Cornell University, Ithaca, United States of America; [2]Department of Public and Ecosystem Health, Cornell University, Ithaca, United States of America; [3]Food Policy and Nutrition, IFPRI, New Delhi, India; [4]Division of Nutritional Sciences, Cornell, Ithaca, United States of America

BACKGROUND AND OBJECTIVES
Behavior change communication (BCC) interventions to improve maternal nutrition (MN) have met with mixed success as adoption of MN behaviors often require material and social support from family members. Using focused ethnography, the present study analyzed emic perspectives of community health workers (CHWs) with experience in family-focused counseling to identify and describe family- and behavior-specific barriers and facilitators that affected CHWs' promotion and mothers' adoption of recommended MN behaviors.
METHODS
We interviewed 35 CHWs providing at-home nutrition education and counseling to rural pregnant women and their families in seven 'Alive & Thrive' intervention sites across two resource-poor Bangladeshi districts. Two card sorting exercises explored barriers and facilitators in promoting and perceived adoption of messages on maternal diet, rest, micronutrient supplements, and weight gain during pregnancy. Quantitative analysis based on how CHWs rated behaviors on scales of difficulty in promoting them and in their perceived adoption by mothers involved estimating correlation between average level of difficulty in promoting and in perceived adoption of a recommended behavior.
RESULTS
Poverty and unsupportive social norms emerged as key barriers for improving diet and rest while provision of free micronutrient supplements, at-home weight monitoring, regular CHW refresher trainings, and organizing husbands' forums emerged as overall facilitators of improved family engagement and CHW credibility. Quantitative analysis of sorting data revealed that behaviors that CHWs perceived as most difficult for mothers to adopt were also most difficult for them to promote (Pearson correlation coefficient = 0.75, p-value = 0.03). These included: higher maternal food intake, daily intake of eggs and dairy, and avoiding heavy workload during pregnancy. Qualitative analysis revealed that CHWs who considered dietary behaviors as 'most difficult' described feeling conflicted to counsel mothers from poor families to purchase expensive foods like eggs and dairy that were also not part of family meals, while 'avoiding heavy workload' was difficult to promote in households with absent male adults or with mothers-in-law who considered the behavior non-normative for rural women, regardless of their pregnancy status.
CONCLUSIONS
In this study, CHWs offered important insights on MN-focused behavior change, including that adoption and promotion of recommended MN behaviors may depend on the extent to which they are perceived as resource-intensive or non- normative.

DEVELOPING THE BALKAN DIETARY PATTERNS MODEL

Milesevic Jelena[1]; Amil Orahovac[2]; Marija Knez[3]; ŠArac Ivana[1]; Aleksandra Martinović[4]; Arar Katica[5]; Nikolić Lidija[5]; Mirjana Gurinovic[6]

[1]Institute for Medical Research, University of Belgrade, Beograd, Serbia; [2]Faculty of Food Safety, Food Technology and Ecology, University of Donja Gorica, Podgorica, Montenegro; [3]Centre of Research Excellence in Nutrition and Metabolism, Institute for Medical Research, University of Belgrade, Beograd, Serbia; [4]Faculty of Food Technology, Food Safety and Ecology, University Donja Gorica, Podgorica, Montenegro; [5]-, Food Safety Agency of Bosnia and Herzegovina, Mostar, Bosnia and Herzegovina; [6]Center of Research Excellence in Nutrition and Metabolism, Institute for Medical Research, University of Belgrade, Belgrade, Serbia

BACKGROUND AND OBJECTIVES

Understanding dietary patterns is essential not only for addressing health-related non-communicable diseases (NCDs) but also for preserving cultural identity, fostering regional development, and supporting sustainable food systems. The Balkan region, characterized by rich cultural and religious diversity, exhibits both unique and shared dietary habits shaped by historical, social, and environmental factors. Using large, harmonized datasets from Bosnia & Herzegovina, Montenegro and Serbia, on food consumption collected between 2017–2022 through the EFSA EU Menu methodology, this study integrates comprehensive data with advanced modeling approaches to develop a multidimensional framework for analyzing regional dietary patterns in alignment with global healthy nutrition recommendations.

METHODS

Dietary data were gathered using 24-hour dietary recalls to capture actual food consumption and Food Propensity Questionnaires to assess usual intake. Both methods followed EFSA EU Menu standards, ensuring harmonization and comparability across Serbia, Montenegro, and Bosnia & Herzegovina. Investigator-defined methods (e.g., Healthy Eating Index), data-driven methods (e.g., principal component analysis), and hybrid modeling methods (e.g., reduced rank regression) were used to analyze the relationship between dietary behavior, cultural diversity, and socioeconomic factors.

RESULTS

Analysis of extensive datasets revealed shared dietary staples, such as grains, dairy, and vegetables, alongside regional variations in processed food consumption and dietary quality reflecting cultural and religious distinctions. Data-driven approaches effectively captured this diversity, while investigator-defined methods ensured alignment with health guidelines. Advanced tools, including machine learning, demonstrated potential for integrating multidimensional data and offering deeper insights into regional dietary patterns and their relations to health indicators.

CONCLUSIONS

By leveraging harmonized, large-scale datasets on food consumption, this study developed a robust multidimensional model that captures both similarities and differences in dietary patterns across the culturally diverse Balkan region. This model addresses health-related NCDs, supports sustainable food systems, and informs evidence-based public health policies. Situating these findings within global nutrition recommendations highlights the region’s potential to influence broader efforts in health promotion, cultural resilience, and sustainability.

MODE OF DELIVERY AT BIRTH AND ITS ASSOCIATION WITH CARDIOMETABOLIC RISK FACTORS IN ADOLESCENCE

Ariane Ribeiro de Freitas Rocha[1]; Nubia De Souza De Morais[1]; Silvia Eloiza Priore[1]; Dayane De Castro De Morais[1]; Sylvia Do Carmo Castro Franceschini[1]; Pedro Paulo Prado Junior[2]; Jackson Martins Rodrigues[3]; Renata Maria Souza De Oliveira E Silva[4]; Eliane Rodrigues De Faria[4]

[1]Programa de Pós Graduação em Ciência da Nutrição - Departamento de Nutrição e Saúde, Universidade Federal de Viçosa, Viçosa, Brazil; [2]Departamento de Enfermagem e Medicina, Universidade Federal de Viçosa, Viçosa, Brazil; [3]Departamento de Meteorologia Aplicada, Universidade Federal de Viçosa, Viçosa, Brazil; [4]Departamento de Nutrição e Saúde, Universidade Federal de Juiz de Fora, Juiz de Fora, Brazil

BACKGROUND AND OBJECTIVES

In vaginal childbirth, the newborn is colonised by beneficial microorganisms from the maternal vaginal flora, such as Lactobacillus. In the caesarean section, the microbiota formed resembles the skin and the hospital environment, which can affect metabolic and cardiovascular regulation throughout life. Our aim was to verify the relationship between the type of birth and cardiometabolic factors in this individual in adolescence.

METHODS

A longitudinal study, with retrospective data from birth and prospective data from adolescence, approved by the Human Research Ethics Committee of the Federal University of Viçosa (6.104.415). A total of 831 adolescents (both sexes) were assessed on a 12-hour fast for weight, height, waist circumference, body mass index (BMI), waist-to-height ratio (WHtR), blood pressure, total cholesterol and fractions and uric acid. Information on the mode of childbirth of these adolescents was obtained from the records of the local maternity hospital. The Mann-Whitney test was applied to verify the relationship between the type of childbirth (vaginal and caesarean section) and cardiometabolic factors in adolescence, using SPSS software (20.0), with a significance level of 5%.

RESULTS

The median age was 16 years (10-19), 65% (n=540) were female, and 65.1% (n=544) were born by caesarean section. In girls, 22.8% (n=123) were overweight and 18.4% (n=99) had an WHtR greater than 0.5; in boys, 21.9% (n=64) and 22.6% (n=66), respectively. Boys born by caesarean section had higher medians (p=0.005) for BMI (20.32 x 18.36 kg/m²), waist circumference (72.00 x 66.50 cm), systolic blood pressure (103.00 x 97, 00 mmHg), total cholesterol (157.00 x 145.50 mg/dL), LDL cholesterol (92.00 x 87.50 mg/dL), and uric acid (3.80 x 3.20 mg/dL) in adolescence, when compared to those born by vaginal childbirth. In girls, those born by caesarean section had higher median waist circumference (p=0.005) (71.78 x 68.50 cm) and WHtR (0.45 x 0.43) in adolescence compared to those born by vaginal childbirth.

CONCLUSIONS

Birth by caesarean section was associated with higher values of these cardiometabolic factors in adolescence, indicating a greater risk of developing cardiovascular and metabolic diseases at this stage of life, which tend to persist or worsen in adulthood, especially in males. *Acknowledgements:* To the Minas Gerais State Research Foundation (FAPEMIG) for the funding (APQ 03016-23), the CAPES Foundation, and the Postgraduate Programme in Nutrition Science at the Federal University of Viçosa.

EPO5_332

UNRAVELING THE FOOD ENVIRONMENT AND SUGAR SWEETENED BEVERAGE CONSUMPTION AMONG EARLY ADOLESCENTS

Alice Koryo-Dabrah[1]; Eunice Berko Nartey[1]; Daniel Mensah,[1]; Elizabeth Minnow,[1]
[1]Department of Nutrition and Dietetics, University of Health and Allied Sciences, Ho, Ghana

BACKGROUND AND OBJECTIVES
Consumption of sugar sweetened beverages (SSBs) is reported to be on the increase among adolescents giving rise to concern regarding the burden of weight gain and non-communicable diseases. Despite interventions to modify the food environment adolescents are exposed to, there is a gap in knowledge examining the relationship between the food environment and SSBs consumption. The study aimed to explore the home and school food environment adolescents are exposed to and identify factors associated with SSBs consumption.
METHODS
A cross-sectional study was conducted using 299 participants from 4 Junior High Schools. Data was collected on socio-demographics; anthropometry; knowledge, attitude, and practice toward SSBs consumption and the home and school food environment. Data was analyzed using the Statistical Package for Social Sciences (SPSS) software version 27. Logistic binary regression was performed to identify the factors associated with SSBs intake at alpha of less than 0.05 at 95% CI. Ethical clearance, parental consent, and child assent were obtained for the for study.
RESULTS
The mean age of the participants was 13 (± 2) years with more than half (57.2%) being girls. The prevalence of stunting and thinness was 5.4% and 4.7% respectively. More than half (57.2%) of the participants had good knowledge of SSBs, however, majority had poor attitude (57.2%) and practice (86.6%) towards SSBs consumption. The prevalence of SSBs consumption among the participants was 38.8%. The factors found to be associated with SSBs intake among the adolescents were having a social networking site [AOR = 2.22; 95% CI (1.28 – 3.85), p = 0.004], how often parents buy SSBs [AOR = 1.67; 95% CI (1.01 – 2.76), p = 0.047], accessibility to SSBs at home [AOR = 2.27; 95% CI (1.31 – 3.94), p = 0.003], Having a policy restricting SSBs at home [AOR = 1.77; 95% CI (1.04 – 3.02), p = 0.036] and parental consumption of SSBs at home [AOR = 0.42; 95% CI (0.22 – 0.83), p = 0.012].
CONCLUSIONS
The home food environment was associated with SSBs consumption among the adolescents but not the school food environment. This highlights the significant role parents have to play in creating a healthy food environment to improve healthy food consumption.

EPO5_333

DIETARY AND HEALTH ASPECTS AND PHYSICAL PERFORMANCE IN MEN WITH RECREATIONAL PHYSICAL ACTIVITY IN THE CONTEXT OF TAKING DIETARY SUPPLEMENTS: A CROSS-SECTIONAL STUDY

Ewa Niedzwiedzka[1]
[1]Department of Human Nutrition, Faculty of Food Science, University of Warmia and Mazury in Olsztyn, Olsztyn, Poland

BACKGROUND AND OBJECTIVES
Many adult men undertake various types of training to improve physical performance and increase muscle mass [1]. More and more of these men take dietary supplements [2]. Aim: To analyse the association between diet, nutritional status, and the use of dietary supplements by men with recreational physical activity.
METHODS
The study involved 170 men with recreational physical activity, aged 19-40. Data were collected on men's lifestyle, type and amount of dietary supplements used. Diet quality was determined using two predefined diet quality scores: pro-healthy diet index (pHDI) and non-healthy diet index (nHDI) based on data collected with the food frequency questionnaire (KomPAN®). The energy and nutritional value of the diet was determined by 3-day food record. Body composition, maximum oxygen consumption (VO2max) in the spiroergometric exercise test with exhaust gas analysis, and heart rate were measured. The concentration of proteins, lipids, glucose, selected hormones, haematological and inflammation markers was determined in fasting venous blood.
RESULTS
69% of the sample used dietary supplements, most often containing milk proteins. Men who used dietary supplements compared to those who did not use them, consumed more protein and/or amino acids from dietary supplements (by 32%; $p<0.0001$), and had a significantly higher dietary intake of docosahexaenoic acid (by 45%); vitamins: B12 (by 33%), B2 (by 28%) and D (by 25%), cholesterol (by 21%), protein (by 20%), folates (by 19%), phosphorus (by 19%), magnesium (by 8%) and zinc (by 7%) and a better diet quality determined by the pHDI (by 47%; $p<0.001$). Men using dietary supplements compared to those who did not use them, had a significantly more favorable body composition: lower body fat content (by 15%), higher lean body mass content (by 3%) and a better result of the maximum exercise test (by 7%). There were no differences between both groups of men in the occurrence of disorders health in relation to 30 out of 33 analysed blood markers.
CONCLUSIONS
The use of dietary supplements by men with recreational physical activity had a weak association with health markers. The observed benefits in body composition and physical performance are rather due to the combined effect of the use of dietary supplements and better quality of the diet.

EPO5_338

ASSOCIATION BETWEEN SERUM EICOSAPENTAENOIC ACID/ARACHIDONIC ACID RATIO AND HYPERTRIGLYCERIDEMIA BY SMOKING STATUS: A CROSS-SECTIONAL STUDY

Yayoi Funakoshi[1]; Koutatsu Maruyama[2]; Kenji Uchiyamada[1]; Naoki Hirano[1]; Kanako Yamauchi[3]; Tadahiro Kato[4]; Isao Saito[1]

[1]Public Health and Epidemiology, Oita University, Yufu, Japan; [2]Department of Bioscience, Ehime University, Matsuyama, Japan; [3]Clinical Psychology, Fukuyama City University, Fukuyama, Japan; [4]Life Span Development and Clinical Psychology, Ehime University, Matsuyama, Japan

BACKGROUND AND OBJECTIVES

A high eicosapentaenoic acid (EPA)/arachidonic acid (AA) ratio is considered a protective factor against hypertriglyceridemia (HTG), whereas smoking is a strong risk factor. The association among smoking history, serum EPA/AA ratio, and HTG levels remains unclear in the general Japanese population. This study aimed to clarify the association between the serum EPA/AA ratio and HTG prevalence in the general Japanese population based on smoking history.

METHODS

A total of 3600 community-dwelling individuals aged ≥ 40 years were enrolled from 2009–2011. We selected 1305 participants aged 40–74 years with no past myocardial infarction or stroke and measured their levels of serum polyunsaturated fatty acids, including EPA and AA. The level of the serum EPA/AA ratio was categorized into quartiles (<0.27, 0.27–0.38, 0.39–0.53, and >0.53). HTG was defined as > 150 mg/dL (1.69 mmol/L) or > 175 mg/dL (1.98 mmol/L) for fasting and non-fasting triglycerides, respectively. Adjusted odds ratios (AORs) and 95% confidence intervals (CIs) were analyzed using logistic regression analysis to evaluate the relationship between the serum EPA/AA ratio and HTG levels in the subgroups stratified according to smoking history (current smoker or non-smoker).

RESULTS

The prevalence of HTG in nonsmokers and smokers in the first (low), second, third, and fourth (high) quartiles of the serum EPA/AA ratio was 20.4% and 26.3%, 21.8% and 22.8%, 19.1% and 25.0%, and 14.2% and 30.6%, respectively. In the multivariate analysis (adjusted for age, sex, body mass index, social status, lifestyle, and medical history, such as hypertension, diabetes mellitus, hyperlipidemia, heart disease, and stroke), non-smokers in the highest quartile of the serum EPA/AA ratio had a significantly lower AOR for HTG than those in the lowest quartile (AOR; 0.54, 95% CI; 0.33, 0.86, P = 0.046), but was not significantly different among smokers (AOR; 0.62, 95% CI; 0.16, 2.34, P = 0.661).

CONCLUSIONS

These findings provide evidence of a significant inverse association between the serum EPA/AA ratio and HTG among nonsmokers; however, no such association was observed in smokers. Smoking may reduce the beneficial effects of EPA, suggesting the importance of smoking cessation.

EFFECTS THROUGH THE APPROACH OF RECOMMENDING A PLANETARY HEALTH DIET TO IMPROVE DIET ON NUTRITIONAL KNOWLEDGE AND DIETARY BEHAVIOUR CHANGE: AN INTERVENTION STUDY IN JAPANESE MALE UNDERGRADUATES

Etsuko Kibayashi[1]; Makiko Nakade[2, 3]
[1]Department of Food and Nutrition Management, Sonoda University , Amagasaki, Japan; [2]Department of Food Science and Nutrition, University of Hyogo, Himeji, Japan; [3]Research Institute for Food and Nutritional Sciences, University of Hyogo, Himeji, Japan

BACKGROUND AND OBJECTIVES

Few young Japanese adults regularly eat breakfast and a well-balanced diet composed of staples, course dishes, and sides, which is associated with poor awareness of healthy diets.

A planetary health diet was recently recommended to achieve Sustainable Development Goals (SDG), with higher SDG awareness among young males. We hypothesised that approaches recommending healthy planetary diets may help promote healthy diets among young Japanese individuals. This study examined the effects of recommending a planetary health diet on nutritional knowledge and dietary behaviour changes in male Japanese university students by comparing pre-intervention and post-intervention RESULTS.

METHODS

The target group comprised 1624 engineering students aged 18–24 years (86.0% male) at a public university in Hyogo Prefecture, Japan. The study contents were announced through the university portal site and flyers/posters. They were recommended a planetary health diet through a 1-year poster display and monthly updates of information videos on a university portal site. For the pre-intervention and post-intervention comparisons, data from 63 young males who responded to both the pre-intervention survey in 2022 (total number of respondents, n = 222) and the post-intervention survey in 2023 (n = 78) were used. The Wilcoxon signed-rank test was used to compare scores (15 to 60) of nutritional knowledge (Cronbach's α, 0.931), as well as stage of dietary behaviour change (practices such as reducing food loss, choosing foods with low food print, and eating a more plant-based diet), regular breakfast consumption, and intake of a well-balanced diet at least twice daily, between pre-intervention and post-intervention.

RESULTS

The median nutrition knowledge score at post-intervention (41.0 points) was significantly higher than that at pre-intervention (38.0 points) (P = 0.022). After the intervention, the stages of dietary behaviour change increased; the percentages of students in the pre-intervention and post-intervention stages were 12.7% and 19.0% in the contemplative stage and 12.7% and 17.5% in the maintenance stage, respectively, showing a trend towards improvement (P = 0.054).

CONCLUSIONS

Among male university students, the approach of recommending a planetary health diet affects nutritional knowledge and the dietary behaviour change stage.

BREAKFAST CONSUMPTION EFFECTS ON MENTAL STATUS AND INTELLECTUAL PERFORMANCE AMONG FEMALE UNIVERSITY STUDENTS IN JAPAN

Makiko Nakade[1]; Ryota Fukui,[2]
[1]Department of Food Science and Nutrition; Research Institute for Food and Nutritional Sciences, University of Hyogo, Himeji, Japan; [2]Department of Health Science, Faculty of Health and Human Development, University of Nagano, Nagano, Japan

BACKGROUND AND OBJECTIVES
Skipping breakfast for young adults, including university students, has been a problem in Japan for many years. Although cross-sectional studies have reported that skipping breakfast is associated with mental health problems and poor academic performance, few intervention studies have examined the effects of eating breakfast among university students in Japan. This study investigated the effects of breakfast intake on university students' mental status and intellectual performance.
METHODS
A randomized crossover study was conducted in 2022 and 2023 among 48 female students from the first through fourth grades in a Hyogo Prefecture, Japan university department. The students participated in the study for non-continuous two days; students ate breakfast for one day (445 kcal, 13.1 protein E%, 24.0 fat E%, and 62.9 carbohydrate E%) and skipped breakfast the other day. Mental arithmetic test and an assessment of mental status using a visual analog scale were conducted. The visual analog scale assessed concentration, sleepiness, vitality, and tiredness. These tests and assessments were conducted at four time points: the time of visit (Time 1), immediately after eating or skipping breakfast (Time 2), and at 60 (Time 3) and 120 min (Time 4) after Time 2.
RESULTS
In mental arithmetic test, compared with Time 1, the number of correct answers increased significantly at Time 2, 3, and 4 on both breakfast and skipped breakfast days. The concentration and vitality scores at Times 2, 3, and 4 on breakfast days were significantly higher than those on skipped breakfast days. The tiredness score at Times 2, 3, and 4 and the sleepiness score at Time 2 on breakfast days were significantly lower than that on skipped breakfast day.
CONCLUSIONS
It was suggested that breakfast consumption positively affected concentration, vitality, and tiredness among female university students.
CONFLICTS OF INTERESTS

[1]Department of Food Science and Nutrition, Faculty of Human Life and environment, Nara Women's University, Nara, Japan; [2]Graduate School of Environmental Health, Azabu University, Sagamihara, Japan; [3]Graduate School of Life Sciences, Showa Women, Setaga, Japan; [4]Institute for Cancer Control, National Cancer Center Japan, Chuo, Japan; [5]Graduate School of Medical and Dental Sciences, Niigata University, Niigata, Japan; [6]Institute for Global Health Policy Research, National Center for Global Health and Medicine, Tokyo, Japan; [7]Graduate School of Public Health, International University of Health and Welfare, Tokyo, Japan

BACKGROUND AND OBJECTIVES
The Japanese Food Guide Spinning Top (JFGST) does not assess dietary salt; nevertheless, salt reduction remains an important issue in population-level studies of diet. This study aimed to investigate the association between adherence to the JFGST calculated by weighed food records (WFRs) or a Food Frequency Questionnaire (FFQ), and urinary sodium and potassium excretion and sodium-to-potassium ratio. Further, salt-added scores were developed and analyzed.
METHODS
We used cross-sectional data, including data from 12-day WFRs, five 24-hour urine collections, and an FFQ. Participants were 248 Japanese aged 35–80 years who participated in the JPHC-NEXT validation study between 2012 and 2013. Main outcomes were 24-hour urinary sodium and potassium excretion and sodium-to-potassium excretion ratio. Multiple regression analysis was performed with urinary excretion as the dependent variable and JFGST score calculated by WFRs and the FFQ as independent variables. Because scores are not proportional to intake under this JFGST scoring method, Spearman's correlation coefficients were calculated between the score and urinary excretion, and between the number of servings and urinary excretion.
RESULTS
When scored by WFRs, the higher JFGST score group tended to have lower sodium excretion (-129 mg/day per one quartile increase; P for trend, 0.051), higher potassium excretion (137 mg/day per one quartile increase, P <0.01), and lower sodium-to-potassium ratio (-0.32 per one quartile increase, P <0.01). When accompanied by salt-added scores, total score was associated with further reductions in sodium excretion (-218 mg/day per one quartile increase; P for trend, <0.001).
CONCLUSIONS
Even though the JFGST does not assess dietary salt, high JFGST adherence tends to be associated with lower sodium excretion and sodium-to-potassium ratio and higher potassium excretion. This inverse association with sodium excretion was strengthened by the addition of a salt-added score.

A 12-WEEK PILOT RANDOMIZED CONTROLLED TRIAL OF AN ORAL NUTRITIONAL SUPPLEMENT IN IMPROVING THE NUTRITIONAL AND HEALTH OUTCOMES OF THE ELDERLY IN PERI URBAN COMMUNITIES

Matilda Anim-Fofie[1]; Gloria Ethel Otoo,[1]; Matilda Steiner-Asiedu[1]; Jolene Nyako[2]; Firibu Kwesi Saalia[1]
[1]Nutrition and Food Science, University of Ghana, Accra, Ghana; [2]Nutrition, Council for scientific and industrial research, Accra, Accra, Ghana

BACKGROUND AND OBJECTIVES
There has been a rapid global increase in the population of the elderly, with this demographic projected to more than double from 1.1 billion in 2021 to nearly 2.1 billion by 2050. Biological and physiological changes, as well as psychological and socioeconomic factors associated with ageing increase vulnerability to undernutrition and poor health. Oral Nutritional Supplements (ONS) have been explored among other interventions to improve the nutrition and health of the elderly with mixed RESULTS. This pilot study is investigating the efficacy of a locally made plant-based ONS in improving the nutritional and health outcomes of the elderly in peri urban communities in Accra, Ghana.
METHODS
A census of the elderly was undertaken in five peri urban communities and a cross-sectional of 200 elderly individuals aged 60 years and above dwelling in these communities will be interviewed to assess the relationship between usual dietary intake and health status. Eighty of the participants will be randomly selected for a 12-week randomized control trial (RCT). The intervention group will receive a 7-day supply of a plant based ONS, which they will consume daily, and the control group will receive nutrition education that will be given to all participants. Data to be collected on all 200 participants at baseline (0 wk.), midline (6 wks.) and endline (12 wks.) include sociodemographic characteristics, usual dietary intake, body weight, physical activity, hand grip strength, systolic and diastolic blood pressure. For the RCT participants, biochemical indicators (serum albumin, ferritin, hemoglobin, cholesterol and C reactive protein) will be collected at 0 wk. and 12 wks. Adherence and morbidity associated with the use of ONS will be collected weekly. Logistic regression will be used to identify the relationship between dietary intake and health outcomes. Repeated measures ANOVA and paired-sample t-test will be used to analyze outcome measures within the intervention and control groups. The multivariate ANOVA and the independent sample t-test will be used to analyze outcome measures between groups.
RESULTS
The study will identify the association between usual dietary intake and health outcomes of the elderly and the effect of daily consumption of a plant based ONS on the nutritional and health outcomes of the elderly.
CONCLUSIONS
The findings would provide insights for a larger randomized controlled trial that could establish the efficacy of a locally produced ONS for the feeding of the elderly.

PERCEPTIONS ABOUT CHILDREN´S ENVIRONMENT THAT COULD CONTRIBUTE TO THE INCREASE OF OBESITY IN YOUTH

Victoria Abril[1]; Valeria Carpio,[2]
[1]Medical Science Faculty/ Nutrition and Dietetic career, University of Cuenca , Cuenca, Ecuador; [2]Nutrition and Dietetic Career, ESPOCH, Riobamba, Ecuador

BACKGROUND AND OBJECTIVES
Worldwide, the prevalence of obesity in children is high and the environments can promote high-fat diets and sedentary lifestyles. Objective: To analyze the perceptions about environments related to nutrition and physical activity of schoolchildren
METHODS
Descriptive qualitative study. Participated 19 caregivers and 7 school´s teachers selected at convenience schools from a rural and urban area of Ecuador. Participants signed an informed consent and a Bioethics Committee approved the protocol.
RESULTS
Caregivers and teachers perceived that children eat fruits and vegetables at home and school. However, children eat frequently unhealthy food like fast food and ultraprocessed products because they are popular among children. Parents and teachers say that children play and do physical activity in home and in the schools in a satisfactory manner (playing in the neighborhood or parks with friends and siblings, walking at home). Caregivers perceived that their work limit the time they share with the children as eating or doing physical activity, which could have an impact on the health of the children
CONCLUSIONS
Parents and teachers are concerned that children frequently consume unhealthy food despite having access to fruits and vegetables. They indicate that children do physical activity but parents do not have time to share with their children and they are exposed to the influence of the environment and peers.

DIETARY INTERVENTION FOR HEIGHT GROWTH PROMOTION IN PRESCHOOL CHILDREN: ASSOCIATION WITH INFORMATION SOURCES AND PARENTAL FACTORS

Kemal Sasaki[1]; Tomomi Kobayashi[2]; Yuki Tada[3]; Yasuyo Wada[4]; Tetsuji Yokoyama[4]
[1]Department of Food and Health Sciences, Jissen Women's University, Hino, Japan; [2]Department of Food Science and Nutrition, Mukogawa Women's University, Nishinomiya City, Japan; [3]Department of Nutritional Science, Tokyo University of Agriculture, Setagaya City, Japan; [4]Department of Health Promotion, National Institute of Public Health, Wako, Japan

BACKGROUND AND OBJECTIVES
This study investigated the types of dietary intervention used by parents to promote the height growth of preschool children and their associations with parental information sources and anthropometric characteristics.
METHODS
In January 2024, a web survey was conducted with 1,400 mothers of children of 3–5 years of age. The analysis included 1,362 participants after excluding those with invalid responses and underlying conditions. The survey items included parent and child physiques, dietary habits, and sources of information on the child's physique. The child's physique was obtained at birth, during infant health check-ups, and at the most recent values. Children with a height ≤-2 standard deviations at any point were classified as having short stature (SS). The participants were classified into the intervention group (n=531) if they implemented dietary measures for height growth promotion, while the remaining participants formed the control group (n=831). The association between nominal variables was evaluated using Fisher's exact test and factors related to dietary interventions were examined using a multiple logistic regression analysis.
RESULTS
One hundred thirty-five (25.4%) participants in the intervention group and 149 (17.9%) in the control group were defined as having SS (P=0.001). The food most frequently consumed for promoting height growth was milk and dairy products (420 [79.1%]). Compared to the control group, the intervention group showed higher rates of appropriate consumption frequency for milk/dairy products and fish. A multivariate analysis showed that dietary intervention was positively associated with SS, food allergies, seeking information about child growth patterns, obtaining information from the family or friends, and a shorter parental height.
CONCLUSIONS
Parental decisions regarding dietary intervention were associated with the child's height status, food allergy, information about physical characteristics, and parental height.

NUTRITIONAL VULNERABILITY OF INTERNALLY DISPLACED PERSONS (IDPS): A STUDY OF FOOD ACCESS AND NUTRITIONAL STATUS OF IDPS

Betrand Tambe Ayuk[1]; K Nganje Metuge[1]; Julie Nchung Ashu[2]; Xikombiso Mbhenyane[3]
[1]Public Health and Hygiene, University of Buea, Buea, Cameroon; [2]Public Health and Hygiene, Faculty of Health Sciences, University of Buea, Buea, Cameroon, Bue, Cameroon; [3]Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch university,, Cape Town, South Africa, South Africa

BACKGROUND AND OBJECTIVES
Concerns about global food insecurity have been on the rise in recent years and more prevalent in low- and middle-income countries [1,2]. This study aimed to assess the determinants of food security among the internally displaced persons (IDPs) living and their children under five and the influence on their nutritional status.
METHODS
This descriptive cross-sectional, community-based study using random sampling of adult internally displaced persons (IDPs) caregivers and children under five in households were included. The caregivers were interviewed using a validated structured questionnaire and nutritional assessment of both the children and adult population was conducted. Data was analysed using Statistical package for the Social Sciences version 27. Ethical clearance was obtained from an institutional review board.
RESULTS
The study findings revealed a high proportion of food insecurity among IDP households, with a staggering 97.6% experiencing some degree of food insecurity. In addition, 28.3% of the surveyed households had good dietary diversity. Also, 50.61% were stunted, over a third were underweight, and 15.8% were wasting, reflecting severe nutritional deficiencies prevalent among IDP children. Besides, 28.4% of the adults were overweight or obese, while a substantial number were underweight. Multiple linear regression estimates revealed that the monthly salary of caregivers and monthly average money spent on food, were associated with decrease in food insecurity. While increase family size and used of coping strategies were associated with increase food insecurity.
CONCLUSIONS
There is a high proportion of food insecurity among IDPs forcing households to adopt various coping strategies, primarily through dietary modifications. Consequently, low dietary diversity and poor nutritional status with underweight, wasting, and stunting among children. These findings emphasize the urgent need for comprehensive interventions to address the root causes of food insecurity, improve access to nutritious food, and ensure the health and well-being of IDPs

ANIMAL SOURCE ENERGY CONSUMPTION – ASSOCIATIONS WITH NUTRIENT INTAKE AND BLOOD BIOMARKERS AMONG FINNISH PRESCHOOLERS

Elina Kettunen[1]; Topi Hovinen[2]; Maijaliisa Erkkola[1]; Anu Suomalainen[2]; Riitta Freese[1]; Liisa Korkalo[1]
[1]Department of Food and Nutrition, University of Helsinki, Helsinki, Finland; [2]Research Programs Unit, Stem Cells and Metabolism, University of Helsinki, Helsinki, Finland

BACKGROUND AND OBJECTIVES
Definitions of vegetarian or plant-based diets vary. In a group of preschool-aged children, we describe consumption of animal source foods quantitatively using a continuous variable. We then aim to analyse how animal source food intake is associated with nutrient intakes and blood biomarker concentrations.
METHODS
Data for this cross-sectional study was collected in 2017. Children aged 1–7-years (n=51) following a vegan (n=7), vegetarian (n=11), or omnivorous diet (n=33) were recruited from municipal daycare centres. Four-day food records, background information, and fasting blood samples (n=40) were collected. Animal source energy as a percentage of total energy intake (ASEP, E%) was calculated from food records. Plasma LDL cholesterol and erythrocyte folate concentrations, and serum untargeted MS-metabolomics were analysed from blood samples.
RESULTS
ASEP ranged from 0E% to 52E%. There was an overlap in ASEPs of vegetarian (median 8E%, range 0E%–20E%) and omnivore groups (median 33E%, range 11E%–52E%). We observed a positive correlation between ASEP and saturated fat (SAFA, E%; r=0.785) and cholesterol (r=0.715) intake, and a negative correlation of ASEP with polyunsaturated fat (PUFA, E%; r=−0.819) and fibre (r=−0.828) intake. In addition, ASEP correlated positively with LDL-cholesterol concentration (r=0.699).
CONCLUSIONS
There was considerable variation in ASEPs of non-vegan participants. Higher intake of animal source foods was linked to a less favorable fatty acid intake profile and lower fiber intake, as well as with higher plasma LDL cholesterol concentrations.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

SURVEY OF THE DIETITIAN'S SUPPORT DURING THE TRANSITION OF PATIENTS WITH FOOD ALLERGY

Noriko Hayashi[1, 2]; Fusayasu Naoko[3]; Noriyuki Yanagida[3]; Kemal Sasaki[2]
[1]Department of Health and Nutrition, Jumonji University, Niiza, Japan; [2]Department of Food and Health Sciences, Jissen Women's University, Hino, Japan; [3]Pediatrics, Sagamihara National Hospital, sagamihara, Japan

BACKGROUND AND OBJECTIVES
Patients with childhood-onset food allergy (FA) may not acquire tolerance in adulthood or may have difficulty introducing foods once eliminated. Dietitians play an important role in the dietary management of patients with FA. However, an optimal support during the transition period is unclear. This study aimed to clarify the challenges faced by transitioning patients with FA and the support that dietitians can provide.
METHODS
A self-administered questionnaire survey was conducted among patients with FA aged 16-25 years between October 2023 and August 2024.
RESULTS
The median (range) age of the participants during the survey was 20 (16-24) years, and the number of eliminated foods was four (1-11) and two (0-6) in the past and present, respectively. Twenty-seven patients (71%) had a history of anaphylaxis. When patients with FA had problems with their FA, 30 (81%) consulted family members, 23 (62%) physicians, two (5%) dietitians, and 15 (41%) non-healthcare professionals. Nineteen patients (51%) had no experience with dietary counseling by hospital dietitians. Twenty-nine, 18, and 11 patients were allergic to hen's egg, milk, and wheat, respectively. Those who were not interested in introducing allergens included 15 patients (52%) for hen's egg, 10 (56%) for milk, and 1 (10%) for wheat. Nineteen patients (66%) found the taste of hen's egg unacceptable, 13 (72%) of milk and one (10%) of wheat. Conversely, the most positive aspects of being cured of FA were "expanded food choices", "increased opportunities to eat out", and "expanded friendships". Patients with FA desired support such as "interaction with other patients", "instructions for allergen intake" and "school life".
CONCLUSIONS
Dietitians should support transitioning patients with FA regarding food elimination, allergen introduction, and interaction with other patients with FA.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

EFFECT OF PERCEIVED HEALTH STATUS AND PERCEIVED BODY IMAGE ON DIETARY BEHAVIOR AMONG UNIVERSITY STUDENTS IN NORTHERN TAIWAN

Dan Ping Chao[1]; Yen Wei Hsieh[2]; Yen Ting Wang[1]; Huai Ting Li[1]; Jia Qi Guo[1]; Hui Yi Kang[1]
[1]Department of Tourism and Leisure Management, China University of Technology, Taipei, Taiwan; [2]PROZ Biotech Co., Ltd., New Taipei, Taiwan

BACKGROUND AND OBJECTIVES
An improper diet is one of the critical factors causing health problems in modern people. High-sugar, high-salt, high-fat, and low-fiber diets are prevalent, particularly in urban areas. Perceived health status (PHS) and perceived body image (PBI), which are personal evaluations of one's health and body shape, respectively, may be affected by subjective thinking, the living environment, and social values. Therefore, the objective of this study was to evaluate the influence of PHS and PBI on dietary behavior among university students based on their subjective feelings of themselves.
METHODS
University students in northern Taiwan were recruited through random sampling, and 415 valid questionnaires were collected. Closed questionnaire items included sociodemographic characteristics, PHS, PBI, and eight dietary behaviors (overeating, restricted eating, low-fat foods, high-fiber foods, salty eating, eating sweets, dietary supplements, and smoked/pickled/fermented foods). Independent sample *t*-test, one-way ANOVA, and multiple linear regression analysis were conducted for statistical analysis.
RESULTS
Dietary behaviors showed significant differences according to institutional orientation, sex, and body mass index (BMI). Specifically, students attending vocational colleges were more likely to adopt salty and sweet eating and to consume dietary supplements and smoked/pickled/fermented foods compared to students attending general universities. Male students were more inclined to consume salty foods, dietary supplements, and smoked/pickled/fermented foods, whereas female students were more inclined to eat low-fat foods. Regarding BMI, students who were underweight (BMI<18.5) were more likely to eat foods that were too sweet compared with those who were of normal weight or overweight. After adjusting for sociodemographic variables that may affect dietary behavior, PHS and PBI were found to have consistently influenced dietary behavior. Students with higher PHS scores were more likely to adopt restricted eating and to consume low-fat and high-fiber foods, dietary supplements, and smoked/pickled/fermented foods. Students with higher PBI scores were more likely to overeat and to eat high-fiber and smoked/pickled/fermented foods.
CONCLUSIONS
In summary, PHS and PBI may be used to screen students who require improvement in their dietary behaviors. The study findings may provide a reference for health education for the government and universities.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

ULTRA-PROCESSED FOODS IN THE DIETARY PATTERNS OF ADULT POPULATION FROM SOUTH AMERICA

Adriana Marcela Ruiz Pineda[1]; Maite Catalina Agudelo-Cifuentes,[2]; Gustavo Cediel-Giraldo,[1]
[1]Escuela de Nutrición y Dietética, Universidad de Antioquia, Medellin, Colombia; [2]Facultad de Enfermería, Univeridad CES, Medellín, Colombia

BACKGROUND AND OBJECTIVES
There is an association between consumption of ultra-processed foods and beverages and development of chronic non-communicable diseases, ultra-processed food should be part of populations dietary patterns. Objective: To identify dietary patterns (DPs) in the adult population from a region in a country in south America, according to the NOVA food classification system, to know the share of processed (PF) and ultra-processed foods (UF) in the diet, and their association with socioeconomic determinants
METHODS
cross-sectional study with a random sample of 1394 adults aged 18 to 59 years, derived from a populational study conducted in 2019. Dietary intake assessment was carried out with 24-hour recalls, food consumption was quantified in grams and grouped according to the NOVA classification. The DPs were established by Factorial Analysis by principal components with varimax orthogonal rotation. To verify the association between DP and socioeconomic variables, Poisson logistic regression with robust variance was used.
RESULTS
Five DPs were defined that represent 28.5% of the variance of the population's diet. DP 1) Cereals/Eggs/Sugar, 2) Oils/Sausages/Drinks/Tubers, 3) Industrialized Cereals/Snacks/Sauces/Preparations, 4) Meats/legumes/Breads, and 5) Fruits/Vegetables/Water/Cheese.
CONCLUSIONS
PF and UF are present in four of the retained DPs and show greater adherence by younger people and those with medium and high economic income. The two DPs with the greatest amount of "*in natura*" foods, one represents a basic diet of subsistence, with greater adherence by people with low income and the other, a diet with better nutritional quality foods, followed by older people and with high income. This study is novel insofar as it classifies food consumption, obtained through R24h, with the NOVA food classification system and allows evidence PF and UF share in the population's diet.

NUTRITIONAL STATUS OF CHILDREN WITH DISABILITIES IN THE KHOMAS REGION, NAMIBIA

Mari-Louise Jeffrey,[1]; Mariette Nel[2]; Louise van den Berg[1]
[1]Nutrition and Dietetics, University of the Free State, Bloemfontein, South Africa; [2]Biostatistics, University of the Free State, Bloemfontein, South Africa

BACKGROUND AND OBJECTIVES
Children with disabilities are especially susceptible to malnutrition, particularly in developing countries, as they are often neglected, their needs disregarded and they frequently experience nutrition-related difficulties. This study investigated malnutrition among children, 6 months to 18 years, with disabilities living in the Khomas region, Namibia.

METHODS
A descriptive, cross-sectional study was conducted to collect sociodemographic and dietary intake data through structured interviews among children recruited, with the consent of their parents/primary caregiver and their own accent, from the schools and care centers for children with disabilities in the Khomas region of Namibia. Anthropometric measurements were taken following standardised procedures. Growth indicators were categorised using the World Health Organisation (WHO) AnthroPlus Software. Data were analysed using Statistical Analyses Software.

RESULTS
The study included 94 children aged six months to 17.5 years (IQR: 3.4-10.9) with various disabilities, including autism spectrum disorder, deafness, developmental delay, emotional disturbances, intellectual disabilities, orthopedic impairments, learning impairments, speech and language impairments, cerebral palsy and visual impairments. Stunting was evident in 42.6% of children (of whom 19.2% were severely stunted), wasting in 33% (18.1% severely wasted), and underweight in 52.2% (18.1% severely underweight). Overall, 32.4% of the children had low MUAC, meeting the diagnostic criteria for severe acute malnutrition, and 41.2% had moderate acute malnutrition. Malnutrition, as indicated by anthropometric markers, was significantly ($p<0.05$) associated with autism, developmental delay, intellectual disability and cerebral palsy. These markers were also significantly associated with sociodemographic characteristics of caregivers, including low education level and low income, lack of household amenities, including sanitation and safe water sources, the amount of money spent on food, access to medical care and multimedia, and household food insecurity.
CONCLUSIONS
In this population, malnutrition was highly prevalent in children with disabilities and was significantly associated with markers of poverty. Strategies to improve nutritional status through improved dietary intake are paramount to support growth and development in this vulnerable population.

WHEN EAST MEETS WEST: UNDERSTANDING HEALTHY EATING PERCEPTIONS AMONG ASIAN ETHNIC GROUPS IN HIGH-INCOME WESTERN COUNTRIES

Hoang Tong[1]; Shuxian Hua[1]; Farheen Zafar[1]; Joel Gittelsohn[1]; Mika Matsuzaki[1]
[1]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America

BACKGROUND AND OBJECTIVES
Asian ethnic groups in high-income Western countries (WHICs) have unique perspectives on healthy eating shaped by traditional and Western eating practice. However, their ability to procure and consume what they consider to be healthy may be compromised due to barriers like limited availability or affordability of culturally appropriate options. This qualitative evidence synthesis (QES) aims to comprehensively summarize 1) what eating patterns are perceived as healthy by these populations and 2) how their cultural beliefs add to these perceptions. Such insights can help improve their food environments and promote healthier, culturally relevant food choices that are distinct to Asian ethnic groups.
METHODS
Exhaustive literature search was performed across six databases (Pubmed, CINAHL, EMBASE, Web of Science, Scopus, PsycINFO). Included studies generated primary qualitative data on healthy eating perception of Asian ethnic groups in WHICs. Data were extracted using an adapted JBI Qualitative Data Extraction form, and JBI Checklist for Qualitative Research was used for quality appraisal. Data synthesis followed the meta-aggregation approach, with cumulative confidence established following the ConQual approach.
RESULTS
From 8118 screened records, 26 papers were included, covering data from nine Asian ethnic groups in seven WHICs. Preliminary findings identified common dietary patterns recognized across ethnic groups as healthy (e.g., high intake of vegetables, fruits, and fish) or unhealthy (e.g., excessive fat, sugar, or calories consumption). “Freshness” and “balance” were key elements of a healthy diet. Traditional diets were viewed as healthier than Western options for some groups (e.g., Chinese, Hmong) but not for others (e.g., Pakistani). All groups integrated their cultural beliefs (e.g., hot/cold energy for Chinese group) with Western concepts (e.g., modern terminologies like calories). They gained their food-related knowledge from social networks, health experts, and mass media. Generational differences emerged, as older and 1st-generation individuals favored traditional beliefs, yet younger and US-born individuals followed Western ideas. Healthy eating was not always prioritized in their practice, as social and cultural significance of food sometimes outweighed health impacts.
CONCLUSIONS
This QES is the first to summarize the healthy eating perceptions across Asian ethnic groups in WHICs and reveal the complexity and nuances of their dietary knowledge. Findings can be integrated in culturally tailored interventions to improve food environments in Asian communities in WHICs, ultimately enhancing their nutritional and overall wellbeing.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

COMPARISON OF BODY COMPOSITION AND NUTRITION BETWEEN ORAL CONTRACEPTIVE USERS AND NON-USERS

ULLE Parm[1]; Anna-Liisa Tamm,[1]; Jelena Sokk,[1]; Ester Jaansoo,[1]; Marit Salus,[1]; Ivi Vaher,[1]; Siret Läänelaid,[2]; Kevin Köster,[1]
[1]Physiotherapy and Environmental Health, Tartu Health Care College, Tartu, Estonia; [2]Nursing and Midwifery Department, Tartu Health Care College, Tartu, Estonia

BACKGROUND AND OBJECTIVES
One of the side effects of oral contraceptive (OC) use has previously been shown to be weight gain, but the current literature is insufficient to draw firm CONCLUSIONS, and objective, precise assessments of body composition have not been thoroughly investigated. Aim: to clarify the body composition parameters (incl fat percentage (%), fat and fat-free mass) body mass index (BMI) and the availability of energy and nutrients from food of OC users (OCU; high- [OCUH] and low-dose [OCUL]) hormone users) and non-consumers (OCN).
METHODS
A total of 45 women with mean age 21.8 ±1.7 years were enrolled. 19 (42.2%) of them were OCN and from OCU 38.8% were OCUL. Three-day dietary recall + Nutridata-program, and dual-energy x-ray absorptiometry were used. For statistical analysis, a chi-squared test, Student's t-test, and Spearman`s correlation was performed.
RESULTS
The mean body height and mass, BMI, fat mass, fat% and fat-free mass was 168.3 ± 5.6 m, 62.5 ± 8.5 kg, 22.5 ±4 kg/m2, 21.7 ± 5.0 kg, 34.5 ± 4.6 kg and 38.6 ± 5.1 kg, respectively. Additionally, there was no difference between any group. Seven subjects were overweight based on BMI and 28 subjects on fat% (including 3 and 16 subjects in OCU, respectively). On average, subjects received 1558.5 ± 515.5 kcal energy from food; 60% received <80% of recommended daily amount; carbohydrates accounted for 43.8%, fats for 38.2% and proteins for 17.4% of dietary energy, with fats accounting for a larger proportion of energy in OCU than in OCN (40.9% *vs* 34.1%, p = 0.002). Unexpectedly, there was no correlation between dietary energy and BMI; (r = -0.29; p = 0.057); and fat% (r = 0.1; p = 0.511). The diet was deficient in micronutrients, particularly iron and folate, as well as vitamins D, A, and E. Among OCN compared to OCU, a greater percentage of women received less than 80% of the recommended intake of vitamin B12 (68% vs. 46.2%; p = 0.01). Vitamin C deficiency was higher among OCU than OCN (76.9% vs. 52.6%; p = 0.002), while OCN received less vitamin C than both groups of OCU recipients (88.9% vs. 50%; p = 0.05). In OCU group, the average time of using OC 4.3 ±2 years.
CONCLUSIONS
Oral contraceptive intake is not associated with diet or body composition; however, significant differences in micronutrient levels were observed between the groups.

PARENTAL OPINIONS AND BELIEFS ON ORGANIC SCHOOL MEALS

Ave Kutman[1]; ULLE Parm[1]; Anna-Liisa Tamm,[1]; Helena Andreson[2]
[1]Physiotherapy and Environmental Health, Tartu Health Care College, Tartu, Estonia; [2]Institute of Veterinary Medicine and Animal Sciences, Estonian University of Life Sciences, Tartu, Estonia

BACKGROUND AND OBJECTIVES
There is a growing interest in healthy lifestyles and organic foods, prompting the Estonian government to increase the proportion of organic food in school meals. However, understanding the perspectives of parents whose children are offered organic food in educational institutions is essential, as organic food generally incurs a higher cost. Parents may need to pay extra for school lunches, which could directly impact household expenses. The study aimed to clarify parents' views on organic school meals, assess their willingness to pay extra, and compare opinions between those who prefer organic food (OFP) and those neutral on the subject (OFN).
METHODS
This prospective cross-sectional study was conducted via an electronic questionnaire in the LimeSurvey environment (www.limesurvey.com) in May 2024. Approval was obtained from the Medical Ethics Committee of the University of Tartu, Estonia (protocol no 388-T8). Continuous data and proportions were compared using t-tests or Mann–Whitney tests, and categorical data using Chi-square or Fisher's exact test.
RESULTS
A total of 98 subjects (32 OFP and 66 OFN) provided open-ended responses about organic food. The average participant age was 43.8 ± 8.4 years (no difference between groups), with 77.8% employed and 13.3% studying. Women constituted 87.8% of respondents. Family sizes ranged from 2 to 7 members, with 60% reporting a monthly household income between 1000–4000 euros. Background characteristics did not differ significantly between groups. Parental opinions fell into 14 categories. Most respondents (28.6%) expressed dissatisfaction with the school food provided, with both groups sharing similar concerns (25% OFP and 30,3% OFN). Dissatisfaction was largely due to children's dislike of the food and caterers. The main difference between the groups was their opinion on the importance of organic food: 29.9% of OFP and 40.9% of OFN parents considered that organic labelling was not important (p=0.027). Both groups equally thought that school food should be varied, nutritious, tasty and sufficient. Only 3.1% of respondents believed school meals should be free, while 9.2% were willing to pay more, and 5.1% were opposed. Most other responses reflected general dissatisfaction with school meals.
CONCLUSIONS
For most parents, the priority was that school meals be nutritious and of high quality, with less importance placed on whether the food was organic. Only a minority expressed willingness to pay extra for organic meals.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

ASSOCIATION BETWEEN DIETARY DIVERSITY DURING PREGNANCY AND POSTPARTUM DEPRESSION

Reina Makabe[1]; Minatsu Kobayashi[1]; Naho Morisaki[2]; Kohei Ogawa[3]; Seung Chik Jwa[4]; Takeo Fujiwara[5]
[1]Graduate School of Studies in Human Culture, Studies in Human Life Sciences, Otsuma Women's University, Tokyo, Japan; [2]Department of Social Medicine, National Research Institute for Child Health and Development, Tokyo, Japan; [3]Center for Maternal-Fetal, Neonatal and Reproductive Medicine, National Center for Child Health and Development, Tokyo, Japan; [4]Department of Obstetrics and Gynecology, Jichi Medical University, Tokyo, Japan; [5]Department of Global Health Promotion, Tokyo Medical and Dental University, Tokyo, Japan

BACKGROUND AND OBJECTIVES
Postpartum depression is an important mental health issue during women's life stages, and its causes include past history of depression and economic status. When evaluating the relationship with diet, it is important to consider not only single nutrients and foods but also the entire diet, including the combination and quantity of foods. In this study, we aimed to clarify the relationship between postpartum depression and the diversity of food intake during pregnancy, focusing on the number of foods consumed per day.
METHODS
Response data (n=1,041) from a semi-quantitative food frequency questionnaire (sFFQ) administered to women in the second trimester of pregnancy were used. sFFQ contains 165 foods and 9 frequency categories and consists of items asking whether the woman habitually consumed the listed foods within the past 2 months. The diversity assessment of food intake was based on the number of foods consumed per day from the foods listed in the sFFQ. (For example, if the respondent answered “once or twice a week,” the number was calculated as 1.5/7 times.) Postpartum depression was determined one month after delivery using the Edinburgh Postpartum Depression Self-Assessment (EPDS), with cutoff values of 8/9 and 12/13 to examine the relationship with the diversity of food intake.
RESULTS
Of the 1,041 subjects, 200 had an EPDS ≥9, and 70 had an EPDS ≥13. Logistic regression analysis was performed with the two EPDS cutoffs as the dependent variable and the quintiles of daily food intake as independent variables. Covariates were age, childbearing history, pre-pregnancy BMI, presence of stress in the past year, marital status, annual household income, and the subject's last level of education. Analysis revealed no significant differences in odds ratios. In a subsequent analysis, the same logistic regression analysis was performed separately for childbearing history, annual household income, and stress in the past year for the subjects, and no significant differences in odds ratios were found.
CONCLUSIONS
In this study, subjects were classified into quintiles based on the number of foods consumed per day, and a difference of more than 10 foods was confirmed between the highest and lowest groups. However, no significant association was found between the diversity of food intake and the onset of postpartum depression. It is suggested that further research on the relationship between the diversity of food intake and postpartum depression should be conducted in other pregnancy periods and with a larger number of subjects.

LOCAL PERCEPTIONS OF HOW BALANCED-ENERGY PROTEIN SUPPLEMENTATION COULD BE TARGETED IN RURAL BANGLADESH

Mary de Boer[1]; Pragna Mondal[2]; Nazrana Khaled[2]; Atiya Rahman[3]; Hasmot Ali; Rezwanul Haque[4]; Hafizur Rahman[4]; Eleonor Zavala[1]; Anna Kalbarczyk[1]; Towfida Siddiqua[4]; Parul Christian[1]; Andrew Thorne-Lyman[1]

BACKGROUND AND OBJECTIVES

Antenatal fortified Balanced Energy Protein (BEP) supplements are an approach that can address maternal undernutrition and inadequate gestational weight gain as causes of low birth weight (birth weight <2500 grams). BEP, however, has high relative costs, raising the question of whether targeting could improve its impact and cost benefit. An ongoing cluster-randomized controlled trial in northern Bangladesh is examining the impact on birth outcomes of targeting BEP based on maternal low body mass index (<18.5 kg/m2) and inadequate gestational weight gain compared to a control or untargeted supplementation. A qualitative study was conducted among women who completed participation in the trial to understand perspectives on targeted supplementation.

METHODS

In-depth interviews were conducted with 32 women following birth of their child. Qualitative data were analyzed thematically, using an implementation research framework from Proctor et al (2011). Participants were asked to rank, using 10 pictorial cards, the types of women in their communities who could most benefit from BEP; they were also asked to explain their opinions. Card ranking data were analyzed for top-3 and bottom-3 ranked categories and the individual and average Spearman's rank correlation coefficients were calculated.

RESULTS

Women struggled to grasp the concept of targeting, identifying BEP as needed by "every pregnant woman." When encouraged to identify women who could benefit most from BEP, the top 3 criteria included those consuming "rice-only diets" (in 32% of women's top-3), being an adolescent mother, and coming from a poor family (both 27%). The three least important criteria were nutritional indicators, viz. women with overweight (in 50% of women's bottom-3), short women (38%), and underweight women (15%). The average Spearman's rank was 0.28, indicating diversity in women's opinions. In justifying their rankings, women described a lack of "connection between [body] fat and food," defining nutrition as when a "body is healthy;" size was seen as an individual characteristic determined by God. Conversely, women described how inadequate diets could reduce a woman's strength, identifying women with poor, monotonous diets as particularly in need of the nutrients they knew were included in BEP.

CONCLUSIONS

While nutritional status indicators are frequently considered to target individuals in nutrition programs, findings from this study in rural Bangladesh suggest that strategies focusing on poverty and poor diets could prove more salient for the beneficiaries of such programs.

STUDY ON THE IODINE NUTRITIONAL STATUS OF NON-PREGNANT WOMEN IN DIFFERENT WATER IODIZATION AREAS

Ying Zhang[1]; Wei Ma[1]; Jing Xu[1]; Xiuwei Li[1]; Jianqiang Wang[1]; Haiyan Wang[1]; Jinpeng Wang[1]
[1]Iodine Deficiency Disorders, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China

BACKGROUND AND OBJECTIVES
In China, iodine-deficient (water iodine concentration (WIC)<40 μg/L), iodine-adequate (40 μg/L ≤ WIC ≤ 100 μg/L), and iodine-excess (WIC >100 μg/L) areas coexist, and the definition of iodine-adequate area was first formulated in 2020. This study aimed to evaluate the iodine nutritional status of non-pregnant women in different water iodization areas using different evaluation indicators.
METHODS
From iodine extra-high areas (IEHA), iodine-excess areas (IEA), iodine-adequate areas (IAA), inland iodine-deficient areas (IIDA), and coastal iodine-deficient areas (CIDA), 1991 non-pregnant local women were randomly selected. An iodine-specific dietary frequency questionnaire was used to investigate women's total dietary iodine intake (TII). Spot urinary iodine concentrations(SUIC), salivary iodine concentrations(SIC), and serum iodine concentrations(BIC) were tested and assessed. SUIC<100 μg/L, iodine defciency; 100–199 μg/L, adequate; 200–299 μg/L, above requirements;≥300 μg/L, excessive.
RESULTS
The RESULTS of WIC, iodized salt coverage rate（CR）, women's TII, SUIC, SIC, and BIC in the five areas are shown in Table 1. There were signifcant differences in WIC ($\chi2$=1874.97, P<0.001), CR ($\chi2$=899.94, P< 0.001), SUIC ($\chi2$=890.44; P < 0.001), SIC ($\chi2$=762.22; P< 0.001), TII ($\chi2$=1296.50, P < 0.001), and BIC($\chi2$=890.44; P < 0.001) among the five regions. SIC was strongly correlated with SUIC(r=0.66, P<0.001).TII(r=0.53, P<0.001), BIC(r=0.46, P<0.001), and SUIC were moderately strongly correlated, respectively.

Variables	CIDA	IIDA	IAA	IEA	IEHA	Total
CR(%)	4.0	89.7	26.6	8.8	4.0	24.5
WIC,μg/L	17.4	4.9	79.5	290.0	771.5	226.8
TII,μg/d	170.9	264.2	191.2	545.6	898.0	321.6
SUIC,μg/L	98.1	144.8	179.0	448.0	606.4	232.2
SIC,μg/L	78.3	113.4	163.6	287.8	677.3	199.0
BIC,μg/L	58.9	59.6	62.1	67.4	76.1	64.1

CONCLUSIONS
Women in CIDA had mild iodine deficiency due to the low coverage of iodized salt. IIDA had high iodized salt coverage, resulting in iodine-suitable status for women. Women in IAA were in an adequate iodine state. Women in IEA and IEHA were in an iodine-excess state due to high WIC.

PRESCHOOL CHILD PHYSIQUE INFORMATION SOURCES AND MATERNAL RECOGNITION IN JAPAN

Tomomi Kobayashi[1]; Kemal Sasaki[2]; Yuki Tada[3]; Yasuyo Wada[4]; Tetsuji Yokoyama[4]
[1]Department of Food Science and Nutrition, Mukogawa Women's University, Nishinomiya City, Japan; [2]Department of Food and Health Sciences, Jissen Women's University, Hino, Japan; [3]Department of Nutritional Science, Tokyo University of Agriculture, Setagaya City, Japan; [4]Department of Health Promotion, National Institute of Public Health, Wako, Japan

BACKGROUND AND OBJECTIVES
The purpose was to: (1) clarify the sources of information on the appropriate physique of Japanese mothers and preschool children (hereinafter, referred to as information sources); and (2) consider the relationship between information sources and the recognition of the physiques of preschool children by their mothers.
METHODS
In 2024, we conducted an online survey on the physiques of Japanese mothers and preschool children (self-reported), the recognition of an preschool children physique from the mother's perspective, information sources, and food intake frequency, targeting 1,400 mothers living with preschool children between the ages 3 to under 6. We calculated dietary scores from food intake frequencies (This score is higher for undesirable eating habits). Physiques were classified into three groups: high (≥ BMI 75%ile), middle (25%ile to < 75%ile), and low (< 25%ile). The consistency and inconsistency between the physique classification and physique recognition of the preschool children from the mother's perspective were defined as the physique/awareness classification and classified as overestimation, agreement, or underestimation. Relevant factors were considered based on a multinomial logistic regression analysis, with physique classification or physique/recognition classification as dependent variables and question items as independent variables.
RESULTS
The subjects for analysis were 1362 preschool children (670 boys and 692 girls). Most mothers listed the Maternal and Child Health Handbook (Handbook) as their information source. Those who did not have the opportunity to know the appropriate physique of preschool children were more significantly higher dietary scores. According to a multinomial logistic regression analysis, the only factor that showed a significant positive association among the low, overestimation, and underestimation groups was not using the Maternal and Child Health Handbook as an information source.
CONCLUSIONS
Although many mothers listed the Handbook as an information source, many in the low group, underestimation group, and overestimation group did not consider the Handbook to be an information source. It was considered necessary to further utilize the Handbook in order to understand the appropriate physique of preschool children.

THE INFLUENCE OF FAMILY ENVIRONMENTAL FACTORS ON YOUNG CHILDREN'S EATING HABITS IN JAPAN

Yasumi Kimura[1]
[1]Department of Health and Nutrition, Hiroshima Shudo University, Hiroshima, Japan

BACKGROUND AND OBJECTIVES
Early childhood is a period of intense physical and mental growth when lifelong dietary habits are established. In recent decades, the family environment has changed, with a decrease in the number of three-generation families and an increase in the number of nuclear families and working mothers. This study was conducted to determine how the increase in the number of nuclear and dual-earner families is related to time and financial freedom, how these parameters affect eating habits in and out of the home, and which family environmental factors influence kindergarteners' eating habits.
METHODS
A self-administered questionnaire-based survey was administered to 265 kindergarten students and their parents (response rate 73.8%) in Japan. The questionnaires were distributed and collected by kindergartens. Survey items included parents' age, employment status, awareness of nutrition education, and time and financial freedom; children's age and eating behavior; family structure; and frequency of eating out. An eating habit score up to 13 was given based on how many foods children disliked, how often foods that children disliked were served at home, how often meals were skipped, and how often families ate together. Participants with scores of ≥9 and <9 were assigned to high and low groups, respectively. Statistical analyses were conducted using SPSS ver. 22.0.
RESULTS
Of the participants, 68.8% were full-time homemakers. Families whose children helped with household chores every day had fewer disliked foods ($p = 0.04$). Eating habits scores of 9 or higher were attributed to 53.2% of participants, and eating habit scores tended to be higher among families who reported having less time to spare ($p = 0.06$). Although a higher percentage of dual-earner families reported having less time to spare, there was no difference in the frequency of eating out between participants with different employment statuses.
CONCLUSIONS
We found that the perception of lack of time in dual-income families was not directly related to an increase in eating out. This may be because parents who feel they have less time are more proactive in promoting healthy behaviors, including nutritional education. In addition, children tended to have fewer likes and dislikes in families where "children help with household chores." This suggests that raising parents' awareness of healthy food behaviors may lead to the formation of desirable eating behaviors in their children.

ANALYSIS OF ANEMIA STATUS AND RELATED FACTORS OF PRIMARY AND SECONDARY SCHOOL STUDENTS IN BEIJING

Liyu Huang[1]; Jiali Duan[1]; Dandan Guo[1]; Yingjie Yu[1]; Yan Zhang[1]; Rui Ma[1]; Bo Yu[1]; Hairong He[1]; Yihong Yao[1]
[1]Institute for Nutrition and Food Hygiene, Beijing Center for Disease Prevention and Control, Beijing, China

BACKGROUND AND OBJECTIVES
Anemia is not only an important indicator of children's nutritional status, but also an important factor affecting their health. Students with anemia may experience symptoms such as palpitations, shortness of breath, dizziness, blurred vision, and poor concentration, which can lower their learning and sports abilities, reduce their resistance, and even affect their normal growth and development.The purpose of this study is to understand the anemia status and related influencing factors of junior and middle school students in Beijing and to provide a basis for relevant departments to formulate targeted intervention strategies and measures.
METHODS
Based on the data of Beijing Students' nutrition literacy survey in 2022-2023, a total of 14181 students in grades 3-12 were included in the study. The mean±standard deviation ($\bar{x}\pm s$) was used to describe the hemoglobin level, and the rate was used to describe the anemia. Independent sample t test and one-way analysis of variance were used to compare the differences in hemoglobin levels between two groups and multiple groups, and chi-square test was used to compare the differences in anemia rates between different groups. Multivariate logistic regression was used to analyze the related factors of anemia.
RESULTS
The average level of hemoglobin was (140.48±13.23) g/L, and the prevalence of anemia was 2.26%. The prevalence of anemia was lower in boys (1.90%) than in girls (2.62%), and higher in urban (3.28%) than in suburban (1.73%).Multivariate Logistic regression analysis showed that:boys,primary grades 3 to 6,suburban areas as reference,girls (OR=1.357,95%CI:1.078-1.708),junior high schools (OR=4.119,95%CI:2.869-5.914),senior high schools (OR=6.492,95%CI:4.526-9.311) and urban students (OR=1.877,95%CI:1.493-2.361) had a higher risk of anemia (all P<0.05).
CONCLUSIONS
The prevalence of anemia still existed among primary and middle school students in Beijing, especially girls,junior and senior high school students and urban students. It is necessary to pay attention to the related departments and carry out active surveillance and targeted intervention.

THE OBESITY RATE IN CHILDREN WITH INTELLECTUAL DISABILITY IN EAST ASIAN COUNTRIES; CHINA, KOREA, TAIWAN, HONG KONG AND JAPAN; A SCOPING REVIEW

Akemi Nishide[1]; Hiroto Sekiguchi[1]; Riko Ito[2]
[1]Faculty of Human Sciences, Wako University, Tokyo, Japan; [2]Graduate School of Comprehensive Human Science, Tsukuba University, Tsukuba, Japan

BACKGROUND AND OBJECTIVES
It has not well documented on the obesity rate in children with intellectual disability in whom a higher prevalence of obesity rate. The aim of the scoping review study is to compare the prevalence of obesity in children with intellectual disability in east asia, and disscuss the factors influencing the rate.
METHODS
A literature search was carried out on the PubMed, CINAHL, Medline and Ichushi-Web (in Japanese). Search terms included “obesity” and “children with intellectual disability”, and “China”, “South Korea”. “Hong Kong”, “Taiwan”, “Mongolia” or “Japan”. The inclusion criteria were: papers should be published in English or Japanese; the full-text articles appear in peer-reviewed journals; the research targeted children with intellectual disabilities (aged 3-18 years).The exclusion criteria were reviews, case reports, intervention studies, proceedings and studies targeting specific patients, such as those presenting with Prader-Willi syndrome, Bardet-Biedl syndrome, Baraitser-Winter syndrome, Cohen syndrome and mental health disorders. However, Autism and Down’s Syndrome were included. Two persons screened the RESULTS.
RESULTS
In total, 12 studies were identified. The obesity rate was varied between studies. The previous studies reported the prevalence to be around 35% in Taiwanese children with intellectual disabilities who were enrolled in all public special education schools in Taiwan (2), around 30% in Chinese children with intellectual disabilities(4), and around 20% in Japanese children(3). These findings determined that children with intellectual disabilities are more at risk of becoming overweight or obese than typically developing children. The obesity rate in children with down syndrome who reffered from two place was reported 83% by Taiwanese study(1). The recruit methods, number of participants, participant rate, weight and height measurment methods, the place of study may infulience on obesity rate.
CONCLUSIONS
Obesity rates of children with intellectual disabilities was varied from 20%-nearly 40%. More acculate methods to obtain the obesity rate is required.

ASSOCIATIONS BETWEEN SERUM 25-HYDROXYVITAMIN D LEVELS AND THE RISK OF DEMENTIA: A MENDELIAN RANDOMIZATION STUDY IN UK BIOBANK

Chiu-Li Yeh[1]; Hsien-Yu Fan[1]; Yi-Chun Chen[1]; Hsin-Yin Hsu[2]; Ming-Chen Tasi[3]; Chih-Jun Lai[4]; Ying Chih Cheng[5]; Lin Yen-Feng[6]
[1]School of Nutrition and Health Sciences, College of Nutrition, Taipei Medical University, Taipei, Taiwan; [2]Department of Family Medicine, Mackay Memorial Hospital, Taipei, Taiwan; [3]Department of Internal Medicine, Mackay Memorial Hospital, Taipei, Taiwan; [4]Department of Anesthesiology, National Taiwan University Hospital, Taipei, Taiwan; [5]Department of Psychiatry, China Medical University Hsinchu Hospital, Hsinchu, Taiwan; [6]National Health Research Institutes, Center for Neuropsychiatric Research, Taipei, Taiwan

BACKGROUND AND OBJECTIVES
Serum vitamin D deficiency has been reported to be associated with dementia in clinical research. While most linear Mendelian randomization (MR) studies found a null effect of vitamin D on the risk of dementia, a non-linear relationship remains unclear. Our aim was to apply the non-linear MR design to investigate the association between serum 25-hydroxyvitamin D concentration and the risk of dementia.
METHODS
We analyzed 447,469 participants from the UK Biobank (mean age, 56 years). First, to corroborate previous observational analyses, participants were categorized into five groups based on serum 25-hydroxyvitamin D levels, with the lowest quintile (Q1) serving as the reference group. Linear regression was used to compare each of the other quintile groups with Q1 to test the association between vitamin D levels and the risk of dementia. Second, using nonlinear MR approaches, we evaluated for nonlinearity in the genetical relationship between serum 25-hydroxyvitamin D concentration on the risk of dementia. A comprehensive MR analysis of serum 25-hydroxyvitamin D concentration required us to also model the risk of dementia, given that the two are strongly correlated.
RESULTS
We found an inverse association between serum 25-hydroxyvitamin D levels and the risk of dementia. Compared to the lowest quintile (Q1, <29), participants in the higher quintiles showed lower hazard ratios (HR) for dementia, with HRs of 0.85, 0.77, 0.69, and 0.72 for Q2 through Q5, respectively. This trend suggests that higher vitamin D levels may be associated with a reduced risk of dementia, with the strongest risk reduction observed in Q4 (52–66), where the HR was 0.69 (95% CI: 0.64–0.72, p=2.0×10-16). MR analysis showed a modest but significant reduction in dementia risk in participants with serum 25-hydroxyvitamin D levels in the fourth quintile (Q4, 50–53), with an odds ratio of approximately 0.998 (p = 0.002). Other quintiles did not show statistically significant associations with dementia risk.
CONCLUSIONS
Our findings suggest a potential protective effect of higher serum 25-hydroxyvitamin D levels against dementia, particularly within a specific range (50–66 nmol/L), indicating a non-linear relationship that warrants further investigation.

BACKGROUND AND OBJECTIVES

Interventions aimed at altering the composition of the gut microbiome have the potential to reduce neonatal morbidity and mortality in low- and middle-income countries where the burden of neonatal mortality remains high. This randomized controlled trial investigated the effects of *Lactiplantibacillus plantarum* ATCC 202195 (LP), provided either as a synbiotic with fructooligosaccharide (LP+FOS) or alone (LP), on the fecal microbiome composition and bacterial diversity in infants living in Dhaka, Bangladesh.

METHODS

Infants were randomized to receive LP (10^9 CFU/5 mg LP + 250 mg maltodextrin; n=103), LP+FOS (10^9 CFU/5 mg LP + 150 mg FOS + 100 mg maltodextrin; n=102), or placebo (250 mg maltodextrin; n=100) orally once daily for 7 days. Stool samples (n=2,079) collected at scheduled visits from birth to day 180 of life were analyzed using shotgun metagenomic sequencing. Outcomes included overall and subgroup analyses of alpha diversity (Shannon and Simpson indices) by delivery mode, beta diversity (unweighted and weighted Unique Fraction [UniFrac]), and differential taxonomic and pathway abundance.

RESULTS

LP or LP+FOS did not significantly affect alpha diversity overall relative to placebo ($p>0.05$). However, among infants delivered via C-section, Shannon ($p=0.009$) and Simpson indices ($p=0.015$) were higher in the LP+FOS group compared to placebo beyond 60 days of age. LP and LP+FOS affected beta diversity measured with unweighted UniFrac (no differences for weighted UniFrac) up to 60 days, but there were no differences beyond 60 days of age.

The relative abundance of the probiotic genus (*Lactiplantibacillus)* was increased in both LP and LP+FOS relative to placebo, although *Lactiplantibacillus* was present at low abundance overall (0.04%) even during the intervention. *Bifidobacterium* (predominantly *B. longum*) dominated the microbiota of all three groups (59%) during and after the probiotic intervention. LP and LP+FOS influenced a few low-abundance bacterial genera (e.g. *Lacticaseibacillus, Leuconostoc*), but did not affect the dominant bacterial taxa. Among the 101 metabolic pathways investigated, the abundance of four pathways was higher in the LP and LP+FOS groups relative to placebo, including the carotenoid biosynthesis pathway, which positively correlated with the abundance of *Lactiplantibacillus.*

CONCLUSIONS

Among infants in Dhaka, Bangladesh, LP provided either as a probiotic or synbiotic had minor and short-term effects on the fecal microbiota composition and did not alter either the overall diversity or the abundance of dominant bacterial taxa.

HEALTH CLAIMS DRIVE CONSUMER PREFERENCE FOR FRESH PRODUCE: A WILLINGNESS TO PAY AND SEGMENTATION STUDY IN THE NETHERLANDS

Belen Beltramo[1]; Miriam Urlings[1]; Yung Hung[2]; Aalt Bast[3]; Hanne Diliën[4]; Alie De Boer[1]
[1]Food Claims Research Centre, Campus Venlo, Faculty of Sciences and Engineering, Maastricht University, Venlo, Netherlands; [2]Department of Agricultural Economics, Ghent University, Gent, Belgium; [3]Department of Pharmacology and Toxicology, Maastricht University, Maastricht, Netherlands; [4]Sensor Engineering Group, Faculty of Science and Engineering, Maastricht University, Maastricht, Netherlands

BACKGROUND AND OBJECTIVES
Nutrition and health claims (NHC) on fresh produce can aid consumers in making conscious, healthier choices, and the producers in positioning their products (1,2). Prior research shows that consumers' intention to buy increases when products depict health and nutrition claims (3); however, most research is done on processed foods (4). Therefore, this study aims to assess and understand consumers' preferences and personal characteristics associated with a perceived added value of food claims on fresh produce and, secondly, to identify the individual predictors of food claims use.
METHODS
A willingness to pay study (5) assessed Dutch consumers' perceptions, preferences and characteristics of white asparagus bearing origin declaration and vitamin C and B9 NHC. Multinomial logit models (MNL) (6) estimated the effect of attributes on WTP and preference heterogeneity was tested with latent class analysis. Further analysis details can we founder elsewhere (7).
RESULTS
Our findings show that health claims were preferred to nutrition claims; in any case, consumers elicited a higher WTP for vitamin C claims. When we studied the consumer's segmentation, 3 groups were clearly distinguished: those that preferred any claims but were very price conscious (63.3%), a health claims-oriented group (20.5%), and a smaller group (16.2%) that preferred only origin declaration produce. Predictors of classes were self-reported reading of price and labels, ability to process claims, and need for information. Those more attentive to price had higher chances of belonging to class 1, and those with higher self-reported ability and interest were probably consumers with higher preferences for health claims (class 2).
CONCLUSIONS
Producers can use health claims on commonly known vitamins, e.g., vitamin C, and on a second level of importance, declare the origin of their produce to increase the positioning and purchase of their fresh produce.

PARTNER SUPPORT IN PREGNANCY AND ITS ASSOCIATED FACTORS

Igbagboyemi Adesola Deniran[1]; Osahon Asowata[2]; Ifeoluwa Omolara Bodunde[3]; Elizabeth Oluwafolakemi Aleru[3]; Akinkunmi Okekunle[4]

[1]Nutrition and Dietetics, Ladoke Akintola University of Technology, Ogbomoso, Nigeria, Federal Republic of; [2]Epidemiology and Medical Statistics, College Of Medicine, University Of Ibadan, Ibadan, Nigeria, Federal Republic of; [3]Human Nutrition and Dietetics, Lead City University, Ibadan, Ibadan, Nigeria, Federal Republic of; [4]Department of Medicine, College Of Medicine, University Of Ibadan, Ibadan, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES

Pregnancy is a critical phase in a woman's life, demanding not only effective healthcare delivery but also social and emotional support to enhance their quality of life and well-being. This need is pronounced in many African regions, where maternal mortality is high, with limited information on the scope of partner support during pregnancy and the associated factors influencing it. This study assessed the magnitude of partner support and related factors among pregnant women.

METHODS

A 31-item point score scale designed by experienced scientists was administered to 394 pregnant women (gestational age ≥13 weeks) to assess self-reported partner support in pregnancy. The score was dichotomized by the mean score into "inadequate" (<24.7) or "adequate" (≥24.7). Also, the odds ratio (OR) and 95% confidence interval (CI) of factors associated with partner support were estimated using logistic regression at a two-sided $P<0.05$.

RESULTS

Overall, mean age was 30.1±5.6 years, and 284 (72.1%) reported adequate support from their partners. Women with tertiary education (OR: 2.76; 95%CI: 1.23, 6.17) and women that are Christian (OR: 2.25; 95%CI: 1.35, 3.76) were at higher odds of receiving adequate partner support during pregnancy.

CONCLUSIONS

Interventions targeting underlying beliefs about women's education and access to health information could improve their negotiating power, fostering greater partner support during pregnancy. This could improve health outcomes and the overall quality of life for women throughout their life course.

BACKGROUND AND OBJECTIVES
Healthy life expectancy (HALE) is a healthy life span that does not require assistance or nursing care from others. Selenium is one of the essential minerals and has important biological functions, including antioxidant properties, that may be associated with HALE. The purpose of this study is to determine the relationship of selenium intake with life expectancy (LE) and HALE over an 11-year period from 2010 to 2021 using international data.
METHODS
Average life expectancy (LE) by country was obtained from the World Bank database, and healthy life expectancy (HALE) was obtained from Global Burden of Disease (GBD) database. Estimated selenium intake by country was obtained from the Global Dietary Database (GDD). As covariates, we used GDP per capita, aging rate, years of education, smoking rate, physical activity, obesity rate, energy supply, sodium intake, average systolic blood pressure, and average LDL cholesterol concentration obtained from the World Bank database and other sources. We analyzed the association of selenium intake in 2010 with LE and HALE over the following 11 years in countries with populations of 1 million or more using linear mixed models controlling for covariates. All explanatory variables were centralized. Statistical software R was used for the analysis.
RESULTS
The fixed effects (standard error) of selenium intake on LE and HALE were 0.024 (0.010), p=0.015 and 0.018 (0.008), p=0.035, both showing significant positive associations. The interaction between year and selenium intake was not significant for both LE and HALE, and the effect of selenium on LE and HALE did not differ by year.
CONCLUSIONS
Intake of selenium is associated with increased LE and HALE, according to an analysis using 11 years of international data.

EPO5_379

ASSOCIATION BETWEEN THE STATUS OF HEALTH AND FOOD STOCKPILING FOR DISASTER AMONG JAPANESE

XIN LIANG; Nobuyo Tsuboyama-Kasaoka[1]; Reiko Ohmori[2]
[1]International Center for Nutrition and Information, National Institutes of Biomedical Innovation, Health and Nutrition, Osaka, Japan; [2]Graduate School of Regional Development and Creativity, Utsunomiya University, Utsunomiya, Japan

BACKGROUND AND OBJECTIVES
Climate-related disasters have occurred frequently globally as a result of global warming. Japan's geography makes it vulnerable to natural disasters, particularly earthquakes; but its preparedness is far from satisfactory. Moreover, disruptions to logistics and the supply chain during disasters can lead to food shortages. It is therefore essential to prepare for disasters in daily life by stockpiling food at home. The objective of this study is to investigate the association between the degree of health and food stockpiling for disasters across Japan.
METHODS
This study was conducted during November 25-29, 2022, using an online questionnaire, aimed to recruit 2000 Japanese individuals aged ≥ 20 years registered with an online survey company. The questionnaire consisted of five categories with a total of 20 items including screening questions, participants' characteristics, awareness and measures of disasters, disaster prevention knowledge, and the degree of health, and food stockpiling for disasters. To assess the degree of health, the 12-item simplified health scale used in the study. Excluding respondents who answered 'no answer' of sex and answered 'unknown' of household income were analyzed (n=1634). Association between sociodemographic characteristics of participants and food stockpiling were assessed through a chi-squared test. Additionally, logistic regression analysis was performed to assess the association between the degree of health and food stockpiling.
RESULTS
A total of 57.9% (n=946) of participants had stockpiled food for disasters. Regarding the degree of health, 11.9% of the participants had a high level of health, while 52.5% had a low level. After adjusting for all variables, the associated factors were gender, family composition, household income, disaster experience and disaster prevention knowledge. Meanwhile, the degree of health had a positive effect on food stockpiling for disasters in physical health, social health and comprehensive health ($p < 0.001$ for all). However, the effect of mental health was not significant with food stockpiling. Compared with low degree of health, high degree of health was more likely to stockpile food for disasters (adjusted OR: 2.26, 95% CI: 1.57-3.25).
CONCLUSIONS
Factors such as disaster experience and disaster prevention knowledge had a significant association with food stockpiling for disaster. Having a high degree of health associated with food stockpiling. Improving the degree of health may contribute to increasing household food stockpiling for disasters.

THE IMPACT OF DIET, ENVIRONMENT, AND LIFESTYLE ON CONSTIPATION IN SCHOOLCHILDREN

shanching hsu[1]; Chingyu Yen[2]
[1]Department of Food Science, Nutrition, and Nutraceutical Biotechnology, Shih Chien University Taipei Campus, Taipei, Taiwan; [2]Department of nutrition, Hungkuang University, Taichung, Taiwan

BACKGROUND AND OBJECTIVES
The prevalence of childhood constipation has been reported to range from 0.7% to 29.6% in previous studies. Lifestyle factors, such as a high-fiber diet and regular exercise, are widely recognized as beneficial for improving bowel movements. However, studies exploring the factors associated with childhood constipation, particularly those related to lifestyle and nutritional knowledge, remain limited.
The purpose of this study is to assess the prevalence of constipation among school children and identify its associated factors.
METHODS
This study recruited 428 participants, focusing on elementary school students in grades 4 and 5. A questionnaire survey method was utilized to examine the students' lifestyle and bowel habits.
RESULTS
The sample consisted of 313 schoolchildren (137 boys and 176 girls), with an average valid questionnaire recovery rate of 73%. The prevalence of constipation was 24.6% (77 children, with a gender distribution of boys: 36, girls: 41). Girls were more likely to experience constipation than boys (46.8% vs. 53.2%, $p=0.634$). A lower intake of fruits was significantly associated with a higher incidence of constipation ($p<0.05$). Parents with higher education levels, particularly those with education above the college level, reported a lower prevalence of constipation in their children ($p<0.05$). Additionally, parents who had regular meal intake patterns were found to have children with a lower incidence of constipation ($p < 0.05$).
CONCLUSIONS
Research indicates a significant correlation between low consumption of vegetables and fruits and constipation. Establishing regular eating habits in parents can reduce the risk of constipation in schoolchildren. For children with parents who have lower levels of education, it is important to strengthen nutritional education to reduce the incidence of constipation.
CONFLICTS OF INTERESTS

DIFFERENCES IN NUTRIENTS AND DIETARY INTAKE OF JAPANESE FEMALE JUNIOR HIGH SCHOOL STUDENTS WITH DIFFERENT SALT REDUCTION AWARENESS

Shiori Oshima[1]; Eriko Horinishi[2]; Tomomi Asano[3]; Satomi Maruyama[3]
[1]Graduate School of Human Ecology, Kinjo Gakuin University, Nagoya, Japan; [2]Nagoya Elementary School Attached, Aichi University of Education, Nagoya, Japan; [3]Food and Nutritional Environment, Kinjo Gakuin University, Nagoya, Japan

BACKGROUND AND OBJECTIVES
Hypertension is the lifestyle-related disease with the highest prevalence in Japan. Reducing salt intake during adolescence is very important. However, in Japan there are few reports on the association between salt reduction awareness and salt intake and dietary habits among adolescent students. The purpose of this study was to clarify the difference in salt reduction awareness and daily dietary intake among female junior high school students.
METHODS
This study design was a cross-sectional study. The participants of this study were 327 female second-year students from a Japanese junior high school aged 13 to 14 years. After excluding those with incomplete questionnaires, we analyzed 278 participants (85 % valid response rate). A self-completion dietary habits survey and a brief-type self-administered dietary history questionnaire were used. Those who answered “yes” to the question “Do you reduce salt in your diet?” in the dietary habits survey were defined as the salt reduction awareness group and those who answered “no” were defined as the non-salt reduction awareness group. Nutrient and food group intakes were adjusted using the density method. Energy, nutrients and food group intakes were compared between groups by t-test. Dietary habits were compared between groups by chi-square test. Statistical significance was set at $p < 0.05$.
RESULTS
The salt reduction awareness group consisted of 117 participants (42.1 %) and the non-salt reduction awareness group consisted of 161 participants (57.9 %). There were significant differences in energy and salt intake between the two groups (energy intake: 2,061 ± 690 vs 2,230 ± 671 kcal, $p < 0.05$; salt intake: 5.8 ± 1.1 vs 5.5 ± 1.1 g/1,000 kcal, $p < 0.05$). Potassium, vegetable and fish intake were higher and sweet intake was lower in the salt reduction awareness group compared to the non-salt reduction awareness group ($p < 0.05$).
CONCLUSIONS
Nutrient and food intakes differed according to salt reduction awareness, in Japanese female junior high school students.

ARE APPLES WE EAT RADIOACTIVE? LONG-TERM INVESTIGATION (1968-2023) OF CS-137 IN APPLES

Tomislav Bituh[1]; Branko Petrinec,[1]; Branimir Zauner,[1]; Dinko Babić,[1]
[1]Division of Radiation Protection, Institute for Medical Research and Occupational Health, Zagreb, Croatia

BACKGROUND AND OBJECTIVES
Due to the consequences of nuclear and/or radiological accidents in the past (Chernobyl,Fukushima, etc.), and potential future events of that kind, the constant monitoring of foods we consume is important. Ingestion is one of the pathways of the transfer of radionuclides from environment to humans. Food ingestion greatly contributes to the total effective dose; hence, it is of great importance to investigate exposure to radionuclides through food. In this paper we present the RESULTS of a long-term investigation of Cs-137 concentrations in apples in northwestern Croatia for the period 1968–2023
METHODS
The apple samples (10 kg obtained from the open market) were dried at 105 C for 2–3 days, and then ashed at 400 C for 24 h. The samples were packed in 200 mL plastic cylindrical containers and the Cs-137 activity concentration was determined using high-resolution gammy-ray spectrometry. To estimate the risk to human consumption, we calculated factors such as: the effective ecological half-life of Cs-137 in apples, the radioecological sensitivity, and the effective dose to adults.
RESULTS
The highest Cs-137 activity concentrationin apples was measured in 1986, decreasing exponentially ever since. The Fukushima-Daiichi accident in 2011 did not cause a significant increase in Cs-137 activity concentration, although the presence of the consequent fallout was detected via the appearance of Cs-134 in some parts of the environment. The observed residence time for Cs-137 in apples was estimated to be 4.5 and 3.9 years for the pre-Chernobyl and post-Chernobyl periods, respectively. The estimated effective dose received by adult members of theCroatian public due to intake of radiocaesium from apples over the overall observed period is 6.4 μSv.
CONCLUSIONS
We can conclude that the consumption of apples was not a critical pathway for the transfer of radiocaesium to humans. However, constant monitoring of radioactivity in foodstuffs is crucial in case new radiological accidents occur.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

EATING DISORDERS IN UNIVERSITY STUDENTS AND THEIR RELATIONSHIP WITH BODY COMPOSITION AND BODY SATISFACTION

Monica Andrews[1]; Maite Orellana[2]
[1]Facultad de Salud, Autonomous University of Chile, Providencia, Chile; [2]Facultad de la Salud, Autonomous University of Chile, Providencia, Chile

BACKGROUND AND OBJECTIVES
Background: Eating disorders (ED) have increased in frequency. DIfferent risk groups for developing this psychiatric illnes have been identified, including young adults and especially adolescents and university students due their social interactions, lifestyles and use of social networks (Kabakus, 2021). Some of the risks identified for the development of eating disorders are the dissatisfaction and distorsion of the body image that is associated with the nutritional statutal of the subjects (Jiménez-Limas, 2022). Early detection and prevention of this condition is necessary for good mental health of young adults Aim: to assess the risk of developing ED in university students using the SCOFF questionnaire and to correlate the findings with body composition and body image perception.
METHODS
500 students of both sexes, between 18 ans 30 years old were evaluated anthropometrically using InBody 270, and their body image was assessed using Stunkard silhouettes, and they were invited to answer the SCOFF questionnaire, which consists of 5 questions.
RESULTS
A high prevalence of 44% was found for the risk of ED, and a significant relationship with sex was observed (chi square, $p<0,01$), with women being the most frequently at risk (63%). Individuals at risk of ED had more wheight, higher BMI and more body fat and less muscle than subjects without the risk (t-student, $p=0,001$, $p=0,0001$, $p=0.0001$ and $p=0.01$, respectively). Significant association was foud between body dissatisfaction and distorsion and ED (chi square, $p<0.0001$, for both). The risk analysis showed that body image, especially body dissatisfaction increases the risk of ED in 3.3 times, also the female sex increases the risk in 2.5 times. Hypephagia was the contition most frequent between all ED (63%)
CONCLUSIONS
The RESULTS show that female sex, dissatisfaction and underestimation of body image are the main risk factors for the development of ED between university students. These data allow for the generation of targeted interventions to prevent the ocurrence of this contition.
CONFLICTS OF INTERESTS

THE AVAILABILITY, ACCESSIBILITY AND CONSISTENCY OF ALLERGEN INFORMATION OF FOOD PRODUCTS ON ONLINE FOOD RETAILERS AND MEAL DELIVERY WEBSITES IN SOUTH AFRICA

Nelene Koen[1]; Nicolette Fredericks[1]
[1]Department of Global Health, Division of Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa

BACKGROUND AND OBJECTIVES
The post-pandemic environment accelerated the digitalisation of society, motivating retailers to develop online purchasing and delivery services. However, digital retail platforms vary in the provision of nutrition and allergen information likely attributed to the lack of legislation regulating these modern developments. The study aimed to assess the availability, accessibility, and consistency of allergen information across online food retailers and meal delivery websites in South Africa.
METHODS
A cross-sectional descriptive study was conducted. Data was collected using validated observational checklists to evaluate online food retailers (n= 10) and meal delivery websites (n=8) that met the inclusion criteria.
RESULTS
All the products assessed (n=109) across the online food retailers' websites and 33.00% (8 of 24) of products on meal delivery websites had general food labelling displayed. Fifty three percent of products on online food retailers' websites and 58.33% on meal delivery websites displayed any type of allergen information. Across online food retailers, 53.33% required zero clicks and 46.67% required one click to reach the allergen information, while on meal delivery websites, 57.00% required zero clicks and 42.86% required one click. For online food retailers, one had to scroll to locate allergen information 81.03% of the time and meal delivery websites 71.00% of the time. Seventy seven percent and 85.71% of products on online food retailers and meal delivery websites respectively, that displayed allergen information, had an allergen heading. All the online food retailers, and 87.50% of meal delivery platforms had a search bar function, creating the capacity to search for allergen-free foods.
CONCLUSIONS
The findings are mostly positive as the majority of products across online food retailers and meal delivery websites had allergen information available that were easily accessible. However, more should be done to ensure the inclusion of allergen information on all digital platforms to create an enabling food environment for consumers with allergies.

EPO5_387

PERCEPTIONS AND SELF-REPORTED USE OF FOOD AND NUTRITION LABELLING AMONGST YOUNG ADULTS AT A TERTIARY INSTITUTION IN SOUTH AFRICA: A MIXED-METHODS STUDY

Nelene Koen[1]; Nicolette Fredericks[1]; Yolande Smit[1]
[1]Department of Global Health, Division of Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa

BACKGROUND AND OBJECTIVES
Young adults are faced with multiple environmental changes as they transition into a new phase of life. They create new lifestyles, preferences, and habits, that can impact determinants of health and the risk of non-communicable disease development. Food and nutrition labelling (FNL) is an effective tool to promote healthy purchasing decisions, by enabling a consumer to make informed food choices. This study aimed to determine the perceptions and self-reported use of FNL in young adults.
METHODS
An explanatory sequential mixed methods study design was employed. The study population consisted of undergraduate students (18-25 years of age) at a tertiary institution in South Africa. Quantitative data was collected using an online survey (N=1137), followed by the collection of qualitative data by means of three focus group discussions (N=23). Quantitative data was analysed using mainly descriptive statistics, while thematic analysis of qualitative data was done.
RESULTS
Majority (92.57%) of survey participants considered FNL important, supported by feedback from focus group participants (FGP), who found them informative and necessary for health reasons. Almost half (43.97%) of survey participants associated price of food items with quality. However, food prices (90.06%) as opposed to nutrition composition (33.17%) was the main factor influencing purchasing decisions. Additionally, FGP reported budget constraints, lack of nutrition knowledge and labels not being user-friendly as large contributors for ignoring FNL and desire more standardised food labelling to aid in the identification of relevant nutrition information.
CONCLUSIONS
While young adults recognised the importance of FNL, barriers such as price, lack of nutrition knowledge and the lay-out hindered its effective utilization. Recommendations include education on the use and importance of FNL in schools, standardised FNL and having better enforcement of the labelling legislation to help increase consumer trust in food labels.

ASSOCIATIONS OF MEAL PREPARATION EXPERIENCES DURING SCHOOL AGE AND ADOLESCENCE WITH DIETARY BEHAVIORS AMONG FEMALE UNIVERSITY STUDENTS IN JAPAN

Kumi Eto[1]; Natsumi Jinbo[1]; Chikako Komaba[1]
[1]School of Nutrition, Kagawa Nutrition University, Sakado Campus, Sakado, Japan

BACKGROUND AND OBJECTIVES
Previous research has shown that involvement in meal preparation, such as helping to prepare meals in childhood, is associated with healthier eating habits later in life. Few studies have examined in details on meal preparation experiences in childhood. The purpose of this study was to determine the association between meal preparation experiences during school age and adolescence and dietary behaviors of female university students in Japan.
METHODS
A cross-sectional survey was conducted for 326 female first-year university students majoring in nutrition in 2021. A total of 298 students (91.4%) answered the survey and 293 valid responses were used for the analysis. Three variables on current dietary behaviors were used: frequencies of eating well-balanced meal, primary cooking, and breakfast consumption. Two sub-scales of the questionnaire of meal preparation competency for female university students were used to assess meal preparation experiences in childhood: 4 items on experiences with assisted meal preparation during primary school and 7 items on experiences with independent meal preparation during middle and high school. Participants were divided into two groups by a current eating behavior and compared meal preparation experiences in childhood using chi-square test. Binary logistic regression analysis was performed using meal preparation experiences in childhood as independent variables and a current dietary behavior as a dependent variable adjusted for demographic variables.
RESULTS
Of the study subjects, 69.6% lived with their family and 49.1% were comfortable with their living arrangements. The score of “experiences with assisted meal preparation during primary school” was associated with current frequency of eating well-balanced meal. Two items, including those whose families were more willing to have them help with cooking, had significantly higher odds ratios of eating well-balanced meal at least twice a day. The score of “experiences with independent meal preparation during middle and high school” was associated with current frequency of primary cooking. Six items, such as often planning and cooking by oneself, were related, and the odds ratio of current primary cooking frequency of 3 or more days per week was significantly higher for those who had experienced independent meal preparation in middle and high school. There was no association between frequency of eating breakfast and meal preparation experiences.
CONCLUSIONS
To ensure that university students practice eating behaviors that lead to better health, meal preparation experiences at each stage of school age and adolescence is crucial.

ACCEPTABILITY TESTING OF PROTOTYPES OF MULTIPLE MICRONUTRIENT SUPPLEMENTS FOR A DOSE-FINDING TRIAL IN WOMEN OF REPRODUCTIVE AGE IN KENYA

Alison Talbert[1]; Fredrick Opel[1]; James A Berkley[1, 2]; Martha Mwangome[1, 2]
[1]Clinical research, KEMRI-Wellcome Trust Research Programme, Kilifi, Kenya; [2]Centre for Tropical Medicine and Global Health, University of Oxford, Oxford, United Kingdom

BACKGROUND AND OBJECTIVES
Data from supplementation studies in The Gambia and Bangladesh indicate that the dose of micronutrients in UNIMMAP may not be adequate for pregnant women in low-or middle-income countries (LMICs) with inadequate diets. Prior to a randomized controlled dose-finding trial with 3 arms: control dose of 15, test dose 1 and test dose 2 of 24, multiple micronutrients supplements (MMS), to correct micronutrient deficiencies in women of reproductive age in Kenya, we conducted a sensory test to choose the most tolerable formulation and flavour.
METHODS
Three different formulations of each dose each in 2 flavours (orange and mango), were colour coded and double-blind tested 40 times on a panel of 90 non-pregnant women.Women aged 18 to 35 years were recruited randomly from a list of residents supplied by a local demographic surveillance system. The women gave written informed consent. Each woman was randomly allocated to test 4 different prototypes in one session, with bread or crackers given in between. Each pack of MMS powder was dissolved in 200mls of bottled water. Each woman was asked to taste 100 ml of each solution and rate tolerability on a 7-point Likert scale (from 1 “dislike very much” to 7 “like very much”) and asked for their comments on the flavour. Lack of tolerability for each formulation was judged on the frequency and intensity of dislike on the Likert scale. Following unblinding, the final choice of formulation was made via elimination of the most intensely disliked. Preference for mango or orange was assessed by comparing median Likert ratings for each flavour.
RESULTS

Formulation	Intolerable (%)	Neutral (%)	Tolerable (%)	Median
Full-strength orange	9	4	47	6
Full-strength mango	19	4	37	5
Without iron orange	29	0	31	5
Without iron mango	28	0	32	5
Half-strength orange	13	6	41	5
Half-strength mango	11	2	47	6

CONCLUSIONS
The full-strength formulation in orange flavour ranked highest in Likert ratings and was chosen for the main trial

IMPLEMENTATION AND EVALUATION OF NUTRITION EDUCATION ON APPROPRIATE PORTIONS PER SINGLE MEAL AND WELL-BALANCED FOOD COMBINATIONS USING LUNCH BOXES FOR JUNIOR HIGH SCHOOL STUDENTS AND THEIR PARENTS IN JAPAN

Naoko Kaneda[1]; Kyugmi Kim[2]; Riko Shinya[2]; Hiroki Maeda[2]; Tomomi Kobayashi[3]
[1]Department of Nutritional Sciences, Tezukayama Gakuin University , Sakai City, Japan; [2]Tezukayama Gakuin Izumigaoka Junior & Senior High School, Tezukayama Gakuin Educational Corporation, Sakai City, Japan; [3]Department of Food Science and Nutrition, Mukogawa Women's University, Nishinomiya City, Japan

BACKGROUND AND OBJECTIVES
The purpose of this study was to provide nutrition education to Japanese junior high school students and their parents regarding the appropriate portions per single meal along with well-balanced food combinations using lunch boxes, then evaluate the RESULTS thereof.
METHODS
The study included 147 first-year junior high school students (7th grade) enrolled in private A junior high school in Japan and 49 parents with children enrolled in A junior high school. In October 2024, students and parents were each provided the education regarding the appropriate portion per single meal and well-balanced food combinations using lunch boxes and a self-administered questionnaire survey was conducted before and after the education. The survey covered knowledge about the appropriate portions per single meal, the appropriate proportion of grain dishes, vegetable dishes, and fish and meat dishes, as well as how to combine desired cooking methods. The data before and after the education were examined using the McNemar test.
RESULTS
The analysis subjects included 119 students and 40 parents who had complete data before and after the education and whose answers were complete. The correct response rate for items related to the appropriate portions per single meal changed from 4.2% to 32.2% for students before and after the education, but remained at 10.0% for parents (students $p<0.001$, parents $p=1.00$). The correct response rate before and after the education for items related to the appropriate portion of grain dishes, vegetable dishes, and fish and meat dishes, changed from 6.7% to 89.1% for students and from 22.5% to 95.0% for parents (both $p<0.001$). The correct response rate before and after the education on the items related to desired cooking method combinations changed from 16.0% to 85.7% for students and from 32.5% to 97.5% for parents (both $p<0.001$). Following the education, when asked if they were confident that the content of this education could be utilized in daily meals and diets, 90.8% of students and all parents responded that they were confident that they could utilize it.
CONCLUSIONS
It was suggested that implementing the education using lunch boxes for junior high school students and their parents could positively contribute to increasing knowledge about appropriate portions per single meal and well-balanced food combinations. However, since this questionnaire was conducted immediately after the education, continued research is necessary to determine whether or not such dietary knowledge has been firmly established.

EXPLORING THE DIFFERENCE IN DIETARY INTAKE BETWEEN NORMOSMIC AND HYPOSMIC ELDERLY NURSING HOME RESIDENTS

Helena Tomic Obrdalj[1]; Irena Keser[2]
[1]Corporate Development, Podravka, Koprivnica, Croatia; [2]Laboratory for Nutrition Science, Faculty of Food Technology and Biotechnology, University of Zagreb, Zagreb, Croatia

BACKGROUND AND OBJECTIVES
Declining perception of olfactory function together with functional changes in the body with progression of age potentially reduces the pleasures of consuming food in elderly population. These changes consequently lead to reduced food intake, contributing to monotonous diet and nutrient deficiency increasing the risk of disease. The aim of this study was to investigate whether there is decline of olfactory perception, analyze dietary intake, and explore possible associations of olfactory function and dietary intake in elderly people.
METHODS
Participants were 123 (76% F) elderly nursing home residents. Olfactory impairment was measured by The European Test of Olfactory Capabilities with total maximum score of 32. Cut-off values were determined for each decade. Decline of olfactory perception was established by comparison of the RESULTS between of elderly group (≥ 65 y) and adult group (18-64 y). Dietary intake was assessed by 24-hour recalls on two separate days collected by the nutritionist. Food portion booklet was used as an aid to estimate the portion sizes of foods consumed, also recipes and portion sizes were obtained from kitchen personnel. Collected data were energy, macro- and micro-nutrients intake. Dietary intake was analyzed by Genesis R&D with added regional and local food data base (ESHA, Salem, OR).
RESULTS
Based on the RESULTS of ETOC 65% of elderly participants had hyposmia, significantly higher compared to 15% in adult population. Average dietary intake of elderly population was 95% of recommendation for energy intake, 140% of proteins, 90% of carbohydrates, 46% of fiber and 113% of fat. Hyposmic participants had significantly lower intake of B vitamins, vitamin C and vitamin E compared to normosmic participants. The main source of B vitamins in the diet of elderly nursing home residents was cereals, and hyposmic population had significantly lower intake of cereals ($p < 0.03$), the main source of vitamin C was fruits and vegetables, and for vitamin E meat eggs, hyposmic participants had significantly lower intake then normosmic ($p<0.009$).
CONCLUSIONS
Lower dietary intake and lack of adherence to dietary recommendations of elderly people has significant impact on occurrence of frailty and development of malnutrition. RESULTS of this study suggest that individuals with reduced perception of smell could have higher risk of nutritional deficiencies particularly for vitamins. Determining olfactory function during nutritional screening should be considered due to potential influence on health and general food intake.

THE EFFECT OF DIFFERENCES IN DIETARY AWARENESS AMONG COLLEGE BASEBALL PLAYERS ON THEIR DIETARY HABITS

Azumi Hida[1]; Toshiki Hata[2]; Syoya Mori[1]; Youichi Katsumata[1]; Yuki Tada[1]
[1]Department of Nutritional Science, Tokyo University of Agriculture, Setagaya City, Japan; [2]Department of Nutrition and Life Sciences, University of Shizuoka, Shizuoka, Japan

BACKGROUND AND OBJECTIVES
In this study, we aimed to investigate the eating awareness and eating habits of university baseball players and examine the relationship between differences in food awareness, eating habits, and physique.
METHODS
After obtaining approval from the University Ethics Committee, players belonging to the university baseball team were asked to participate in the study and consent was obtained. Of the 80 participants, six were excluded from the analysis owing to incomplete survey content, while 74 were included. The analysis included measurements of height and body composition (InBody430, InBody Japan Inc.) and a questionnaire survey. For the dietary survey, participants were instructed to record their meals and take photos on two exercise days and one rest day. The contents will be confirmed in an interview in the near future, and nutrient and food group intakes will be calculated using Excel Eiyo-kun ver. 8.0 (Kenpakusha Co., Ltd.). For the comparison of continuous variables, unpaired t-tests or Mann-Whitney U tests based on normality were used, and chi-square tests were used for categorical variables. Statistical analyses were performed using IBM SPSS ver. 23, with a significance level of 5%.
RESULTS
Based on their responses to the question, "Are you aware of your dietary intake to improve your performance?", participants were divided into an "awareness" group (n=55) and a "non-awareness" group (n=19), and their dietary intake was compared. There were no significant differences in grade or position between the two groups; however, the "awareness" group was significantly taller and had a significantly lower body fat percentage. When adjusted for height squared, the "awareness" group also had a significantly higher lean body mass index. Regarding food group intake, the "awareness" group consumed significantly more total vegetables, soybeans, and oils and fats.
CONCLUSIONS
As there was a significant difference in body composition due to differences in dietary awareness, raising dietary awareness may be important for building athletes' bodies. Most of the subjects lived in dormitory rooms, and even in a limited food environment. The group with high dietary awareness had a significantly higher intake of soybeans, which was thought to be due to the effort to add natto (traditional Japanese fermented soybean), and other foods to their diet. This shows the importance of raising dietary awareness through dietary education to build athletes' bodies.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

FACTORS ASSOCIATED WITH LEFTOVER SCHOOL LUNCHES ~IN JAPANESE JUNIOR HIGH SCHOOL LUNCHES~

Chihiro Toji[1]; Satomi Watanabe[1]; Sakiko Tamaki[2]; Yuuki Nishimura[3]; Koichi Hayashi[3]
[1]Department of Nutrition, Faculty of Nutrition, Senri Kinran University, Suita, Japan; [2]Department of Food and Nutrition, Faculty of Human Life Studies, Hagoromo University of International Studies, Sakai, Japan; [3]Department of Food Sciences and Nutrition, School of Food Sciences and Nutrition, Mukogawa, nishinomiya, Japan

BACKGROUND AND OBJECTIVES
School-age children are in an important phase for developing their dietary habits, and nutrition education should be tailored to their development. In addition, school lunches in Japan are designed to be delicious and leave no leftovers, supporting the healthy growth of students. However, the percentage of leftover food in school lunches at public junior high schools in S City, Osaka Prefecture, has risen. Therefore, the actual situation must be understood to prevent the trend of increasing leftovers of school lunches. The purpose of this study was to investigate the factors related to students' uneaten food, to clarify the actual situation and issues, and to link this to future nutrition education activities.
METHODS
The target schools for the survey were private junior high schools in Osaka Prefecture, Japan, where the purpose of the survey was explained to the principals, and their informal consent was obtained. This junior high school is affiliated with Senri Kinran University, and 73 junior high school students enrolled at this junior high school were the study subjects. In September 2023, the researcher personally administered in each class a questionnaire. The survey included information on the number of leftovers, confidence in eating school lunches, likes and dislikes of school lunches, sleeping time, and time spent on the Internet.
RESULTS
A total of 71 students were analyzed (40 first-year students, 17 second-year students, and 24 third-year students) for a valid response rate of 97%. The status of school lunch leftovers was 32 (45.1%) and 39 (54.9%) respondents who answered that they "always eat all" and "sometimes leave or always leave," respectively. The tendency to leave food uneaten was significantly greater the higher the school year. The relationship between sleep time and Internet usage time according to school lunch leftover status was examined. The longer the time spent using the Internet both on weekdays and weekends, the more likely they were to leave food. The wider the range of sleeping hours between weekdays and weekends, the more food was left uneaten.
CONCLUSIONS
This study found that students' regular lifestyle affects their eating habits regarding leftovers from school lunches. In the future, nutrition education activities for adolescent junior high school students should focus on sleep time and educate them to think about the dangers of Internet time.
CONFLICTS OF INTERESTS

PERILLA OIL AND THE OIL IN COMBINATION WITH EITHER NOBILETIN-RICH PONKAN POWDER OR ANREDERA CORDIFOLIA LEAF POWDER ATTENUATE COGNITIVE DECLINE WITH AGING IN HEALTHY ELDERLY JAPANESE INDIVIDUALS: A DOUBLE-BLIND, RANDOMIZED, PARALLEL-ARMED STUDY

Michio Hashimoto[1]; Matsuzaki Kentaro[2]; Maruyama Koji[3]; Wakatsuki Harumi[2]; Ohno Miho[4]; Kuroda Yoko[1]; Kato Setsushi[4]; Shido Osamu[5]; Nagai Atsushi[1]

BACKGROUND AND OBJECTIVES
Docosahexaenoic acid (DHA) included into fish oil has major roles in the cognitive function and mental health of humans. As the consumption of fish, but, is steadily declining, we must consider alternative foods for DHA. As a-linolenic acid (ALA) is converted to eicosapentaenoic acid (EPA) and DHA, we investigated the effects of dietary *perilla* seed oil (PO), a rich source (54–64%) of ALA, and PO combined with either nobiletin-rich ponkan powder (PP) or *Anredera cordifolia* leaf powder (AC) intake on cognitive functions and mental health in healthy elderly Japanese individuals.
METHODS
We carried out two human interventional trials: a 1-year, double-blind, randomized, parallel-armed study in healthy elderly Japanese individuals. Volunteers aged 60-84 years were randomly divided into either two or three groups: one trial consisted of a control and a PO (7 mL/day)-administered (PO) groups, and the other trial consisted of three groups which were administered a PO (1.47mL/day), and a PO combing either 1.12 g PP or 1.12g AC. At baseline and after 12 months of intervention, cognitive function, mental health condition, the fatty acid profile of the red blood cell plasma membranes (RBC-PM), and serum biochemical parameters were evaluated.
RESULTS
After 12 months of intervention, the PO group showed significantly higher cognitive index scores than the control group, accompanied by increases in ALA levels in RBC-PM and serum biological antioxidant potential. At the end of the intervention for 12 months, the POPP and POAC groups showed generally higher cognitive index scores than the PO group, associated with increased ALA, EPA, and/or DHA levels in RBC-PM, increased serum biological antioxidant potential, and decreased serum triglyceride, and *N*-(epsilon)-carboxymethyl-lysine (CML), an advanced glycation end-product and biochemical marker of oxidative stress levels.
CONCLUSIONS
The combined long-term supplementation with PO and either PP or AC more effectively ameliorates age-related cognitive decline than PO alone. These findings may serve as a basis for the development of new supplements for brain health.

FAST-FOOD CONSUMPTION AND PHYSICAL ACTIVITIES IMPACT ON BODY WEIGHT AMONG YOUNG PRIVATE-SECTOR EMPLOYEES

Arosha De Silva[1]; Ananda Chandrasekara[2]
[1]Postgraduate Institute of Agriculture, University of Peradeniya, Peradeniya, Sri Lanka; [2]Applied Nutrition, Wayamba University of Sri Lanka, Makandura, Sri Lanka

BACKGROUND AND OBJECTIVES
This study seeks to comprehensively examine the influence of fast-food consumption and physical activity levels on the body weight of young employees within the private sector of Sri Lanka. The escalating popularity of fast food has raised concerns about its nutritional content and associated health ramifications. A cohort of 100 individuals aged between 25-45, employed in Sri Lanka's private sector, participated in this research. These participants provided sociodemographic data through a standardized questionnaire, enabling the characterization of their backgrounds. Participants disclosed their frequency of fast-food consumption and engagement in physical activities, utilizing validated assessment tools.

METHODS
The collected data was meticulously compiled into an Excel spreadsheet and subjected to rigorous statistical analysis. Descriptive statistics, such as percentages and proportions, were employed to delineate the body weight status of the participants. Employing chi-square tests, our study identified significant associations between fast-food consumption, levels of physical activity, and body weight categories. Furthermore, through binary logistic regression analysis, potential risk factors contributing to overweight and obesity within the young employee cohort were elucidated.

RESULTS
Our findings revealed a disconcerting trend, with 6% of participants classified as underweight, 32% within the normal weight range, and a substantial 62% categorized as overweight or obese. These outcomes underscore the alarming prevalence of overweight and obesity among young private-sector employees, particularly within the bustling urban landscape of Colombo, Sri Lanka. The data strongly imply a robust correlation between fast-food consumption, sedentary behaviors, and higher body weight categories, reflective of the evolving lifestyle patterns associated with the nation's economic growth.

CONCLUSIONS
This study emphasizes the urgent need for effective interventions to counter the detrimental effects of fast food consumption. The implementation of awareness campaigns elucidating the adverse health consequences of fast food, coupled with comprehensive nutritional education, can empower individuals to make informed dietary choices. Workplace interventions, including the provision of healthier meal alternatives and the facilitation of physical activity opportunities, are essential in fostering a healthier workforce and mitigating the escalating burden of overweight and obesity in Sri Lanka.

VARIETY AND FREQUENCY OF FRUIT AND VEGETABLES EATEN BY YOUNG NEW ZEALAND CHILDREN

Grace Laws[1]; Kathryn Beck[1]; Pamela Von Hurst[1]; Rachael Taylor; Anne-Louise Heath,[2]; Jill Haszard[3]; Lisa Te Morenga[4]; Riz Firestone[5]; Cathryn Conlon[1]
[1]School of Sport, Exercise and Nutrition, Massey University, Auckland, New Zealand; [2]Department of Human Nutrition, University of Otago, Dunedin, New Zealand; [3]Biostatistics, Haszard Biostatistics, Dunedin, New Zealand; [4]Research Centre for Hauora and Health, Massey University, Wellington, New Zealand; [5]Centre for Public Health Research, Massey University, Wellington, New Zealand

BACKGROUND AND OBJECTIVES
Habitually consuming a variety of fruit and vegetables (FVs) is important for diet quality, growth, development and prevention of non-communicable diseases in children (Ramsay 2017, Hodder 2024). Despite amassing evidence relating to the health benefits of FV intake and variety in the early stages of life, little is known about the frequency and variety of FVs consumed by young children in Aotearoa New Zealand (NZ). The objective of this study was to explore FV intake in diets of young NZ children aged 1-4 years.
METHODS
This observational cross-sectional study utilised data from the Young Foods New Zealand study. Two 24-hour dietary recalls and socioeconomic data from 289 children aged 1-4 years were collected. Variety was measured as the number of different FV categories consumed over the 2 day diet recall, with each type of FV consumed given a score of 1 (e.g. if an apple was consumed twice, it was counted once). Independent t-tests and one-way ANOVAs determined differences between variety scores and demographic characteristics.
RESULTS
The children (female n=147, 51%) had a mean(SD) age of 2.5(0.9) years. Bananas (n=204, 71%) and carrots (n=142, 49%) were the fruit and vegetable children consumed the most. The least consumed vegetable group was leafy greens (n=60, 21%). Fruit Variety Scores (FVS) ranged from 0 to 9 with the highest proportion of children (22%) obtaining a 3. Vegetable Variety Scores (VVS) ranged from 0 to 11 with the highest proportion of children (15%) obtaining a 4. Mean VVS was significantly higher in households with one child (VVS=5.4) than those with four or more children (VVS=3.5) (p=0.013, 95% CI=0.25, 3.4). The socioeconomic deprivation category of the household influenced FVS, with differences seen between those in the low (FVS=3.6) and high (FVS=2.9) deprivation categories (p=0.048, 95% CI=0.01, 1.35). Children of respondents on unpaid leave had significantly higher FVS (FVS=4.8) than those on paid parental leave (FVS=2.9) (p=0.031, 95% CI=0.10, 3.62), those not working (FVS=3.0)(p<0.001, 95% CI=0.66, 2.97), and those who worked part-time (FVS=3.3) (p=0.004, 95% CI=0.3, 2.64). Children of respondents who achieved a university-level education had a significantly higher FVS (FVS=3.8) compared to children of school (FVS=2.8) educated respondents (p=0.003, 95% CI=0.26, 1.56).
CONCLUSIONS
Young children's fruit and vegetable (FV) variety scores were associated with socioeconomic factors. The findings highlight FV consumption patterns among young children in Aotearoa NZ and warrant further research into socioeconomic influences.

DIETARY AND LIFESTYLE CORRELATES OF IRON STATUS AMONG PREGNANT ADOLESCENTS BETWEEN THE AGES 15 TO 19 YEARS

Nicholas Amartei Laryea[1]; Awude Emelia[2]
[1]Departments of Nutrition and Dietetics, University of Health and Allied Sciences, Ho, Ghana; [2]Department of Nutrition and Dietetics, University of Health and Allied Sciences, Ho, Ghana

BACKGROUND AND OBJECTIVES
Pregnancy places female adolescents who in general are at a risk of low iron status at even greater risk. This study aimed to assess the association between dietary and lifestyle practices and iron status of pregnant adolescents between the ages 15 to 19 years.
METHODS
A cross-sectional study was conducted on 120 adolescent pregnant adolescents attending antenatal clinics at three conveniently selected hospitals in the municipality. A well-structured questionnaire was used to gather dietary and lifestyle data. Haemoglobin levels were measured. Data were analyzed using SPSS and Microsoft Excel. Chi-square was used to measure association between dietary and lifestyle and iron status.
RESULTS
There was a significant association between breakfast intake, fruit and vegetable intake, physical activity and pica intake and iron status of participants (p= 0.002, 0.021, 0.002, 0.000 and 0.037 respectively). However, there was no statistically significant relationship between herbal medication intake and iron status (p= 0.981) of study participants.

CONCLUSIONS
About a quarter of the participants had low iron status. An impactful way to improve the iron status of pregnant adolescents is to encourage the intake of breakfast, fruits and vegetables and minimizing pica practice.

EXPLORING FOOD AND NUTRITION-BASED SOCIAL ENTERPRISE MODELS AS INNOVATIVE SOLUTIONS FOR FINANCIAL SUSTAINABILITY IN EDUCATION-BASED SETTINGS: A SCOPING REVIEW

Leila Fathi[1]; Jacqueline Walker[1]; Robyn Littlewood[2]; Jayne Woodside[3]; Helen Truby[1]
[1]School of Human Movement and Nutrition Sciences, The University of Queensland, Brisbane, Australia; [2]Health and Wellbeing Queensland, Health and Wellbeing Queensland, Brisbane, Australia; [3]School of Medicine, Dentistry and Biomedical Sciences, Queen's University Belfast, Belfast, United Kingdom

BACKGROUND AND OBJECTIVES
Most school-based food and nutrition programs are discontinued within two years due to insufficient external funding, underscoring the need for alternative financial models. This scoping review explored what operational models exist within education-based settings that deliver on food and nutrition-based outcomes for students (with implementation greater than one year).
METHODS
Scoping review methodology was applied in November 2024, with data cross-checked for currency via Google. Eight databases were searched (PubMed, Web of Science, Embase, Cinahl, Social Science Database, Sociological Abstracts, Business Source Complete, ABI/Inform Collection). The included articles were synthesised narratively.
RESULTS
Five food and nutrition-based social enterprises were identified in educational contexts through case studies. Three were in the United States of America, one in New Zealand and one in Israel. Three enterprises utilised a targeted customer service model, selling healthy meals or snacks within educational settings and to other institutions or food retailers. One enterprise followed a social business model, using revenue from corporate catering to fund free school meals. One enterprise employed a combined employment and social business model, providing employment to women to prepare school meals.
CONCLUSIONS
Targeted customer service and social business models can contribute to creating health-promoting educational environments whilst generating revenue for self-sustainability. There is a need for more rigorous, formal evaluations beyond case studies to assess education-based food and nutrition social enterprises. Social enterprises should be integrated into public health strategies as potential solutions to sustain health promotion food and nutrition programs long term.

THE RELATIONSHIP BETWEEN NUTRITIONAL INTAKE AND ACTIVITY LEVELS OF CHILDREN AMONG UNDERPRIVILEGED COMMUNITIES IN CEBU, PHILIPPINES

Atsuko Kayashita[1]; Hiroyuki Ishizuka[2]; Junko Uchiyama[3]
[1]Health Sciences, Hiroshima Shudo University, Hiroshima, Japan; [2]English Language and Literature, Hiroshima Shudo University, Hiroshima, Japan; [3]DAREDEMO HERO, DAREDEMO HERO, Cebu City, Philippines

BACKGROUND AND OBJECTIVES
Child undernutrition in the underprivileged communities of Cebu, Philippines is a problem, but we conducted this investigation because we do not have a detailed understanding of the situation in order to improve it.
METHODS
The survey period is from June to August 2024. The subjects were 119 people (46 males, 73 females) under the age of 15 living in three districts. We investigated the amount of food intake and daily activities on a given day.
RESULTS
Average energy intake for men and women was 1,627 kcal for ages 1-2, 1,129 kcal for ages 3-5, 1,141 kcal for ages 6-9, 1,221 kcal for ages 10-12, and 1,354 kcal for ages 13-15, which was lower than the recommended intake in the Philippines for both men and women. . On the other hand, protein intake was similar for both men and women. The nutrients they lacked were calcium, iron, zinc, iodine, vitamin C, and dietary fiber, and their salt intake was high. The average total daily activity was 51 METs.
CONCLUSIONS
Now that the nutritional deficiencies have been identified, nutritional education will be recommended to residents.
CONFLICTS OF INTERESTS

EPO5_404

A SCOPING REVIEW OF DIETARY INTAKE AMONG YOUNG ADULTS IN LOW- AND MIDDLE-INCOME COUNTRIES

Zoe Pei Jing Ong[1]; Ai Kah Ng[2, 1]; Suhaili Ismail Siti[1]; Hazreen Abdul Majid[3, 2, 1]
[1]Department of Social and Preventive Medicine, Universiti Malaya, Kuala Lumpur, Malaysia; [2]Centre for Population Health (CePH), Universiti Malaya, Kuala Lumpur, Malaysia; [3]School of Health and Rehabilitation Sciences, Health Sciences University, Bournemouth, United Kingdom

BACKGROUND AND OBJECTIVES
The dietary intake of young adults is a critical area of study, particularly in low- and middle-income countries (LMICs), where rapid urbanization and economic changes influence food availability, dietary choices, and overall nutrition. Young adults (18 to 30 years) are at a transitional life stage marked by shifts in lifestyle and independence, which often impact their dietary intake and nutritional status. Poor dietary intake during this period can increase the risk of chronic diseases such as obesity, diabetes, and cardiovascular issues, which are rising concerns in LMICs. This scoping review aims to investigate current knowledge on dietary intake among young adults in LMICs, highlighting their energy and nutrient intakes.
METHODS
Literature search was conducted via several databases which includes Ovid MEDLINE, PubMed, Scopus, Web of Science and EBSCOhost to identify observational studies published in English from 1st January 2014 to 31st July 2024. The methodology outlined by the Joanna Briggs Institute (2020) and Arksey and O'Malley et al. were followed. Rayyan.ai was used to remove duplicates and facilitate the study selection process, which was independently carried out by two researchers. Studies that reported on the energy and nutrient intake of healthy young adults from the general community, aged 18-30 years in LMICs were included. The protocol for this review has been registered on the Open Science Framework (Registration DOI: https://doi.org/10.17605/OSF.IO/XZKBA).
RESULTS
A total of 14 studies were included (nine from upper-middle income countries, five from lower-middle income countries, none from low-income countries). Majority of the studies are cross-sectional (71.4%). The energy intake of young adults from upper-middle income countries varies, ranging from 1700 – 2400kcal/day. Young adult females in lower-middle income countries showed patterns of low energy and insufficient consumption of micronutrients. Most of the energy intake reported came from carbohydrate-based food sources, followed by fat and protein.
CONCLUSIONS
This review highlighted the need for more research in low-income countries and provided an overview of nutritional intake among young adults from the upper- and lower-middle income countries, which is essential for informing policies and interventions aimed at improving public health outcomes.

Typology of out-of-home-eaters: RESULTS from a large French cohort

Emma Meyer[1]; ; Justine Berlivet[1]; Sandrine Péneau[1]; Alice Bellicha[1]; Mathilde Touvier[1]; Philippe Pointereau[2]; Denis Lairon[3]; Emmanuelle Kesse-Guyot[1]; Julia Baudry[1]
[1]Équipe de Recherche en Épidémiologie Nutritionnelle (EREN), Sorbonne Paris Nord University, Inserm, CNAM, INRAE, Bobigny, France; [2]Solagro, Solagro, Toulouse, France; [3]Aix Marseille Université, Inserm, INRAE, C2VN, Marseille, France

BACKGROUND AND OBJECTIVES
Given the high number of people in Western countries who regularly eat out of home (OOH) in various settings, the OOH consumption sector probably has an important lever potential towards more sustainable and healthier diets. As the understanding of OOH consumer profiles is crucial to identify levers of action, the objective of the study was to identify a typology of OOH consumers and to describe these groups in terms of socio-demographics, lifestyle and diet.
METHODS
Based on a sub-sample of a large French cohort (n = 29,140), the typology of OOH consumption patterns was constructed using a multiple factor analysis followed by hierarchical ascending classification and k-means procedures. ANCOVA models adjusted for energy intake were applied to compare the groups' characteristics. The comparisons covered socio-demographic characteristics, lifestyles and diet-related nutritional (using dietary scores) and environmental factors (greenhouse gas emissions, land use and energy consumption) including at home and OOH consumption.
RESULTS
Five clusters of individuals were identified based on their OOH consumption patterns: 1) Weekday-only eaters (19%); 2) Frequent weekday and weekend eaters (24%); 3) Organic eaters (6%); 4) Weekend and evening eaters (19%) and 5) Home-only eaters (32%). The RESULTS showed significant differences in sociodemographic and diet-related factors between the groups. Individuals who frequently consumed OOH generally were younger and had a higher socio-economic status as well as a diet of poorer nutritional quality and greater environmental impacts. Participants who tended to choose organic options when eating OOH were more likely to follow specific diets, and showed healthier overall diets with lower environmental pressures.
CONCLUSIONS
Our RESULTS underline that OOH target groups are various and suggest the existence of a link between certain dietary and socio-demographic factors and OOH consumption habits.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

VITAMIN D STATUS AND ASSOCIATION WITH INFLAMMATION, DIETARY INTAKE, COGNITIVE PERFORMANCE AND DEPRESSION IN UNIVERSITY STUDENTS AFTER SUMMER BREAK

Emilia Zawieja[1]; Nowak ŁUkasz[2]; Andrzejewska Zofia[2]; Gawelska Weronika[2]; Alammari Magdalena[2]; Bykowska-Derda Aleksandra
[1]Department of Human Nutrition and Dietetics, Poznan Univeristy of Life Sciences, Poznań, Poland; [2]Dietetics Science Club, Poznan University of Life Sciences, Poznań, Poland

BACKGROUND AND OBJECTIVES
Vitamin D deficiency is a widespread issue in Poland due to limited sun exposure during the fall, winter, and spring. This study aims to assess the concentration of 25(OH)D in university students and examine its associations with vitamin D intake, inflammation, body composition, cognitive performance, and depressive symptoms.
METHODS
The participants (n = 62) were university students (aged 18–30 years) of both sexes, with no chronic diseases. The study was conducted in October 2024. During the study session, blood samples were collected, body composition was measured using air displacement plethysmography (BodPod, Cosmed, Italy), and cognitive testing was conducted using the Stroop Color Test, the Wisconsin Card Sorting Test, and the Word Fluency Test. Vitamin D intake was assessed with a previously validated food frequency questionnaire for the Polish population. Depressive symptoms were evaluated using the Beck Depression Inventory II (BDI-II) and the Patient Health Questionnaire-9 (PHQ-9). Serum 25(OH)D and C-reactive protein (CRP) concentrations were measured using ELISA methods with commercial kits (EIA-5396, DRG, Germany; DM E-4600, LDN, Germany). Data analysis was performed using the Mann–Whitney test and Spearman correlation in Statistica 13 (StatSoft, USA).
RESULTS
Among the participants, 23% had vitamin D deficiency, 58% had insufficiency, and only 19% had sufficient 25(OH)D concentrations. Vitamin D supplementation was reported by 46% of participants. Serum 25(OH)D concentrations were positively correlated with total vitamin D intake from diet and supplementation ($r_s = 0.30$, $p < 0.05$). Participants who supplemented vitamin D had significantly higher 25(OH)D concentrations compared to those who did not supplement (15.3 ± 9.2 ng/mL vs. 22.3 ± 12.7 ng/mL, $p = 0.027$). No significant associations were observed between 25(OH)D concentrations and CRP levels, cognitive performance, or depressive symptoms.
CONCLUSIONS
Vitamin D deficiency and insufficiency are common among university students in Poland, even in October, following the summer season. Despite nearly half of the participants reporting vitamin D supplementation, insufficient 25(OH)D levels remain prevalent. Serum 25(OH)D concentrations were positively correlated with vitamin D intake from diet and supplementation. Further research is needed to establish appropriate vitamin D supplementation dosing for this demographic to mitigate deficiency risk.

IMPACT OF ULTRA-PROCESSED FOOD INTAKE ON DIET QUALITY AND ITS ASSOCIATION WITH GESTATIONAL DIABETES MELLITUS: THE MUTABA'AH STUDY

Aisha A. Almulla[1, 2]; Hanna Augustin[1]; Luai A. Ahmed[3, 4]; Linnea Bärebring[1]
[1]Department of Internal Medicine and Clinical Nutrition, Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden; [2]Dietary Services, Tawam Hospital, Abu Dhabi Health Services Company (SEHA), Abu Dhabi, United Arab Emirates, al Ain, United Arab Emirates; [3]Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates, Al Ain, United Arab Emirates; [4]Zayed Centre for Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates, Al Ain, United Arab Emirates

BACKGROUND AND OBJECTIVES
The increasing intake of Ultra-Processed Food (UPF) has raised concerns about the potential role of UPF to impair maternal diet quality and increased risk of Gestational Diabetes Mellitus (GDM). This study aimed to evaluate the associations between UPF intake and adherence to the Mediterranean Diet and risk of GDM among pregnant women in the United Arab Emirates (UAE).
METHODS
The analysis included 1054 pregnant women from the dietary sub-cohort conducted between 2019-2022 within the Mutaba'ah prospective cohort study in UAE. Dietary data was assessed through a semi-quantitative food frequency questionnaire, and UPF intake in energy-adjusted servings/day was classified according to the NOVA system. The alternate Mediterranean Diet (aMED) score for pregnancy, was used to assess adherence to the Mediterranean Diet. GDM diagnosis was assessed based on the National Institute for Health and Clinical Excellence criteria. Logistic regression analysis was used to assess associations between UPF intake and aMED score (continuous or tertiles) and GDM.
RESULTS
Mean±SD of UPF intake was 9.4±3.4 servings/day and aMED score was 4.0±1.5. Pregnant women in the highest tertile of UPF intake had lower aMED score, compared to women in the lowest tertile (4.3±1.4 vs. 3.6±1.4, $P<0.001$). Also, women in the highest tertile of UPF intake had lower intakes of protein, total fat, monounsaturated fatty acids, vegetables, fruits, red-meats, legumes, nuts and higher intakes of carbohydrates, saturated fatty acids, sodium, selenium, whole grains and sweetened beverages compared to those in the lowest tertile ($P<0.05$). No significant associations were found between UPF intake (continuous or tertiles) and GDM (OR=0.97, 95% CI: 0.92-1.03, OR=0.85, 95% CI: 0.54-1.34, respectively). Similarly, no significant associations were found between aMED score (continuous or tertiles) and GDM (OR=0.99, 95% CI: 0.87-1.11, OR=0.94, 95% CI: 0.54-1.64, respectively).
CONCLUSIONS
Among pregnant women from the UAE, higher intake of UPF was associated with a lower adherence to the Mediterranean Diet. However, our findings didn't show any association between UPF intake or aMED score and the risk of GDM. Further research is needed to clarify the effects of UPF intake during pregnancy.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

DEVELOPMENT OF WHOLE GRAIN BREAD SUITABLE FOR EVENING MEALS AND ITS NUTRITIONAL AND FUNCTIONAL PROPERTIES

Akiko Furutani[1]; Masahiro Harada[2]; Shinichi Ando[2]; Yoshifumi Inoue[2]; Kazuko Hirao[1]; Shigenobu Shibata[1, 3]
[1]Home economics, Aikoku Gakuen Junior College, Edogawa City, Japan; [2]Baking Technology Education Division, Japan Bread Technology Institute, Inc, Tokyo, Japan; [3]Advanced sciences, Waseda University, Shinjuku City, Japan

BACKGROUND AND OBJECTIVES
Whole grain bread is well-known for its health benefits, including cholesterol regulation, suppression of postprandial blood glucose spikes, and prolonged satiety, making it a valuable functional food for preventing lifestyle-related diseases. However, due to its poor palatability and texture, it isn't widely consumed on a daily basis especially in Japan.Furthermore the impact of late-night meals on sleep quality has become a significant concern, particularly for individuals with irregular eating schedules. This study aimed to develop 100% whole grain bread optimized for late-night and to evaluate its effects on blood glucose and sleep quality.
METHODS
To improve the baking quality and palatability of 100% whole grain bread, we adjusted gluten levels and incorporated additional ingredients such as whole eggs, yogurt, and sourdough. As a result, adding 6–8% gluten and 15% whole eggs significantly improved the bread's volume and texture, while pre-gelatinizing 10% of the whole grain flour enhanced its moist texture and overall palatability. Subsequently, a sensory evaluation was conducted with 43 participants (aged 18–70) to select the most palatable product among three types of whole grain bread. Finally, an open-label crossover trial was performed using the highest-rated whole grain bread. Participants consumed either whole grain bread or white bread as part of their dinner and late-night meal, and blood glucose levels were monitored using a continuous glucose monitoring system. Sleep quality was evaluated using OSA-MA scores.
RESULTS
The trials on baking quality and palatability revealed that appropriate levels of gluten and whole egg additives improved bread specific volume, softness, and taste. Baking further enhanced the flavor profile, particularly for younger age groups, and the product containing whole eggs received ratings comparable to those of white bread. In the human trial, whole grain bread consumption significantly suppressed postprandial blood glucose spikes compared to white bread. Furthermore, subjective sleep quality, including parameters such as ease of falling asleep and reduced morning fatigue, improved significantly with whole grain bread consumption. When no late-night meal was consumed, participants reported worsened sleep onset due to hunger, leading to lower subjective sleep scores.
CONCLUSIONS
This study demonstrates that appropriately formulated 100% whole grain bread serves as a functional option for late-night meals, improving glycemic control and promoting better sleep quality. These findings suggest that whole grain bread could be a valuable dietary choice for individuals with busy lifestyles or irregular eating schedules.

A QUALITATIVE STUDY ON BREASTFEEDING EXPERIENCES OF EMPLOYED MOTHERS IN MANUFACTURING, RETAIL AND PUBLIC SECTORS AT DESIGNATED WORKPLACES

Lynette Daniels[1]; Xikombiso Mbheneyane[1]; Lisanne du Plessis[1]
[1]Department of Global Health, Division of Human Nutrition, Stellenbosch University, Cape Town, South Africa

BACKGROUND AND OBJECTIVES
The work environment presents major challenges for breastfeeding mothers through the physical separation of the mother and the baby post maternity leave. The objective of the study was to explore the experiences of employed breastfeeding mothers from designated workplaces (with more than 50 employees) in Worcester, South Africa.
METHODS
A qualitative study was conducted using focus group discussions (FDGs). Employed breastfeeding mothers from designated retail, manufacturing and public workplaces were recruited from local communities. Eligible participants were those who had exclusively or predominantly breastfed their children for up to 6 months and had given birth within the last 24 months. A community fieldworker recruited participants and coordinated scheduling for the FDGs.
RESULTS
Five FDGs (N=24) were conducted. The mothers described returning to work as emotionally and logistically challenging. Those who continued breastfeeding while working demonstrated a strong commitment to and belief in breastfeeding. Consistent enabling factors and main sources of support mentioned included immediate family members, such as grandmothers, siblings and spouses. The challenges identified were a lack of private spaces and time to express breastmilk at work, an unsupportive workplace culture and a lack of work-life balance.
CONCLUSIONS
There is a need for psychosocial support for breastfeeding mothers to manage the emotional demands of returning to work and logistical support, such as providing breastfeeding spaces and time for expressing breastmilk. Human resource managers, occupational health nurses and wellness officials should inform mothers about the recommendation to provide breastfeeding breaks at work. Advocacy efforts with workplaces on the importance of breastfeeding support should be initiated.

THREE-YEAR CHANGES IN DIET QUALITY AND LOX-INDEX AMONG JAPANESE WORKERS

Mirai Sakanari[1]; Masanori Ohta[2, 1]; Mayumi Nagano[2]; Yoko Umeki[2, 1]; Akiko Nanri[2, 1]
[1]Graduate School of Health and Environmental Sciences, Fukuoka Women's University, Fukuoka, Japan; [2]Department of Food and Health Sciences, International College of Arts and Sciences, Fukuoka Women's University, Fukuoka, Japan

BACKGROUND AND OBJECTIVES
A high-quality diet based on adherence to dietary guidelines or recommendations has been associated with decreased risk of cardiovascular disease (CVD) (1). The Japanese Food Guide Spinning Top (JFGST) (2) has also been associated with lower CVD risk (3,4). However, the association between JFGST and atherosclerosis, a precursor to CVD, is unclear. We therefore examined the association between three-year changes in JFGST score and LOX-index, a predictive biomarker of atherosclerosis and CVD (5), among Japanese workers.
METHODS
Participants were 226 workers (121 men and 103 women aged 19-66 years) with no history of serious disease who participated in both the baseline and 3-year follow-up surveys. Dietary intake was assessed using a validated self-administered diet questionnaire. JFGST score was evaluated on a scale of 0 to 70 (high adherence) based on the number of servings of grain dishes, vegetable dishes, fish and meat dishes, milk, and fruits; total energy intake; and energy from snacks and alcoholic beverages (2,3,4). Participants were divided into three groups based on the change in JFGST score over the 3-year period: decreased score (> -2 points), maintained score (≤ ±2 points), and improved score (> +2 points). LOX-index was calculated by multiplying serum concentration of the soluble form of lectin-like oxidized LDL receptor-1 by those of LOX-1 ligands containing apolipoprotein B (5). Multiple regression analysis was used to estimate the geometric mean of LOX-index after 3 years according to change in JFGST score.
RESULTS
Change in JFGST score was not associated with LOX-index after 3 years in either the age- and sex-adjusted or multivariable-adjusted models. Multivariable-adjusted geometric means (95% confidence intervals) of LOX-index after 3 years were 1,147 (1,031–1,276) for the decreased score group, 1,096 (975–1,233) for the maintained score group, and 1,275 (1,135–1,433) for the improved score group (*P* for trend = 0.23).
CONCLUSIONS
Our RESULTS suggest that three-year change in JFGST score was not associated with LOX-index among Japanese workers.

EFFECTIVE COVERAGE OF WASTING MANAGEMENT IN ETHIOPIA

Alinoor Farah[1]; Samson Gebremedhin[2]; Beshada Rago,[2]; Aweke Kebede[3]; Kemeria Barsenga[4]; Mufaro Chiriga[4]; Tefara Darge[2]; Tafara Ndumiyana[4]; Tayech Yimer[4]; Hiwot Darsene[5]; Beza Yilma[2]; SEIFU HAGOS GEBREYESUS[6]

[1]School of Public Health , Addis Ababa University, Addis Ababa, Ethiopia; [2]School of Public Health, Addis Ababa University, Addis Ababa, Ethiopia; [3]Nutrition, World Food Programme (WFP), Addis Ababa, Ethiopia, Addis Ababa, Ethiopia; [4]Nutrition, WFP, Addis Ababa, Ethiopia; [5]Nutrition, Ministry of Health, Addis Ababa, Ethiopia; [6]Nutrition and Dietetics, School of Public Health, Addis Ababa University (Sefere Selam Campus), Addis Ababa, Ethiopia

BACKGROUND AND OBJECTIVES

Child wasting and acute malnutrition are life-threatening conditions that increase the risk of death and serious illnesses. Despite efforts such as the Global Action Plan on Child Wasting, which aims to reduce the wasting prevalence to less than 3% by 2030, challenges persist, with Ethiopia recording a 7.2% rate. A major shortcoming of the global strategy is contact coverage, which often overlooks the service quality. Effective coverage that measures the quality of health services offers a solution. Thus, the objective of this study is to assess the effectiveness of child wasting management in six regions of Ethiopia.

METHODS

A secondary analysis of cross-sectional data obtained from household and institutional surveys was performed. A total of 1440 children aged 6-59 months were included in the study. For the household survey, participants were selected using a multistage cluster sampling approach, and 72 health posts were selected health posts were selected randomly from six regions. By combining household data with expanded measures of health facility readiness and process quality from health posts, the quality-adjusted coverage was calculated.

RESULTS

Contact coverage for severe acute malnutrition (SAM) and moderate acute malnutrition (MAM) was 40% and 37%, respectively. The readiness scores for providing SAM and MAM services at health posts were 57.9% and 53.9%, respectively. The input-adjusted coverage for SAM and MAM considering facility readiness was 23% and 20%, respectively. The coverage adjusted for receipt of complete intervention was 7% for the SAM and 8% for the MAM. Quality-adjusted coverage for SAM and MAM were 4% and 3%, respectively.

CONCLUSIONS

Efforts to address acute malnutrition in the Ethiopian health system show commendable progress but also highlight critical gaps and inconsistencies. A holistic, quality-driven approach is needed to effectively combat child-wasting in Ethiopia.

CHARACTERISTICS OF FOOD INTAKE AS INDEXED BY DIETARY SODIUM-TO-POTASSIUM RATIO

Chie Tabuchi[1]; Saki Yamanaka[2]; Yukiko Kawamata[3]; Kazuhiro Uenishi[4, 5]; Hiromi Ishida[2, 4]
[1]Green House Group Green Hospitality Food Service Co., Ltd., Tokyo, Japan; [2]Laboratory of Administrative Dietetics, Kagawa Nutrition University, Sakado, Japan; [3]Graduate research student, Kagawa Nutrition University, Sakado Campus, Sakado, Japan; [4]Graduate School, Kagawa Nutrition University, Sakado Campus, Sakado, Japan; [5]Laboratory of Physiological Nutrition, Kagawa Nutrition University, Sakado, Japan

BACKGROUND AND OBJECTIVES
Recently, the urine sodium-to-potassium (Na/K) ratio has attracted worldwide attention for hypertension prevention; however, there are few reports relating urine Na/K ratios to diet. Therefore, the objective of this study was to identify the food intake characteristics that reduce urine and dietary Na/K ratios.
METHODS
A total of 126 female college students participated in this study. Dietary records (food-weighted method and photographic method), physical measurements, and 24-h urine collection were conducted on two non-consecutive weekdays and holidays. Nutritional calculations were performed using the Standard Tables of Food Composition in Japan (Eighth Revised Edition)-Updated and Enlarged Version 2023, and energy and nutrient intakes were calculated considering the cooking methods. The median of the average dietary salt and K intake over 2 days was divided into four groups: I salt: low K: high, II salt: high K: high, III salt: low K: low, IV salt: high K: low. Urinary Na and K excretions, energy and nutrients intakes, and intakes of food group were compared among the four groups.
RESULTS
The participants had a mean age of 19.3 ± 0.8 years, a height of 158.0 ± 4.5 cm, a weight of 53.7 ± 6.7 kg, and a BMI of 21.5 ± 2.5 kg/m2. The median energy and nutrient intakes [25-75P] were 1614 [1411-1776] kcal, 2865 [2143-3415] mg sodium, 1985 [1689-2324] mg potassium, and 7.3 [5.5-8.6] g salt. The median of Na/K ratio of the diet was 1.6 [1.4-1.8] mmol/mmol in groupI, 2.6 [2.4-2.9] in groupII, 2.1 [1.9-2.5] in groupIII and 3.2 [2.9-4.1] in groupIV. Dietary as well as urinary Na/K was lowest in group I and highest in group IV ($p<.001$). The ratio in the appropriate BMI range was the highest in groupI (90.6 %). In terms of dietary intake, group I consumed significantly more protein, potassium, calcium, iron, vitamin B12, and pantothenic acid, and significantly less salt than group IV. In terms of food group intake, group I consumed significantly more beans, vegetables, seafood (excluding processed foods), and dairy products (excluding cheese) than group IV and significantly fewer cereals (wheat and processed wheat products).
CONCLUSIONS
It is important to incorporate dairy products (milk and yogurt) with low salt content, as well as vegetables and fruits, to reduce the Na/K ratio in the urine and diet.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

THE IMPACT OF NUTRI-SCORE ON CONSUMER CHOICES IN POLAND - FINDINGS FROM THE NATIONWIDE, CROSS-SECTIONAL STUDY

Hubert Dobrowolski[1]; Dariusz Włodarek[2]; Mariusz Panczyk[3]
[1]School of Medical & Health Sciences, University of Economics and Human Sciences in Warsaw, Warsaw, Poland; [2]Department of Dietetics, Institute of Human Nutrition Sciences, Warsaw University of Life Sciences (SGGW), Warsaw, Poland; [3]Department of Education and Research in Health Sciences, Faculty of Health Science, Medical University of Warsaw, Warsaw, Poland

BACKGROUND AND OBJECTIVES
In recent years, there has been an increasing discussion about common front-of-pack labelling in Europe. One candidate is the Nutri-Score (NS) system, popular in some of the European Union countries. There are no independent studies on its effectiveness in Poland, where it is used as a voluntary label. The aim of the study was to assess the impact of the Nutri-Score system on Polish consumers making healthier dietary choices.
METHODS
The cross-sectional study was conducted over March and April 2024 with CAWI technique. A representative sample of the Polish population, consisting of 1,035 respondents, participated in the study. These respondents were recruited from a research panel and regularly make their grocery purchases in retail chains. The study utilized a questionnaire that included metric questions and assessments of nutritional knowledge. It also evaluated familiarity with the Nutri-Score system. Additionally, participants engaged in a simulated product selection task, choosing one item from each of eight product pairs based on their health value, both with and without the Nutri-Score system visible.
RESULTS
A large proportion of respondents were not familiar with the NS system prior to the survey (33.2%) or did not understand its meaning (25.6%). The majority of respondents obtained their knowledge of it from product packaging (65.4%). Almost 37% pay attention to this system ‘sometimes’ when shopping. The average score achieved in the nutritional knowledge test was 5.6±2.14 out of a possible 10 points. The average score obtained by respondents in the NS labelling knowledge test was 2.9±1.66 out of a possible 7 points. Of the 8 pairs of products, only for one pair the study participants made a more favourable nutritional choice after the NS system was made visible. For 2 pairs, they made no change, while for 5 pairs a less favourable nutritional choice was made after making the score visible. Statistical significance was, however, shown for only 2, negative changes ($p<0.001$). There was a correlation between nutritional knowledge and quality of choices with both invisible ($p<0.001$, rho=0.216) and visible ($p<0.001$, rho=0.164) labelling.
CONCLUSIONS
Our study suggests a minor impact of the system on consumers' food choices. The RESULTS indicate that it does not guarantee an improvement in the choice of products with better nutritional and health properties. Nutritional knowledge remains essential for informed dietary decisions. Further studies are needed to assess the usefulness of the NS in improving the public's diet and making better nutritional choices.

GESTATIONAL WEIGHT GAIN AND EXPERIENCES OF WOMEN LIVING WITH GESTATIONAL DIABETES MELLITUS

Rachel Nolan[1]; Lynette Mcknight[2]; Alison Gallagher[1]; Alyson Hill[1]
[1]NICHE, Ulster University, Coleraine, United Kingdom; [2]Department of Nutrition and Dietetics, Northern Health and Social Care Trust, Antrim Area Hospital, Antrim, United Kingdom

BACKGROUND AND OBJECTIVES
Gestational diabetes mellitus (GDM) is a common pregnancy complication which can result in serious adverse effects. GDM carries long-term health risks with an 8-10-fold increased risk of developing Type 2 diabetes mellitus (T2DM) within 3-6 years post-pregnancy [1,2]. Excessive gestational weight gain is a key contributor to, T2DM progression and developing obesity [3], yet many women receive little guidance on weight management [4], and the adverse effects. This study aimed to evaluate weight changes during pregnancy and explore knowledge and current weight management practices in women with GDM.
METHODS
Pregnant women aged 18-45 years old attending an antenatal clinic between Nov 2023 - Dec 2024 following a GDM diagnosis were invited to participate. 123 women with GDM completed an anonymous questionnaire investigating their experiences of weight management during pregnancy. Of these, 97 women consented to be weighed at 3 time-points during pregnancy by trained clinic staff, with body weight measured at booking appointment (≤14 weeks), again at GDM diagnosis (around 28 weeks) and at term (36-40 weeks). Additionally, age, parity, diabetes biochemistry and GDM management data were also collected.
RESULTS
RESULTS showed that 35% (n=43) of participants reported that they did receive enough information on weight management during pregnancy, and only 17.9% (n=22) could correctly identify adverse effects of gaining excessive gestational weight. Almost two thirds (61.8% n=76) did not consider weight gain a sensitive topic, and 59.3% (n=73) wanted to be informed if they were gaining excessive or inadequate weight. Accurate weight measurements were available for 85.6% (n=83) of participants during pregnancy, with mean age 31.2 (SD 4.5), mean early pregnancy BMI, 32.5kg/m2 (SD 6.7). Rate of weight gain per gestational week was calculated using IOM guidance [5] and stratified according to BMI categories: healthy weight (n=11) 0.57kg/wk, overweight (n=16) 0.47 kg/wk, and obese (n=56) 0.27 kg/wk. These preliminary RESULTS show that, healthy weight and overweight women exceeded IOM recommendations by 0.07 and 0.14 kg/wk respectively, whilst those in the obese category remained within the recommended range (0.17-0.27kg/wk).
CONCLUSIONS
In summary, women with GDM reported lacking awareness of the risks of excessive weight gain during pregnancy and would welcome further information. Recommendations for weight gain in high-risk women with GDM are urgently required within the UK to reduce the short and long terms health risks for all women.

CURRENT PRACTICES AND CHALLENGES OF DIETARY SUPPORT IN JAPANESE NURSERY SCHOOLS: A QUALITATIVE STUDY OF PARENTS' NEEDS AND NURSERY TEACHERS' PERSPECTIVES

Daisuke Fujita[1]; Yuki Tada[2]; Jun-Ichiro Shimizu[3]; Kazuko Ishikawa-Takata[2]; Azumi Hida[2]
[1]Department of Food and Nutritional Science, Tokyo University of Agriculture, Setagaya City, Japan; [2]Department of Nutritional Science, Tokyo University of Agriculture, Setagaya City, Japan; [3]Hiyoko Dai3 Nusery School, Hiyoko Dai3 Nusery School, Sagamihara City, Japan

BACKGROUND AND OBJECTIVES
It is unclear whether dietary support in nursery schools addresses the dietary concerns faced by parents of preschool children. This study aimed to clarify the current practices and challenges of dietary support in order to determine ideal activities that meet both the needs of parents and the capabilities of nursery teachers.
METHODS
Focus group interviews with parents (4 groups, n=16) and nursery teachers (2 groups, n=10, stratified by duration of work experience) were conducted in October 2024. Interviews were recorded, transcribed verbatim, and analyzed using qualitative content analysis. Codes, subcategories (in quotes), and categories were identified from the verbatim transcripts independently for each group. The two groups were then combined, **frameworks (in bold)** were created for individual categories, and subcategories were compared for similarities and differences.
RESULTS
In the comparison of **Concerns perceived at the scenes of child's eating**, "Picky eating" was extracted from both parents and nursery teachers, but "Taking too much time to eat" was extracted only from the parent group. In the comparison of **Reactions and perceptions related to specific dietary support activities**, both groups agreed that "Cooking experience during childcare" was beneficial for children. In the comparison of **Parents' desired dietary support and feasibility assessed by nursery teachers**, "Cultivation activities" was desired by parents, but nursery teachers found this difficult to implement.
CONCLUSIONS
This study revealed that parents and nursery teachers shared some concerns about children's eating, but that gaps exist between what parents desire and what teachers can feasibly provide. The findings highlight challenges in implementing dietary support and offer insights that would contribute to the development of effective dietary support in nursery schools.

ERYTHROCYTE LEVELS OF N-3 POLYUNSATURATED FATTY ACIDS, AS A MARKER FOR INCIDENCE OF FRAILTY AFTER A 6-YEAR FOLLOW-UP: THE KOREAN FRAILTY AND AGING COHORT STUDY

Yongsoon Park[1]; Jueun Kim,[1]
[1]Food and Nutrition, Hanyang University, Seoul, Korea, Republic of

BACKGROUND AND OBJECTIVES
Previous studies have shown that the blood levels of n-3 polyunsaturated fatty acids (PUFA) are inversely associated with the prevalence of frailty, but associations with frailty incidence remain unknown. We examined the hypothesis that the erythrocyte levels of n-3 PUFA such as eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) are inversely associated with the incidence of frailty after a 6-year follow-up.
METHODS
Using the Korean Frailty and Aging Cohort Study data, 1119 community-dwelling Korean participants aged 70-84 years without frailty were observed for 6 years. Frailty was defined using the Cardiovascular Health Study index.
RESULTS
In the multivariable adjusted model, the incidence of frailty was 11.1% after a 6-year follow-up and inversely associated with the Omega-3 Index (HR: 0.47; 95% CI: 0.27-0.84; *P* for trend = 0.005), and DHA levels (HR: 0.36; 95% CI: 0.19-0.68; *P* for trend = 0.003). Regarding frailty components, the incidence of low physical activity, slow walking speed, and weight loss were inversely associated with the Omega-3 Index and DHA levels. The Omega-3 Index (*P* = 0.043) and DHA levels (*P* = 0.019) differed significantly among the frailty transition groups (persistence, reversal, and deterioration). All-cause mortality was inversely associated with the Omega-3 Index (*P* = 0.011), and EPA (*P* = 0.012) and DHA levels (*P* = 0.032).
CONCLUSIONS
The incidence of frailty was inversely associated with the Omega-3 Index and erythrocyte DHA levels, suggesting that interventions with n-3 PUFA are beneficial for preventing the progression of frailty and mortality among community-dwelling older adults in Korea.

BACKGROUND AND OBJECTIVES
The Traditional Japanese Dietary Score (TJDS) has been created and reportedusing open data to examine associations with health indicators and theenvironment We newly developed AHEI and DASH and examined for associationwith cancer mortality. The purpose of this study is to clarify the associationbetween these dietary scores and cancer mortality.
METHODS
TJDS was calculated using previously published methods, DASH was calculated byFung et al. and AHEI by a modification of the method of Miller et al. Food and totalenergy supply were from the Food and Agriculture Organization of the UnitedNations database, and other data including covariates (salt intake, GDP, agingrate, years of education, smoking rate and obesity rate) were from the GlobalBurden of Disease 2021 or World Bank's databases. At first, correlations wereobtained for each score in 2010. Data from 2010 to 2021 were analyzedlongitudinally in a linear mixed model for 145 countries with populations of 1 millionor more, with each score as the independent variable and cancer mortality as thedependent variable, adjusted for all covariates.
RESULTS
Correlations between scores were TJDS and AHEI ($r=0.42$, $p<0.001$), TJDS andDASH ($r=0.19$, $p<0.05$), and AHEI and DASH ($r=0.65$. $p<0.001$). The fixed effects(SE) of the TJDS, AHEI, or DASH and cancer mortality were TJDS -2.791 (0.901, $P<0.01$), AHEI -0.741 (0.334, $P<0.05$) and DASH -2.302 (0.664, $p<0.001$).
CONCLUSIONS
Similar to TJDS, healthy dietary patterns of AHEI and DASH may also reducecancer mortality using open data.

BARRIERS AND FACILITATORS TO ADOLESCENT MOTHERS ACCESSING QUALITY CARE IN THE MANAGEMENT OF SMALL AND NUTRITIONALLY AT-RISK INFANTS

Patricia Welch[1]; Charles Okoro,[2]; Shannon Pryor,[3]; Ayan Seal,[4]; Suleiman Bata,[5]; Olatunji Alabi,[6]
[1]Centre for Humanitarian Public Health Team, Save the Children Schweiz - Organisation für die Rechte der Kinder, Zürich, Switzerland; [2]MEAL, Save the, Maiduguri, Nigeria, Federal Republic of; [3]Global Health, Save the Chil, Washington, United States of America; [4]Program Development & Quality, Save the Children, Abuja, Nigeria, Federal Republic of; [5]Nutrition, Save the children international, Maiduguri, Nigeria, Federal Republic of; [6]MEAL, Save the Children, Abuja, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
Adolescent childbearing is a known risk factor for health and nutrition complications for both the mother and her infant. Recognizing the increased health and nutrition risks that these mothers and their children face, being an adolescent mother is an automatic enrolment criterion into the Management of small and nutritionally at-risk infants <6 months and their mothers (MAMI) Care Pathway. The MAMI Care Pathway aims to enable infants <6 months to survive and thrive through increased identification of small and nutritionally at-risk infants <6 months and their mothers and strengthening the quality and availability of services for them. To better understand the barriers and facilitators to accessing quality health and nutrition services for adolescent mothers 15-19 years and their <6 months infants along the MAMI Care Pathway in Borno state, Nigeria, a formative research study was conducted.
METHODS
Using a combination of purposive and snowball sampling, a total of 146 study participants were selected, including: pregnant adolescents, adolescent mothers with an <6 month infant enrolled in MAMI, adolescent mothers with an <6 month infant not enrolled in MAMI, male partners of adolescent mothers, older female relatives of adolescent mothers, community health workers, and health facility-based providers. Data was collected via focus group discussions, in-depth interviews, and key informant interviews then transcribed, translated to English, and analyzed using a thematic framework analysis and Atlas.ti software.
RESULTS
Key barriers include: stigma against adolescent pregnancy; financial cost of health services and/or transportation; judgmental and/or poor quality care; lack of privacy during services; influence of family/community members; high level of trust in traditional birth attendants (TBAs); and lack of decision-making within her marriage. Key facilitators include: family, male partner, and/or community support; desire to keep herself and her baby healthy; close proximity to the health service point; low/no financial cost; hearing positive experiences from community members about services; and quality, non-judgmental medical care.
CONCLUSIONS
CONCLUSIONS
Recommendations include: train health workers on adolescent-inclusive care; initiate an adolescent mentorship program; integrate content into father-to-father support groups to support shared decision-making between husbands and wives; build linkages between TBAs and MAMI; include messaging in mother support groups on recommended health/nutrition contact points for her and her baby; and strengthen community awareness of MAMI.

ACCULTURATION AND ULTRA-PROCESSED FOOD INTAKE AMONG HISPANIC ADULTS IN THE US: A SECONDARY ANALYSIS OF NHANES 2001-2018

Carlos Soto Diaz[1]; Gabriela Vatavuk Serrati[1]; Lindsey Smith Taillie[1]
[1]Department of Nutrition, University of North Carolina at Chapel Hill, Chapel Hill, United States of America

BACKGROUND AND OBJECTIVES
Hispanics in the United States (US) face many diet-related health disparities. Acculturation, the process by which migrants adopt cultural practices in a new country while maintaining aspects of their original culture, is associated with reduced diet quality. In the US, intake of ultra-processed foods (UPFs) has risen in past decades. UPFs, industrial formulations of chemically modified ingredients, typically high in sodium, added sugars, and saturated fats, are associated with chronic diseases. How acculturation relates to UPF intake among Hispanics remains unaddressed. This study aims to investigate how acculturation relates to UPF consumption and whether this relationship varies by sociodemographic characteristics.
METHODS
We used nationally representative, cross-sectional data from the National Health and Nutrition Examination Survey (NHANES), between 2001 and 2018 collected via two 24-hour dietary recalls (n=9,329). Latent Class analysis (LCA) classified acculturation levels, using two variables: proportion of life in the US and language spoken at home. AIC, BIC, R-squared and LRTs were used to determine best number of classes. Food items were classified according to the NOVA system. Percentage of total energy was calculated using multiple linear regression analysis. Marginal means were estimated for UPF intake across acculturation classes and level of sociodemographic variables. Models were adjusted for sex, age, education, income, marital status, and ethnicity. Wald tests assessed group differences.
RESULTS
Two latent classes were identified: a) least acculturated class, represented by participants who spoke mostly Spanish and lived in the US for less than half of their life and b) most acculturated class, represented by participants who spoke mostly English and lived in the US for most of their life. The most accultured class had higher UPF intake, with a mean energy intake of 56.0% (95% CI:55.0-57.1), while the least accultured class had a mean energy intake of 46.8% (95%CI:46.0-47.7). Ethnicity and education modified the relationship between acculturation and UPF intake, with a stronger positive association between being least acculturated and UPF intake for Mexican Americans than other Hispanic adults, and for individuals with a college degree compared to those who did not graduate high school. There was no modification by sex, age, marital status, and income.
CONCLUSIONS
Increase in UPF consumption with acculturation are concerning given existing health disparities among Hispanics. Prospective studies are needed to establish temporality between acculturation and UPF intake.
CONFLICTS OF INTERESTS

DEVELOPMENT OF A FRAMEWORK AND EVALUATION INDICATORS FOR ASSESSING THE EFFECTIVENESS OF MEAL MANAGEMENT SUPPORT SERVICES IN CARE FACILITIES FOR VULNERABLE POPULATIONS IN SOUTH KOREA

Seulgi Lee,[1]; Ji-Yun Hwang,[2]; Sohyun Park[3, 4]; Hyun Joo Ryou,[5]; Jieun Oh,[6]; Jiwon An,[1]; Seojin Yun,[1]; Kirang Kim[1]
[1]Food Science and Nutrition, Dankook University, Cheonan, Korea, Republic of; [2]Major of Fooservice Management and Nutrition, Sangmyung University, Seoul, Korea, Republic of; [3]Food Science and Nutrition, Hallym University, Chuncheon, Korea, Republic of; [4]The Korean institute of Nutrition, Hallym University, Chuncheon, Korea, Republic of; [5]Planning Department, The Ecological Eating and Culture Association, Seoul, Korea, Republic of; [6]College of Science and Industry Convergence, Ewha Womans University, Seoul, Korea, Republic of

BACKGROUND AND OBJECTIVES
Meals provided in care facilities for nutritionally vulnerable groups, such as children and older adults, significantly influence their nutritional and health outcomes. To address this, the Korean government established the Meal Management Support Centers in 2012 to ensure hygienically safe and nutritionally adequate meals through management and education. However, evaluation systems to assess the impact of the centers' services on beneficiaries' nutrition and health are insufficient. This study aimed to develop a framework and indicators to evaluate the effectiveness of the centers' meal management support services.
METHODS
A comprehensive review of meal service program evaluation literature, a logic model-based assessment of existing evaluation indicators, data analysis, stakeholder interviews, and feasibility testing of new indicators were conducted to design an evaluation framework.
RESULTS
Applying the existing evaluation indicators for the centers' services to a logical model revealed that most were focused on input and process indicators, with insufficient outcome indicators. Therefore, it was developed with a focus on outcome indicators, and its applicability in the field was assessed. The current indicators used to evaluate the center's support services were used as input and process indicators, with the adequacy of budget and personnel as input indicator, and the number of management visits to care facilities and educational sessions provided to care facility beneficiaries as process indicators. The short-term outcome indicators included satisfaction levels among care facility managers and guardians. The mid-term outcome indicators focused on compliance with legal requirements for food safety and provision of nutritious meals, as well as healthy dietary practice scores. The long-term outcome indicators were designed to evaluate foodborne illness rates and food allergy incidents in care facilities, increased vegetable and fruit intake and reduced sugar consumption for children, and reduced malnutrition, weight maintenance, and frailty prevention for older adults.
CONCLUSIONS
The proposed evaluation framework and indicators to assess the effectiveness of centers' meal management support services are expected to enhance the quality of meal services for nutritionally vulnerable groups.

DIETARY CHOLINE AND BETAINE INTAKES DURING PREGNANCY AND BIRTH WEIGHT IN A CHINESE POPULATION

ZIqi XIAO[1]; Jiaomei Yang[2]
[1]School of Public Health, Xi'an Jiaotong University, Xi'an, China; [2]Epidemiology and Biostatistics, Xi'an Jiaotong University, Xi'an, China

BACKGROUND AND OBJECTIVES
Few studies have focused on the relationships between maternal dietary intakes of choline and betaine during pregnancy and birth outcomes. Moreover, the effects of dietary choline and betaine intakes from different sources on fetal growth are less known. This study aimed to examine the associations of different dietary choline and betaine sources during pregnancy with birth weight and the related adverse birth outcomes.
METHODS
We used a multi-stage stratified cluster random method to recruit 7310 women in Shaanxi, Northwest China. Maternal dietary intakes were collected by a validated FFQ and other characteristics were gathered via a standard questionnaire. We measured neonatal anthropometric values at birth. Multiple linear regression models were used to estimate birth weight changes or ORs (95% CIs) for adverse birth outcomes associated with dietary choline and betaine intakes during pregnancy.
RESULTS
The mean total dietary choline intake was 321.2 (SD 159.6) mg/d, with 41.2% from animal choline and 58.8% from plant choline. The mean total dietary betaine intake was 49.9 (SD 51.6) mg/d, with 5.8% from animal betaine and 94.2% from plant betaine. Per 100 g increases in total choline and animal choline were associated with birth weight increases of 11.0 g (95% CI 0.4–21.6), and 26.8 g (5.2–48.4), respectively. The highest tertile of total choline intake compared with the lowest tertile was negatively associated with low birth weight (LBW) (OR 0.53; 95 % CI 0.33, 0.86) and small for gestational age (SGA) (OR 0.76; 95 % CI 0.60, 0.98). Per 100 g increase in total choline was associated with lower risks of LBW (OR 0.85; 95 % CI 0.74, 0.98) and SGA (OR 0.91; 95 % CI 0.84, 0.98). The highest tertile of animal choline intake compared with the lowest tertile was negatively associated with LBW (OR 0.63; 95 % CI 0.40, 0.98) and SGA (OR 0.81; 95 % CI 0.67, 0.98). Per 100 g increase in animal choline was associated with lower risks of LBW (OR 0.74; 95 % CI 0.56, 0.97) and SGA (OR 0.90; 95 % CI 0.83, 0.97). We observed no associations of plant choline and different dietary betaine sources with birth weight, LBW, or SGA.
CONCLUSIONS
Our findings suggest that higher choline intake during pregnancy, in particular animal choline, is associated with higher birth weight and lower risks of LBW and SGA.

EPO5_431

INVESTIGATION OF THE FACTORS THAT PROLONG WEIGHT GAIN DURING WINTER

Asumi Yoshida[1]; Arata Tsutaki[2]
[1]Department of Nutrition and Health, Sagami Women's University, Kanagawa, Japan; [2]Department of Sport Science and Health, Kyushu sangyo University, Fukuoka, Japan

BACKGROUND AND OBJECTIVES
Excess weight and subsequent obesity caused by irregular eating habits are associated with various diseases. The symptoms are known as "holiday weight gain", and are said to occur particularly in winter (Schoeller, 2014). In a systematic review of winter holiday eating and obesity, most participants reported experiencing weight fluctuations during the study period, particularly during winter (Abdulan et al., 2023). In Japan, there is a pattern of weight gain in winter that may lead to long-term increases in BMI. Here, we investigated the participants' holiday weight gain, dietary patterns, food preferences, and lifestyle habits to elucidate the factors that lead to long-term winter weight gain.
METHODS
After explaining the purpose of the study, we asked the participants to complete a self-administered questionnaire. The questionnaire items included age, sex, winter weight gain, taste preferences, and lifestyle habits, including diet and sleep.
RESULTS
The participants were 141 men and 198 women. Of them, 207 (61.1%) reported experiencing holiday weight gain, with 72 men (51.1%) and 135 women (68.2%) reporting weight gain. The average weight gain for those who gained weight in winter was 2.2 ± 1.1 kg, with men gaining 2.3 ± 1.2 kg and women gaining 2.0 ± 1.1 kg. A predictive model for prolonged holiday weight gain was created by dividing the participants into two groups; those who took more than a month to lose weight and those who did not. Consequently, in men, sedentary behaviour during holidays was extracted as a predictor, with a positive predictive rate of 69.4%. In women, preference for sour foods, number of days of alcohol consumption, weekday sleep time, and holiday sleep time were extracted as predictors, with a positive predictive rate of 68.9%.
CONCLUSIONS
Even among Japanese individuals, the existence of specific holiday weight gain has been recognised. The characteristics of individuals who took a long time to return to their original weight differed between men and women. For men, it was found regardless of whether they spent their days off actively, whereas for women, their daily sleeping hours and food preferences were related. To return to one's original weight and prevent obesity during winter, it is necessary to increase physical activity and support lifestyle habits, such as sleep.

THE ASSOCIATIONS OF DIETARY INTAKE AND ANEMIA-RELATED BIOMARKERS WITH PRE-PREGNANCY BODY MASS INDEX IN THE FIRST TRIMESTER OF TAIWANESE PREGNANT WOMEN

Nguyen Thi Hong Nhi[1, 2]; Bai Chyi-Huey[3, 4]; Jung-Su Chang[1, 4]; Yi-Chun Chen[1]; Ya-Li Huang[5]; Chien-Yeh Hsu[6, 7]; Fan-Fen Wang[8]; Jane C.-J. Chao[1, 4]

[1]School of Nutrition and Health Sciences, College of Nutrition, Taipei Medical University, Taipei, Taiwan; [2]Health Personnal Training Institute, Hue University of Medicine and Pharmacy, Hue, Vietnam; [3]Department of Public Health, School of Medicine, Taipei Medical University, Taipei, Taiwan; [4]TMU Research Center for Digestive Medicine, Taipei Medical University, Taipei, Taiwan; [5]School of Public Health; Department of Public Health, School of Medicine, Taipei Medical University, Taipei, Taiwan; [6]Department of Information Management, National Taipei University of Nursing and Health Sciences, Taipei, Taiwan; [7]Master Program in Global Health and Health Security, Taipei Medical University, Taipei, Taiwan; [8]Department of Internal Medicine, Yangming Branch, Taipei City Hospital, Taipei, Taiwan

BACKGROUND AND OBJECTIVES

Adequate maternal is essential during pregnancy, especially in the first trimester when fetal development is crucial. However, few studies have investigated the associations between nutrient intake and pre-pregnancy body mass index (BMI). Therefore, this study aims to explore the associations of nutrient intake with pre-pregnancy BMI in the first trimester of gestation.

METHODS

A cross-sectional study was carried out on 373 pregnant women in the first trimester in Taiwan. Dietary intake was assessed using a food frequency questionnaire and a 24-hour dietary recall method. Student's *t* test was utilized to investigate the associations of dietary intake and anemia-related biomarkers with pre-pregnancy BMI among the participants.

RESULTS

The mean age of study participants was 30.2 years (± 6.1). The participants' average pre-pregnancy height was 1.59 m, with a mean weight of 57.5 kg, and mean BMI was 22.5 kg/m2. Among the respondents, 15.2% or 12.9% women were classified as overweight or obese, respectively. The majority of pregnant women had attained a graduate-level education. Fat intake, in terms of g (*r*: 0.13; $p = 0.013$) or % of energy (*r*: 0.14; $p = 0.009$), was positively correlated to pre-pregnancy BMI. Supplement intake, including multivitamins/multiminerals (*r*: -0.13; $p = 0.009$), was negatively correlated with pre-pregnancy BMI. Pregnant women with abnormal serum iron levels were observed to have a higher pre-pregnancy BMI compared to those with normal serum iron levels ($p = 0.007$). Meanwhile, pregnant women with abnormal serum vitamin D levels had a lower pre-pregnancy BMI than those with normal serum vitamin D levels ($p = 0.026$).

CONCLUSIONS

Pregnant women with higher pre-pregnancy BMI had significantly greater fat intake. Abnormal serum iron or vitamin D levels were also associated with higher or lower pre-pregnancy BMI, respectively.

ENERGY INTAKE AND BODY FAT OF ADOLESCENT GIRLS: A PILOT STUDY

Patricia Ukegbu[1]; Augusta Amaeze[1]; Mayowa Adegboyega[2]; Victoria Asumugha[1]; Juliana Anyika-Elekeh[1]; Precious Uche[1]; Ejimchi Anyanwu[3]; Ijeoma Okereke[1]; Roseline Kanu[3]; Andrew Ukegbu[4]; Herman Pontzer[2]
[1]Department of Human Nutrition and Dietetics, michael okpara university, Umuahia, Nigeria, Federal Republic of; [2]Department of Evolutionary Anthropology, Duke University, Durham, United States of America; [3]Department of Agricultural Extension, michael okpara university, Umuahia, Nigeria, Federal Republic of; [4]Department of Community Medicine, Federal Medical Centre, Umuahia, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
The adolescent stage is critical for disrupting the cycle of malnutrition, yet poor dietary intake remains a major issue (1). Adolescent girls globally suffer from both micro and macro- nutrient malnutrition, affecting their health and wellbeing (2). Poor nutrition predisposes adolescents to stunted growth, excess body fat and chronic diseases (3). This pilot study assessed the energy intake and body fat of adolescent girls.
METHODS
A school-based pilot study was conducted using purposive sampling to collect data from 40 adolescent girls aged 10-19 years. Dietary data (24-hour recall) for three days was determined using the International Dietary Data Expansion Project Application (INDDEX 24 App). Body fat was measured with an Omron Body Composition Monitor and Scale (BF-511). Data were analysed with IBM SPSS Statistics version 25. Pearson correlation (r) was used to determine the relationship between dietary intake and percentage body fat.
RESULTS
More than half (52.5%) of the adolescent girls were in the late adolescent period (15-19 years). Energy intake averaged 2208.44 kcal/day, with 37.5% not meeting recommended values. Over 90% of the participants fell within the recommended carbohydrate range, with about 70% having protein intake (primarily plant-based) above the minimum intake level. Fat intake was within the Acceptable Macronutrient Distribution Range (AMDR) for 55% of the adolescent girls, and saturated fat intake aligned with WHO recommendations. Carbohydrate, protein and fat contributed 54%, 10% and 36%, respectively to total calorie intake. Body fat was normal for 60%, while 25% were overfat/obese. No significant correlations were found between energy intake and body fat percentage ($p > 0.05$).
CONCLUSIONS
The study highlights high carbohydrate intake, moderate protein from plant sources, and high fat intake for most of the girls. Promoting balanced diets with diversified protein sources and moderate carbohydrate and fat consumption is crucial for improving adolescent health.

HOUSEHOLD FOOD SAFETY AND HYGIENE PRACTICES IN AFRICA: KEY DETERMINANTS AND INFLUENCING FACTORS: A SYSTEMATIC REVIEW AND META-ANALYSIS

Negasa Soboksa[1]; Zoe Nomakhushe Nxusani[2]; Vhushavhelo Nedzingahe[3]; Xikombiso Mbheneyane[2]
[1]Divsion of human nutrition, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa; [2]Division of Human Nutrition, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa; [3]Human Nutrition, Stellenbosch University, Stellenbosch, South Africa

BACKGROUND AND OBJECTIVES
Food safety and hygiene practices are critical components of public health, particularly in Africa, where foodborne illnesses pose significant health risk. Despite the importance of proper food handling and sanitation practices, there is a lack of compressive data on household food safety practices across the continent. Various socio-economic, cultural, and environmental factors may influence these practices, yet the interplay between these determinants is still unclear. Thus, this systematic review aimed to analyze the key determinants and influencing factors of household food safety and hygiene practices in Africa.
METHODS
Comprehensive literature searches were performed using PubMed, Embase, African Journals Online, and ScienceDirect databases. Furthermore, Google Scholar and citations from other studies were also incorporated. We conducted our search using a combination of keywords and medical subject-heading terms linked to the study title. The study aimed to estimate household food safety and hygiene practices while also finding the key determinants and influencing factors. Two reviewers extracted data from the studies included using Excel**.** Stata version 17.0 was used to perform the meta-analysis using a random effect model.
RESULTS
In total, 33,713 published and unpublished research records were retrieved. From this, 17 studies were included for systematic review, and 7 studies were included in the meta-analysis. The prevalence of good food hygiene practice in households ranges from 17.6% to 60.0%, and major influence factors include disease awareness, availability of latrines, handwashing facilities, liquid waste disposal pits, and workload. A total of 53% (95% CI, 43%–64%) of the households included in the meta-analysis had good food safety practices. Good knowledge and a positive attitude towards food safety were key factors that enhanced food safety practices.
CONCLUSIONS
In this review, half of the households from seven African countries that took part in the studies were not practicing proper food hygiene and safety. Key influence factors for food hygiene practices include disease awareness, access to sanitation facilities, and workload, while good knowledge and positive attitudes towards food safety were crucial for improving the food safety practices of households in Africa.

INSIGHTS RELATING TO HETEROGENOUS INNATE IMMUNE TRAINING IN MONOCYTES FROM OLDER INDIVIDUALS

Sive Duncan[1]; Christopher E Shannon[2]; Anna Quinn[1]; Brian Mullen[1]; Katy Horner[3]; Martina Wallace[4]; Helen Roche[5]

[1]Nutrigenomics Research Group, UCD Conway Institute, School of Public Health, Physiotherapy and Sports Science, University College Dublin, Dublin, Ireland; [2]Nutrigenomics Research Group, UCD Conway Institute and School of Medicine, University College Dublin , Dublin Ireland; [3]School of Public Health, Physiotherapy and Sports Science, University College Dublin, Dublin, Ireland; [4]School of Agriculture and Food Science,, UCD Conway Institute, University College Dublin,, Dublin Ireland; [5]Nutrigenomics Research Group, UCD Conway Institute, School of Public Health, Physiotherapy and Sports Science, Institute for GFS, QUB., Dublin, Ireland

BACKGROUND AND OBJECTIVES

Monocytes and macrophages are key players in innate immune training (IIT), a form of immunological memory of innate immune cells. Dietary ingredients, including yeast β-glucan, can induce IIT, improving immune function. Nevertheless, IIT capacity has not been determined in older cohorts at risk of malnutrition that may benefit from immune training. Understanding this could lead to therapies enhancing IIT. The aim of this study is to examine IIT capability in monocytes from older individuals.

METHODS

Monocytes from 60 individuals over 65 were isolated and macrophage selected. IIT was tested by exposing cells to yeast β-glucan (stimulus 1) one-day post-isolation and LPS (stimulus 2) after a 4-day rest to return cells to a non-activated state. TNF-α, IL-6, and IL-10 were measured post-LPS stimulation, a ≥10% increase in cytokine response to LPS in cells pre-treated with β-glucan was classified as IIT.

RESULTS

Heterogeneous training responses were observed, with 45% and 41% of the cohort displaying TNF-α and IL-6 training responses, respectively. Training responses varied among individuals, and a significant inverse relationship with BMI & training was observed. Monocytes with higher baseline cytokine responses to LPS alone demonstrated lower training responses.

CONCLUSIONS

This study is the first to demonstrate that IIT of monocytes by β-glucan can be induced in a large proportion of subjects in an elderly cohort. Increasing BMI was associated with a lower training response, further analysis will focus on the impact of other phenotypic factors within this cohort on training.

ASSOCIATION BETWEEN FREQUENCY OF CONSUMPTION OF DAIRY PRODUCTS AND SEVERITY OF DEPRESSION SYMPTOMS AMONG UNIVERSITY STUDENTS

Joanna Kowalkowska[1]
[1]Department of Human Nutrition, Faculty of Food Science, University of Warmia and Mazury in Olsztyn, Olsztyn, Poland

BACKGROUND AND OBJECTIVES
Some studies suggest that consumption of dairy products may help maintain mental health and potentially reduce the risk of developing depression. The aim of this study was to assess an association between consumption frequency of dairy products and severity of depression symptoms among university students.
METHODS
The cross-sectional study was conducted among 304 Polish university students aged 18-26 years (74% females). Severity of depression symptoms was assessed with a subscale of the Depression Anxiety Stress Scale (DASS-21) including 7 items, and evaluated in 3 categories: normal (0-4 points; reference group), mild/moderate (5-10 points), severe (11-21 points). Dietary data were collected with the validated 72-item semi-quantitative food frequency questionnaire (72-item SQ-FFQ), including 5 items regarding dairy products (e.g., milk and natural milk beverages, cheese). Consumption of dairy products at least 2 times/day was considered as in line with dietary recommendations. Association between analysed variables was assessed using Spearman's correlation coefficient and logistic regression analysis. Odds ratios (ORs) were adjusted for sex and age.
RESULTS
Depression symptoms were mild/moderate in 37.4% and severe in 31.1% of the university students. Less than half of the university students (42.4%) consumed dairy products at least 2 times/day. Significant negative correlation of consumption frequency of dairy products with depression symptoms among university students was found ($r = -0.12$, $p = 0.038$). Students who met the recommend consumption frequency of dairy products were significantly less likely to have depression symptoms at a mild/moderate level (OR = 0.57, 95% CI = 0.33-0.99) or a severe level (OR = 0.47, 95% CI = 0.26-0.85) compared to those who consumed dairy products less than 2 times a day.
CONCLUSIONS
Consumption of dairy products at the recommended level (at least 2 times/day) was negatively associated with severity of depressive symptoms among Polish university students. Adequate dairy consumption can promote better mental health among students.

EPO5_439

ASSOCIATION BETWEEN MINDFUL EATING AND DIETARY PATTERNS AMONG UNIVERSITY STUDENTS

Joanna Kowalkowska[1]
[1]Department of Human Nutrition, Faculty of Food Science, University of Warmia and Mazury in Olsztyn, Olsztyn, Poland

BACKGROUND AND OBJECTIVES
Mindful eating is maintaining an in-the-moment awareness of the food consumed and can promote healthy food choices and better diet quality. The aim of this study was to assess an association between mindful eating and dietary patterns among university students.
METHODS
The cross-sectional study was conducted among 304 Polish university students aged 18-26 years (74% females). Mindful eating was assessed with the Mindful Eating Scale (MES) including 28 items. MES score was evaluated as the average of all item scores and analysed using two levels: low (<3 points; reference group), higher (3-4 points). Dietary data were collected with the validated 72-item semi-quantitative food frequency questionnaire (72-item SQ-FFQ). Three dietary patterns (DPs) were derived using Principal Component Analysis (PCA): Prudent, Western, Traditional, and analysed in tertiles. Association between analysed variables was assessed using Spearman's correlation coefficient and logistic regression analysis. ORs were adjusted for sex, age, and BMI.
RESULTS
The higher level of mindful eating had 49.3% of the university students. Mindful eating score was positively correlated with Prudent DP ($r = 0.20$, $p < 0.001$), and negatively correlated with Western DP ($r = -0.24$, $p < 0.001$) and Traditional DP ($r = -0.12$, $p = 0.039$). Students with the higher level of mindful eating were significantly more likely to adhere to Prudent DP (middle tertile: OR = 2.34, 95% CI = 1.29-4.27; upper tertile: OR = 2.38, 95% CI = 1.30-4.36), and significantly less likely to adhere to Western DP (upper tertile: OR = 0.30, 95% CI = 0.16-0.55) compared to those with the low level of mindful eating. Students with the higher level of mindful eating were also less likely to adhere to Traditional DP, but this association was not significant (upper tertile: OR = 0.60, 95% CI = 0.33-1.08).
CONCLUSIONS
Mindful eating was positively associated with pro-healthy dietary pattern, and negatively associated with less healthy dietary patterns among university students. Mindful eating can promote healthier dietary behaviours among students.

DETERMINANTS OF HEALTHY WEIGHT IN TEENAGERS: A WHOLE SYSTEMS APPROACH

Kathryn Hart[1]; Helen Lambert,[1]; Barbara Engel[1]; Jane Ogden[1]; Katy Penfold[2]
[1]Faculty of Health and Medical Sciences, University of Surrey, Guildford, United Kingdom; [2]School of Psychology, University of Wolverhampton, Wolverhampton, United Kingdom

BACKGROUND AND OBJECTIVES
Over a third (37%) of children aged 10-11 years, and 64% of adults in England are overweight or obese(1), indicating a steep increase during adolescence. The UK Government's Child Obesity Plan outlines strategies to address obesity in younger children but provision for the adolescent population is limited, reflecting the challenges of addressing healthy weight in this age-group. The Whole Systems Approach to Obesity (WSA)(2) is a multi-faceted approach, comprising six phases, which engages with the many determinants of healthy weight, and draws on the strengths of key community stakeholders. Following WSA phases 1-4, this study aimed to identify the factors influencing healthy weight in 13-17 year-olds in Surrey (UK), to inform a targeted local strategy.
METHODS
An online survey was distributed to those working with young people in Surrey, exploring perceived barriers and facilitators to making healthy choices in five areas: healthy eating, physical activity, weight management, mental health and wellbeing. Focus groups conducted amongst young people recruited locally explored similar areas. Causal maps were created using outputs from the survey and focus groups to enable visualisation of the underlying network of causes and effect, to identify common themes, and highlight interactions between them.
RESULTS
The survey (n=35) showed lower confidence and lack of training amongst those working with young people, in discussing the issue of healthy weight compared to other topics. The influence of role models, teachers, food environment, and peer pressure were identified by young people (n=27) as key determinants of food and activity choices. Key priority areas for action emerged from the causal mapping: supporting positive role models, including parents, teachers, youth workers and social media; improving the food environment in and outside of school; mental health support, and incorporating food and health in all local government policies, including providing safe, affordable exercise spaces. These priorities are being used locally to identify existing areas of provision that could be focussed on the needs of young people, and areas for additional input.
CONCLUSIONS
A WSA, with causal mapping, enables the multifactorial and complex macro and micro influences impacting young people (and their interactions) to be explored in depth, and priorities for action to be set which are likely to have the greatest impact on this hard-to-reach population group.

BREAST MILK INTAKE OF KENYAN INFANTS PARTICIPATING IN COMPLEMENTARY FEEDING INTERVENTION

Cecilie Eleonora Wille[1]; Nicky Okeyo,[2]; John Gachoya[3]; Dorcus Mbithe David-Kigaru[4]; Victor Owino,[5]; Pernille Kaestel,[5]; Nanna Roos[1]; Silvenus Konyole[2]
[1]Nutrition, Exercise and Sports, University of Copenhagen, Copenhagen, Denmark; [2]Nutritional Sciences, Masinde Muliro University of Science and Technology, Kakamega, Kenya; [3]Food, Nutrition & Dietetics, Kenyatta University, Nairobi, Kenya; [4]Foods, nutrition & dietetics, Kenyatta University, Nairobi, Kenya; [5]Nuclear Sciences and Applications, International Atomic Energy Agency, Vienna, Austria

BACKGROUND AND OBJECTIVES
Human milk is uniquely tailored to the individual child and is packed with nutrients and bioactive components promoting health, growth and development well beyond 6 months of age. The transition to complementary feeding (CF) in food-insecure settings is a critical period that significantly influences a child's risk of developing malnutrition. As studies progress towards finding sustainable and optimized complementary foods to help prevent the burden of undernutrition in vulnerable communities, care must be taken to not displace breastfeeding and the essential components it provides.
The main objective was to examine the impact on the human breast milk intake (HMI) in infants participating in a CF intervention. Secondary objectives explored HMI associations with growth and demographic and socioeconomic factors.
METHODS
Nested within the larger HEALTHYNSECT intervention, a sub-sample of sixty mother-infant dyads were assessed for HMI using Deuterium Dose-to-mother (DDTM) isotope technique. Dosed deuterium dilution in mother and child was measured in saliva samples over 14 days and quantified by Fourier Transform Infrared Spectroscopy (FTIR). Demographic and socioeconomic factors were assessed by interview-administered questionnaires.
RESULTS
The intervention exposures did not vary in impact on HMI amongst the on average 6.9±0.6 month old infants. The mean HMI was 783±211 g/day, providing on average 90±22% of the energy requirement. High HMI was observed irrespective of the intervention arm, indicating that the CF intervention did not displace breast milk. We found a positive association (P<0.05) between HMI and weight-for-length Z-score (WHZ) and a trend of a positive association, with length-for-age Z-score (HAZ) (P<0.10). Additional significant associates of HMI included maternal age and the number of antenatal clinic (ANC) visits during pregnancy.
CONCLUSIONS
Providing high-quality CFs did not displace breastfeeding. This study adds to the understanding of the association of breast milk intake volumes with growth and nutritional status amongst infants. Promoting continued breastfeeding and access to antenatal care in food insecure settings are keys to the prevention of undernutrition.
CONFLICTS OF INTERESTS

CO-CREATING PRACTICAL TOOLS FOR GENDER TRANSFORMATIVE NUTRITION: BRIDGING GAPS IN PUBLIC HEALTH APPROACHES ACROSS THE LIFE CYCLE

Jenna Hickey[1]; Alison Riddle[2]; Sara Wuehler[3]; Leila Dusabe[4]; Daniel Sellen[1]
[1]Anthropology, University of Toronto, Toronto, Canada; [2]Global Health, Bruyère Health, Ottawa, Canada; [3]M&E, Nutrition International, Ottawa, Canada; [4]Global Health, Bruyere Research Institute, Kigali, Rwanda

BACKGROUND AND OBJECTIVES
Gender inequalities influence nutrition outcomes across the life cycle, yet practical approaches to integrating gender into nutrition programs and policies remain underdeveloped. This participatory research project aimed to co-create tools that bridge this gap, enabling nutrition professionals to effectively address gender dimensions in their work. We developed our tools based on the Gender Transformative Framework for Nutrition (GTFN), an evidence-based model designed to help nutrition programs address gender inequalities. The GTFN highlights how gender norms, institutions and power dynamics limit women's and girls' access rates and identifies opportunities to tackle the social complexities of malnutrition.
METHODS
A co-creative, participatory approach was applied, engaging stakeholders from diverse contexts, in iterative consultations. A landscaping analysis, needs assessment, and stakeholder-led task forces provided the foundation. This process sought to integrate gender-transformative action with public health nutrition principles to ensure relevance and usability. Stakeholder feedback informed the tools' design, content, and application, ensuring local alignment.
RESULTS
The project produced three practical tools tailored for professionals to integrate gender in their life cycle approaches [and beyond] to nutrition: 1) a tool that utilizes the GTFN to take a systems-based thinking approach to problem definition, 2) a tool based on the GTFN that offers practical guidance for establishing organizational practices to implement gender-transformative programs and 3) a guidance note focused on advocating for gender-transformative nutrition approaches. Two supplementary briefing notes are also drafted to guide the integration of intersectionality into nutrition programs and policies. All resources were refined through user testing and are freely available.
CONCLUSIONS
These tools demonstrate that integrating gender into nutrition is feasible & essential for achieving equitable health outcomes across the entirety of the life cycle. The project addresses the pressing need for practical and actionable gender transformative resources. This presentation will highlight the tools' application and invite dialogue with practitioners who may not yet consider gender in their work; emphasizing the utility in creating impactful & inclusive nutrition strategies, and in program development & implementation.

A STUDY ON THE CONTRIBUTION OF NURSERY SCHOOL LUNCHES TO CHILDREN'S DIETS IN JAPAN

Atsuki Sakai; Katsushi Yoshita[1]; Takako Takahashi[1]; Tetsuko Okabe[2]; Ruriko Sasaki[3]; Hiromi Ishida[4]; Yukiko Yoshioka[5]; Miho Nozue[6]; Tatsuaki Sakamoto[7]; Nobuko Murayama[8]
[1]Department of nutrition, Osaka Metropolitan University, Osaka, Japan; [2]Department of Nutrition, Tenshi College, Sapporo, Japan; [3]Department of Food and Nutritional Science, Miyagi Gakuin Women's University, Sendai, Japan; [4]Department of Applied Nutrition, Kagawa Nutrition University, Sakado, Japan; [5]Department of Nutritional Management, Sagami Women's University, Sagamihara, Japan; [6]Department of Health and Nutritional Sciences, Tokoha University, Hamamatsu, Japan; [7]Department of Food &Health Sciences, Prefectural University of Kumamoto, Kumamoto, Japan; [8]Department of Health and Nutrition, University of Niigata Prefecture, Niigata, Japan

BACKGROUND AND OBJECTIVES
In Japanese nursery schools, meals are systematically prepared by dietitians. However, virtually no detailed studies have examined the actual contribution of nursery school lunch to children’s diet. The purpose of this study was to evaluate the current contribution of nursery school lunch to the diet of children attending nursery schools in Japan.
METHODS
This study included 778 children (435 boys and 343 girls, totaling 1,556 person-days), aged 3–6 years, from nursery schools in seven cities in Japan. Food records were collected on two nonconsecutive weekdays in 2019 and 2020 by using food record methods. Meals were classified into four categories: breakfast, lunch, dinner, and snacks, with lunch provided at the nursery schools. We estimated the usual intake, based on the nutrient intake from two weekdays. We calculated the lunch contribution rate for each child as the lunch intake divided by total intake and determined the mean values, based on sex.
RESULTS
The mean total energy intake on weekdays was 1,476 ± 169 kcal for boys and 1,367 kcal for girls. The energy of lunch was 402 ± 67 kcal for boys and 382 ± 60 kcal for girls, with lunch contribution rates of 27.6% and 28.4%, respectively. Nutrients with less than 20% contribution from lunch were calcium and saturated fatty acids. Nutrients with more than 30% contribution included protein, dietary fiber, vitamin A, thiamine, vitamin C, potassium, magnesium, iron, zinc, and copper.
CONCLUSIONS
This study is the first to comprehensively examine the contribution of nursery school lunches to children’s dietary intake across multiple regions in Japan. The findings indicated that children attending nursery schools consumed more than 30% of their total intake of vitamins and minerals from lunch on weekdays. Furthermore, the nursery school lunches provided a diet low in saturated fatty acids, the intake of which should be restricted, suggesting that lunches may be designed to provide desirable nutrient intake for children. The low calcium contribution rate was likely because milk, a primary calcium source, was provided as a post-lunch snack and thus not included in the lunch contribution rate. Future research should evaluate the contribution rate, including snacks provided by nursery schools, and assess nutrient intake at nursery schools using dietary reference intake for Japanese.
CONFLICTS OF INTERESTS

ASSOCIATION BETWEEN HEALTH LITERACY AND DIETARY HABITS/INTEREST IN FOOD INFORMATION AMONG YOUNG WOMEN

Minatsu Kobayashi[1]; Kyoko Bessho[1]; Mieko Horiguchi[2]
[1]Food Science, Otsuma Women's University, Tokyo, Japan; [2]Junior College Division, Otsuma Women's University, Tokyo, Japan

BACKGROUND AND OBJECTIVES
In Japan, approximately 19.1% of young women have a BMI < 18.5, raising concerns about nutritional deficiencies and hormonal imbalances. "Normal weight obesity," characterized by normal BMI but high body fat percentage, is an emerging issue. The proliferation of health information through social media has improved accessibility and spread misinformation. “Health literacy," defined by WHO as the ability to access, understand, and utilize health-related information, is critical for maintaining health. This study examined relationships between health literacy, body type, lifestyle habits, dietary habits, and mental health among young Japanese women to identify factors promoting healthier lifestyles.
METHODS
A cross-sectional survey was conducted with 261 female university students at O University in Tokyo in 2023 and 2024. Health literacy was assessed using the CCHL scale, with the average score calculated from five items. Dietary habits were evaluated using 28 items on a four-point scale, while interest in food information was assessed with 13 items indicating interest. Body composition was measured using InBody770, and participants were classified into four groups: underweight, expected weight, normal weight obesity, and overweight. Chi-square tests analyzed associations between health literacy and factors. Binomial logistic regression was conducted with CCHL scores (≤3.2 vs. >3.2) as the dependent variable and depressive tendencies, dietary habits, and interest in food information as variables.
RESULTS
Quartile analysis CCHL showed no significant differences in body type or depressive tendencies. However, significant differences were observed in dietary habits, with the low health literacy group reporting lower frequencies of considering nutritional balance and consuming a diverse range of foods at least five times weekly ($p < 0.01$). The low health literacy group also showed less interest in "nutrition" and "food culture" ($p < 0.05$). Multivariate analysis revealed a significant association between higher CCHL scores and interest in food culture (OR: 0.40, 95% CI: 0.17–0.97).
CONCLUSIONS
Health literacy was not directly associated with body type or depressive tendencies but influenced dietary habits and interest in food information. Participants with low health literacy demonstrated reduced awareness of nutritional balance and dietary diversity and lower engagement with food culture. These findings underscore the importance of health literacy education in fostering improved health behaviors, greater interest in nutrition, and promoting healthier lifestyles.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

FOOD LITERACY AMONG JAPANESE JUNIOR HIGH SCHOOL STUDENTS

Katsura Omori[1]
[1]Academic Assembly, Yamagata University, Yamagata-city, Japan

BACKGROUND AND OBJECTIVES

In Japan, the *Shokuiku* (Food Education) Basic Act was enacted in 2005, and the government has promoted *Shokuiku* as an essential education for all generations. Our school lunch system and Home Economics class has played a key role in *Shokuiku* at school. We are currently facing not only health problems but also societal issues such as food waste and poor self-sufficiency. The concept of food literacy has become more important to practice healthy and sustainable eating around the world. The objective of our research is to assess students' food literacy in order to develop effective methods for food education at school.

METHODS

We developed an original questionnaire on food literacy which contained 34 items to assess a wide range of the attitudes, knowledge, skills and behaviors associated with students' dietary life. This questionnaire was distributed in Home Economics classes at two public schools in Yamagata prefecture. The answers of 187 students were analyzed using descriptive statistics. SPSS was also used for statistical analysis and significance was determined at $P < .05$.

RESULTS

More than 80% of the students in both schools answered positively about eating breakfast every day and recycling food containers. Also, most of them answered that they washed their hands before cooking and eating. However, less than 50% of them showed the positive action with regard to searching and using information for healthy eating. In addition, around 40% of the students answered that they sometimes wasted food by leaving it uneaten. As for nutritional knowledge, more than 90% of them could correctly choose rice as a good source of carbohydrates, and fruits & vegetables as a good source of vitamin C. Around half of the students could plan a healthy menu from several food items such as rice, fruits & vegetables, meat & fish and milk.

CONCLUSIONS

Our RESULTS suggest that Japanese junior high school students have positive attitudes towards eating breakfast regularly, recycling food containers and food sanitation. They understood the nutritional value of rice and fruits & vegetables. It is expected that the Japanese *Shokuiku* could have a positive effect on students' attitudes and knowledge. Furthermore, it is necessary for the students to learn how to utilize information appropriately for practicing healthy eating through food education at school.

FRAMEWORKS AND LOGIC MODELS DESCRIBING CONSUMER RESPONSE TO FRONT-OF-PACK LABELLING (FOPLS): A SCOPING REVIEW

Batoul YAZBECK[1, 2, 3]; Ghosn Lina[4, 5]; Boutron Isabelle[4, 5, 3]; Chantal Julia[2, 6]
[1]Ecole Doctorale Galilée, Paris University 13 - Bobigny Campus, Bobigny, France; [2]Équipe de Recherche en Épidémiologie Nutritionnelle (EREN), Sorbonne Paris Nord University, Inserm, CNAM, INRAE, Bobigny, France; [3]Cochrane France, Cochrane, Paris, France; [4]Méthodes d'évaluation thérapeutique des maladies chroniques, Center Research Epidemiology And Statistics - Inserm University Paris City, Paris, France; [5]Centre d'Épidémiologie Clinique, Hôpital Hôtel-Dieu - APHP, Paris, France; [6]Département de Santé Publique, Hôpitaux Universitaires Paris Seine-Saint-Denis, APHP, site Avicenne, Bobigny, France

BACKGROUND AND OBJECTIVES
The WHO defines front-of-pack nutrition labellings (FOPLs) as nutrition labelling systems displayed on the front of food packages and they provide consumers with simplified information on the nutritional content of food products(1). Hence, understanding consumer response to these FOPLs is essential(2). Few structural frameworks and logic models were created to illustrate how different domains interact in shaping consumer responses to FOPLs. Many domains were commonly explored in various ways in some of the frameworks or logic models, while partially included in others(3,4). However, the limited number of frameworks and logic models presented in the literature makes it challenging for researchers and policy makers to have a predefined structure describing the consumer response to FOPLs.
This scoping review aims to identify frameworks and logic models describing consumer response to FOPLs. Secondarily, we will specify and categorise the different domains of each framework or logic model, determine how these these were developed, analyse the commonalities and differences between them and explore citation patterns existing in the literature.
METHODS
We will conduct a scoping review of studies publishing a framework or logic model describing consumer response to FOPLs. Studies will be identified through PubMed, Embase, Scopus, Web of Science and the first ten pages of Google Scholar. We will develop the search strategy with input from the information specialist and the project team and adapted to each database. A sample of the references will be screened in duplicate for title and abstract with consensus in case of disagreement. Full texts will be then screened by two authors and disagreements will be resolved through a discussion with a third author. A standardised data extraction involving both standard and qualitative data collection will be developed and piloted. We will extract the following information: general characteristics, framework or logic model constituents and the links between them, information on how the framework or logic model was developed, data on the citation of these frameworks in existing research and data on the methods of the studies.
RESULTS
We will descriptively summarise the various elements included in the study and the frameworks or logic models. Then, we will categorise domains progressively. Finally, we will analyse the commonalities and differences between the different domains.
CONCLUSIONS
Providing a consensus framework makes it easier for researchers and policy makers to have a predefined structure describing the consumer response to FOPLs. Therefore, this may enhance the synthesis of evidence thus limiting research waste and boosting policy modifications.

DAIRY INTAKE AND CHRONOTYPE IN PERI- AND POSTMENOPAUSAL WOMEN: A PRELIMINARY CROSS-SECTIONAL STUDY

Beata Stasiewicz[1]
[1]Department of Human Nutrition, University of Warmia and Mazury in Olsztyn, Olsztyn, Poland

BACKGROUND AND OBJECTIVES
It is known that a diet based on milk and dairy is effective in improving sleep quality. However, the association of dairy consumption with chronotype remains unknown. This study aimed to assess the association of total dairy intake and the main dairy groups with chronotype in peri- and postmenopausal women.
METHODS
This preliminary cross-sectional study involved 236 women aged 48-68 years from north-eastern Poland. Dietary data was collected using a food frequency questionnaire (62-item FFQ-6®). Data on the frequency consumption of five dairy groups: milk/fermented milk drinks, sweetened milk drinks, cheese, cheese curd, and flavored cheese curd was expressed in times per day and then summarized as total dairy consumption. The five-item Women's Health Initiative Insomnia Rating Scale (WHIIRS) was calculated (ranged 0-20 points). Based on the declared data on the time of greatest activity during the day, women were divided into two groups according to chronotype: ‘morning’ and ‘evening’. The logistic regression analysis was performed. The odds ratios (ORs) and the 95% confidence interval (95%CI) were calculated. The ORs were adjusted for age, BMI, WHIIRS, professional status, overall physical activity, using a smartphone/tablet/telephone/computer/TV before sleep, menopausal symptoms, and chronic diseases.
RESULTS
The total dairy consumption at least two times/day and milk/fermented milk drinks consumption at least once a day were associated with approx. two-times higher odds of evening chronotype occurrence compared to the morning chronotype, independently of many potential confounders (OR=1.86, 95%CI: 1.01-3.41, $p<0.05$; OR=1.90, 95%CI: 1.04-3.47, $p<0.05$, respectively). A one-time/day increment in cheese consumption increased the odds of evening chronotype occurrence, however, this association disappeared after adjustment. There were no significant associations of consumption of sweetened milk drinks, and cheese curds, including flavored with women's chronotype.
CONCLUSIONS
A higher consumption of milk and total dairy was positively associated with the evening chronotype in women from north-eastern Poland. The higher frequency consumption of milk and total dairy could result from sleep quality care by women with evening chronotype.

ADHERENCE TO THE MEDITERRANEAN DIET AND CHRONOTYPE IN PERI- AND POSTMENOPAUSAL WOMEN: A PRELIMINARY CROSS-SECTIONAL STUDY

Beata Stasiewicz[1]
[1]Department of Human Nutrition, University of Warmia and Mazury in Olsztyn, Olsztyn, Poland

BACKGROUND AND OBJECTIVES
Available studies indicate a beneficial effect of adherence to the Mediterranean diet (MED) on sleep quality. However, the RESULTS of studies on MED and chronotype in European countries outside the Mediterranean Sea region are limited and inconclusive. This study aimed to assess the association between adherence to the Mediterranean diet expressed in the Polish-adapted Mediterranean Diet® (Polish-aMED®) score and chronotype in peri- and postmenopausal women.
METHODS
This preliminary cross-sectional study involved 236 women aged 48-68 years from north-eastern Poland. The food frequency consumption data was collected using a food frequency questionnaire (62-item FFQ-6®). The Polish-aMED® score involving 8 items: vegetables, fruit, whole grain, fish, legumes, nuts/seeds, the ratio of vegetable oils to animal fat, and red/processed meat was calculated (range: 0-8 points). The five-item Women's Health Initiative Insomnia Rating Scale (WHIIRS) was calculated (ranged 0-20 points). Based on the declared data on the time of greatest activity during the day, women were divided into two groups according to chronotype: ‘morning’ and ‘evening’. The logistic regression analysis was performed. The odds ratios (ORs) and the 95% confidence interval (95%CI) were calculated. The ORs were adjusted for age, BMI, WHIIRS, professional status, overall physical activity, using a smartphone/tablet/telephone/computer/TV before sleep, menopausal symptoms, and chronic diseases.
RESULTS
The ORs of the morning chronotype compared to the evening chronotype (OR=1.00) were approx. two-times higher for women with a higher level of adherence to the Polish-aMED® score (6-8 vs. 0-3 points, OR=2.39, 95%CI: 1.12-5.09, $p<0.05$), those who consumed fruit at least once a day (OR=1.86, 95%CI: 1.04-3.33, $p<0.05$), and had a ratio of vegetable oils to animal fat consumption at least one (OR=2.54, 95%CI: 1.15-2.59, $p<0.05$), independently of many potential confounders. Consumption of legumes and nuts/seeds at least several times/week also increased the odds of morning chronotype occurrence, however, this association disappeared after adjustment.
CONCLUSIONS
The higher adherence to the Mediterranean diet in Polish adaptation was positively associated with the morning chronotype in women from north-eastern Poland. These RESULTS may provide a basis for dietary recommendations taking into account the circadian rhythm of women living in non-Mediterranean countries.

ASSOCIATION BETWEEN SWEETS INTAKE AND PREMENSTRUAL SYNDROME ~ CROSS-SECTIONAL SURVEY OF JAPANESE YOUNG ADULT WOMEN ~

Mitsuki Ohashi[1]; Kikuno Oneda[1]; Haruna Ogawa[1]; Hiyori Sato[1]; Reiko Suzuki[1]
[1]Nutrition, Japan Women's University Mejiro Campus, Bunkyo City, Japan

BACKGROUND AND OBJECTIVES
Recent epidemiological studies of young adult women have reported relationship between sweets intake and Premenstrual Syndrome, but the RESULTS are inconsistent. Therefore, we conducted a cross-sectional survey of Japanese young adult women to examine the association between sweets and Premenstrual Syndrome.
METHODS
The subjects were 519 Japanese young adult women aged 18-29 years. Estimated sweets intake was assessed using the food frequency questionnaire FFQgVer.6, which has been validated. The presence or absence of Premenstrual Syndrome was assessed using a self-report questionnaire. The association between sweets intake and Premenstrual Syndrome was evaluated using logistic regression analysis. The statistical significance level was set at $p<0.05$.
This survey was approved by the ethics review committee of Japan Women's University (No. 499) and was carried out according to the ethics guidance on medical research for people (Ministry of education Ministry of Health, Labour and Welfare)
RESULTS
We observed a statistical significant positive association between sweets intake and Premenstrual Syndrome.
Age-adjusted OR (Q4 vs. Q1) = 2.21 (95% CI: 1.34-3.64: p=0.0023)
Multivariate-adjusted OR = 2.26 (95% CI: 1.36-3.73:0.0021)
CONCLUSIONS
Our study suggested that those with higher sweets inatake had a higher risk of Premenstrual Syndrome in Japanese young adult women.

ACTIONS AND CHALLENGES OF COMMUNITY COMPREHENSIVE SUPPORT CENTERS FOR PREVENTING MALNUTRITION IN OLDER ADULTS

Junko Karashima[1]; Yuki Mizukami[2]; Emiko Harashima[3]
[1]Faculty of Human Life Sciences, Jissen Women's University, Hino, Japan; [2]Faculty of Nutritional Science, Sagami Women's University, Sagamihara, Japan; [3]Health and Medical Sciences, Kanagawa Institute of Technology, Atsugi, Japan

BACKGROUND AND OBJECTIVES
In Japan, the number of people aged 65 years and above is 36.23 million, accounting for29.1% of the total population. By 2070, one in 2.6 people will be 65 years old and over, and one in 4.0 will be 75 years old and over. Therefore, highly individualized and complex support is required forthe older adults in the community. Japan's community comprehensive support centers areintended to provide residents with comprehensive support by offering the assistancenecessary to maintain their health and stabilize their lives. This study aimed to examine thenutritional challenges and support status of older adults in the community, as captured by these community comprehensive support centers.
METHODS
A mailed questionnaire survey regarding nutritional issues and support for older adults in thecommunity was conducted from July to August 2023 at community comprehensive supportcenters in Tokyo and Kanagawa prefectures.
RESULTS
The survey covered 840 centers, from which311 responses were obtained (response rate of 37.0%).Among the criteria for determining malnutrition, the most common criteria were thinappearance (84.6%), weight loss or rate of weight loss (79.1%), and decreased food intake(78.8%). In contrast, blood test RESULTS (40.8%), lower leg circumference (15.8%), and MNA®-SF (1.3%), which can objectively assess malnutrition, were not generally utilized. The mostcommon support methods for malnutrition were recommending visits to medical institutions(89.1%), the use of meal delivery services (83.3%), and checking for food intake (77.8%).Very few centers (6.1%) implemented the calculation of energy and nutrient intake throughmeals to ensure that the required amounts were administered. No nutrition specialists wereassigned to the community support centers, and the percentage of those who regularlycollaborated with a registered dietitian was low (12.5 %).
CONCLUSIONS
This study suggests that properassessment and specialized nutritional intervention are necessary to prevent malnutrition incommunity-dwelling older adults.
CONFLICTS OF INTERESTS

IMPLEMENTING HEALTHY EATING INTERVENTIONS IN FOOD RETAILERS: STAKEHOLDER MAPPING AND ANALYSIS IN SMALL MUNICIPALITIES IN BRAZIL

Beatriz Lainy Penha Marques Torres[1]; Gabriela Kimie De Azevedo Kimura[1]; Camila Aparecida Borges[2]; Patricia Constante Jaime[1]; Ana Paula Bortoletto Martins[3]
[1]Nutrition in Public Health, University of Sao Paulo, São Paulo, Brazil; [2]Food Science and Technology, University of Sao Paulo, São Paulo, Brazil; [3]Nutrition Department / School of Public Health, University of Sao Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
Excessive ultra-processed food consumption is a significant risk factor for non-communicable diseases (NCDs), such as obesity. Smaller cities face additional challenges due to limited access to healthy foods, making ultra-processed options more accessible (Cacau et al.,2024; Louzada et al.,2015). Engaging stakeholders is, therefore, crucial to driving food policy changes and supporting interventions. This study aims to map and analyze stakeholders for interventions in small Brazilian food retailers to promote healthier food choices.
METHODS
We used a mixed-methods approach, selecting seven municipalities in the São Paulo State, Brazil based on demographic, socioeconomic, and nutritional status criteria. Stakeholders were mapped through searches on government websites, municipal administrations, Google Maps, and data from previous field visits. Stakeholder analysis followed a structured plan covering stages of identification, data collection, and categorization (public, private, hybrid, or third-sector actors). We also applied Mendizabal's Alignment, Interest, and Influence Matrix (AIIM) to identify stakeholders with higher levels of influence and alignment with the development of an intervention in small Brazilian food retailers to promote healthier food choices (Hollmann et al.,2022; Lacy-Nichols et al.,2023; Mendizabal,2010).
RESULTS
An initial search mapped 62 municipal actors across the seven municipalities included in the study. Exploratory in-person visits and virtual meetings identified additional actors, totaling 93, including public entities (52.7%), third sector (19.3%), hybrid (17.2%), and private entities(10.8%). The AIIM indicated that actors with the highest alignment and interest scores were the Health Secretariats and the Ministry of Health while opposing actors included local commercial and industrial associations.
CONCLUSIONS
The mapping and analysis of stakeholders across seven municipalities will support the development and execution of an engagement plan. The involvement of local actors is key to reducing barriers to intervention. Key actors, such as Health Secretariats and the Ministry of Health, were identified as crucial for the potential scalability and sustainability of the food retail interventions, including the implementation of food environment policies on a national scale.

DIETARY PATTERNS AND THE RISK OF EATING DISORDERS AMONG HEALTH SCIENCE STUDENTS IN A TERTIARY INSTITUTION IN GHANA

Frank Hayford[1]; Abubakari Fatayia[1]; Owoo Ruth[1]
[1]Department of Dietetics, College of Health Sciences, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES
Health is a comprehensive term encompassing physical, mental and social well-being. Often, people lose sight of this holistic approach, emphasizing only on the physical aspect. Adjustments to new environments, changes in the food environment, coupled with stressful studying schedules are common features associated with university students. Hence, the need to assess dietary pattern and risk of eating disorders among this population to ensure adequate measures are put in place to deal with such problems should they exist. Thus, the study sought to determine whether there was an association between dietary pattern and risk of eating disorder among these students.
METHODS
It was a descriptive cross-sectional study among 200 health science students randomly selected from the college of health sciences campus of the University. Food frequency questionnaires were administered to assess participants' frequency of intakes. Principal component analysis was used to determine dietary patterns from frequency of intakes. The validated Eating Attitudes Test - 26 (EAT- 26) questionnaire was used to assess their risk of eating disorders. Statistical Package for Social Sciences (SPSS) version 26 was used for data analysis.
RESULTS
Most (54.9%) participants were females. Participants' age ranged between 18 – 27 years. About a sixth (14.6%) of participants were at risk of eating disorders. Two major dietary patterns were identified, nutrient dense pattern and convenience dietary patterns. Nutrient-dense dietary pattern accounted for the largest variance in the food consumption data. It consisted of legumes and nuts, vegetables, oils, and oily foods. There was no significant association between the convenience and nutrient - dense dietary patterns and the risk of eating disorders ($p=0.568$ & $p=0.433$ respectively)
CONCLUSIONS
There was a low risk of eating disorders among the health science students and there was no association between the dietary patterns and the risk of eating disorders. Nevertheless, continuous nutrition education is still needed among this population to prevent eating disorders and its associated health implications

ASSOCIATION BETWEEN ANTHROPOMETRIC INDICES AND DIETARY PATTERNS OF OLDER ADULTS WITH PERIODONTAL DISEASE; A CROSS-SECTIONAL STUDY

Frank Hayford[1]; Franklina Addae[1]; Ndanu Thomas[2]
[1]Department of Dietetics, College of Health Sciences, University of Ghana, Accra, Ghana; [2]Department of Community and Preventive dentistry, University of Ghana Dental School, University, Accra, Ghana

BACKGROUND AND OBJECTIVES
Periodontal disease (PD) affects about 743 million people globally and is a growing public issue. It reduces the quality of life of older adults and is a major cause of tooth loss. However, the association between dietary patterns and anthropometric indices among older adults with PD is not clear. Hence, the critical need to investigate these interactions of public health concern.
METHODS
Socio-demographic information and dietary data were obtained using a structured questionnaire, and a validated qualitative food frequency questionnaire respectively. Height was measured by a stadiometer and a bioelectric impedance analyzer used to measure weight, body mass index, body fat, visceral fat, and muscle mass. Dietary patterns were determined using Principal Component Analysis (PCA). Pearson's correlation and an independent T-test were used to determine the relationships at statistical significance level of $p \leq 0.05$.
RESULTS
Nine dietary patterns were identified using the frequency of dietary intakes out of the 57 food items investigated. Cereals and grains were mostly consumed (31.4%) with majority (23%) being males. Similarly, vegetables (47.5%), legumes and nuts (56.9%), animal and animal products (37.3%) and high sugary foods (75.5%) were consumed on a weekly basis. The dietary Pattern of participants was more of the “Sweets and Alcoholic Beverages”. A weak positive relationship (r=.283, p=0.000) between muscle mass and “sweets and alcoholic beverages patterns” was established, and a weak negative association (r=-.188, p=0.007) between body fat and “shellfish dietary pattern”. “The shellfish dietary pattern” had a weak positive association (r=.205, p=0.003) with muscle mass. “High Protein dietary Pattern” had a weak negative association (r=-.171, p=0.014) with muscle mass.
CONCLUSIONS
The frequency of dietary intake revealed that older adults with PD consumed more sugary foods and alcoholic beverages, suggestive of “sweets and alcoholic beverages dietary patterns”, despite their disease condition. “High Protein dietary Pattern” on the other hand had a weak negative association with muscle mass. There is therefore the need for counsel for older adults to adopt healthier eating patterns and to establish healthier body weights by dieticians.

DIGITAL SWEETNESS: HOW SOCIAL MEDIA MARKETING AFFECTS SUGAR-SWEETENED BEVERAGE CONSUMPTION AMONG ADOLESCENTS IN TAIWAN

Chi-Hsuan Liu[1]; Yi-Chun Chen[1]; Bai Chyi-Huey[2]; Cheng Yu-Yao[3]; Mei Chung[4]; Shu-Han Yang[1]
[1]School of Nutrition and Health Sciences, College of Nutrition, Taipei Medical University, Taipei, Taiwan; [2]Department of Public Health, School of Medicine, Taipei Medical University, Taipei, Taiwan; [3]Department of Health and Nutrition, Chia Nan University of Pharmacy and Science, Tainan, Taiwan; [4]Friedman School of Nutrition Science and Policy, Tufts University, Medford, United States of America

BACKGROUND AND OBJECTIVES
Recent research indicated that sugar-sweetened beverage (SSB) consumption among Taiwanese adolescents was quite high. Pervasive marketing campaigns on social media may be a key factor influencing dietary behaviors. This study, employing the Theory of Planned Behavior (TPB) framework, aimed to investigate how social media marketing (SMM) affects adolescents' SSB consumption behaviors in Taiwan.
METHODS
A cross-sectional online survey assessed self-reported SSB consumption behaviors, social media engagement, and SMM-related TPB factors among 654 senior high school students who were regular SSB consumers and active social media users. Participants were grouped by weekly SSB consumption frequency: low-consumption (1–3 times), medium-consumption (4–6 times), and high-consumption (≥ 7 times).
RESULTS
Males, non-metropolitan school students, those with a high weekly allowance (≥ NT$1000 (≈US$31)), those with a preference for more-sugar options, those who spent ≥ 3 hours daily on social media, and those who exhibited a higher level of exposure to SMM were significantly correlated with high SSB consumption. After adjusting for certain demographic factors, the multinomial logistic regression model revealed that screen time, SMM-related perceived behavioral controls, and SMM-related purchase intentions affected SSB consumption. Furthermore, SMM-related purchase intentions mediated this impact.
CONCLUSIONS
This study emphasizes the need for stricter regulations on social media food marketing to protect adolescents. Further research should explore effective strategies leveraging social media to reduce adolescents' SSB consumption.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

タイトルを入力しVIEWPOINTS ON DESIRABLE HEALTH CONDITIONS, AND TRAINING SATISFACTION AMONG UNIVERSITY ATHLETESてください

Wakako TATSUTA[1]; Mizuho Adachi[2]; Takayo Inayama[3]
[1]College of Sports Sciences, Nihon University Sangenjaya Campus, Setagaya City, Japan; [2]Department of Physical Education, Nippon Sport Science University, Setagaya City, Japan; [3]Department of Food and Health Sciences, The University of Nagano, Nagano, Japan

BACKGROUND AND OBJECTIVES
In recent years, nutritional and dietary support for athletes has been widely implemented. However, not all support aligns with established nutrition management theories. One underlying factor is the challenge of setting outcome goals for athletes. In addition to applying objective indicators, which are typically limited by their invasiveness and cost, identifying simple and valid health assessment indicators could facilitate their use in assessments during nutrition education interventions. This study aimed to identify the health and nutritional status items that athletes strive for as a preliminary step toward creating a health assessment score that can serve as an outcome goal for nutrition education interventions.
METHODS
From June to July 2024, individual interviews were conducted with eight university student athletes and eight sports coaches. The interview questions focused on (1) desirable health conditions for training and (2) perspectives for evaluating satisfaction with training. Verbatim interview transcripts were created, and the textual data were segmented into individual content units. For each segmented piece of information, we summarized (coded) the content into concise and appropriate codes. Codes with similar content were grouped into subcategories and subsequently into broader categories.
RESULTS
Desirable health conditions for training were summarized into 18 subcategories and further grouped into 7 categories: “overall physical condition,” “musculoskeletal condition,” “digestive condition,” “weight control,” “psychological condition,” “prevention of symptoms and injuries,” and “other health conditions.” Ten subcategories, such as “energy is replenished,” “fatigue recovery is achieved,” and “not feeling exhausted during training” were identified by both athletes and coaches. Perspectives for evaluating training satisfaction were summarized into 24 subcategories and further grouped into nine categories: “performance,” “goal setting and achievement,” “psychological satisfaction,” “technical satisfaction,” “physical satisfaction,” “adjustment ability,” “physical outcomes,” “relative self-evaluation,” and “observational evaluation by coaches.” Among these, nine subcategories, including “performance,” “maintaining focus,” and “approaching training without anxiety,” were common to both athletes and coaches.
CONCLUSIONS
Based on these findings, this study aimed to develop and validate health indicators for athletes.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

A STUDY ON COMPARATIVE ANALYSIS OF THE BACTERIAL COMMUNITIES IN THE GUT OF HEALTHY, OBESE AND UNDERWEIGHT CHILDREN

Jovis Jacob[1]; Samarasimha Reddy[1]; K Venkatesh[2]; Jj Babu Geddam[3]; K Rajender Rao[4]
[1]Clinical Epidemiology, ICMR - National Institute of Nutrition, Hyderabad, India; [2]MYAS-NIN, Extension and Training Division, ICMR - National Institute of Nutrition, Hyderabad, India; [3]Clinical Epidemiology, ICMR-National Institute of Nutrition, Hyderabad, India; [4]Animal Facility, ICMR - National Institute of Nutrition, Hyderabad, India

BACKGROUND AND OBJECTIVES
Gut dysbiosis, marked by an imbalance between beneficial and harmful bacteria, is a characteristic feature of malnutrition. However, there is a lack of a standardized microbial index for assessing gut health in community studies. Therefore, the objective of the study is to determine the relative abundance of key bacterial communities in underweight, obese, and normal-weight children and adolescents using the quantitative PCR technique (qPCR).
METHODS
A case-control study was conducted in the urban settlement of India with children aged 6-18 years (n=72) categorized into three equal groups: thin (BAZ <-2 SD; case – group 1), normal-weight (controls), and obese (BAZ> 2SD, case – group 2). Electronic data collection toolkit was used to collect data on socio-demographic characteristics and standardised equipment was used to collect data on anthropometry. Fecal samples were collected and analyzed using the Roche Light Cycler 480 PCR machine by the qPCR technique. The relative abundance of target bacteria species were calculated with respect to the abundance of total bacteria species of each sample. The level of significance was kept $p<0.05$ for ANOVA.
RESULTS
The data of qPCR revealed a significantly higher abundance of Lactobacillus and Bacteroides in obese children.The increased abundance of Lactobacillus is probably due to small intestinal bacterial overgrowth in obese children and an increased Bacteroides could be due to an high bile turnover leading to an increase in bile tolerant bacteria Bacteroides. The abundance of Bifidobacterium was found to be higher in normal children and a lower abundance in obese children. The lower abundance of Bifidobacterium in obese children could be due to increased chronic inflammation in colon.
CONCLUSIONS
qPCR based biomarkers can be used to screen gut health of children in communities. Early response to interventions may be easily evaluated by using these markers.

CHANGES OF PREGNANT WOMEN'S BODY COMPOSITION AT DIFFERENT GESTATIONAL WEEKS AND ITS CORRELATION WITH NEONATAL BIRTH WEIGHT

Rong Xiao[1]; Huanling Yu[1]
[1]School of Public Health, Capital Medical University, Beijing, China

BACKGROUND AND OBJECTIVES
Changes in maternal body composition during pregnancy are associated with pregnancy outcomes, Neonatal birth weight is an important indicator for assessing maternal nutritional status and fetal health. This study aims to examine the changes in body composition throughout pregnancy and investigate their correlation with neonatal birth weight.
METHODS
A total of 479 singleton pregnant women who delivered at Fuxing Hospital, Capital Medical University, between 2017 and 2019 were included. Body composition measurements, including body fat, body fat percentage, trunk fat mass, and visceral fat area, were obtained using a body composition analyzer. The relationship between these body composition parameters at different stages of pregnancy and neonatal birth weight was analyzed.
RESULTS
Body composition increased with advancing gestational age. Pearson correlation analysis revealed a positive correlation between body fat and trunk fat mass in mid-to-late pregnancy and neonatal birth weight. In the late pregnancy period, visceral fat area also showed a positive correlation with birth weight (p<0.05). After adjusting for covariates, body fat and trunk fat mass in late pregnancy remained positively correlated with neonatal birth weight, with statistical significance (p<0.05). The trend of change in body fat during pregnancy was positively associated with birth weight (B = 55.27, p = 0.000). Similarly, the trend of change in body fat percentage was positively correlated with birth weight (B = 37.52, p = 0.014), and the trend of change in visceral fat area was also positively associated with birth weight (B = 8.96, p = 0.000).
CONCLUSIONS
Changes in maternal body composition during pregnancy can influence fetal birth weight.

EFFECT OF ULTRA-PROCESSED FOOD CONSUMPTION ON THE GUT MICROBIOTA IN THE FIRST YEAR OF LIFE

Lucas Damasio Faggiani[1]; Paula França[1]; Sofia Gonçalves Seabra[2]; Ester Cerdeira Sabino[3]; Lu Qi[4]; Marly Augusto Cardoso[1]

[1]Department of Nutrition, Universidade de São Paulo, São Paulo, Brazil; [2]Instituto de Higiene e Medicina Tropical (IHMT), Universidade NOVA de Lisboa, Lisboa, Portugal; [3]Instituto de Medicina Tropical, Faculdade de Medicina da Universidade de São Paulo, São Paulo, Brazil; [4]Department of Epidemiology, Tulane University School of Public Health and Tropical Medicine, New Orleans, United States of America

BACKGROUND AND OBJECTIVES

The first years of life are fundamental for the establishment of the gut microbiota, with diet being one of the main early exposures. The beneficial effect of breastfeeding is well known; however, there are important gaps in the literature on the effects of ultra-processed food (UPF) consumption and research on healthy children in low- and middle-income countries, particularly in longitudinal and large sample designs. Through a population-based prospective birth cohort study, we investigated the effects of UPF consumption on the gut microbiota of children during the first year of life.

METHODS

This study included children from the MINA-Brazil population-based birth cohort with gut microbiota data available at the 1-year follow-up (n=728). Data on breastfeeding practices were collected after childbirth and during follow-up visits. Complementary feeding was measured using a semi-structured questionnaire, referring to the day before the interview at the 1-year follow-up. A combined variable was generated according to breastfeeding practices and UPF consumption and was used as an independent variable in the adjusted median regression models, with alpha diversity parameters as the dependent variable. Beta diversity was analyzed using PERMANOVA according to Bray–Curtis dissimilarity and db-RDA adjusted by covariates. Relative abundance was analyzed using ANCOM-BC (FDR) and MaAsLin2 was used for multivariable analysis.

RESULTS

Weaned children who consumed UPF showed a significant increase in alpha diversity for all parameters in the median regression models (Observed ASVs: p-adj=.005; Shannon: p-adj=.036; Chao1: p-adj=.026; Simpson: p-adj=.012) and in beta diversity (PERMANOVA: p-adj=.006; db-RDA: p-adj<.001) compared to breastfed children who did not consume UPF. Breastfed children who did not consume UPF had a higher relative abundance of *Bifidobacterium* than weaned children who consumed UPF (p-adj<.001 for ANCOM-BC and MaAsLin2) and a lower relative abundance of *Firmicutes* (p-adj<.001 for MaAsLin2), *Blautia* (p-adj<.001 for ANCOM-BC and MaAsLin2), *Sellimonas* (p-adj=.008 for ANCOM-BC) and *Finegoldia* (p-adj=.045 for MaAsLin2) than weaned children who consumed UPF.

CONCLUSIONS

The findings of this cohort study suggest that UPF consumption may have effects on the diversity and abundance of the gut microbiota, being enhanced in children who have already been weaned.

ASSOCIATION BETWEEN EARLY ADIPOSITY REBOUND AND THE INTAKE OF GRAIN, FISH AND MEAT, AND VEGETABLE DISHES AMONG JAPANESE PRESCHOOL CHILDREN: A CROSS-SECTIONAL STUDY

Yuki Tada[1]; Kemal Sasaki[2]; Tomomi Kobayashi[3]; Yasuyo Wada[4]; Daisuke Fujita[5]; Tetsuji Yokoyama[4]
[1]Department of Nutritional Science, Tokyo University of Agriculture, Setagaya City, Japan; [2]Department of Food and Health Sciences, Jissen Women's University, Hino, Japan; [3]Department of Food Science and Nutrition, Mukogawa Women's University, Nishinomiya City, Japan; [4]Department of Health Promotion, National Institute of Public Health, Wako, Japan; [5]Food and Nutritional Science, Tokyo University of Agriculture, Tokyo, Japan

BACKGROUND AND OBJECTIVES
Early adiposity rebound (AR) has been reported to be a risk factor for adult obesity. The Japanese Ministry of Health, Labor, and Welfare recommends a meal that includes a Grain, Fish and Meat, and Vegetable Dish for prevention of disease, but to date no studies have examined the relationship between AR and intake of meals that include a grain, fish and meat, and vegetable in preschool children. In this study, we examined the relationship between AR and intake of meals that include a grain, fish and meat, and vegetable dish.
METHODS
We conducted an online self-reporting questionnaire survey among 750 mothers with children aged 3 and older who had been registered with an online research company. The questionnaire is a Japanese version of a nutritional status screening questionnaire that we developed to assess nutritional risks of infants (22 items including frequency of intake by food group, lifestyle, financial status, etc.). We were provided photos of height and weight measurements at 18 months and age 3 written on the maternal and child health handbooks at mandatory health check-ups. AR was calculated by subtracting BMI at 18 months from BMI at age 3. Children with values greater than zero were classified into the AR group (n=193), and the remainder were classified into the non-AR group (n=488). We scored intake status of each food group depending on the frequency of favorable meal intake, and calculated comprehensive risk scores (0-12 points; higher scores indicate less favorable RESULTS) of grain, fish and meat, and vegetable dish. Logistic regression analysis was performed with the presence or absence of AR as the dependent variable, and the logarithmically transformed risk scores for grain, fish and meat, and vegetable dish, and confounding factors as independent variables.
RESULTS
The BMI of the AR group at age 3 was higher than that of non-AR group, and the risk score associated with an grain, fish and meat, and vegetable dish was high. Logistic regression analysis showed that an elevated grain, fish and meat, and vegetable dish risk score correlated with higher risk of AR (adjusted odds ratio; 2.59（95%CI: 1.09-6.16）.
CONCLUSIONS
This study suggests that meals that include a grain, fish and meat, and vegetable dish are recommended even during preschool children because an elevated grain, fish and meat, and vegetable dish risk score correlated with higher risk of AR.

EFFECTS OF GENETIC VARIATION ON RESTING METABOLIC RATE AND DIET-INDUCED THERMOGENESIS IN HEALTHY YOUNG WOMEN

Naoko Komenami[1]; Kanako Kawase[1]; Kayoko Yamazaki[2]
[1]Department of Food and Nutrition, Kyoto Women's University, 35 Kitahiyoshi-cho, Imakumano, Higashiyama Ward, Kyoto, Japan; [2]Department of Early Childhood Education, Osaka Christian College, 1-3-61 Maruyamadori, Abeno Ward, Osaka, Japan

BACKGROUND AND OBJECTIVES
In modern Japanese society, the diversification of lifestyles has led to meals becoming markedly more Westernized, and there are concerns that these changes may lead to future health issues. Resting metabolic rate (RMR) and diet-induced thermogenesis (DIT) plays an important role in energy metabolism. Enhancement of these rates are expected to prevent fat accumulation and obesity by increasing energy expenditure in response to overeating. This research aimed to determine whether single nucleotide polymorphisms (SNPs) of obesity-related genes affect RMR and DIT.
METHODS
Participants were 52 healthy young women. We measured oxygen consumption, metabolic rate, respiratory quotient, and heart rate for 360 min before and after a standard meal (652 kcal, protein: fat: carbohydrate (PFC) ratio of 16.0: 28.2: 55.8 %). We asked participants about their lifestyle, measured their body composition, collected oral mucosa, and analyzed SNP (rs1042713) of β2 adrenergic receptor (β2-AR), SNP (rs4994) of β3 adrenergic receptor (β3-AR), and SNP (rs1800592) of uncoupling protein 1 (UCP1). The study was approved by the Kyoto Women's University Research Ethics Committee.
RESULTS
The β2-AR genotype was classified as 27% AA wild, 48% AG hetero, and 25% GG homo type; the β3-AR genotype was classified as 60% TT wild, 40% TC hetero, and 0% CC homo type; and the UCP1 genotype was classified as, 29% AA, 42% AG hetero, and 29% GG homo wild type. The genotype of β2-AR and β3-AR did not affect RMR and DIT in the standard meals, but the homo mutant type of UCP1 had a significantly lower RMR, muscle mass and lean body mass compared with those in the hetero mutant and wild type of UCP1.
CONCLUSIONS
The RESULTS suggest that energy expenditure and body composition might be affected by SNPs of UCP1 in healthy young women.

RELATIONSHIPS AMONG BODY IMAGE, EATING BEHAVIORS, AND DEPRESSION IN RELATION TO EATING DISORDER TENDENCIES AMONG YOUNG JAPANESE WOMEN

Miku Matsui[1]; Naomi Hayami[1]
[1]graduate school of Human Life and ecology, Osaka Metropolitan University - Sugimoto Campus, Osaka, Japan

BACKGROUND AND OBJECTIVES
A number of Japanese young women are at risk for eating disorders (ED) and they do not have access to clinical support, aside from those who have already been diagnosed with ED. This study aimed to compare eating behaviors and body image between high and low tendency groups for ED as measures to suggest future nutrition education strategy.
METHODS
An online survey was conducted in November 2024. The survey assessed symptoms of ED, eating behaviors and dieting habits. The final dataset included 181 women (average age: 25.9 years), who had not been diagnosed with an ED. The assessment was based on scores from the following measures: Eating Disorder Examination-Questionnaire Short (EDE-QS), Patient Health Questionnaire-2 (PHQ-2), Body Appreciation Scale-2 (BAS-2), Three-Factor Eating Questionnaire-R21-Cognitive restraint (TFEQ-R21-CR), Subjective Diet-Related Quality of Life (SDQOL), as well as questions on body image. Participants' tendencies toward ED were categorized into two groups (low and high) based on a cutoff. The Mann-Whitney U test was conducted to compare two groups. Binary logistic regression analyses were also performed to determine factors associated with high ED tendencies.
RESULTS
The low-tendency group comprised 72.9% of the participants while the high-tendency group consisted of 27.1% of the participants. In the low-tendency group, 28.0% of the individuals self-identified as overweight, which was significantly lower ($p = 0.008$). 72.0% of participants in the low-tendency group reported no distortion in their body image, which was significantly higher than high-tendency group ($p = 0.002$). The proportion of individuals with low TFEQ scores, high SDQOL scores, and low PHQ-2 scores was significantly higher in the low-tendency group ($p < 0.001$, $p = 0.003$, $p < 0.001$, respectively). Logistic regression analysis revealed significant associations between high ED tendencies and the following factors: TFEQ (OR: 2.751; 95% CI: 1.290-5.864, $p = 0.009$), SDQOL (OR: 0.838; 95% CI: 0.733-0.959, $p = 0.010$), PHQ-2 (OR: 1.877; 95% CI: 1.404-2.510, $p < 0.001$), and BAS-2 (OR: 2.828; 95% CI: 1.601-4.995, $p < 0.001$).
CONCLUSIONS
Our findings suggest that nutrition education may help correct distorted body image, prevent restrictive eating behaviors, and enhance SDQOL, thereby maintaining a low risk of ED among young Japanese women. Further studies are required to scrutinize a relationship between inappropriate dietary restrictions and positive body image, which could result in a higher ED tendency.

VALIDITY AND RELIABILITY OF THE JAPANESE VERSION OF SHORT FOOD LITERACY QUESTIONNAIRE IN OLDER ADULTS

Sayaka Nagao-Sato[1]; Yui Kawasaki[2]; Rie Akamatsu[3]
[1]Depertment of Nutrition, Takasaki University of Health and Welfare, Takasaki, Japan; [2]Institute for SDGs Promotion, Ochanomizu University, Bunkyo City, Japan; [3]Natural Science Division, Ochanomizu University, Bunkyo City, Japan

BACKGROUND AND OBJECTIVES
Food literacy (FL) is essential for Japanese community-dwelling older adults to improve their diet to prevent frailty. To develop an assessment tool for FL of Japanese older adults, this study aimed to evaluate the validity and reliability of the Japanese version of the short food literacy questionnaire (SFLQ), originally developed by Krause et al.
METHODS
SFLQ (16 items) was translated into Japanese by three Japanese researchers, and a researcher whose mother language is English checked the back-translated version of Japanese SFLQ. Japanese SFLQ has been modified until all the researchers agreed. A paper-based questionnaire survey was conducted to assess the validity and reliability of Japanese SFLQ for community-dwelling older adults in December and November 2024. The survey questionnaire included Japanese SFLQ (score range: 16–90) assessing for FL, HLS-Q12 (score range: 12–48) for health literacy (HL), healthy eating literacy scale (score range: 5–25) for healthy eating literacy (HEL), eHEALS (score range: 8–40) for eHealth Literacy (eHL) and knowledge tests. The knowledge tests included two questions regarding components of the Japanese food guide and vegetable intake recommended by the government. Reliability was tested using Cronbach's α. Validity was evaluated using correlations (Kendall's τb) between HL, HEL, eHL, and FL or using *t*-tests to identify the difference in FL by the knowledge test RESULTS.
RESULTS
One hundred and forty-five Japanese community-dwelling older adults participated in this study (85.5% female, mean age 81.4). The overall median (25, 75 percentiles) scores of FL, HL. HEL, and eHL were 57 (51.5, 61), 30 (26, 34), 19 (17, 21), and 16 (8, 24), respectively. Cronbach's α of FL was high (α = 0.918). Weak and moderate correlation coefficients were observed between FL and HL (τb = 0.320), and FL and HEL (τb = 0.453), while there was no correlation between FL and eHEALS (τb = 0.163). The mean FL scores did not differ by the RESULTS of the Japanese food guide test (P = 0.394) but the mean FL score of the participants who answered correctly in the vegetable test was higher than that of the participants who did not (P = 0.002).
CONCLUSIONS
The validity and reliability of the Japanese SFLQ were confirmed in Japanese community-dwelling older adults.

HE ROLE OF SCHOOL LUNCHES FROM THE PERSPECTIVE OF THE SEASONINGS USED IN JAPANESE CUISINE

Akemi Nakanishi[1]; Haruka Komatsu[2]; Sakurako Kita[2]
[1]Undergraduate School of Nntrition Sciences, Kagawa Nutrition University, Sakado Campus, Sakado, Japan;
[2]Department of Applied Nutrition, Kagawa Nutrition University, Sakado Campus, Sakado, Japan

BACKGROUND AND OBJECTIVES
School lunches in Japan, which were started with the aim of helping children living in poverty, have changed their role as the times have changed. Today, school lunches not only provide appropriate nutrition, but also serve as a 'teaching tool for learning about food'. As a result, the content of the menus has also changed. In this study, we compared the seasonings used in school lunches in the past and today, and aimed to clarify the role of school lunches in the past and today by clarifying the changes in Japanese cuisines served in school lunches.
METHODS
The method was to classify the dishes into Japanese, Western and Chinese cuisine, using the menus published in the 'Monthly School Lunch' magazine from 1961 to 1965 and from 2019 to 2023. Next, Japanese cuisines were classified into staple foods, main dishes and side dishes. Furthermore, the use of 19 types of seasonings used in Japanese dishes, such as soy sauce, salt, sugar, natural dashi and mirin, was investigated. The analysis method used was the $\chi 2$ test. IBM SPSS Statistics 27 was used for the analysis, and the significance level was set at 5%.
RESULTS
The number of dishes extracted was 2743 (1960s: 1204 dishes, modern: 1539 dishes). The proportion of Japanese cuisines has increased from 36.4% in the 1960s to 74.1% in the present day. In seasonings, the use of natural dashi has increased from 8.3% in the 1960s to 37.4% in the present day, and mirin has also increased from 0% to 26.9%. On the other hand, the use of chemical seasonings has decreased from 14.9% in the past to zero in the present day, showing that the authentic flavour of Japanese food dishes is progressing.
CONCLUSIONS
These changes show that school lunches today are playing a role in passing on food culture by providing children with authentic flavors, rather than just providing nutritional supplements. School lunches have moved on from their role as nutritional supplements, and today they are playing a role in passing on food culture by providing children with authentic flavors, which are less common at home, and even going so far as to use particular seasonings.

High reliance on vitamin D-fortified foods and oral supplements among young children in Sweden: RESULTS from a national, population-based dietary survey from 2021-24

Andre Hesselink[1]; Anna Winkvist[1]; Anna Karin Lindroos[2, 3, 1]; Lotta Moraeus[3]; Helena Bjermo[3]; Sanna Lignell[3]; Hanieh Moshtaghian[4]; Linnea Bärebring[1]; Elinor Hallström[5]; Hanna Augustin[1]
[1]Department of Internal Medicine and Clinical Nutrition, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden; [2]Department of Food Studies, Nutrition and Dietetics, Uppsala University, Uppsala, Sweden; [3]Department of Risk and Benefit Assessment, Swedish Food Agency, Uppsala, Sweden; [4]Department of Agriculture and Food, RISE Research Institutes of Sweden, Gothenburg, Sweden; [5]Nutrition, Sustainability and Health Promotion, National Food Institute, Technical University of Denmark, Kgs Lyngby, Denmark

BACKGROUND AND OBJECTIVES
Vitamin D is essential for skeletal development in small children. In Sweden, where sun exposure is low during winter, vitamin D-fortified foods such as milk, yoghurt and fat spreads, and to a lesser extent, fatty fish are important dietary sources but may also generate significant greenhouse gas emissions (GHGEs). This study aimed to assess vitamin D intake, main dietary sources of vitamin D and their climate impact, as well as determinants of vitamin D status in young children in Sweden.
METHODS
Data from the Swedish national dietary survey Riksmaten Young Children 2021-24 (ages 18 months, n=1074; 4 years, n=746) included dietary intake from a two-day food diary, non-consecutive days, linked to databases for food composition and climate impact. 25-hydroxyvitamin D (25(OH)D) was measured from plasma (18 months, n=281; 4 years, n=270) by high performance liquid chromatography-mass spectrometry. Linear regression assessed associations between 25(OH)D and vitamin D intake (including oral vitamin D drops), other supplement use, sampling season, age, parents' origin, and household education.
RESULTS
Vitamin D intakes below the average requirement (7.5 µg/d) were observed in 16% of 18-month-olds and 61% of 4-year-olds. Oral vitamin D drops accounted for 50% of intake in 18-month-olds and 8% in 4-year-olds. Additional dietary sources for 18-month-olds included fortified dairy and fats (20%) and porridge (15%). For 4-year-olds, main dietary sources were fortified dairy and fats (49%), fish and shellfish (7%), and porridge (5%). These foods contributed 0.3 kg CO_2 equivalents per day, or 17% of total diet-related GHGEs with fortified dairy accounting for 13%. For 25(OH)D, 7% of 18-month-olds and 4% of 4-year-olds were below 50 nmol/l, but none were vitamin D deficient (<30 nmol/l). Regression RESULTS showed 25(OH)D associated with vitamin D intake (β=+0.91, $p<0.01$), sampling during winter (β=-3.74, $p<0.01$) and parents' origin outside Nordics (β=-3.62, $p=0.02$).
CONCLUSIONS
A large proportion of young children in Sweden, particularly 4-year-olds, are at risk of having inadequate vitamin D intake. Despite this, no children were vitamin D deficient. Oral vitamin D drops were the main source at younger age, whereas at older age, fortified dairy products contributed most, and in addition, accounted for a large share of diet-related GHGEs. Future strategies should aim to improve vitamin D intake while also addressing the environmental impact of dietary sources.
CONFLICTS OF INTERESTS

MULTIPLE MICRONUTRIENT STATUS AND FACTORS ASSOCIATED WITH ANEMIA AMONG ADOLESCENTS IN SENEGAL

Mariame Sy[1]; Abdou Badiane[1]; Nafissatou Ba Lo[2]; Mane Hélène Faye[1]; Fadima Diallo[1]; Fadame Diagne[1]; Judith Nihorimbere[3]; Nicole Idohou-Dossou[1]; Adama Diouf[1]
[1]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Université Cheikh Anta Diop (UCAD), Dakar, Senegal; [2]Secrétariat Exécutif, Conseil National de Développement de la Nutrition, Dakar, Senegal; [3]PINGS, Nutrition International, Ottawa, Canada

BACKGROUND AND OBJECTIVES
Anemia, especially established during adolescence, remains one of the most widespread public health concerns. However, studies about micronutrient status in Senegalese adolescents are scarce. This study aimed to determine the factors associated with anemia among Senegalese adolescents.
METHODS
A nationwide representative cross-sectional study was conducted in Senegal in November-December 2023 including 2,193 adolescent, boys and girls aged 10-19 years, selected from 2,260 households through a stratified three-stage sampling procedure. Sociodemographic, health, and dietary data were collected by questionnaire. Nutritional status was assessed using BMI-for-age and waist-to-height ratio. Dietary diversity was measured using 24-hour dietary recall. Biomarkers (hemoglobin, serum ferritin, vitamins B9 and B12) were measured and the diagnosis of sickle-cell disease was made by Emmel test, according to standardized protocols. Associations between anemia and sociodemographic, nutritional status and biological characteristics were modeled using multivariable logistic regressions.
RESULTS
Nearly 23% of Senegalese adolescents were underweight and 7.5% suffered from overweight/obesity. Iron deficiency, vitamin B9 and B12 deficiencies affected 24.2%, 2.8% and 1.8% of adolescents, respectively. The prevalence of sickle cell disease was 8.4%. Overall, 29.1% of adolescents were anemic and among them, 11.4% suffered from iron deficiency anemia. More than 80% had reached the minimum dietary diversity. Adolescents aged 15-19 years (OR=1.812; P=0.001), iron deficient (OR=3.032; P<0.001) and suffering from sickle cell disease (OR=1.730; P=0.045) were at greater risk of suffering from anemia. Those who ate fruits 3 to 7 days per week were 49% less likely to suffer from anemia (OR=0.514; P=0.002).
CONCLUSIONS
Anemia and iron deficiencies are moderate public health problems among Senegalese adolescents, whereas prevalences of vitamin B9 and B12 deficiencies are low. Nutrition policies and strategies targeting 15-19 years old adolescent considering dietary patterns and sickle cell disease, are essential to effectively fight against anemia.

CURRENT BODY IMAGE OF BUSINESS GROUP FEMALE VOLLEYBALL PLAYER AND THE EFFECTS OF NUTRITION EDUCATION

Ayumi Kunimoto[1]; Kageyama Chie[2]
[1]Faculty of Health and Nutrition, Okinawa University, Naha-shi, Japan; [2]Faculty of Food Culture, Kurashiki Sakuyo University, Kurashiki-shi, Japan

BACKGROUND AND OBJECTIVES
Concerns about body image are a major problem for athletes, as they can lead to eating disorders. It has also been shown that this tendency is stronger in women than in men. This study examined the current state of body image in Business group female volleyball player and the effects of nutritional education.
METHODS
The subjects were 15 Business group female volleyball player (age 22.2 ± 2.2 years) to belong to Japan Volleyball Association who gave consent for the study. Questionnaires on body image, physical measurements, and dietary surveys were conducted in April and September 2023, with nutrition education provided between the first and second surveys. Questionnaire items were body image, health status, dietary behavior, and dietary awareness. For the body image item, a silhouette chart created by Thompson & Gray was used. Then, a comparison was made before and after the nutrition education intervention regarding the body image questionnaire.
RESULTS
The subjects were of normal build, with a height of 166.0 ± 6.7 cm, a weight of 60.8 ± 5.0 kg, and a BMI of 22.2 ± 2.3. However, none of them were satisfied with their current weight in the first survey. In the second survey, the number of respondents who were satisfied with their current weight increased to two. The number of respondents who felt they were in good health increased significantly from the first survey to 10 (66.7%). Body image survey RESULTS showed that the participants perceived their current body shape as normal (5.1±1.3), which did not change due to nutrition education. The ideal body type tended to choose a thin body type, but nutrition education significantly increased the mean ideal body type, 3.6 ± 0.7 in the first survey and 4.1 ± 0.7 in the second survey. In level of ideal dissatisfaction, which is calculated as the difference between the ideal body shape and the current body shape, it was significantly smaller, -1.5±1.2 in the first survey and -0.9±1.3 in the second survey.
CONCLUSIONS
Nutrition education has been shown to improve not only health status and food awareness, but also body image. It is hoped that appropriate nutrition education for athletes will lead to the resolution of body image concerns.

THE EFFECTS OF BODY COMPOSITION, DIETARY INTAKE AND TRAINING OF MALE ATHLETES ON BLOOD ALT AND Γ-GTP

Yukika Yoshizawa[1]; Jun Konno[1]; Koichi Mizushima[1]; Megumi Matsumoto[1]
[1]Department of Physical Education, Nihon University, College of Humanities and Science, Setagaya City, Japan

BACKGROUND AND OBJECTIVES
In athletes, impaired liver function may lead to delayed recovery from fatigue and reduced performance. Factors that can cause a decline in liver function in the general population include overeating, excessive alcohol consumption, and a lack of exercise. However, as previous studies were limited to heavyweight athletes, it is unclear whether the same relationship would be observed in other athletes who are not overweight. Furthermore, there is no established method for conditioning athletes to restore their liver function. Therefore, in this study, we decided to analyze in detail the factors related to the deterioration of blood test data, which are indicators of liver function, based on the physical composition, dietary intake, and physical activities of athletes from various sports.
METHODS
The subjects were 132 male athletes aged between 18 and 40 years (sports: track and field, lifesaving, judo, wrestling, swimming, gymnastics, basketball, American football etc.). We performed body composition measurement using impedance method, training survey, semi-quantitative diet survey for 3 days, and fingerstick blood test. Statistical analysis was performed based on blood test data of the subjects, and the data was divided into two conditions (ALT<30 group (n=98) vs ALT≧30 group (n=34), γ-GTP<50 group (n=8) vs γ-GTP≧50 group (n=124)), and compared using the Mann-Whitney U test.
RESULTS
Body weight, body fat percentage, and waist circumference (WC) were significantly higher in ALT≧30 group (weight:78.5kg, body fat:18.1%, WC:86.3cm) compared to ALT<30 group (weight:70.4kg, body fat:14.0%, WC:78.6cm) ($p<0.01$). Protein intake, carbohydrate intake, and carbohydrate % total energy intake (TEI) were significantly higher in γ-GTP≧50 group (protein:137.7g, carbohydrates:546.2g, carbohydrate%E: 61.1%) compared to γ-GTP<50 group (protein:111.1g, carbohydrates:367.4g, carbohydrate %E:54.8%) ($p<0.01$). On the other hand, the fat % TEI was significantly lower in the γ-GTP≧50 group (fat %E:22.2%) compared to the γ-GTP<50 group (fat %E:28.3%) ($p<0.05$).
CONCLUSIONS
In male athletes, it was thought that overweight and high body fat percentage, as in the general population, would affect liver function. In this study, overweight athletes with impaired liver function had a low energy intake (EI) from fat and a high energy from carbohydrate, so it was thought that excessive carbohydrate intake might be a problem. In order to improve liver function of athletes, it was thought that it would be necessary to adjust PFC (protein, fat, carbohydrate) balance without lowering EI from fat too much.

FOOD SYSTEM PLATFORMS: PROMOTING WOMEN, YOUTH, AND CIVIL SOCIETY ENGAGEMENT TO IMPROVE NUTRITION

Lita Palomares-Estrada[1, 2]; Jocelyne Ingabire[3]; Elizabeth Imbo[4]; Dominique Barjolle[5]; Charles Chigemezu Nwokoro[5]; Helen Prytherch[1]
[1]Swiss Centre for International Health, Swiss Tropical And Public Health Institute, Allschwil, Switzerland; [2]Faculty of Medicine, Universität Basel, Basel, Switzerland; [3]Swiss Tropical and Public Health Institute - Regional Office Kigali, Swiss Tropical and Public Health Instititute, Kigali, Rwanda; [4]Sustainable Agriculture Foundation Africa, Sustainable Agriculture Foundation Africa, Nairob, Kenya; [5]Sustainable Agroecosystems Group, ETH Zürich, Zürich, Switzerland

BACKGROUND AND OBJECTIVES
Taking action to transform our food system is key to fighting malnutrition in all its forms. Food system platforms could facilitate improving nutrition outcomes in vulnerable urban populations. This study aimed to promote the development of the Food System Platforms (FSP) and to increase the participation of women, youth, and civil society organizations (CSO) in the FSP in two cities each in Kenya and Rwanda.
METHODS
We applied an intervention strategy focused on improving the capacities of the cities to increase leadership, as well as intercity peer learning and experience-sharing concepts. The intervention strategy included awareness campaigns that highlighted the significance of women, youth, and CSO involvements, stakeholder mapping identifying key actors required to strengthen platform membership, gender training sessions emphasizing the mainstreaming of gender in FSP action planning and implementation, and platform institutionalization e.g., to make them part of city by-laws or formal standing committees.
RESULTS
After the intervention strategy, in the Kenyan cities, new platforms were established, capacity-building sessions were organized to increase understanding of the FSP operational approach, and peer-learning meetings took place between cities working on urban food systems. These FSPs have a formulated vision and mission and are working to develop food system charters for improving visibility in the cities and to establish legitimacy and authority in food systems transformation. The FSP together with other stakeholders was involved in the development of the county food safety policy. In the Rwandan cities, new platforms were also created as a sub-committee of the existing larger district Joint Action Development Forum (JADF). Moreover, steps have been taken to involve organizational members (e.g., local CSO and consumer groups), and to succeed in institutionalizing the platforms through facilitated discussion and validation workshops. The participation of women, youth, and CSOs in the FSP has increased in the cities involved in both countries (Table N°1).
CONCLUSIONS
Women, youths, and CSOs' participation and engagement in the FSPs have increased and improved the food systems strategy development agenda in all the cities. There is a need to continuously engage and develop adapted intervention strategies to the different roles of women, youth, and CSOs in FSP activities. This engagement is necessary for developing and implementing the FSPs' actions to succeed in improving nutrition.

CHANGES IN OBESITY AMONG URBAN AND RURAL PRIMARY SCHOOLCHILDREN OVER A DECADE: INSIGHTS FROM SEANUTS I AND II MALAYSIA

Giin Shang Yeo[1]; Shoo Thien Lee[2]; Jyh Eiin Wong[1, 3]; Ilse Khouw[4]; Nik Shanita Safii[1, 3]; Bee Koon Poh[1, 3]; On Behalf Of Seanuts Ii Malaysia Study Group[1]

[1]Faculty of Health Sciences, Malaysia National University Kuala Lumpur Campus, Kuala Lumpur, Malaysia; [2]Faculty of Health and Life Sciences, Management & Science University (MSU), Shah Alam, Selangor, Malaysia, Malaysia; [3]Obesity-UKM Research Group, Universiti Kebangsaan Malaysia, Bangi, Selangor, Malaysia, Malaysia; [4]FrieslandCampina, FrieslandCampina, Amersfoort, Netherlands

BACKGROUND AND OBJECTIVES

Rapid urbanisation has led to unhealthy diets and sedentary lifestyles among children, impacting their nutritional status. These effects may differ by residential areas. This study examines changes in obesity indices among primary schoolchildren aged 6.0-12.9 years over the past decade.

METHODS

Data from 1,433 children in SEANUTS I (2010/2011) and 1,527 children in SEANUTS II (2019/2020) were analysed. Body weight, height, waist and hip circumferences were measured and used to derive obesity indices, including body mass index (BMI), waist-to-hip ratio (WHR), and waist-to-height ratio (WHtR). Complex samples general linear model was employed to compare changes in obesity indicators between urban and rural children across the two surveys.

RESULTS

Study findings highlighted significant changes in childhood obesity and body composition over the decade, showing clear differences between urban and rural areas. In urban locations, overweight and obesity rates among children dropped from 34.1% to 28.5% ($p=0.031$). This decline was accompanied by lower average body weight (33.8 kg in 2010 vs. 32.3 kg in 2020, $p<0.05$) and BMI (18.1 kg/m² in 2010 vs. 17.5 kg/m² in 2020, $p<0.01$). Additionally, urban children experienced a 75% lower BMI-for-age z-score in 2020 (SEANUTS I: 0.28; SEANUTS II: 0.07, $p<0.05$). Conversely, in rural areas, prevalence of overweight and obesity increased from 25.7% to 31.6%, although this change was not statistically significant ($p=0.123$). However, waist and hip circumferences were notably higher in 2020 at 62.4cm (2010: 59.4cm, $p<0.01$) and 73.7cm (2010: 71.4cm, $p<0.05$), respectively. Indicators of central obesity, including WHR and WHtR, among rural children were 0.44 and 0.83, respectively, in 2010, but were higher at 0.46 ($p<0.001$) and 0.84 ($p<0.01$) after a decade.

CONCLUSIONS

Over the course of a decade, while urban children have shown declines in obesity rates, rural children have experienced increases. Tailored interventions that address the specific challenges faced by different residential areas are urgently needed, with a particular focus on rural communities.

NUTRITIONAL ASSESSMENT OF CHILDREN IN RURAL CAMBODIA: NUTRITIONAL VALUES BASED ON DIETARY SURVEYS WITH PHOTOGRAPHS

Yuri Kinoshita[1, 2]; Mari Ujiie[3, 2]; Manami Aono[4]; Saki Horie[5, 2]; Mieko Morgan[6]; Huon Sok[6]; Konthea Chieb[6]; Sakiko Mizoguchi[6]; Mari Arimitsu[7]; Mio Kushibuchi[6]; Tae Kamikura[6]

[1]Department of Health and Nutritional Sciences, Faculty of Health Sciences, Aichi Gakuin University, Aichi, Japan; [2]JICA JOCV Dietitian Network, Japan Overseas Cooperative Association (JOCA) HQ, Komagane, Japan; [3]Department of Nutritional Sciences, Morioka University, Takizawa, Japan; [4]Department of Nutrition, Shizuoka Home Clinic, Shizuoka, Japan; [5]Department of Public Health, Keio University, Minato City, Japan; [6]SHARE Cambodia, Services for the Health in Asian and African Regions (SHARE), Preah Vihear Town, Cambodia; [7]SHARE Tokyo, Services for the Health in Asian and African Regions (SHARE), Tokyo, Japan

BACKGROUND AND OBJECTIVES

Cambodia's infant mortality rate (per 1,000 live births) has been declining since 2000 (1990: 85, 2021: 21), and has since dropped below the world average of 28 (1). However, rates of stunting, wasting, and malnutrition in children are higher than the global average. Since 2017, SHARE, an NGO, has been conducting a project to improve child nutrition in the north part of Cambodia, the most impoverished province (44.3% stunting rate) of Preah Vihear. However, infant and young child feeding (IYCF) initiatives conducted to date have been unable to concretely determine the status of dietary and nutritional intake. This study aimed to conduct a dietary survey and nutritional assessment of children under 5 in rural Cambodia to determine appropriate approaches to nutritional interventions.

METHODS

The target area covered four of the seven counties in the province of Preah Vihear. A baseline survey (random sampling method, 123 participants) was conducted, and 40 children under 5 years of age who were determined to be at high risk of wasting, stunting, and being underweight were selected. In February 2024, the caregivers kept dietary records for three days (using food records, photographs, interviews). The mean and standard deviation of the daily intakes of Energy (E), Protein (P), Ca, and Fe were calculated for ages 1-5 years.

RESULTS

A total of 120 days' worth of data was collected from 38 participants, of which 84 days were complete with no missing data. Two children were under 1 year old and breastfed.

【1 year old (n=10)】E:550±192 kcal P:22±11 g Ca:181±157 mg Fe:2.6±1.2 mg

【2 years old (n=11)】E:775±233 kcal P:29±12 g Ca:175±113 mg Fe:4.6±2.5 mg

【3 years old (n=11)】E:708±228 kcal P:28±8 g Ca:108±41 mg Fe:4.0±1.6 mg

【4 years old (n=2)】E:957±130 kcal P:40±9 g Ca:116±23 mg Fe:4.8±0.7 mg

【5 years old (n=2)】E:920±442 kcal P:46±28 g Ca:138±74 mg Fe:5.8±2.8 mg

During the survey period, the percentages of children who consumed discretionary processed foods and beverages were 40% for juices, 37% for snacks, and 29% for sweet processed foods.

CONCLUSIONS

We investigated the dietary intake and nutritional status of 38 children in rural Cambodia. A trend was that all items were significantly lower than the WHO's RDA. As nutritional status from infancy to around 3 years of age is related to growth disorders, it was suggested that prompt nutritional intervention is necessary.

DIET QUALITY IMPROVEMENT ASSOCIATED WITH A NUTRITION ASSISTANCE PROGRAM IN THE WORKPLACE

Ingrid Bezerra[1]; Karina Torres[1]; Anissa Souza[2]; Raiane Costa[2]; Gabriela Pereira[2]; Celia Morais[1]; Antonio Oliveira[3]

[1]Nutrition department, Federal University of Rio Grande do Norte, Natal, Brazil; [2]Postgraduate Program in Health Sciences, Federal University of Rio Grande do Norte, Natal, Brazil; [3]Pharmacy Department, Federal University of Rio Grande do Norte, Natal, Brazil

BACKGROUND AND OBJECTIVES

Public food and nutrition policies have a notable impact in reducing poverty and food insecurity, but their influence on the diet quality of participants is not completely clarified. This study aimed to evaluate the association of participation in a nutritional assistance policy with food quality.

METHODS

Cross-sectional, comparative study of manufacturing workers from companies participating and not participating in the Worker's Food Program (WFP). A combined stratified and two-stage sampling was used to obtain a probability sample of workers from northeastern Brazil. Usual food consumption was assessed with the 24-hour dietary recall method and diet quality with the Diet Quality Index-International (DQI-I). Multiple linear regression was used to analyze the association between the DQI-I score and its categories and components with WFP participation, worker's sex, and their interaction.

RESULTS

The survey included 441 workers from 16 WFP companies and 480 workers from 17 non-WFP companies. The RESULTS showed that WFP participation was associated with better diet quality ($p = 0.002$). Interaction analysis showed that the difference was significant only among women ($p = 0.001$). In the analysis of DQI-I categories, the score for the Variety category was higher among WFP participants ($p = 0.005$), as were the scores for the component's food groups ($p = 0.008$) and sources of protein ($p = 0.032$). The Adequacy category showed better scores among WFP participants ($p = 0.034$) in both sexes (interaction $p = 0.73$). The Moderation category didn't show association with WFP participation ($p = 0.30$), but among their components, WFP participation was associated with lower consumption of saturated fat and sodium, but only among women (interaction $p = 0.032$ and $p = 0.053$, respectively). WFP participation was not associated with scores in the Overall Balance category ($p = 0.17$).

CONCLUSIONS

Participation in a WFP was positively associated with better diet quality as assessed by the DQI-I, with a more pronounced effect in women.

SUGAR REFORMULATION IN SOLID FOODS: LIMITATIONS AND CHALLENGES

Jimmy Chun Yu Louie[1]
[1]Department of Allied Health, Swinburne University of Technology, Hawthorn, Australia

BACKGROUND AND OBJECTIVES
The global obesity epidemic is a pressing public health issue, driving the search for effective interventions. One approach, sugar reformulation in foods, has gained attention for its potential to reduce calorie intake and curb obesity. While this strategy has shown promise in sugar-sweetened beverages (SSBs), its application to solid foods is less understood and may carry distinct challenges and risks.
METHODS
This work examines the efficacy of sugar reformulation in solid foods by analyzing its technical feasibility, the differences between sugar in SSBs and solid foods, and the broader implications for obesity prevention. It also evaluates evidence from modelling studies and explores potential unintended consequences of reformulation efforts.
RESULTS
There were significant challenges in sugar reformulation for solid foods, including technical difficulties in maintaining taste and texture, and the possibility of replacing sugar with ingredients that may not offer health benefits. Evidence suggests that sugars in SSBs and solid foods differ in their impact on energy balance and metabolic health. Modelling studies supporting reformulation often have limitations, such as oversimplified assumptions and lack of real-world applicability.
CONCLUSIONS
While sugar reformulation in solid foods is a well-meaning intervention, it is unlikely to serve as a standalone solution for obesity prevention. In some cases, it could inadvertently contribute to the problem by introducing new health risks or shifting dietary patterns in unanticipated ways. A more cautious and evidence-driven approach is needed when considering reformulation as a public health strategy.
CONFLICTS OF INTERESTS

BREASTFEEDING DURATION AND DIET BEHAVIORS AMONG YOUNG CHILDREN IN THE [XXX]

Tanisha Aflague[1]; Dareon Rios,[1]; Ashley Yamanaka,[2]; Kristi Hammond,[3]; Hannah Shai,[2]; Patricia Coleman,[4]; Lynne Wilkens,[5]; Rachel Novotny,[3]
[1]College of Natural and Applied Sciences, University of Guam, Mangilao, United States of America; [2]College of Tropical Agriculture and Human Resilience, University of Hawaii, Honolulu, United States of America; [3]Department of Human Nutrition, Food and Animal Sciences, University of Hawaii at Manoa, Honolulu, United States of America; [4]Cooperative Research, Extension, and Education Services, Northern Marianas College, Saipan, United States Minor Outlying Islands; [5]Cancer Center, University of Hawaii Cancer Center, Honolulu, United States of America

BACKGROUND AND OBJECTIVES
Breastfeeding plays a unique role in shaping children's long-term food preferences and dietary behaviors. Childhood overweight and obesity [OWOB] prevalence remains a global concern, with the prevalence among young children in the [XXX], exceeding the US national average. As breastfeeding initiation and duration decline in the [XXX], this study aims to examine the relationship between breastfeeding initiation status and duration and early childhood dietary behaviors among young children in the [XXX].
METHODS
Children's Healthy Living [CHL] Program baseline data, including 1140 children (ages 2-8 years) in the [XXX], were analyzed cross-sectionally. This study utilized comprehensive data including demographics, 2-day child diet records and caregiver-reported early feeding history. Diet quality was assessed using the US Dietary Guidelines Healthy Eating Index-2020 [HEI-2020] with data processed through the Pacific Tracker version 3.0. Breastfeeding history was categorized by initiation status (yes - ever breastfed, no - never breastfed), exclusive breastfeeding duration (0-6 months, 6 or more months), and breastfeeding duration (0-6 months, 6-12 months, 12 or more months). Statistical analysis employed means and ANOVA testing, accounting for clustering in the survey design. Comparisons were made of mean intake of sugar-sweetened beverages [SSB], water, HEI-2020 component and total scores across different breastfeeding categories.
RESULTS
Study participants were predominantly indigenous CHamoru children (58.2%), with most households earning an annual income below $35,000 (59.7%) and receiving food assistance (59.3%). Approximately 72.1% of children were breastfed, while 27.9% were never breastfed. Children who were breastfed had higher total HEI-2020 scores in childhood (p=0.03) and Meat intake (p=0.05) compared to children who were not breastfed. Children exclusively breastfed for 12+ months had lower SSB (p=0.02) and higher Meat (p=0.02) intakes in childhood relative to those breastfed for 0-6 months. Longer breastfeeding duration correlated with significantly better childhood total HEI-2020 scores (p=0.01), and Greens & Beans (p=0.02), Total Protein (p=0.01), and Fatty Acid Ratio (p=0.02) scores.
CONCLUSIONS
Breastfeeding, particularly extended duration, is associated with better diet quality in early to middle childhood. This highlights the importance of breastfeeding initiation and sustained duration as potential strategies to mitigate childhood OWOB in the [XXX].

EPO5_486

FACTORS ASSOCIATED WITH DISCRETIONARY FOOD INTAKE TRAJECTORIES IN EARLY CHILDHOOD

Miaobing Jazzmin Zheng[1, 2]; Rachel Laws[1]; Karen Campell[1]; Kylie Hesketh[1]
[1]Institute for Physical Activity and Nutrition, Deakin University, Melbourne, Australia; [2]School of Health Sciences, University of New South Wales, Sydney, Australia

BACKGROUND AND OBJECTIVES
High intake of energy dense and nutrient poor discretionary foods is a global concern. Our understanding of how discretionary food intake changes in early childhood and associated factors is limited. This study explored the changes in discretionary food intake (i.e., trajectories) and its influencing factors in early childhood.
METHODS
Secondary data analysis of the Melbourne INFANT program (n=432) was conducted. INFANT is a cluster-randomized controlled trial that targets healthy eating and active play from infancy. It involves an intervention phase from age 3 to 18 months and a follow-up phase without intervention until age 60 months. Discretionary food intake was collected by three 24-hour recalls at ages 9, 18, 42 and 60 months. Group-based trajectory modelling described intake trajectories from ages 9 to 60 months. Multivariable logistic regression examined the association between intervention allocation, child, maternal characteristics and identified intake trajectories.
RESULTS
Three discretionary food intake trajectory groups were identified. Most children (59%) followed a “moderate” increasing intake trajectory with percentage energy intake increasing from 2.5% at age 9 months to 23.9% at age 60 months. Fourteen percent of the children followed a “high” increasing intake trajectory with percentage energy intake ranging from 5.0% to 42.0%. In contrast, the remaining children (27%) exhibited a “low” intake trajectory that had percentage energy intake ranging from 2.5% to 11.7%. Children from the intervention group (OR 0.52 95%CI 0.29, 0.94) and children of women with university education (OR 0.46 95%CI 0.23, 0.92) had lower odds of following the “high” intake trajectory group than children from the control group and children of women without a university education. Maternal pre-pregnancy body mass index (≥25 vs <25 kg/m2) was associated with higher odds (OR 2.09 95%CI 1.16, 3.77) of following the “high” intake trajectory group. No evidence of an association was found for maternal country of birth, marital status, child sex, body mass index z-score at birth, and gestational age.
CONCLUSIONS
Distinct trajectories of low, moderate, and high discretionary food intake were identified in early childhood. Children who received intervention in infancy were less likely to have a high discretionary food intake trajectory in early childhood. Lower maternal education and high pre-pregnancy body weight status were associated with the high discretionary food intake trajectory in early childhood.

USE OF INTERNET AND SOCIAL MEDIA AND ITS ASSOCIATIONS WITH CURRENT AND IDEAL BODY MASS INDEX AMONG FEMALE HIGH SCHOOL STUDENTS IN JAPAN

Fumi Oono[1]; Mai Matsumoto[1]; Mayu Kikukawa[1]; Yumi Ueyama[1]; Hiroko Ikeuchi[2]
[1]Center for Nutritional Epidemiology and Policy Research, National Institutes of Biomedical Innovation, Health, and Nutrition, Osaka, Japan; [2]Department of Health and Welfare Services, Health Promotion Division, Tochigi Prefectural Government, Tochigi, Japan

BACKGROUND AND OBJECTIVES
Being underweight and the desire to be thin are major concerns among young women, especially in Japan. Media exposure has been reported to lead to thin desire, mainly in Western countries, but there are few studies in Japan, where there is a high prevalence of underweight young women. This study examined associations of the use of the internet and social media as health information sources and time spent on electronic devices and social media with current and ideal body mass index among female high school students in Japan.
METHODS
A questionnaire was distributed to all students (2,567 male and female) in one randomly selected 2nd-grade class (generally aged 16-17 years) at each of 73 high schools in Tochigi Prefecture in 2022. Among 1,338 females who responded, this study included those who provided body height and current and ideal body weight (n=1,160), which were used to calculate body mass index (BMI). Participants were asked about their use of each health information source (e.g., the internet and social networking services [SNS], family members, television) and time spent on electronic devices (e.g., computers, smartphones), SNS (e.g., LINE, Twitter), and entertainment (e.g., YouTube, gaming).
RESULTS
Popular health information sources were the internet and SNS (68.6%) and family members (67.6%). The mean daily device use was 4.0 hours, including 1.7 hours on SNS and 2.3 hours on entertainment. Use of the internet and SNS as health information sources showed no association with current BMI but was associated with a lower ideal BMI (19.0 kg/m2 in non-users vs 18.7 kg/m2 in users, a difference [95% confidence interval] of 0.26 [0.03 to 0.48] kg/m2). Time spent on electronic devices, SNS, and entertainment showed negligible correlations with current and ideal BMI; Pearson's coefficients ranged from −0.07 (between SNS and ideal BMI) to 0.09 (between electronic devices and current BMI).
CONCLUSIONS
In this study of Japanese female high school students, the use of the internet and SNS as health information sources was associated with a marginally lower ideal BMI (mean difference of 0.26 kg/m2, indicating a difference of 0.7 kg for females with 158 cm). Also, this study showed negligible associations between time spent on electronic devices or social media and current or ideal BMI. Future research should examine exposure to specific content related to thin desire.

LEVERAGING HUMAN CENTERED DESIGN TO ADDRESS SOCIAL NORMS WITHIN A LARGE-SCALE MULTI-SECTORAL NUTRITION INITIATIVE IN NEPAL

Indra Dhoj Kshetri[1]; Pooja Pandey Rana[2]; Sheela Shrestha[3]; Lisa Sherburne[4]; Ershad Ahmad[5]; Kanishtha Kujur[5]
[1]Communication Lead, USAID Integrated Nutrition, Helen Keller Intl, Kathmandu, Nepal; [2]Chief of Party, USAID Integrated Nutrition, Helen Keller Intl Nepal, Lalitpur, Nepal; [3]Senior Health Education Administrator, National Health Education Information And Communication Center, Kathmandu, Nepal; [4]Deputy Chief of Party, USAID Integrated Nutrition, Helen Keller Intl Nepal, Lalitpur, Nepal; [5]Research, Kaboom Social Impact Pvt. Ltd, New Delhi, India

BACKGROUND AND OBJECTIVES
Social norms are pivotal in shaping health and nutrition-related behaviors, yet addressing them effectively requires context-specific strategies. This study used human-centered design to collaboratively develop approaches for shifting harmful gender and social norms within USAID Integrated Nutrition, a multi-sectoral initiative aiming to improve the nutritional status of women, children, and adolescents in underserved communities of Nepal.
METHODS
Using human-centered design (HCD)-led discovery and generative design research, the study will systematically explore and co-create local solutions to shift regressive gender and social norms to improve nutritional outcomes among women, children, and adolescents. Discovery and generative design research will explore beliefs, motivations, and enablers for normative change in four districts of Nepal representing different agroecological zones. Methods will include facilitated group activities [n=15] and in-depth interviews [n=90] with mothers, fathers, and adolescents to understand aspirations, social networks, and other enablers. Semi-structured interviews [n=30] with community leaders, traditional and religious leaders, and providers will explore their recommendations. After co-design, facilitated group discussions [n=30] with the same groups will iteratively test and refine local solutions.
RESULTS
RESULTS forthcoming. Data collection will be conducted from January to February 2025. Ethical approval will be sought from the Nepal Health Research Council. Research participants will generate multiple products. These will include 1) user personas of program participant groups (e.g., women, children, adolescents); 2) decision graphs identifying factors influencing choice; 3) users' interactions with health and nutrition to identify narratives that shape nutrition service uptake; and 4) ecosystem maps of external forces including norms. Subsequent prototype design and testing will explore acceptable ways to shift the identified norms with different vulnerable groups (i.e., influencers of adolescent vs. older mothers).
CONCLUSIONS
This new application of HCD to nutrition-related social norms will elicit locally driven solutions from the most vulnerable groups, who are usually left out of policy and programs. To date, HCD has been primarily used to address behaviors, such as maternal dietary diversity, and this work fills the gap that HCD can be adopted to explore and address gender and social norms. Effective solutions will be adopted and scaled up to implement through USAID Integrated Nutrition in underserved communities across all provinces of Nepal.

THE NUTRITION INFORMATION SOURCES USED AND TRUSTED BY 18-35 YEAR OLDS LIVING IN AUSTRALIA: A QUANTITATIVE ANALYSIS

Julie Wood[1]; Evangeline Lammers[2]; Alison Booth,[1]; Janandani Nanayakkara,[3]; Claire Margerison[1]
[1]Institute for Physical Activity and Nutrition, Deakin University, Burwood, Australia; [2]School of Exercise and Nutrition Sciences, Deakin University, Burwood, Australia; [3]Institute for Physical Activity and Nutrition, Deakin University, Geelong, Australia

BACKGROUND AND OBJECTIVES
There is an increasing prevalence of obesity and non-communicable diseases amongst young adults living in high-income countries, such as Australia.[1] Nutrition and diet are recognised as modifiable risk factors.[2] With a plethora of diet and nutrition information available online, it is important to understand which sources this population use and trust.
METHODS
This quantitative, cross-sectional, exploratory study used an online questionnaire to gather data from adults, aged 18-35, in relation to the nutrition sources and advice that they access, use and trust. A combination of dichotomous, scale, multiple-choice, and open-ended questions were used for data collection. Frequencies and percentages were calculated.
RESULTS
A total of 162 people participated, of which 75% were female. Over 90% spoke English at home, 70% were aged 25-35, and just over 80% were university educated. Google search RESULTS were the most frequently reported source used in the past for nutrition information and advice (*n*=111, 69%), followed by doctors/GPs (*n*=101, 62%), family (*n*=81, 50%) social media (*n*=79, 49%) and friends (*n*=68, 42%). Google searches were the most likely source to be used in the future (*n*=130, 80%) for nutrition information, followed by professional organisations (*n*=106, 65%), and dietitians (*n*=95, 59%). Nearly 90% reported that it is easy to access nutrition information (*n*=142). Google searches were reported as the easiest to access (*n*= 153, 94%), followed by social media (*n*=148, 91%). Just under two thirds were confident they could determine if a nutrition source was trustworthy (*n*=105, 65%) and 70% reported knowing what a trustworthy nutrition source looks like (*n*=115, 71%). The most trusted nutrition sources were dietitians (*n*=55, 34%), doctors/GPs (*n*=32, 20%), then nutritionists (*n*=31, 19%), but barriers to access (reported via an open-ended question) included cost, time for appointments, and source availability.
CONCLUSIONS
The internet was reported as the leading source of nutrition information and advice for adults aged 18-35. It was also the easiest source to access. With Google search RESULTS now including AI-generated information, it is an important next step to further understand if this population use and trust AI for nutrition information. Nutrition professionals and doctors were most trusted but there were barriers to access. It is therefore vital that evidence-based nutrition information and advice is readily available online and that barriers impeding access to trusted nutrition professionals are addressed for young adults.

DYNAMICS OF GROWTH TRANSITIONS OF CHILDREN IN BANGLADESH: FINDINGS FROM A NATIONWIDE NUTRITION PANEL STUDY

Malay Kanti Mridha[1]; Md. Mokbul Hossain,[1]; Fahmida Akter[2]; Mahbub Latif,[3]; Abu Ahmed Shamim[1]; Wameq Azfar Raza[4]; Deepika Chaudhery[5]

[1]James P Grant School of Public Health, BRAC University, Dhaka, Bangladesh; [2]BRAC James P Grant School of Public Health, BRAC University, Dhaka, Bangladesh; [3]Institute of Statistical Research and Training (ISRT), Dhaka University, Dhaka, Bangladesh; [4]Bangladesh Office, World Bank, Dhaka, Bangladesh; [5]India Office, World Bank, Delhi, India

BACKGROUND AND OBJECTIVES

Similar to many other lower- and middle-income countries, Bangladesh is also facing the double burden of child malnutrition. The objective of this study was to report temporal changes in nutritional status and determinants of the changes.

METHODS

We analyzed paired data of 3,005 children collected in 2018-19 and 2023 from 90 sentinel surveillance sites distributed in the rural, non-slum urban and slum areas of eight administrative division of Bangladesh. The data included household characteristics, parents' characteristics, child characteristics and anthropometric variables. We carried out descriptive and linear mixed effects regression (LMER) analyses. The outcome variables for LMER were height for age Z score (HAZ), weight for age Z score (WAZ), and body-mass-index for age Z score (BAZ).

RESULTS

Overall, 78% of children who were underweight in 2018-19, remained underweight in 2023. In the case of normal weight children, 66% children remained normal weight, but 29% children also became underweight in 2023. The majority of the overweight (76%) and obese (60%) children transitioned to normal weight. Between 2018-19 and 2023, there was a significant increase in HAZ score (0.34 units, $p<0.001$) and a significant decrease in BAZ (-0.16 units, $p=0.011$) but WAZ score remained unchanged. Higher maternal and paternal education, residence in the non-slum urban areas were positively associated with all three outcomes; and residence in Chattogram and Sylhet division were negatively associated with all three outcomes. Moreover, frequency of processed food consumption, belonging to moderate or severe food insecure households had negative association with HAZ; age of the children and childhood morbidity were negatively associated with both WAZ and BAZ; and higher wealth status had positive association with HAZ and WAZ.

CONCLUSIONS

All these findings call for short- and long-term programmatic and policy interventions to further improve the nutritional status of the children in Bangladesh. The short-term interventions can be targeted towards reduction of processed food consumption, prevention and control of childhood morbidity, and reduction of food insecurity, while the long-term intervention should focus on further improvement of both maternal and paternal education and adoption of macro-economic policies to enhance the wealth status of the households.

SIMULATION OF THE FRUIT AND VEGETABLE INTAKES REQUIRED FOR MEETING THE DIETARY REFERENCE INTAKES OF JAPANESE ADULTS: DATA FROM THE 2019 NATIONAL HEALTH AND NUTRITION SURVEY

Mai Matsumoto[1]; Emiko Okada[1]; Xiaoi Yuan[1]; Chika Okada[1]; Mayu Kikukawa[1]; Mieko Nakamura[1]; Hidemi Takimoto[1]
[1]Center for Nutritional Epidemiology and Policy Research, National Institutes of Biomedical Innovation, Health, and Nutrition, Osaka, Japan

BACKGROUND AND OBJECTIVES
Fruit and vegetable intake has been associated with a reduced risk of noncommunicable diseases. Therefore, it is necessary to consider fruit and vegetable target amounts that can reduce disease risk and provide adequate nutrient intake. This study aimed to estimate the amount of fruit and vegetable intake necessary to meet the reference values of “the Dietary Reference Intakes for the Japanese (DRIs)” for selected nutrients using the 2019 National Health and Nutrition Survey (NHNS).
METHODS
We used data from 4927 Japanese adults aged 20 years and over who participated in the dietary survey in the 2019 NHNS. Dietary intake data was were obtained from one-day semi-weighed household dietary records. Nine scenarios (70-90% of Japanese adults consuming between 100 g and 200 g of fruit, based on the current Japanese fruits intake 100g and the previous and current goal of "more than 70% of individuals consuming over 100 g of fruits," and “consuming 200 g of fruits”, respectively) were used to predict the average intake of fruits and vegetables that met the reference values of the DRIs for dietary fibre, vitamin A, folate, and vitamin C as fruits and vegetables are the main sources of these nutrients.
RESULTS
The intake of dietary fibre, vitamin A, folate, and vitamin C from fruits and vegetables constituted approximately 40-70% of the total intake among the participants in the 2019 NHNS. The scenario in which more than 90% of adults consumed 200 g of fruits per day almost met the DRIs reference values for dietary fibre, vitamin A, folate, and vitamin C. Hence, the approximate average fruit and vegetable intakes were found to be 200 g and 350 g, respectively.
CONCLUSIONS
Our scenarios showed that an intake of 200 g of fruits and 350 g of vegetables, which have previously been reported to reduce disease risk, would be sufficient to meet DRIs reference values. Further research is needed to examine policies and interventions to increase fruit and vegetable consumption in the Japanese population.

RELATIONSHIP BETWEEN MEALTIMES AND LIFESTYLE HABITS IN JAPANESE JUNIOR HIGH SCHOOL STUDENTS

Naoko Yamada[1]; Hideki Fujiiwa[2]
[1]Faculty of Health and Nutrition, Namegaya, 1100, Chigasaki, Kanagawa, Japan; [2]Faculty of Economics, Management and Information Science, Hisayamada-cho, 1600-2, Onomichi, Hiroshima, Japan

BACKGROUND AND OBJECTIVES

Recently, attention has been focused on the "time" of meals, such as the time when meals start (time of day), eating at roughly the same time (regularity), and whether meals are skipped (frequency). Humans maintain various functions in the body according to circadian rhythms; however disruptions to daily rhythms have been reported in surveys of junior and senior high school students and have been associated with sleep and obesity. Mealtimes have a significant impact on circadian rhythms.

In today's Japanese society, not only adults but also children have busy daily lives, including school, cram school, extracurricular activities, social media use, and long periods of screen time. Many people are aware that their meals (time, regularity, frequency), especially breakfast and dinner, are affected by these activities and would like to improve their use of time.

The purpose of this study was to understand the actual state of mealtimes especially at dinner among junior high school students in Japan and to clarify the relationship lifestyle habits.

METHODS

The participants of this study were 580 boys and girls junior high school students attending two public schools (Schools A and B) in Hiroshima Prefecture, Japan. The survey was conducted anonymously in October 2024 using Google Forms. Permission was obtained from the principal before the survey, and each teacher explained the survey to the participants in writing, online, and verbally. Only those who gave consent were administered the survey (eating at roughly the same time at dinner (regularity), daytime sleepiness, after school activities etc). This study was approved by the Fukuyama University Research Safety and Ethics Committee (approval number: 2024-H-34).

RESULTS

The survey RESULTS showed that 63.1% of School A and 68.6% of School B ate dinner regularly on weekdays, and 74.9% of School A and 75.7% of School B ate dinner regularly on weekends. In addition, those who had regular weekday dinner times also had regular weekday bedtimes and significantly less daytime sleepiness.

CONCLUSIONS

This study clarified the relationship actual mealtimes especially dinner. In the future, we will conduct a detailed survey to clarify the factors affecting mealtimes.

EPO5_498

IMPROVED DIETARY HABITS OF YOUNG CHILDREN AND FAMILY CONSUMPTION WEEKLY ROUTINES DURING PANDEMIC TIMES

Vesselka Duleva[1]; Ekaterina Chikova-Iscener,[2]; Lalka Rangelova,[2]; Plamen Dimitrov,[3]
[1]Department Food and Nutrition, National Center of Public Health and Analyses, Blvd. Ivan Geshov 15, Sofia, Bulgaria, Sofia, Bulgaria; [2]Food and Nutrition, National Center of Public Health and Analyses, Blvd. Ivan geshov 15, Sofia, Bulgaria, Sofia, Bulgaria; [3]Director, National Center of Public Health and Analyses, Blvd. Ivan geshov 15, Sofia, Bulgaria, Sofia, Bulgaria

BACKGROUND AND OBJECTIVES
With the current trends for worsening of the childhood obesity epidemic, unexpected crises as pandemics can additionally affect the nutritional adequacy of the diet of children and their families, increasing the risk for malnutrition. The objective of the current study is to assess the change in the dietary habits of young children and family consumption weekly routines during the COVID-19 pandemic period in Bulgaria.
METHODS
A cross-sectional survey among 7-years-old schoolchildren in Bulgaria was carried out in the spring of 2023 on a nationally representative sample of 3124 students as part of the WHO European Childhood Obesity Surveillance Initiative (COSI). Information on the impact of the COVID-19 pandemic on children's daily habits and behaviours, including dietary patterns and family consumption weekly routines was assessed through voluntary questionnaire, answered for the Pre-COVID-19 period and for the COVID-19 pandemic period by the parents/caregivers of children with response rate 79.6%.
RESULTS
During the COVID-19 pandemic the consumption of fresh fruits increased among 8.2% of the first-graders and decreased among 3.1%, compared to the pre-COVID-19 period. Similar positive changes were observed for vegetables (6.4% increase vs. 2.7% decrease), dairy products (5.5% increase vs. 2.4% decrease); savoury snacks (4.7% increase vs. 7.1% decrease); sweets (4.9% increase vs. 5.4% decrease) and soft drinks containing sugar (1.9% increase vs. 9.7% decrease). The family consumption weekly routines during the COVID-19 pandemic improved for eating home-cooked meals (21.7% increase vs. 1.3% decrease); eating together as a family (19.7% increase vs. 1.2% decrease); cooking meals together with the children (15.1% increase vs. 2.7% decrease); having breakfast (11.6% increase vs. 1.1% decrease); reusing leftovers for another meal (6.8% increase vs. 5.6% decrease); planning purchases and meals in advance (13.9% increase vs. 3.4% decrease) and buying food in large quantities (18.1% increase vs. 9.4% decrease).
CONCLUSIONS
The increased burden of the COVID-19 pandemic period in Bulgaria over the socio-economic status of the families and more time spent at home due to lockdowns and social distancing, actually turned into window of opportunity for the families to more carefully plan their purchase of foods and drinks and meal preparation, leading to improved dietary habits of the children.

U.S. PARENTS' PERCEPTIONS OF THE SAFETY AND HEALTHFULNESS OF NON-SUGAR SWEETENERS FOR CHILDREN

Mariana Fagundes Grilo[1]; Lindsey Smith Taillie[2]; James W. Krieger,[3]; Natalie J. Vallone,[1]; Allison C. Sylvetsky,[1]

[1]Department of Exercise and Nutrition Sciences, The George Washington University, Washington, United States of America; [2]Department of Nutrition, University of North Carolina at Chapel Hill, Chapel Hill, United States of America; [3]School of Public Health, University of Washington, Seattle, United States of America

BACKGROUND AND OBJECTIVES

Non-sugar sweeteners (NSS) are increasingly present in packaged foods and beverages, including in products marketed to children. However, whether NSS are helpful for harmful for weight management and chronic disease prevention is debated. This study assessed U.S. parents' perceptions of the safety and healthfulness of NSS for children, confidence in identifying NSS on product packaging, views on front-of-package label formats highlighting the presence of NSS, and opinions about terminology used to refer to NSS.

METHODS

A total of 1,047 parents of children aged 2–12 years from across the U.S. completed a 31-item survey. The survey included 15 items about general perceptions of NSS, focusing on their healthfulness and safety; 10 items on perceptions of the safety and healthfulness of NSS specifically for children; and 6 items on NSS identification and labeling. Participants responded using 5-point Likert scales ranging from "strongly disagree" to "strongly agree." Additionally, participants were asked to select the most understandable and preferred terms for NSS from a list of terms provided. Descriptive statistics, including means and frequencies, were used to analyze the responses.

RESULTS

Most participants were 30–49 years old (84.9%), 86.9% identified as White, and 11.7% were Hispanic or Latino. Over half (58.1%) of parents believed NSS could help reduce children's sugar intake, yet only 21.9% felt confident that NSS were safe for children to consume daily. Artificial NSS (e.g. aspartame, sucralose) were viewed as less safe for children (26.6% deemed them safe) compared to "natural" NSS such as stevia or monk fruit extract (60.5% deemed them safe). Parents indicated that a front-of-package label for NSS would be helpful, with 92.6% agreeing it would help them identify NSS in products and 44.1% reporting it would decrease their likelihood of providing NSS-containing products to their children. The term artificial sweeteners was the most recognized, with 41.7% of the parents indicating that it was the most understandable compared with other terms including non-sugar sweeteners (24.3%), sugar substitutes (21.8%), or low-calorie sweeteners (5.5%).

CONCLUSIONS

While U.S. parents perceive NSS as useful for reducing sugar intake, they reported concerns about the safety and healthfulness of NSS for children, particularly artificial sweeteners. The findings highlight the potential of front-of-package labels for NSS to help parents make informed choices about giving their children products with NSS.

PREVALENCE OR IRON DEFICIENCY IN WOMEN OF REPRODUCTIVE AGE IN SWITZERLAND: THE ROLE OF INFLAMMATION AND SERUM FERRITIN THRESHOLDS

Isabelle Herter-Aeberli[1]; Maria Andersson; Valeria Galetti[2]
[1]Departement of Health Sciences and Technology, ETH Zürich, Zürich, Switzerland;
[2]GroundWork, GroundWork, Fläsch, Switzerland

BACKGROUND AND OBJECTIVES
Data on the prevalence of iron deficiency in women of reproductive age in Switzerland is scarce. The primary aim of this study was to determine the prevalence of iron deficiency in young women in Switzerland, to determine a physiological threshold for iron deficiency, and to identify factors influencing iron status. Furthermore, we investigated the effect of different correction methods for inflammation on the prevalence of iron deficiency.
METHODS
This is a secondary, pooled data analysis including data from 26 studies conducted in Switzerland between 2009 and 2020. Participants were a convenience sample of generally healthy women aged between 18 and 54 years (n=2709). Serum ferritin, hemoglobin, and C-reactive protein were measured in all participants.
RESULTS
The prevalence of iron deficiency was 18.9%, while 4.7% of the women were anemic and 3.3% were iron deficient anemic. We showed that hemoglobin decreased below a serum ferritin concentration of 28.5 ng/ml. The prevalence of overweight (BMI ≥ 25 kg/m2) was 7.2% and 1.4% were obese (BMI ≥ 30 kg/m2). Acute inflammation (CRP ≥ 5 mg/l) was found in 8.9% of the women. In a multivariate regression analysis, BMI and age were significant positive predictors of serum ferritin, while inflammation was not associated with serum ferritin. Depending on the method used to correct for inflammation, iron deficiency prevalence ranged from 18.9% to 21.3%.
CONCLUSIONS
In this convenience sample of young women in Switzerland, one in five was found to be iron deficient and one in 20 was anemic due to iron deficiency. We have further determined a physiological threshold for iron deficiency at a serum ferritin concentration of 28.5 ng/ml. Controlling serum ferritin concentrations for inflammation did not substantially affect the prevalence of iron deficiency, indicating that such corrections are not necessary in a healthy population with low prevalence of inflammation.
CONFLICTS OF INTERESTS

EPO5_501

ASSOCIATION BETWEEN ULTRA-PROCESSED FOOD CONSUMPTION AND SYSTEMIC INFLAMMATION IN CHILEAN ADOLESCENT GIRLS DURING PUBERTY

Joyce Singer[1]; Marcela Reyes[1]; Ana Pereira[1]
[1]CIAPEC, Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile

BACKGROUND AND OBJECTIVES
Ultra-processed foods (UPFs) constitute a substantial portion of global dietary intake and have been linked to chronic diseases, particularly those with inflammatory origins. While high-UPF diets may elevate systemic inflammation (SI) via excess adiposity, evidence suggests that UPFs independently influence SI by producing pro-inflammatory cytokines. This study aimed to evaluate the association between UPF consumption and SI markers—serum ultrasensitive C-reactive protein (PCR), interleukin-6 (IL-6), and tumor necrosis factor receptor 2 (TNFR2)—in Chilean adolescent girls during puberty, while considering the independent effects of body mass index (BMI).
METHODS
We did a longitudinal study using data from a cohort of Chilean girls. UPF consumption was assessed using 24-hour dietary recalls, categorized by the NOVA classification. Serum inflammatory markers were measured (ultrasensitive PCR, IL-6, and TNFR2). We performed multivariable linear regression models between each quartile of UPF (kcal and grams) and each inflammatory marker. Models were adjusted by potential confounders (age, maternal education, menarche, and energy intake from other NOVA food groups). We also analyzed the models independent from BMI z-scores (zBMI).
RESULTS
Data from 244 adolescent girls were analyzed (mean age 11.5 years, SD = 0.7), and 14.5% were classified as obese. More than half (56%) provided two or more dietary recalls. The mean total energy intake was 1899 kcal (SD = 585), with UPFs contributing 42% of kcal and 38% of consumed grams. Median levels of inflammatory markers were PCR: 0.5 mg/L (IQR: 0.2–2.0), IL-6: 1.2 pg/mL (IQR: 0.8–2.1), and TNFR2: 2245 pg/mL (IQR: 1920–2532). No consistent associations were found between UPF consumption and PCR or IL-6 levels. However, a significant negative association was observed between UPF consumption (grams) and TNFR2 in the third quartile after adjusting for zBMI (β = -203.8; 95% CI, -402.3 to -5.3; $p < 0.05$). Positive correlations were noted between adiposity indicators (zBMI, waist circumference, % body fat) and all SI markers.
CONCLUSIONS
In this cohort of Chilean adolescent girls, UPF intake was not consistently associated with SI markers during puberty. The observed negative association between UPF intake and TNFR2 warrants further investigation. Longitudinal studies are necessary to explore the long-term effects of UPF consumption on inflammation and related health outcomes during critical developmental stages.

RIPPLE EFFECTS OF THE ARIGATO (GRATITUDE) RECIPE BOOK DEVELOPED IN DISASTER-AFFECTED AREAS: A SUSTAINABLE APPROACH TO COMMUNITY SUPPORT THAT CONNECTS MENTAL AND PHYSICAL HEALTH

Yuka Miura[1]; Yuri Kinoshita[2]; Toshiya Kuchii[3]; Kanako Sato[4]; Ai Kuroda[5]; Hiroki Hara[1]; Mikio Yamada[1]; Naomi Ito[6]; Natsumi Ishii[7]; Yuji Masuda[8]; Yuko Kurokawa[8]; Yoshiharu Fukuda[5]
[1]Disaster Prevention Support and Reconstruction Support Project through the Power of Food, The Ajinomoto Foundation, Tokyo, Japan; [2]Department of Health and Nutritional Sciences, Faculty of Health Sciences, Aichi Gakuin University, Aichi, Japan; [3]Evaluation Team, Red Apron Project, Tokyo, Japan; [4]Junior College, Chukyo Gakuin University, Mizunami, Japan; [5]Graduate School of Public Health, Teikyo University, Tokyo, Japan; [6]Department of Radiation Health Management, Fukushima Medical University School of Medicine, Fukushima, Japan; [7]Department of Nutrition, Kashinoki Internal Medicine, Fukushima, Japan; [8]Department of Life and Culture, Tohoku Seikatsu Bunka Junior College, Sendai, Japan

BACKGROUND AND OBJECTIVES
In October 2011, the Ajinomoto Foundation (TAF) launched the Red Apron Project to support residents affected by the Great East Japan Earthquake. The project aimed to improve nutrition and revitalize communities through cooking classes. To address disaster victims'health issues and weakened community bonds, TAF held 3,771 cooking classes with 54,434 participants over 8.5 years. In 2021, TAF published the "ARIGATO (Gratitude) Recipe Collection" to thank stakeholders and support independent local efforts. Featuring 109 recipes and tips for cooking classes, the book focuses on nutritional balance, ease of preparation, and accessible ingredients, and is tailored to temporary housing kitchens. Over 80,000 copies were distributed. This study examines the diffusion process and success factors of the recipe book and its potential as a sustainable community support model.
METHODS
In December 2022, an anonymous web-based survey was conducted with 213 stakeholders, including government officials, educators, and other supporters. Demographic data were collected, the book's usefulness assessed on a 1-to-5 scale (5 = most useful), and diffusion evaluated using five factors from the diffusion of innovation theory.
RESULTS
A total of 115 respondents participated in the survey, yielding a 54% response rate. Among them, 41 respondents ("implementers") conducted cooking classes using the "ARIGATO Recipe Book," while 74 ("nonimplementers") did not. Both groups rated the book's seven chapters highly(average scores exceeding 4.0), with no significant differences between them. Implementers valued the book for its usefulness in selecting recipes, ensuring sanitation, planning classes, and preparing ingredients. According to the diffusion of innovation theory, the booksucceeded due to its "relative advantage," addressing disaster victims' physical and mental health needs while accommodating their constraints. The book was also characterized by "low complexity," with simple recipes suitable for disaster-stricken areas.
CONCLUSIONS
The "ARIGATO Recipe Book" is considered a versatile and practical tool for improving nutrition and revitalizing local communities. The reason for this success could be that the content that places emphasis on the quality of life of the victims is compatible with the diverse needs of society. This study highlights the potential of recipe books as central components of sustainable community support models and long-term solutions for other regions.

COMPARATIVE ANALYSIS OF LIPIDS IN AN INFANT FORMULA CONTAINING A BLEND OF DAIRY AND PLANT-BASED LIPIDS VERSUS A FORMULA EXCLUSIVELY USING PLANT-BASED LIPIDS

Charlotte Magnant[1]; Mathilde Guerville[1]; Emmeline Salameh[1]; Isabelle Cuinet[2]; Véronique Carbon[2]; Romane Troadec[1]; Amandine Ligneul[1]
[1]Nutrition Department, Lactalis Research & Development, Retiers, France, Retiers, France;
[2]Development, LACTALIS Research and Development, Craon, France

BACKGROUND AND OBJECTIVES
Breast milk is the nutritional gold standard, known for its rich and complex lipid composition, which includes a wide variety of fatty acids, phospholipids, gangliosides, and cholesterol. These lipids play a crucial role in infant development, contributing to optimal growth, immune function, and cognitive development. However, replicating this complexity in infant formulas (IFs) remains a significant challenge. Dairy lipids are recognized for their diversity and combining them with plant-based lipid sources could improve the lipid profile of IFs. This study aims to compare the lipid composition of an IF containing a blend of dairy and plant-based lipids with that of an IF made exclusively from plant-based oils.
METHODS
Three IFs with different lipid sources were analyzed: an IF containing a blend of dairy and plant-based lipids (DL-IF) and two IFs made exclusively with plant-based oils (P-IF1 and P-IF2). Lipid components, including fatty acid profiles and bioactive lipids such as phospholipids and gangliosides, were analyzed. Cholesterol was quantified by gas chromatography following thin-layer chromatography separation. Fatty acid profiles were assessed using gas chromatography of fatty acid methyl esters. Phospholipids and gangliosides were analyzed by high-performance liquid chromatography (HPLC), with gangliosides quantified by HPLC coupled with mass spectrometry. Sn-2 palmitic acid content was determined via enzymatic hydrolysis.
RESULTS
The DL-IF contained 26.3 g of lipids/100 g of powder, P-IF1 contained 24.8 g of lipids/100 g of powder, and P-IF2 contained 27.5 g of lipids/100 g of powder. The DL-IF had a higher proportion of palmitic acid compared to P-IF1 and P-IF2 (19 g/100 g total fat vs. 7 g/100 g and 6 g/100 g, respectively). The sn-2 palmitic acid proportion in DL-IF was 33% (of total palmitic acid), compared to 6% in P-IF1 and 5% in P-IF2.
CONCLUSIONS
This study highlights the importance of lipid sources in infant formula. Combining dairy and plant-based lipids offers unique benefits compared to plant-only formulations, providing a more complex and diverse fatty acid profile. Preliminary RESULTS indicate that the composition and palmitic acid profile of DL-IF are closer to those of breast milk, which contains 17–25% palmitic acid in total fatty acids (1), with approximately 70% in the sn-2 position (2). Incorporating dairy lipids into IFs may help approach the composition of breast milk, optimizing infant nutrition products to better support overall infant health and development.

VIRTUAL COMMUNICATION ON INFANT NUTRITION VIA SOCIAL MEDIA

Sabryna da Silva Lima[1]; Luiza Santana Cavallari[1]; Maria Teresa Bechere Fernandes[2]
[1]Nutrition student at Faculty of Public Health USP, Faculdade de Saúde Pública USP, São Paulo, Brazil;
[2]Department of Pediatrics, Faculdade de Medicina da Universidade de São Paulo (FMUSP), São Paulo, Brazil

BACKGROUND AND OBJECTIVES
Instagram has been considered an effective platform for disseminating information, influencing the choices and decisions of those responsible for children's nutrition. Considering this model of knowledge transmission, the objectives of this project are:

1. To create a virtual communication network that enables the dissemination of reliable information on child health and nutrition.
2. To use Instagram to share evidence-based information on infant nutrition.
3. To present healthy recipe options that contribute to improving children's nutrition.

METHODS
Adapt scientific information to an accessible language for the target audience (caregivers and children), by using visual resources such as images and clear text to ensure better understanding. Create posts based on scientific evidence of healthy eating habits, physical activity, and children's nutrition, providing accurate and reliable guidance. Additionally, develop posts featuring healthy and appealing recipes, especially aimed at children, in order to encourage more balanced and flavorful eating habits.
RESULTS
Creation of the Instagram account @ateliedaalimentacao.usp, which includes posts on healthy recipes, physical activity, ultra-processed foods, and breastfeeding. Currently, the account has 233 followers and has reached 430 profiles.
CONCLUSIONS
Using Instagram to disseminate information on infant nutrition has demonstrated its potential in reaching a significant audience. By adapting scientific content to an accessible and visually attractive language, it was possible to engage followers and share essential information on nutrition. With 233 followers and 430 profiles reached, the project highlights the platform’s potential to encourage changes concerning children's eating behaviors.

WHICH FOOD GROUPS MAKE UP SCHOOL MEALS IN BRAZIL? AN EVALUATION OF MENUS FROM THE NATIONAL SCHOOL FOOD PROGRAM (PNAE)

Isabela Martins[1]; Rafaella Camargo[2]; Angélica Oliveira[3]; Evandro Ribeiro[3]; Semíramis Martins Álvares Domene[4]

[1]Postgraduate Program in Nutrition, Federal University of São Paulo Unifesp, São Paulo, Brazil; [2]Interdisciplinary Postgraduate Program in Health Sciences, Universidade Federal de São Paulo - Campus Baixada Santista - Edifício Acadêmico I, Santos, Brazil; [3]Department of Administration, School of Economics, Administration and Accounting of Ribeirão Pr, USP Campus de Ribeirão Preto, Ribeirao Preto, Brazil; [4]Department of Public Policies and Collective Health, Institute of Health and Society, Universidade Federal de São Paulo - Campus Baixada Santista - Edifício Acadêmico I, Santos, Brazil

BACKGROUND AND OBJECTIVES

The National School Feeding Program (PNAE) is the oldest and most significant public policy in Brazil aimed at promoting the right to food for students in basic education [1, 2]. It is recognized as a global reference for its efforts to promote healthy eating combined with sustainability [3]. The program advocates for the provision of fresh and minimally processed foods as the foundation of meals and restricts the procurement of processed and ultra-processed foods, aiming to promote adequate and healthy eating [4]. This study aimed to evaluate school menus and determine the weekly frequency of food groups present in Brazilian school menus.

METHODS

This quantitative, cross-sectional study used data from the project "School meal menu patterns and their relationship with nutritional quality and sociodemographic factor". A sample of 557 weekly menus (five days) from elementary schools across Brazilian municipalities was assessed. Data were collected between 2022 and 2024 and subjected to descriptive and exploratory analysis.

RESULTS

Cereals and tubers were present five times per week in 52.06% of the evaluated school menus, while legumes appeared from one to two times per week in 47.04%, with rice and beans being the most common items in these groups. Vegetables occurred at least three times per week in 69.30% of the menus, while fruits were offered two to three times per week in 51,71% of the menus. Red meat was served two to three times per week in 62.30% of municipalities, while eggs, poultry, and fish appeared one to two times per week in 68.94%. Dairy products were served one to two times per week in 53.50% of the menus but were absent in 41.47% of municipalities. Processed foods were not included on any day in 53.68% of the menus, while ultra-processed foods appeared one to two times per week in 60.14% of the menus analyzed. Additionally, 78.28% of municipalities did not include sociobiodiversity foods on any day of the week, and regional foods were included only one to two times per week in 53.86% of the menus.

CONCLUSIONS

Fresh and minimally processed foods were prevalent; however, ultra-processed foods remain frequent, while sociobiodiversity and regional foods are still underrepresented. These findings indicate that despite the advances achieved by the PNAE, further improvements in menu planning are necessary.

EPO5_508

THE ROLE OF THE DIETITIAN IN THE SOCIAL ASSISTANCE SYSTEM

Samantha Mescoloto[1]; Gabriela Pongiluppi[1]; Semíramis Martins Álvares Domene[2]
[1]Post-Graduate Program in Nutrition, Federal University of São Paulo, São Paulo, Brazil; [2]Department of Public Policies and Collective Health, Institute of Health and Society, Universidade Federal de São Paulo - Campus Baixada Santista - Edifício Acadêmico I, Santos, Brazil

BACKGROUND AND OBJECTIVES
In Brazil, social assistance has been organized since 2003 through the Unified Social Assistance System (SUAS), which aims to promote social protection and guarantee the rights of vulnerable families and individuals. Although food is a constitutional right, hunger and food insecurity are still persistent challenges. Within this context, the role of dietitian in the social assistance network contributes to the realization of the human right to adequate food and the fight against malnutrition in all its forms, aligned with current recommendations. However, there is an absence of recognized guidelines regarding social assistance teams. This study aims to understand the work processes of dietitians in the SUAS, based on a dialogical approach that can strengthen the presence of these professionals in the social assistance network throughout Brazil.
METHODS
This is a prospective study with a qualitative, descriptive and analytical approach. The sample consisted of 15 dietitians working in social assistance, selected through electronic invitations. The interviews were conducted using a semi-structured script so as to allow content analysis according to established thematic nuclei.
RESULTS
The interviews conducted enabled information to be gathered on the daily practices and challenges faced by dietitians. The professionals emphasized the importance of sensitizing the teams to the transversality of the human right to food. They also identified weaknesses in Food and Nutrition Education actions and difficulties in intersectoral coordination. Additionally, they emphasize the need to strengthen social control spaces in municipalities. This would help to guarantee the continuity of initiatives, even with the change of governments and/or professional teams. In addition, there is a growing articulation between dietitians, public managers and researchers, with the development of programs, actions and research aimed at rebuilding the public food and nutrition agenda in the SUAS.
CONCLUSIONS
Efforts to consolidate the role of dietitians in social assistance are gaining momentum, resulting in positive outcomes such as promoting healthy eating practices, tackling food insecurity, and realizing food-related rights The continuity and expansion of these actions depend on the integration between different sectors, the strengthening of social control and collective engagement, as resources in the fight against hunger and the promotion of adequate and healthy food.

DEVELOPMENT, VALIDITY AND REPRODUCIBILITY OF A SEMI-QUANTITATIVE FOOD FREQUENCY QUESTIONNAIRE FOR USE AMONG THE ADULT POPULATION IN REUNION ISLAND

Eric Verger[1]; Sabrina Eymard-Duvernay[1]; Sarah Amiri,[1]; Noah Nourly,[1]; Magali Tarnus,[2]; ; Caroline Méjean[3]
[1]Moisa, Institut de Recherche pour le Développement (IRD), Montpellier, France; [2]Independent dietician, Lekip Diet, Sainte-Marie, Réunion; [3]MoISA, Univ Montpellier, CIHEAM-IAMM, CIRAD, INRAE, Institut Agro, IRD, Montpellier, France

BACKGROUND AND OBJECTIVES
Despite the urgency regarding increasing prevalence of obesity and chronic diseases in Reunion island, data on eating habits and nutritional intakes to characterise this nutritional transition remains scarce and incomplete. One of the scientific challenges of the Comportements Alimentaires à la RéunIon (CARI) observatory is to develop and validate methodologies adapted to the Reunionese context to obtain robust and reliable data. The aims of the study were: (i) to describe the development of a semiquantitative food frequency questionnaire (FFQ) for use among the adult population in Reunion island to measure usual food intakes during the past month; (ii) to assess its reproducibility; and (iii) to assess its relative validity compared with self-administered web-based 24-hour dietary recalls (DRs).
METHODS
The layout and format of the CARI FFQ was based on the French FFQ of the Nutrinet study but the food list was adapted to better reflect dietary practices and nutritional challenges on Reunion Island, with the support of a local dietician and import and agricultural production data. The CARI FFQ was administered twice to 108 purposively selected adults in Reunion Island, 4 weeks apart, from March to May 2024, to determine its reproducibility. Participants were asked to complete a weekly DR over the same period to determine the FFQ's validity. Both FFQ and DRs were administered by 7 trained dieticians and answers were entered directly onto a tablet on the NutriNet-Santé study platform. Several measures of reproducibility and validity were evaluated: estimations of 18 food groups, energy, and 38 nutrient intakes from the DRs and the FFQ, rank correlation and cross-classification.
RESULTS
Regarding validity tests, we found a median rank correlation of 0·51 (from 0.27 to 0·68) for nutrients and 0·43 (from -0.02 to 0·71) for food groups. Most participants were correctly classified into the same or adjacent quintile (median of 71% for nutrients and 68% for food group) while the median percentage of gross misclassification was low (1.8% for nutrients and 0.9% for food groups). Regarding reproducibility tests, we found a median rank correlation of 0·55 (from 0.16 to 0·70) for nutrients and 0·64 (from 0.41 to 0·83) for food groups. Most participants were correctly classified into the same or adjacent quintile (median of 80% for nutrients and 83% for food group) while the median percentage of gross misclassification was low (2.7% for nutrients and 0.9% for food groups).
CONCLUSIONS
The CARI FFQ demonstrated a moderate to good level of validity for ranking food and nutrient intakes within an adult population in Reunion, and a good level of reproducibility.

THE HEALTH BENEFITS AND COST-EFFECTIVENESS OF A SUGAR-SWEETENED BEVERAGE TAX FOR NEW ZEALAND YOUTH

Courtney Steele[1]; Cristina Cleghorn[1]; Louise Signal[1]
[1]Department of Public Health, University of Otago, Wellington, Wellington, New Zealand

BACKGROUND AND OBJECTIVES
Sugar-sweetened beverage (SSB) intake is associated with dental caries, diabetes, and obesity. New Zealand (NZ) has the second highest prevalence of childhood obesity among OECD countries and poor nutritional intake, including consumption of SSBs, is an important contributor. Significant inequities in SSB intake and obesity exist by ethnicity and socioeconomic status. SSB taxes have been shown to be effective and are recommended by health bodies such as the WHO. This study modelled the potential health and equity impacts and cost-effectiveness of an SSB tax implemented in NZ, focusing on outcomes for youth.
METHODS
We modelled the effect of a range of SSB taxes on consumption of SSBs, other dietary risk factors, and body mass index in youth aged 2-19 over their lifetimes. Baseline dietary intake was obtained from the NZ National Children's and Adult's Nutrition Surveys, and changes in consumption were estimated using a matrix of NZ price elasticities. A proportional multistate life table model was used to predict the change in incidence of nutrition-related communicable diseases in both childhood and adulthood, disutility associated with childhood overweight and obesity, quality-adjusted life years (QALYs), and healthcare system costs (2011 NZ$) over the lifespan of the NZ population alive in 2011 (3% discounting). Scenario analyses considered SSB tax levels of 10% and 20% and a range of SSB definitions.
RESULTS
In the total NZ population, a 20% tax on SSBs (soft drinks only) generated 133,470 QALYs (95% uncertainty interval (UI): 109,860 to 160,160) and saved $2,530 million (95% UI: 1,950 to 3,200) in healthcare expenditure over the life course of the cohort. Age-standardised per capita health gains were 2.9 times greater for Māori than non-Māori youth. The tax prevented 60,900 and 210 lifetime incident cases of dental caries and type 2 diabetes in youth. Health gains generated in the NZ youth population ranged from 72,070 QALYs (95% UI: 58,950 to 86,610) for a 10% tax on sugar-sweetened soft drinks to 192,430 QALYs (95% UI: 159,300 to 230,990) for a 20% tax on sugar-sweetened soft drinks, fruit juices, and fruit, energy, and sports drinks. The respective healthcare-system cost savings ranged from $1,340 million (95% UI: 1,040 to 1,700) to $3,620 million (95% UI: 2,820 to 4,530).
CONCLUSIONS
This study showed that an SSB tax implemented in NZ would result in substantial health system cost-savings and improve health and health equity for Māori. This policy could be an effective component of a population-level strategy to improve nutrition and health.

THE RELATIONSHIP BETWEEN TRADITIONAL JAPANESE DIET SCORE AND BONE HEALTH: AN ECOLOGICAL STUDY

Chisato Abe[1]; Tomoko Imai[2]; Ayako Sezaki[3]; Keiko Miyamoyto[4]; Fumiya Kawase[5]; Yoshiro Shirai[3]; Masayo Sanada[6]; Norie Sugihara[7]; Inden Ayaka[8]; Hiroshi Shimokata[9]

BACKGROUND AND OBJECTIVES
The traditional Japanese diet is thought to be related to the longevity of the Japanese people. We have calculated traditional Japanese diet score (TJDS) using foods commonly eaten around the world, and we have reported that TJDS was positivity associated with healthy life expectancy and negatively associated with incidence and mortality of certain non-communicable diseases in ecological studies. On the other hand, traditional Japanese diet is considered to be lacking in calcium and not very good for bone health. The purpose of this study is to clarify the global association between TJDS and bone health indicators through a longitudinal analysis using data from 2010 to 2021.
METHODS
Low bone mineral density rate (LBMD) and bone mineral density among population age 60 and over years (BMD60) were used as indicators of bone health. Data on food supply, LBMD, BMD60, and covariables by country were obtained from a relevant internationally available database. TJDS by country was calculated from eight food groups and the total score ranged from -8 to 8, with higher scores indicating greater adherence to a traditional Japanese diet. We evaluated the longitudinal association between TJDS and LBMD, BMD60 using 2010-2021 in 144 countries with populations of more than one million. A longitudinal analysis was performed using linear mixed models controlling for covariates. The natural logarithms of LBMD and BMD60 were used as the dependent variables, and the risk ratio (RR) was calculated from the difference in the logarithms of TJDS.
RESULTS
The fixed effects (standard error) of TJDS on LBMD and BMD60 were 0.015 (0.004), $p<0.001$, -0.004 (0.001), $p= 0.007$, respectively. When TJDS was -6, the RR for LBMD and BMD60 were 0.912 (0.870-0.956) and 1.023 (1.007-1.040), and when TJDS was 6, the RR for LBM and BMD60 were 1.097 (1.046-1.150) and 0.977 (0.961-0.993), respectively.
CONCLUSIONS
This longitudinal ecological study suggests that traditional Japanese diet is associated with high LBMD and low BMD60, worldwide.

PREVALENCE OF MALNUTRITION AND CHILDHOOD ANEMIA IN A NON-GOVERNMENTAL NUTRITION PROGRAM

Eduardo Thébar Gómez[1]; Cristian Angel Rosales Gómez[1]; Fabián Olvera Flores[1]; Sandra Luz Sandoval Arredondo[1]; Andrea Itzayana López Pastrana[2]; Yosimara De La Cruz Valle[2]; Jaqueline Manzanarez Cuevas[2]; Angeles Zayuri Gonzaga Camilo[2]
[1]Monitoreo, Evaluación e Investigación, Un Kilo De Ayuda, A.C., Ciudad de México, Mexico; [2]CRES-ZN, Universidad Autónoma de Guerrero, Guerrero, Mexico

BACKGROUND AND OBJECTIVES
According to the World Health Organization (WHO), child malnutrition due to deficits remains a persistent global public health issue. Recent estimates indicate that 6.7% of preschool-aged children suffer from wasting, 22% from stunting, and 40% from anemia. In Mexico, 3.9% of children have low weight, 1.2% suffer from wasting, 13.9% from stunting, and 9.4% from anemia. This study aimed to determine the prevalence of nutritional status and anemia in preschoolers participating in a non-governmental nutrition program.
METHODS
Weight, height, and capillary hemoglobin [HbC] were measured based on recommended techniques in 17,520 preschoolers participating in community activities proposed by Un Kilo de Ayuda. To classify nutritional status and HbC concentration, the indicators, values, and cut-off points established by the WHO were used. Prevalence rates and confidence intervals were calculated for nutritional status categories, and frequencies, percentages, and chi-square tests were used for group comparisons.
RESULTS
The gender distribution was 50.3% boys and 49.7% girls. The prevalence of wasting was 1.8% (95% CI: 1.4, 2.4), stunting 29.2% (95% CI: 14.5, 50.2), and low weight 9.3% (95% CI: 5.8, 14.6). When stratified by gender, wasting was 2.2% (95% CI: 1.7, 2.8) in boys and 1.5% (95% CI: 1.1, 2.1) in girls. Stunting was higher in boys (30.1% [95% CI: 15, 51.2]) compared to girls (28.4% [95% CI: 14, 49.1]). Low weight was also higher in boys (9.7% [95% CI: 6.3, 14.7]) versus girls (8.9% [95% CI: 5.3, 14.7]). The overall prevalence of anemia was 23.4% (95% CI: 22.7, 24), with 23.7% (95% CI: 22.8, 24.6) in boys and 23% (95% CI: 22.1, 23.9) in girls. A significant association was observed between nutritional status and anemia: wasting ($p<0.001$), stunting ($p<0.05$), and low weight ($p<0.001$).
CONCLUSIONS
The various forms of malnutrition in preschoolers continue to pose a significant health challenge, jeopardizing early childhood development and increasing morbidity and mortality in later life stages. This, in turn, reduces the potential for personal and economic development in affected countries. Non-governmental programs represent an effective strategy for monitoring and improving the nutritional and health status of preschoolers. Furthermore, the community actions proposed by these programs can inform the design of nutrition policies and programs.

[1]Devision of Applied Nutrition, Faculty of Nutritiontrition, Kobe Gakuin University, Hyogo, Japan; [2]Department of Occupational Therapy, Faculty of Rehabilitation, Kobe Gakuin University, Hyogo, Japan; [3]Department of Physical Therapy, Faculty of Rehabilitation, Kobe Gakuin University, Hyogo, Japan; [4]Kobe Lab, PITTAN Inc., Hyogo, Japan

BACKGROUND AND OBJECTIVES

Sarcopenia is the progressive loss of muscle mass and function in older adults. Aging is the most prevalent cause of sarcopenia; however, physical inactivity and malnutrition worsen sarcopenia. Protein–energy malnutrition is frequently assessed from biomarkers in serum, but blood collection is painful and burdensome for the patient. Therefore, we focused on human sweat, which is a component produced from blood plasma, which can be collected noninvasively. Amino acids are quantified from very small samples of sweat collected at rest using high-performance liquid chromatography (HPLC) (Tsunoda M *et al*, 2024). This study aimed to identify the association between sweat amino acid levels and muscle status and estimated protein intake and to investigate the effectiveness of sweat amino acid analysis as a risk assessment tool for sarcopenia.

METHODS

The subjects included 146 community-dwelling older adults (34 males and 112 females) aged 60–92 years.

- Sweat was collected by applying a medical patch to the calves for 3 min in the sitting position. The amino acid content in the sweat was analyzed by HPLC.
- Physical measurements were conducted, including body composition, calf circumference (CC), grip strength, and walking speed.
- Diet surveys were conducted using a brief-type self-administered diet history questionnaire (BDHQ) to identify the frequency of food intake and estimated nutrient intake.
- Self-administered paper questionnaires, such as the Japanese version of the Cardiovascular Health Study (J-CHS) criteria, were conducted.

RESULTS

HPLC quantified 13 amino acids in the sweat of calves. The multiple regression analysis revealed a positive association between the estimated protein intake identified by BDHQ and arginine levels in sweat. The glutamic acid level in sweat was negatively associated with the J-CHS score and positively associated with CC.

CONCLUSIONS

Several amino acids in calf sweat may reflect muscle condition and estimated protein intake, indicating potential application in reliable risk assessment of sarcopenia.

NUTRITIONAL ASSESSMENT OF CHILDREN IN RURAL CAMBODIA: ASSESSMENT USING THE MINIMUM DIETARY DIVERSITY FOR WOMEN IN CHILDREN AGED 24–59 MONTHS

Mari Ujiie[1, 2, 3]; Yuri Kinoshita[4, 3]; Manami Aono[5]; Saki Horie[6, 3]; Mieko Morgan[7]; Huon Sok[7]; Konthea Chieb[7]; Sakiko Mizoguchi[7]; Mari Arimitsu[8]; Mio Kushibuchi[7]; Tae Kamikura[7]

BACKGROUND AND OBJECTIVES

Chronic malnutrition among children <5 years is a global issue. Rates of stunting and wasting are particularly high in rural Cambodia (1-3). In low-income countries, while standard indicators for children aged 6–23 months (4) exist, there are no established indicators for children aged 24–59 months. Thus, we aimed to assess the minimum dietary diversity (MDD) and explore factors contributing to malnutrition among children aged 24–59 months in rural Cambodia. We also aimed to identify key determinants related to children's nutritional status and provide recommendations for nutritional improvements.

METHODS

The target area covered four of the seven counties in the province of Preah Vihear. A baseline survey (random sampling method, 123 participants) was conducted, and 40 children under 5 years of age who were determined to be at high risk of wasting, stunting, and being underweight were selected. In February 2024, the caregivers kept dietary records for three days (using food records, photographs, interviews). Children aged 24–59 months were evaluated using the MDD for Women (MDD-W) guidelines (5), assessing the intake of 10 or additional food groups, as well as food intake frequency.

RESULTS

Data from 26 children (13 boys) over a total of 55 days were analyzed to calculate the MDD-W. The recommended intake of 5 or more food groups per day was achieved in 18 days (32.7%), with 12 children (46.2%) meeting this criterion. The minimum number of food groups consumed was 2, the maximum was 9, and the mode was 4. The most-consumed food group was "Grains, etc.," followed by "Meat, etc." The least-consumed food groups were "Nuts, etc." and "Milk, etc." Additionally, the intake of unhealthy food groups not included in the MDD-W, such as snacks and instant noodles, was frequently observed in the 30 days' worth of meal records collected from 18 children. In terms of meal frequency, 22 children had 4 or more meals per day.

CONCLUSIONS

The MDD, typically used for children aged 6–23 months, does not cover children aged 24 months and older. By adapting the MDD-W for children aged 24–59 months, we found that the intake of mineral-rich food groups was low, and the frequency of consuming unhealthy food groups was high. Future studies should explore how these findings relate to nutrient Recommended Dietary Allowance, malnutrition indicators, and differences based on caregivers' educational backgrounds and residential areas.

KNOWLEDGE ON THE SAFETY AND QUALITY OF DRINKING WATER AMONG HEALTHCARE PROFESSIONALS

Diana Sunardi[1]; Putri Nc Insani[2]; Bernie E Medise[3]; Dian N Chandra,[1]; Dewi Friska,[4]; Nurul Rm Manikam,[5]; Wiji Lestari,[1]; Aisyah N Amirah,[6]; Maudy P Arfi,[7]

[1]Department of Nutrition, Faculty of Medicine Universitas Indonesia - Cipto Mangunkusumo Hospital, Jakarta, Indonesia; [2]Indonesian Hydration Working Group, Fakultas Kedokteran Universitas Indonesia, Jakarta, Indonesia; [3]Department of Paediatric, Faculty of Medicine Universitas Indonesia - Cipto Mangunkusumo Hospital, Jakarta, Indonesia; [4]Department of Community Medicine, Faculty of Medicine Universita, Jakarta, Indonesia; [5]Department of Nutrition, Faculty of Medicine Universitas Indonesia - Ciptomangunkusumo Hospital, Jakarta, Indonesia; [6]Indonesian Hydration Working Group, Faculty of Medicine Universitas Indonesia, Jakarta, Indonesia; [7]Indonesian Hyration working Group, Faculty of Medicine Universitas Indonesia, Jakarta, Indonesia

BACKGROUND AND OBJECTIVES

Water has very diverse benefits for the body. Drinking water needs to be considered for its safety and quality, as it may impact health as infectious diseases and NCDs. Healthcare (HC) professionals' knowledge on the safety and quality of drinking water is important because they are educators and role models in society. This research aims to evaluate health professionals' level of knowledge about drinking water's safety and quality.

METHODS

A cross-sectional study with a population of HC professionals taking part in a conference in Jakarta and coming from various regions in Indonesia. The sample was the entire population who were willing to participate. Subjects fill out a questionnaire regarding demographics, drinking habits, and knowledge.

RESULTS

One hundred thirty-one subjects joined the study, 14.5% were male, and 82.4% were from Java Island. Age distribution between >35 years old and ≤35 years old were almost the same, 53.4% and 46.6% respectively. This study shows that only 19.1% of the subjects had good knowledge, while 51.9% fair and 29.0% low. There was no significant difference in the level of knowledge between specialist doctors, GPs, or dieticians. These RESULTS mean that healthcare professionals need further education about the safety and quality of drinking water. We found that the three most false answers from the 10 questions were about the requirements of good drinking water, how contamination can harm health, and what diseases may result from consuming contaminated water.

CONCLUSIONS

HC professional's knowledge of drinking water safety and quality must be enhanced.

ADHERENCE TO DIET RECOMMENDATIONS IN WOMEN WITH GESTATIONAL DIABETES MELLITUS

Kirsi Laitinen[1, 2]; Tero Vahlberg[3]; Outi Pellonperä[4]; Kristiina Tertti[4]; Lotta Saros[2]
[1]Nutrition and Food Research Center, University of Turku, Turku, Finland; [2]Institute of Biomedicine, University of Turku, Turku, Finland; [3]Institute of Clinical Medicine, Biostatistics, University of Turku, Turku, Finland; [4]Department of Obstetrics and Gynecology, University of Turku and Turku University Hospital, Turku, Finland

BACKGROUND AND OBJECTIVES
Gestational diabetes mellitus (GDM) is a common disorder of glucose metabolism that is detected for the first time in pregnancy. The main risk factor for GDM is obesity. GDM may compromise the health of both the mother and the child, and thus blood glucose levels are controlled by lifestyle modifications including diet and physical activity. The objective was to investigate the adherence to the dietary recommendations of women with GDM.
METHODS
Women with prepregnancy overweight (BMI≥25) or obesity (BMI≥30) were studied. Dietary intake was assessed from 3-day food-diaries with nutrient intakes calculated and compared to dietary recommendations. GDM was diagnosed with a 2-hour oral glucose tolerance test. Altogether 98 women with GDM and 251 pregnant women without GDM were studied.
RESULTS
Of the women with GDM 51% adhered to recommendations for carbohydrate intake, 54% for total fat and 69% for sucrose intake, whilst only 16% adhered to the protein and 4% to fibre intake recommendations. Women with GDM had lower adherence to protein, total fat and fibre recommendations but higher adherence to that of sucrose than women without GDM.
CONCLUSIONS
Adherence to dietary recommendations, particularly fibre and protein intake, is unsatisfactory in women with GDM.
CONFLICTS OF INTERESTS

PLANT-BASED EATING THROUGH A CULTURAL LENS: A DIETARY INTERVENTION FOR AFRICAN AMERICANS

April Stull[1]; Allison Pettit[1]; Cassidy Dudley[1]; Stephanie Boddie[2]; Sydney Johns[1]; Karen Melton[1]
[1]Department of Human Sciences and Design, Baylor University, Waco, United States of America; [2]Diana R. Garland School of Social Work, Baylor University, Waco, United States of America

BACKGROUND AND OBJECTIVES
Plant-based diets have been linked to a reduced risk of chronic diseases. However, there is limited data on their receptivity and effectiveness within African American populations. This study evaluated the feasibility and efficacy of a culturally tailored plant-based dietary intervention among African Americans.
METHODS
A quasi-experimental pilot study was conducted over 12 weeks, including a 6-week intervention phase with 1 session per week (nutrition education, healthy eating activities, and cooking demonstrations) followed by a 6-week follow-up period without an intervention. Weekly 75-minute sessions were guided by the curriculum, *A Taste of African Heritage [Oldways]*. The curriculum emphasized plant-based foods and healthy lifestyle practices inspired by the traditions of the African Diaspora. Feasibility was assessed through participant recruitment and retention, and session attendance, engagement, and satisfaction. Additional outcomes included cooking frequency, food group intake, exercise, and attitudes toward a plant-based diet via surveys at baseline (week 0), post-intervention (week 6), and follow-up (week 12).
RESULTS
Participants (n=20) self-identified as African American, with a mean age of 62.1 ± 14.7 (Mean ± SD) years and mean body mass index of 34.3 ± 6.5 kg/m². The intervention had a low dropout rate (9%) and high session attendance rate (99%). Participants reported strong engagement, high satisfaction, and noted that the sessions were a good use of their time. All participants agreed that history and heritage motivated healthy eating and living. Mixed-effects models for behavioral changes over time demonstrated significant improvements, including an increase in vegetarian-based meal frequency ($t=3.73$, $p<0.001$) and greater participation in exercise ($t=2.59$, $p=0.013$). There were trends in increasing fruit ($p=0.058$) and vegetable ($p=0.054$) consumption. Perceptions of plant-based diets improved, including attitude towards diet ($t=2.72$, $p<0.01$), perceived benefits of the diet ($t=3.29$, $p<0.01$), and enjoyment and pleasantness of following the diet ($t=2.96$, $p<0.01$).
CONCLUSIONS
The intervention encouraged positive lifestyle behavior changes and improved perceptions of plant-based diets. Incorporating cultural heritage may be a valuable strategy for encouraging plant-based eating among African Americans. However, a controlled trial with a larger sample size is warranted.

STUNTING AMIDST FOOD PLENTY AND WEALTH: A PARADOX

Joyce Kinabo[1]; Abdallah Mtumwa[2]; Teddy Chivaghula[3]
[1]Agriculture, Sokoine University of Agriculture MAIN CAMPUS, Morogoro, Tanzania, United Republic of; [2]Statistics, University of Dodoma, Dodoma, Tanzania, United Republic of; [3]HUMAN NUTRITION AND CONSUMER SCIENCES, Sokoine University of Agriculture MAIN CAMPUS, Morogoro, Tanzania, United Republic of

BACKGROUND AND OBJECTIVES
stunting is a very challenging form of malnutrition to address it with successful outcomes. In Tanzania, prevalence of stunting is high in wealthy and high food production areas and this is a paradox that needs to be unravelled. It is envisaged that causes of stunting. The 2022 DHS report showed that 30% of children below five years of age are stunted, of which 9% are severely stunted. This proportion translates to 2.9 million children. There is wide geophysical disparities of prevalence of stunting. The objective of this analysis was to examine the relationship between food security measured by self sufficiency ratio and wealth index measured as poverty level.
METHODS
nutrition data from the 2022 DHS , production data from the ministry of agriculture and poverty level were analyzed to determine the association between stunting and food security measured in terms of self sufficiency ratio. Similarly, stunting was correlated with wealthy index based on the 2018 Tanzania food and basic poverty data.
RESULTS
When the food SSR was compared with malnutrition stunting rates, it showed that regions that have high SSR also have high stunting rates (correlation coefficient of 0.63). Similarly, the highest prevalence of stunting was observed in Njombe, where the basic need and food poverty were the lowest. This is a paradox and clearly shows that the amount of wealth generated in a region like Njombe is not translated into improved consumption and nutritional status of children. This could be related to inadequate information about consumption of nutritious foods and nutrition of children, but also due to inadequate knowledge on how to translate the generated wealth into improved dietary intake. The ‘paradox’ of high levels of malnutrition in areas with high food crop production can be explained by challenges for mothers and child caretakers to have sufficient time, knowledge/skills, family support and command over resources to meet the needs of children in terms of care, feeding, hygiene and general cleanliness; also stimulation and emotional support and other critical care functions.
CONCLUSIONS
Specific needs and challenges are highly context-specific and, therefore, food security and nutrition interventions and programmes will require formative and operational research to ascertain that all of the critical outcomes for nutrition security are fulfilled, this include household food security, healthy environment and health services as well as care and support knowledge and skills.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

ASSESSING THE FOOD ENVIRONMENT IN MALAYSIA: A NARRATIVE REVIEW

Ai Ni Teoh[1]
[1]Research, Khazanah Research Institute, Kuala Lumpur, Malaysia

BACKGROUND AND OBJECTIVES
Food environment is a significant determinant of dietary choices and intake, making it a key policy entry point to address malnutrition and the growing prevalence of non-communicable diseases. This review aims to summarise the evidence on food environment characteristics in Malaysia, providing an overview of each dimension and identifying its potential implications for food choices.
METHODS
A literature search was conducted to identify English-language publications and grey literature. Sources were analysed and synthesised to describe Malaysian food environments in five dimensions: food availability, food affordability, food properties, vendor properties, and food messaging.
RESULTS
Malaysia has been increasingly reliance on imports for food supply. With that, the import of unhealthy food has also risen. Since 1990, the weight of imported ultra-processed, energy-dense and high-fat foods has increased at a compounded annual growth rate of 5.8%, higher than healthier foods (4.9%). The increased consumption of food away from home, commonly associated with higher energy intake and poorer diet quality, also poses additional challenges to healthy eating. This can be reinforced by the increased use of meal delivery apps (MDAs) and food delivery services, which expand access to unhealthy food options. Findings from Grab, a leading MDA in Malaysia, show that deep-fried, high-fat and sugar-sweetened beverages were more frequently searched or ordered on the platform. Meanwhile, the national supply of fruits and vegetables per capita per day consistently falls below the recommended intake level. On the other hand, the cost of a healthy diet in Malaysia has been rising against the backdrop of wage stagnation, recording an increase of 9.2% from 2017 to 2021. Fruits account for the highest share (29%) of the cost of a healthy diet, followed by animal-sourced foods (26%) and vegetables (20%). There is also an established body of evidence that points to the targeting of unhealthy food advertisements on television and YouTube to children through higher advertising rates during children's peak viewing time and on school holidays.
CONCLUSIONS
Evidence suggests that Malaysia's food environments are largely characterised by the increased availability, accessibility and desirability of unhealthy food and the unaffordability of healthier options. This can disproportionately impact people with financial constraints, time-poor individuals, children and adolescents.

EFFECT OF SPORTS NUTRITION MANAGEMENT ON GASTROINTESTINAL HEALTH AND INTESTINAL FLORA IN ATHLETES UNDERGOING INTENSE TRAINING

Yukina Fukuda[1, 2]; Yukika Yoshizawa[1]; Megumi Matsumoto[1]
[1]Department of Physical Education, Nihon University, College of Humanities and Science, Setagaya City, Japan; [2]Research and Development Division, Healthcare Systems Co. Ltd., Minato, Japan

BACKGROUND AND OBJECTIVES
In sports nutrition management, a personalized nutritional plan is developed based on assessments of the athlete's training regimen, dietary habits, body composition, and overall health. The goal is to help athletes to achieve specific objectives within a set timeframe while providing ongoing support. Athletes often engage in high-intensity training to improve performance, but prolonged and intense exercise can lead to gastrointestinal discomfort. This study aimed to evaluate the effectiveness of a sports nutrition management program designed for athletes involved in long-duration, high-intensity exercise.
METHODS
Male triathletes, swimmers, long-distance runners, and walkers with gastrointestinal issues were identified through a screening survey and divided into a nutrition intervention group (n=9) and a control group (n=9). The intervention lasted 1 month. Before and after the intervention, saliva, urine, and fecal samples were collected, and participants underwent anthropometric measurements, dietary and physical activity surveys, and physical condition assessments. The intervention group's nutritional management plan was developed based on anthropometric and survey RESULTS to align with individual goals. The plan included consuming 25–30 g/day of dietary fiber and two servings of fermented foods daily to support gastrointestinal health. Counseling sessions were provided three times during the study.
RESULTS
In the intervention group, dietary fiber intake increased to 29.5±2.7 g/day, and fermented food consumption rose to 2.6±1.3 servings/day. The proportion of *Bifidobacterium* increased by 10.0%±6.1%, while the proportion of *Bacteroides* decreased by 10.7%±4.3%. Additionally, the frequency of diarrhea or watery stools decreased in the intervention group.
CONCLUSIONS
The observed increase in Bifidobacterium may have enhanced the intestinal barrier function by breaking down lactose and oligosaccharides and producing organic acids such as butyric acid, contributing to improved gastrointestinal health. These findings imply that athletes may benefit from higher dietary fiber and fermented-food intake compared with the general population to prevent gastrointestinal issues associated with intense training. This study supports an intake of 25–30 g/day of dietary fiber and two or more servings of fermented foods daily as effective targets for sports nutrition management to regulate gastrointestinal health.

CHANGES IN INTESTINAL MICROBIOTA DURING THE TRAINING PERIOD IN COLLEGE MALE LONG-DISTANCE ATHLETES

Matsumoto Megumi[1]; Hikari Kajita[1]; Yukika Yoshizawa[1]; Masahito Hagio[2]
[1]Department of Physical Education, Nihon University, College of Humanities and Science, Setagaya City, Japan; [2]Faculty of science and chemistry, Kanagawa Prefectural Institute of Public Health, kanagawa, Japan

BACKGROUND AND OBJECTIVES
Probiotics, such as *Lactobacillus* and *Bifidobacterium*, have been shown to improve the intestinal environment and to have immunomodulatory effects. Athletes are often exposed to intense training and stress, and conditioning methods based on nutritional management with probiotics are attracting attention. Therefore, this study investigated changes in nutrient intake and intestinal microflora in track and field athletes, a sport that often causes abdominal pain, to examine how athletes eat and manage their physical condition within their yearly schedule.
METHODS
Body composition measurements and faecal microflora tests were conducted twice during the competition season (periods I and II) and once during the off-season (off-period) in six male university track and field long-distance athletes. In addition, a TDMS-based survey on mood on the day of the study, questionnaires on physical condition and abdominal condition, and a three-day dietary survey were conducted. Physical activity during the study period was assessed in terms of distance run. The faecal intestinal microbiota was examined by next-generation sequencing and amplicon analysis.
RESULTS
Dietary intake of protein, calcium, iron and vitamins C and D increased significantly in competition periods II, while energy intake and other nutrients did not change significantly. At the phylum and genus level, no significant changes in the composition of the intestinal microbiota of the six participants during competition periods I, II and the off-period were observed. In addition, no period-specific clusters were formed in the composition of the intestinal flora. However, the composition of *Bifidobacterium* spp. showed a negative correlation ($p<0.05$, $r=0.829$) with monthly running distance in competition period II and a positive correlation ($p<0.05$, $r=0.886$) with soluble fibre intake in the off period.
CONCLUSIONS
Changes in the intestinal microbiota were not clearly influenced by the course of the long-distance runners' yearly schedule or by psychological stress. On the other hand, long-term observations suggested that the amount of physical activity and dietary fibre intake of athletes influenced the composition of the intestinal microbiota.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

VALIDATION OF THE CLUSTER-COMPOSITING METHOD TO ASSESS THE PERFORMANCE OF THE SALT IODIZATION PROGRAM IN ETHIOPIA

Nahom Tefera[1]; Omar Dary[2]; Ramadhani Noor[3]; Alemayehu Hussein[1]; Teshome Assefa[1]; Meseret Woldeyohannes[1]; Bedassa Tessema[1]; Arnaud Laillou[4]; Getachew Tollera[1]; Mesay Hailu[1]; Stanley Chitekwe[3]; Masresha Tessema[1]
[1]Nutrition Research, Ethiopian Public Health Institute, Addis Ababa, Ethiopia; [2]Public Health Nutrition, Private Advisor, Washington, United States of America; [3]Nutrition, UNICEF Ethiopia, Addis Ababa, Ethiopia; [4]Department of Child Survival and Development, UNICEF Cambodia, Phnom Penh, Cambodia

BACKGROUND AND OBJECTIVES
Assess performance of iodized salt at households is costly. Innovative solutions are needed to support surveillance for constant prevention of iodine deficiency disorders (IDD) through salt iodization. This study aimed to assess the validity of the Cluster-Compositing Method for monitoring iodized salt in Ethiopia.
METHODS
The study was cross-sectional at the national and sub-national levels. A total of 6148 households' salt samples were collected from 576 clusters. Single samples from the same cluster were mixed in equal proportions to make a cluster-level composite sample. Iodine determination was conducted using the titration method. The mean iodine content was determined in coarse and fine salt types.
RESULTS
Iodine content was higher in urban settings households, with higher education, and with higher wealth. Significant geographical differences were observed across sub-national levels. The two methods supported the same deductions. A strong positive correlation (r=0.83) was observed between the iodine contents estimated with composite samples and the averages per cluster based on single samples. The prevalence estimates of salt samples with iodine content below 15 ppm was comparable, although lower using the composite method (23% vs 26%). The proportion of salt samples with an iodine content between 15 and 40 ppm was also larger using composite samples (69%) against single samples (51%), and which is explained by the high random variation of the RESULTS of the latter.
CONCLUSIONS
The cluster-compositing method not only provides a cost-effective alternative to assess the performance of USI programs but also it is more precise.

DECLINED DIETARY DIVERSITY IN CHILDREN AGED 12–36 MONTHS IN ACEH PROVINCE, INDONESIA

Madeleine Randell[1]; Tanvir Huda[1]; Mu Li[1]
[1]School of Public Health, The University of Sydney, Camperdown, Australia

BACKGROUND AND OBJECTIVES
Malnutrition in children under five remains a significant global public health problem. Minimum dietary diversity (MDD) is an important indicator for monitoring the nutritional status of children 6–23 months. There is less evidence for those aged 24–59 months, despite this being a crucial window for children's growth and development. This study investigates dietary diversity among children aged 12 to 36 months in Aceh Province, Indonesia.
METHODS
We used data from cross-sectional surveys conducted in 2018 and 2021 as part of an evaluation of a child well-being intervention. The 2018 survey was carried out in eight of the 23 districts in Aceh Province, while four of those eight districts were sampled in the 2021 survey. Data from 1140 participants in 2018 and 802 participants in 2021 were included in this analysis. We used descriptive statistics to compare the proportion of children aged 12–23 months and 24-36 months meeting minimum dietary diversity between 2018 and 2021.
RESULTS
The overall proportion of children aged 12-36 months who met MDD in 2021 (41%, 95% CI 37.6, 44.4) was significantly lower than in 2018 (68.2%, 95% CI 65.0, 70.4). The average MDD score for children 12–23 months decreased from 5.3 in 2018 to 4.5 in 2021; while for children aged 24-36 months, it dropped from 5.1 in 2018 to 4.1 in 2021. Compared to 2018, a significant reduction in the consumption of animal-sourced foods and vitamin A-rich fruits and vegetables was observed in 2021 ($p<0.001$).
CONCLUSIONS
Minimum dietary diversity declined among children aged 12-36 months in Aceh Province, Indonesia, between 2018 and 2021, particularly in 24-36-month-olds. The COVID-19 pandemic may have amplified the situation. This highlights the urgent need to investigate the factors influencing dietary diversity in children between the ages of 2 and 5 and strengthen programs to improve the nutritional status of this age group. These findings also call for the government's action to protect all children under 5 in public health emergencies.

EFFECT OF CRICKET ENRICHED COMPLEMENTARY PORRIDGE AND NUTRITION EDUCATION ON GROWTH AMONG CHILDREN AGED 6-14MONTHS: A RANDOMIZED 2 × 2 FACTORIAL TRIAL, KENYA

Nicky Okeyo[1]; Cecilie Eleonora Wille[2]; Asenath Sigot[1]; Jeremy Ng'ang'a[3]; John Kinyuru[3]; Nanna Roos,[4]; Silvenus Konyole[1]
[1]Nutritional Sciences, Masinde Muliro University of Science and Technology, Kakamega, Kenya; [2]Nutrition, exercise and Sports , University of Copenhagen, Copenhagen, Denmark; [3]Food Science, Jomo Kenyatta University Of Agriculture And Technology, Juja, Kenya; [4]Department of Nutrition, Exercise, and Sports, University of Copenhagen, Frederiksberg Campus, Frederiksberg, Denmark

BACKGROUND AND OBJECTIVES
Improving complementary food (CF) and feeding practices are pathways for better child nutrition in food-insecure settings. Edible insect such as cricket containing high-quality protein and micronutrients are relevant in child nutrition, as potential alternative animal-source food. We evaluated effects of exposing infants enrolled at 6 months to a daily serving of cricket enriched CF porridge, combined with mother's exposure or none-exposure to nutrition education, over an 8 months period.
METHODS
We designed a 2x2 factorial randomized controlled trial having: Control, Cricket treatment (+CR), Nutrition Education (+NE) and a combined +NE with +CR. Mothers of infants were invited, and randomly assigned to the four study arms. Study CF were provided for take-home monthly supply with daily rations adjusted for age with the +CR having 20% cricket in the formulation. The +NE sessions were personalized audio-visual sessions with education messages and appointment reminder sent to mother's phones. Infant's anthropometric, household characteristics, feeding practices and child health data were collected monthly by trained assistants.
RESULTS
We enrolled 284 eligible mother/infant dyads between February and April 2023. At baseline infants were 6.3±0.5 months, weighing 7.6±1.1kgs, 65.7±3.2cm in length and stunting (< -2 Z-score) affected 12.4% of the infants. After 8 months, we found no significant ($p>0.05$) effects of either education or cricket treatment on infants' height. The WHZ gain amongst those receiving education was 0.36 Z-score ($p=0.02$).
CONCLUSIONS
Cricket enriched CF or nutrition education did not affect linear growth. Nutrition education combined with CF supported weight grain. Short-term interventions are likely insufficient to prevent stunting. ClinicalTrial NCT06002620.

THE UNSUNG HEROES OF RECYCLING: ADDRESSING THE NEEDS OF WASTE PICKERS IN THE ZERO WASTE JOURNEY

Ju Lan Phan[1]; Avita Usfar[2]
[1]Research, Dakra Consultant, Bekasi, Indonesia; [2]Research, Reconstra Utama Integra, Jakarta, Indonesia

BACKGROUND AND OBJECTIVES
Approximately 1 to 2 million tons plastic waste enter the oceans each year, causing considerable harm to marine life and ecosystems. Several key regulations aimed at achieving zero waste and improving waste management was implemented, such as the regulation on waste reduction, recycling, and reuse. A presidential regulation targets a 30% reduction in waste and processing of at least 70% of the remaining waste by 2025. The involvement of waste pickers (pemulung) plays a crucial role as they can supply up to 80% of the recycle materials to companies. The study provides insights into improving the life of waste pickers.
METHODS
In-depth interviews were conducted to five waste pickers in residential suburban areas. The informants were purposively selected and the interview lasted for about 30 minutes.
RESULTS
The waste pickers, aged between 48 and 67 years, have been working for periods ranging from 2 to 30 years. They typically work 4 to 8 hours a day. Some live in the same complex with the waste collectors who lend them pushcarts. They were able to collect 1 to 3 sacks of waste per collecting period. At home or at pool sites, these materials are dried before being sold. The waste is sorted into paper/cardboard, PET bottles, tin cans, and PP plastic, with PET bottles fetching the highest price per kilogram. Waste is compiled and sold weekly, generating a total income of around IDR 300,000 to 500,000 (approximately USD 20.00 to 33.00 per month). All of the waste pickers work full-time; while her/his spouse works as a daily laborer and the other engages in farm labor. One was a family of waste pickers consists of a husband, wife, and their child. Only one waste picker has received government social safety net programs in the form of free rice and cash, while others hope to receive similar assistance in the form of free rice or cash.
CONCLUSIONS
Waste pickers play a crucial role in recycling but often lack recognition and work without the benefits and protections of formal workers, facing economic uncertainty. To address these challenges, they should be integrated into the formal waste management sector with better pay, job security, and benefits. Health and safety measures, including protective gear, health insurance, and access to medical facilities, are essential. Educational programs can help them improve their skills and transition to stable employment. Increasing public awareness and government support through micro-loans or subsidies can reduce stigma and improve their economic situation.

BACKGROUND AND OBJECTIVES

High-quality dietary patterns may protect against chronic disease, but limited data exist from longitudinal studies on the impact of diet on body composition components, especially in the elderly. We aimed to assess prospectively the association between changes in adherence to the Mediterranean Diet (MedDiet) pattern and body composition measured with imaging technique in older adults with overweight/obesity and metabolic syndrome.

METHODS

This longitudinal study included 1456 men and women (at average 65 years) from the PREDIMED-Plus trial, conducted in Spain. Adherence to the MedDiet pattern with calorie-restriction was determined using the validated energy-reduced MedDiet (erMedDiet) screener (0-17 points; higher scores indicate greater adherence) at baseline. one and three years; Body composition (total fat mass (%), lean mass (%), lean-to-fat mass ratio, and visceral adipose tissue (g)) were measured with dual-energy X-ray absorptiometry at the same time-points. Multivariable mixed-effects linear regression models were used to determine the associations between changes in MedDiet pattern and body composition with available data at baseline, one, and three years of follow-up.

RESULTS

Greater adherence to the MedDiet was significantly associated with better body composition components. Each one-point increment in the erMedDiet score was associated with significantly (all p-values <0.001) lower total fat (β -0.10 %, 95% CI -0.13; -0.07) and visceral fat mass (-16.5 g, -22.8; -10.1), higher total lean (0.09 %, 0.07; 0.12) and lean-to-fat mass ratio (0.01, 0.01; 0.01) over 3-year period. Significant dose-response relationship (all P for trend <0.001) was observed between all body components and erMedDiet score modeled as categorical (in tertiles) variable.

CONCLUSIONS

Greater adherence to an energy-reduced Mediterranean Diet pattern, was associated with favourable body composition changes in older adults with overweight/obesity and metabolic syndrome.

LEADING CHANGE IN CHILD AND ADOLESCENT NUTRITION THROUGH WORLD VISION INTERNATIONAL CHILD-LED ADVOCACY AND MEANINGFUL PARTICIPATION (CHAMP) RESEARCH IN THE SOUTH ASIA PACIFIC REGION

Catharine AK Fleming[1]; Stephanie Hannah[2]; Mercy Chipo Jumo[3]; Pavithra Rajan[2]; Daniel Pritchard[2]; Kathrine Rose R Yee[4]; Lilly Moody[2]; Philip James Ceriales[5]
[1]School of Health Science, Western Sydney University , Sydney, Australia; [2]Young and Resilient Research Centre, Western Sydney University, Sydney, Australia; [3]Advocacy & External Engagement South Asia and Pacific, World Vision International, Melbourne, Australia; [4]Advocacy & External Engagement, World Vision International, Manila, Philippines; [5]Impact, Evidence and Research Specialist (South Asia and Pacific), World Vision International, San Juan, Philippines

BACKGROUND AND OBJECTIVES
Children in the South Asia and Pacific (SAP) region face a double burden of malnutrition, with stunting affecting approximately 30% of children under five and wasting impacting around 14% (GNR 2022). In response to this pressing issue, the World Vision International South Asia and Pacific (WVI-SAP) Child-Led Advocacy and Meaningful Participation (CHAMP) regional changemakers convened in 2023 to initiate a multi-country, child-led research project focused on hunger and malnutrition (WV2024). Building on this effort, WVI partnered with the Young and Resilient Research Centre (Y&R) at Western Sydney University to empower CHAMP youth leaders. This collaboration supports young leaders in conducting child-led research projects, providing them with tools to explore the impacts of hunger and malnutrition within their own communities.
METHODS
Working with WVI Country Offices in Bangladesh, India, Indonesia, Nepal, Philippines, and Sri Lanka, Y&R held research capacity building training sessions with 15 CHAMP youth leaders (aged 16-22) on research methods, research ethics, workshop facilitation and data analysis. CHAMP youth leaders identified a food and nutrition issue they are facing and developed a research question. A qualitative, participatory workshop methodology was then utilised by CHAMP youth leaders to explore their research questions. Participatory workshops involved the use of interactive and creative activities selected by the CHAMP youth leaders to elicit participants' responses and ideas.
RESULTS
From July 2024, researchers from Y&R supported 15 WVI CHAMP youth leaders and their mentors to generate child-led research from their chosen research question. Research questions varied from exploring knowledge gaps in adolescent girls for iron-rich foods, through to food access for vulnerable communities, and impacts of economic crisis on the food impacting the ability of young people to get enough healthy food. Twenty participants aged 10 to 18 years were recruited from each country (n=120) for the participatory workshops.
CONCLUSIONS
The youth-led workshops provided valuable insights from young people on school meals, nutrition knowledge, impact of climate and humanitarian considerations and the experience of hunger in the most vulnerable communities. Enabling young people to lead nutritional research from study design to data gathering and interpretation of findings, empowering them to be advocates for change in their communities.

CHALLENGES AND SOLUTIONS TO ADOPTING HEALTHY DIETS AMONGST WOMEN OF REPRODUCTIVE AGE AND CHILDREN UNDER FIVE: A QUALITATIVE PHOTOVOICE STUDY IN URBAN ETHIOPIA HIGHLIGHTS THE NEED FOR GOVERNMENT AND SOCIETAL ACTION

Meron Worku[1, 2]; Michelle Holdsworth[3]; Marie Ruel[4]; Ana Irache[5]; Kaleab Baye[1, 6]; Mark Spires[7]; Nicolas Bricas[3]; Rebecca Pradeilles[3, 4]

[1]Center for Food Science and Nutrition, Addis Ababa University | Natural Sciences Campus, Addis Ababa, Ethiopia; [2]Menelik II, Medical and Health Science College, Addis Ababa, Ethiopia; [3]UMR MoISA (Montpellier Interdisciplinary Centre On Sustainable Agri-Food Systems), Univ Montpellier, CIRAD, CIHEAM-IAMM, INRAE, Institut Agro, IRD, Montpellier, France; [4]Nutrition, Diets & Health Unit (NDH), International Food Policy Research Institute, Washington, United States of America; [5]Nursing Department, Faculty of Medicine, Universidad Autónoma de Madrid, Madrid, Spain; [6]Nutrition and food systems division, Research center for Inclusive Development in Arica (RIDA), Addis Ababa, Ethiopia; [7]Centre for Food Systems Research, Natural Resources Institute, University of Greenwich, London, United Kingdom

BACKGROUND AND OBJECTIVES

The coexistence of multiple forms of malnutrition is a public health challenge in Sub-Saharan Africa that requires new interventions and approaches. Ethiopia has one of the highest rates of undernutrition amongst children under 5 and women of reproductive age (WRA) globally, alongside rising overweight/obesity, particularly in urban areas. Poor diet is a shared driver of multiple forms of malnutrition. Hence, our study explored the perceived challenges and solutions for achieving healthy diets among WRA and their children in urban Ethiopia.

METHODS

Qualitative participatory photography (Photovoice) was used among WRA living in deprived or wealthier neighbourhoods of Addis Ababa. Women told the stories of their photographs and discussed challenges and solutions to adopting healthy diets in focus group discussion workshops (n=5). Inductive thematic analysis was undertaken to identify emerging themes and subthemes, with comparisons across socio-economic groups.

RESULTS

Across all socio-economic groups, WRA reported that the main challenges regarding the adoption of healthy diets were the high cost of food, time constraints, lack of knowledge about healthy diets, and inaccessibility of healthy foods. Solutions proposed by women included: the creation of job opportunities; raising awareness, via mainstream/social media and healthcare professionals, about healthy diets and equal division of labour related to caregiving and household chores; opening government-owned stores that sell nutritious foods at a lower price; and providing land to build daycare centres. In deprived groups, women reported issues with their home food environment (e.g., unclean cooking area, lack of cooking utilities, power cuts, water scarcity) that were unconducive to preparing healthy and safe meals. Women proposed that the government provides sustainable water and electricity to households and subsidise the cost of household appliances. Women also proposed strengthening an existing community loan scheme (Ekub). In wealthier groups, unhealthy food preferences, easy access to unhealthy foods, and availability of unhealthy foods at social events were stated as challenges. Restricting the promotion and availability of unhealthy foods was seen, by wealthier groups, as key to achieving healthy diets.

CONCLUSIONS

Financial and physical inaccessibility to healthy foods, time constraints and poor knowledge about healthy diets are the biggest contributors to poor diets in this context. Women proposed several context-relevant solutions to facilitate the adoption of healthy diets, thereby tackling multiple forms of malnutrition.

EPO5_537

LACTOSE INTAKE IN THE CHINESE POPULATION: A DIET MODELLING STUDY WITH A LOW-LACTOSE MILK

Charlotte Debras[1]; Olga Sakwinska[1]; Dantong Wang[1]
[1]Nutrition & Digestion, Nestlé Institute of Health Sciences S.A., Lausanne, Switzerland

BACKGROUND AND OBJECTIVES
Dairy intake in the Chinese population is far below the nutritional guidelines, due to concerns linked to lactose malabsorption (Storhaug et al., 2017). However, there is emerging evidence linking low lactose consumption, i.e., below the threshold for causing malabsorption related complaints, with health benefits including reduction of the risk of having lactose intolerance symptoms (JanssenDuijghuijsen et al., 2023; Li et al 2018; Luo et al., 2024). The objective of this study is to assess the lactose intake in the Chinese population and model the potential impact of a newly formulated low-lactose milk.
METHODS
Due to the lack of lactose content in the Chinese Food Composition table, we imputed lactose values by mapping dairy-based food items to equivalents from the USDA or French food composition databases and applying a lactose-to-carbohydrate ratio. Using the China Health and Nutrition Survey (CHNS)-2011, we estimated the baseline lactose intake in the Chinese population. Two diet modelling scenarios were applied to assess the changes in lactose intake: addition of one serving (200ml) of low-lactose milk vs. normal milk to participants not meeting the dairy recommendation, and substitution of current dairy products with equivalent low-lactose milk among dairy consumers. We considered 12g/d as the lactose threshold for risk of lactose intolerance symptoms (EFSA, 2010) and assessed the percentage of participants above this threshold in both scenarios.
RESULTS
The study included data from 14,178 CHNS-2011 participants aged 3 years and above. 67.6% of participants did not consume any dairy product, and only 1.4% adhered to the daily dairy recommendation of at least 300g/d. The overall lactose intake at baseline was 1.9±6.5g/d (mean ± SD) with 3.7% of the population above 12g threshold. Among dairy consumers, the lactose intake was 8.3±10.7g/d and 16.3% of them above the 12g/d threshold. Addition of low-lactose milk led 4.9% of participants consuming excess lactose, vs. 12.4% with addition of normal milk. Substituting all dairy consumption with low-lactose milk decreased the percentage of participants above the 12g/d threshold from 16.3% to 0.8%.
CONCLUSIONS
In the context of the high prevalence of lactose malabsorption in China, low-lactose milk could be an optimal solution, as consuming small amounts of lactose could help to reduce the risk of having lactose intolerance symptoms while benefiting from lactose consumption.

ASSESSING THE NUTRITION EDUCATION NEEDS OF PATIENTS FOLLOWING TOOTH EXTRACTIONS

Laurene Boateng[1]; Davina Agodzo,[1]
[1]Department of Dietetics, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES
Tooth extractions are common procedures carried out in dental practices globally. Some research has reported that dietary changes are reported among 24% - 32% of patients after dental extraction with the most frequent issues being difficulty in chewing and the inability to enjoy the experience of eating food. These issues could result in a compromised nutritional status which could in turn result in an impaired immune response, increased infections, retarded wound healing and ultimately compromising overall health. Nutrition education is currently underemphasized in dental facilities in Ghana. This study aimed to evaluate the nutrition education needs of tooth extraction patients in a university hospital in Ghana.
METHODS
A cross-sectional online survey design was employed to collect data from participants aged 18 years and above, who had previously undergone a tooth extraction. Background information, history of tooth extraction and nutritional challenges after tooth extraction were collected using a pretested questionnaire developed by the researchers. Data were analysed using the Statistical Package for Social Sciences (SPSS version 23.0). Ethical approval for the study was sought and obtained from the Ethics and Protocol Review Committee of the School of Biomedical and Allied Health Sciences with protocol identification number SBAHS/AA/DT/10624586/2019-2020. Informed consent was obtained electronically from each participant.
RESULTS
A total of 63 eligible responses were received of which majority (n=40, 63.5%) were females. Ten respondents reported complaints post tooth extraction, with majority (6) reporting debilitating pain as their chief complaint. About half of respondents (n=32, 50.8%) reported difficulties in eating and drinking certain foods and beverages post tooth extraction,. Majority of respondents (n=43, 67.9%) reported that they would have benefited from general oral care advice after tooth extraction, whilst 20.6% (n=13) would have liked to receive specific advice on foods to avoid after tooth extraction. None of the respondents consulted with a dietitian or nutrition professional regarding their tooth extraction.
CONCLUSIONS
There is the need for provision of tailored nutrition services to patients who undergo dental extractions to help manage debilitating pain, prevent infections, support wound healing and ensure optimal recovery. This study highlights the importance of collaborations and partnerships to improve outcomes of patients who undergo tooth extraction.

PROBIOTICS/FISH OIL INTERVENTION IN PREGNANT WOMEN WITH OVERWEIGHT/OBESITY LOWERS THE RISK OF OVERWEIGHT IN THEIR 24-MONTH-OLD CHILDREN

Lotta Saros[1]; Tero Vahlberg[2]; Ella Koivuniemi[1]; Noora Houttu[1]; Harri Niinikoski[1, 3]; Kristiina Tertti[4]; Kirsi Laitinen[5, 1]

[1]Institute of Biomedicine, University of Turku, Turku, Finland; [2]Department of Biostatistics, University of Turku, Turku, Finland; [3]Department of Pediatrics and Adolescent Medicine, Turku University Hospital, Turku, Finland; [4]Department of Obstetrics and Gynecology, Turku University Hospital, Turku, Finland; [5]Nutrition and Food Research Center, University of Turku, Turku, Finland

BACKGROUND AND OBJECTIVES

Children of women with overweight/obesity have an increased risk themselves to become overweight. The aim in this study was to investigate the influence of fish oil and/or probiotics intervention in pregnant women with overweight/obesity on their two-year-old children's overweight risk.

METHODS

Women (n = 439) were double-blindly randomized into four intervention groups (fish oil+placebo, probiotics+placebo, probiotics+fish oil, and placebo+placebo) in early pregnancy and the intervention lasted up to six months post-partum. Fish oil capsules contained 1.9 g docosahexaenoic acid and 0.22 g eicosapentaenoic acid while probiotic capsules included *Lacticaseibacillus rhamnosus* HN001 and *Bifidobacterium animalis* ssp. *lactis* 420, 10^10 colony-forming units each. Growth data of children (n=330) were gathered at three, six, 12 and 24 months from welfare clinic cards. The growth variables were calculated based on the Finnish growth charts. Adjusted logistic regression models were used in the analysis.

RESULTS

Maternal consumption of probiotics+placebo and probiotics+fish oil were associated with lower odds of child being overweight (weight-for-height%, adj.OR=0.36, 95% CI=0.14–0.95, weight-for-age SD-score adj.OR=0.22, 95% CI=0.07–0.71) when compared to the placebo+placebo. Similar RESULTS were seen when probiotics' main effect was evaluated compared to non-probiotics: weight-for-height% adj. OR=0.48, 95% CI=0.25–0.95, weight-for-age SD-score adj. OR=0.42, 95% CI=0.20–0.88. No fish oil main effect was detected.

CONCLUSIONS

Consumption of probiotics alone or in combination with fish oil by pregnant women with overweight or obesity could lower their children's overweight risk at the age of two years.

EVALUATING THE PLANNING AND IMPLEMENTATION OF VITAMIN A SUPPLEMENTATION (VAS) MASS CAMPAIGNS; INSIGHTS FROM SEVEN AFRICAN COUNTRIES DURING (JANUARY – JUNE 2024)

Mohamed Lamine Fofana[1]; Fatou Berete Ndiaye,[2]; Melissa Baker[3]; Fridah Mutea,[3]; Romance Disseka,[4]; Abiodou Moise Owoloye,[4]; David Doledec,[3]
[1]Vitamin A Supplementation, Helen Keller INTL, Conakry, Guinea; [2]Vitamin A Supplementation, Helen Keller INTL - Regional & Senegal, Dakar, Senegal; [3]Vitamin A Supplementation, Helen Keller International, Nairobi, Kenya; [4]Vitamin A Supplementation, Helen Keller INTL, Abidjan, Ivory Coast

BACKGROUND AND OBJECTIVES
In 2024, Helen Keller supported vitamin A supplementation (VAS) campaigns for children aged 6 to 59 months in several countries, aiming for 100% coverage. For effective implementation, Helen Keller uses tools to control and optimize planning and execution, track timelines, prepare data, and coordinate stakeholders. This study evaluates the planning and implementation processes for VAS campaigns in the first half of 2024.
METHODS
This analysis examined data from 7 countries (Burkina Faso, Cameroon, Côte d'Ivoire, DRC, Guinea, Kenya, Madagascar, Mali, Niger, Nigeria) where Helen Keller supported VAS campaigns in the first half of 2024. Data was collected using various monitoring tools:
Checklists: Tracked campaign stages (stakeholder coordination, procurement, funds, training, social mobilization).
Campaign Reports: Documented challenges.
Email Records: Tracked contract approval with state entities, focusing on approval dates.
The data were analyzed using Excel to evaluate key indicators, including VAS capsule availability, contract government approval deadlines, and variations between planned and actual start dates.
RESULTS
In the first half of 2024, only 20% of countries met the six-month interval between VAS campaigns. The rest experienced delays of 0.33 to 3.1 months due to heavy rainfall, supply issues, and program interference. While 30% of countries prepared inputs on time, 70% faced delays due to insufficient vitamin A stocks. Financial coordination improved, with 75% of countries approving contracts on time. However, gaps in targeting populations could affect campaign coverage and efficacy.
CONCLUSIONS
These findings highlight critical areas for improvement in planning, resource management, and stakeholder coordination to optimize future VAS campaigns.

EFFECT OF INFANT VITAMIN D SUPPLEMENTATION ON EPIGENOME-WIDE DNA METHYLATION

Helena Hauta-alus[1, 2, 3]; Minna Pekkinen,[2]; Maria Enlund-Cerullo[1, 2]; Saara Valkama[1, 4]; Sture Andersson[4]; Elisa Holmlund-Suila[4, 1]; Outi Mäkitie[1, 2, 4, 5]

[1]Research Program for Clinical and Molecular Metabolism (CAMM), University of Helsinki, Helsinki, Finland; [2]Folkhälsan Institute of Genetics, Folkhälsan Institute of Genetics, Helsinki, Finland; [3]Clinical Medicine Research unit, University of Oulu, Oulu, Finland; [4]Children's Hospital, University of Helsinki and Helsinki University Hospital, Helsinki, Finland; [5]Department of Molecular Medicine and Surgery, Karolinska University Hospital, Stockholm, Sweden

BACKGROUND AND OBJECTIVES

Early life exposures can alter individual's epigenome and lead to long-term health consequences. Severe and chronic vitamin D deficiency causes nutritional rickets in childhood; however, high vitamin D dosages can also have disadvantageous health implications. Data on vitamin D and epigenetic alterations are limited. We aimed to examine whether higher vitamin D supplementation dose compared with a standard dose affects epigenome-wide DNA methylation (DNAm) in 1-year-old infants.

METHODS

In the Vitamin D Intervention in Infants (VIDI) study, 987 infants were randomized to receive daily vitamin D supplementation of 10µg (group-10) or 30µg (group-30) from age 2 weeks until age 2 years. To analyze DNAm with Illumina EPIC 850K array, we randomly selected 286 participants at age 1 year with available DNA samples isolated from whole blood within intervention groups and sexes. Epigenome-wide association analyses were conducted via R package *Meffil* adjusted for sex, parental smoking status, maternal age and education, infant length-adjusted weight and age, cell count estimates and batch effect.

RESULTS

We observed no significant epigenome-wide DNAm differences between group-10 (n=143) and group-30 (n=143) ($p<9.4 \times 10-8$). Top three sites, comparing group-10 with group-30, were annotated to genes *PRDM16* (cg05790380: coefficient 0.007, p=3.0 × 10-7), *HIPK2* (cg20001906: 0.02, p=1.9 × 10-6) and *PPM1H* (cg03919488: 0.01, p=2.4 × 10-6) related with e.g. brown adipocyte differentiation, serine/threonine kinase functions and phosphorylation processes, respectively.

CONCLUSIONS

Our RESULTS indicate no effect of higher vitamin supplementation of 30µg compared with standard dose of 10µg on epigenome-wide DNAm in infants aged 1 year. Further plan is to examine the effect in specific vitamin D related sites as well as to explore individual dose-response effect on DNAm.

EPO5_542

MATERNITY PROTECTION FOR WOMEN AND THE POTENTIAL IMPLICATIONS FOR BREASTFEEDING ON RETURN TO WORK AT A TERTIARY HOSPITAL

Crystal Jacobs[1]
[1]Department Human Nutrition Tygerberg Hospital, Department of Health South Africa, Cape Town, South Africa

BACKGROUND AND OBJECTIVES
Optimal maternal health and support in the workplace can have a positive impact on the health outcomes of mother and baby. Therefore, legislation specifies that women be protected during the pregnancy period and on return to work. Adequate maternity protection in the workplace can result in benefits to the child's long-term health and positive effects for workplaces. The aim of this research was to determine the availability of maternity protection practices in the workplaces and the potential implications for breastfeeding.
Objectives: To describe available policies on maternity protection and support to staff at a tertiary hospital. To explore associations between knowledge of women working at a tertiary hospital on maternity protection and their breastfeeding practices on return to work after maternity leave.To explore the attitudes, knowledge and level of support from individuals in management positions at a tertiary hospital, towards women breastfeeding on return to work following maternity leave.
METHODS
A descriptive study using an online questionnaire with purposefully selected women employees at the tertiary hospital who have had a baby in the last 3 years. Additionally, a semi-structured questionnaire will be completed with purposefully selected members of different levels of management at the hospital. Data will be analyzed with support of statistical software and presented in table and graph format.
RESULTS
The findings demonstrated in terms of the maternity protection package such as maternity leave, women were granted four months including paid benefits. With the protection of the women's health, they had mixed responses as to how certain duties affected their health. A lack of knowledge shown of their right to health and safety during pregnancy and after birth was evident. Overall, women lack the knowledge and understanding of the policies and legislation on maternity protection. Only 67% responded that they continued breastfeeding on return to work.The semi-structured interviews demonstrated lack of knowledge of policies and legislation.
CONCLUSIONS
Findings suggests the need to inform women and create more awareness on maternity protection benefits and rights of women during and after pregnancy. The study identified implementation gaps that limits effectiveness of maternity protection.

THE ASSOCIATION BETWEEN DIETARY DIVERSITY, PHYSICAL EXERCISE, NUTRIENT INTAKE AND OTHER FACTORS AMONG ADULTS

Shreya Rathi[1]; Abhaya R. Joglekar[2]; Bhakti Dangra[3]
[1]Department of Home Science, Govt. D. B. Girls' P. G. College, Raipur, Raipur, India; [2]Principal, Badri Prasad Lodhi Govt.College Arang, Arang, India; [3]Freelance, Analyst, Bhopal, India

BACKGROUND AND OBJECTIVES
The increasing studies for nutritional assessment of specific disease conditions and for women, children and geriatric people creates a lack of recent nutritional assessment related studies for the seemingly healthy adult population. This research aimed to search between the various factors that have been associated with nutrition among the adult population of Raipur citizens.
METHODS
The research was a cross-sectional study of citizens of Raipur city aged between 16 and 45 years of age. The samples were selected by convenient sampling. A total of 65 samples were given to fill a self-prepared questionnaire, which included questions assessing the nutrient intake of the population, their cooking and eating habits, their physical activities, consumption of unhealthy/packaged foods, and lifestyle-related habits. The data was analyzed using SPSS software.
RESULTS
From the analysis of the data collected, it was deduced that the average calorie (60%) intake of the sample is lower than what is recommended by RDA, as is the case with carbohydrates (47%) and fat (48%). However, the protein intake (104%) is more. Contribution of macronutrients to total calories does not fully comply with EAT-Lancet recommendation, with more carbohydrate intake, lower fat intake and normal protein intake. Average scores of dietary diversity, nutrient intake, physical activity, cooking and eating practices, lifestyle practices and consumption of unhealthy foods were 6.83 (out of 10), 3.20, 0.70, 3.97, 4.16 and 1.70 (out of 5) respectively. A decreasing trend is seen regarding calorie intake from food groups from underweight to overweight/obese samples, indicating more consumption of processed and packaged food by the latter. The scores of dietary diversity and good cooking and eating practices decreased with increasing BMI. The scores of lifestyle practices and physical activity increased with increasing BMI.
CONCLUSIONS
This study provides valuable insights into how dietary diversity, physical activity, nutrient intake, and lifestyle practices collectively influence the nutritional status and BMI of adults in Raipur. The RESULTS suggest that the overweight population consumes fewer nutrients essential for a balanced diet compared to their underweight counterparts, reflecting the impact of poor dietary choices. There may be certain other factors that influence the nutritional status and BMI of people.

NUTRITION KNOWLEDGE AND DIETARY HABITS AMONG UNIVERSITY STUDENT-ATHLETES

Esime W.T. Agordjor[1]; Sackar Samual[1]; Frank Hayford[1]
[1]Department of Dietetics, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES
Nutrition is invaluable in enhancing athletic performance. It is of greater importance in student-athletes who require good nutrition for both academic and athletic performance. In spite of this, research has shown that this population often have poor dietary habits. With nutrition education programs based on the premise that, good nutrition knowledge equals good dietary habits at the forefront of solutions to promoting good dietary habits, this study looked at participants' nutrition knowledge, dietary habits and preferred source of nutrition information and assessed correlations between these variables.
METHODS
The study was cross-sectional and used self-administered questionnaire to collect socio-demographic data and information about the preferred source of nutrition information as well as assess the nutrition knowledge and dietary habits of its ninety-one participants, who were student-athletes of a university in Ghana. Associations between nutrition knowledge and dietary habits and variables of interest were subsequently investigated using Spearman's correlation test, chi-square, linear and multiple regression analyses with the level of statistical significance set at $p< 0.05$.
RESULTS
The analysis showed a very weak, insignificant but positive relationship between nutrition knowledge and dietary habits ($rs = 0.098$, $p = 0.380$). Similar RESULTS were obtained for age and nutrition knowledge ($rs = 0.239$, $p = 0.025$). No other variables yielded statistically significant correlations. The internet was the most patronized source of nutrition information (39.6%) and nutrition professional were the least patronized (4.4%).
CONCLUSIONS
Improving the dietary habits of this population would require programs which aim at helping student-athletes practicalize their nutrition knowledge. The study also highlighted the low involvement of nutrition professionals in sports in universities.

NUTRITIONAL RISK PREVALENCE AND PROFILE AMONGST INFANTS UNDER 6-MONTHS IN KENYA, MOZAMBIQUE, NIGERIA, SOMALILAND, AND YEMEN

Alice Marcia Burrell[1]; Eilidh Higgins,[2]; Daniel Muhinja,[3]; Sugow Mathey,[4]
[1]Humanitarian Public Health Team, Save the Children International, London, United Kingdom; [2]Humanitarian Public Health, Save the Children International, London, United Kingdom; [3]Programme Development and Quality, SAVE THE CHILDREN, Nairobi, Kenya; [4]Programme Operations, SAVE THE CHILDREN, Nairobi, Kenya

BACKGROUND AND OBJECTIVES
With support from The Church of Jesus Christ of Latter-Day Saints (LDSC), as part of the 'Helping Babies Thrive': management of small and nutritionally at-risk infants under 6 months (u6m) and their mothers (MAMI) Project, Save the Children conducted an assessment in Kenya, Mozambique, Nigeria, Somalia, and Yemen with the objective to measure the prevalence and risk profile of small and nutritionally at-risk infants u6m.
METHODS
Simplified Lot Quality Assurance Evaluation of Access and Coverage (SLEAC) methodology was applied as the assessment also measured coverage of the MAMI Care Pathway in project locations. Sample size for Coverage was used for all other indicators of interest. The first stage of sampling was random selection of villages within included health facility catchment areas and second stage was exhaustive, including all infants u6m in selected villages, through door-door questionnaires. Prevalence was estimated based on the total number of infants u6m and their mothers who completed the MAMI eligibility questionnaire during the coverage assessment. Qualitative data was also collected through focus group discussions and key informant interviews with key members of the community.
RESULTS
Prevalence of small and nutritionally at-risk infants less than 6 months was estimated as 48% in Kenya, 63% in Mozambique, 76% in Nigeria, 65% in Somalia and 78% in Yemen.

Risk Factor	Kenya	Mozambique	Nigeria	Somalia	Yemen
Feeding risk(s)	56%	21%	52%	34%	58%
Underweight (WAZ<-2SD)	15%	24%	36%	32%	40%
Low Infant MUAC	35%	34%	18%	25%	33%
Low Weight-for-Length (WFL<-2SD)	19%	8%	26%	54%	29%
Pre-term birth	6%	10%	25%	13%	16%
Low birthweight	7%	17%	22%	15%	11%
Mother with acute malnutrition (by MUAC)	10%	34%	7%	2%	31%
Adolescent mother	6%	18%	2%	12%	7%
Multiple birth e.g. twin, triplet	5%	5%	9%	6%	2%
Orphan	6%	4%	1%	7%	2%
Presence of Oedema	0%	0%	1%	2%	0%

CONCLUSIONS
Prevalence of small and nutritionally at-risk infants u6m in project locations was found to be high confirming a critical need to ensure we identify and support at-risk infants u6m.

FOOD ADDICTION, NUTRITIONAL STATUS AND ULTRA-PROCESSED FOODS CONSUMPTION IN CHILEAN UNIVERSITY STUDENTS

Carina Valenzuela[1]; Michelle Valenzuela Santander[2]; Ximena Díaz-Torrente[3]
[1]CEIC, CMBi, Escuela de Nutrición y Dietética, Facultad de Farmacia, Universidad de Valparaíso, Valparaíso, Chile; [2]Escuela de Nutrición y Dietética, Universidad de Valparaiso, Valparaíso, Chile; [3]Nutrition and Dietetics Career, Universidad del Desarrollo - UDD, Las Condes, Chile

BACKGROUND AND OBJECTIVES
Food addiction (FA) to ultra-processed foods (UPF) has been identified as a contributing factor to the onset and progression of obesity. In Chile, obesity represents a critical public health issue. Despite indications that FA is becoming increasingly prevalent among young adults, its prevalence in the Chilean population has been the focus of only a limited number of studies. The aim of this study was to evaluate the association between FA, nutritional status, and the consumption of UPF in Chilean university students.
METHODS
An observational, analytical and cross-sectional study was carried out. Sampling was non-probabilistic for convenience. N=287 participants were recruited, from two Universities. YFAS 2.0-Chile and an adapted version of the NOVA screener were applied using the online platform REDCap. In addition, body composition (InBody® technology BIA) and anthropometric measurements (weight, height, waist circumference) were assessed by trained and standardized evaluators, to determine nutritional status.
RESULTS
The sample was composed mainly by women (55.7%), with an average age of 21.3 ± 2.3 years. The prevalence of FA was 17.4% (4% for mild, 14% for moderate and 82% for severe FA), the mean symptom count was 2.5 ± 3.1), with “food consumed in larger quantities or over a longer period than intended” being the most prevalent criterion (33.5%). Students with FA had significantly higher body mass index (BMI) and body fat percentage compared to non-FA students ($p = 0.024$ and <0.001, respectively). Additionally, participant with FA consumed higher amount of UPF beverages and snacks the day before ($p = 0.027$ and 0.009, respectively), with significantly higher punctuations in NOVA score (7.1 ± 2.6 vs 6.3 ± 3.1; $p=0.032$). Finally, a weak but significant correlation between NOVA score and FA symptom count was found (rho=0.19 $p=0.001$).
CONCLUSIONS
This study identifies a significant prevalence of FA among Chilean university students, with associations to higher BMI and body fat percentage. FA was also linked to greater UPF consumption and elevated NOVA classification scores. A weak but significant correlation was found between UPF consumption and FA symptoms. These findings underline the role of UPF in addictive eating behaviors. Targeted interventions are essential to mitigate FA's impact on obesity and dietary health in young adults.

ROLE OF DOMESTIC FOOD ENVIRONMENTS IN THE RELATIONSHIP BETWEEN FOOD ACCESS AND DIET QUALITY IN CHILDREN DURING THE COVID-19 LOCKDOWN IN CHILE: A MIXED METHOD STUDY

Isabel Pemjean[1]; Camila Corvalán[1]; Sergi Fabregues,[2]
[1]CIAPEC, Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile; [2]GenTIC, UOC Open University of Catalonia - Barcelona, Barcelona, Spain

BACKGROUND AND OBJECTIVES
Households from lower socioeconomic backgrounds are disproportionately exposed to unhealthy external food environments, resulting in poorer dietary quality. To mitigate health disparities, it is essential to understand the interplay between these external environments and intra-household dynamics that influence food acquisition, particularly among children. This study examines the relationship between food access, domestic food environments, and dietary quality among low- to middle-income Chilean children during the COVID-19 lockdown.
METHODS
We used an explanatory sequential mixed methods design, combining a survey of 999 households with a qualitative photo-elicitation study in a nested sample of 14 households. This abstract focuses specifically on the integration stage of the study, which occurred by merging the quantitative and qualitative RESULTS through a side-by-side joint display. This process involved two steps: (1) displaying the quantitative and qualitative RESULTS for each of the study's overarching themes in a joint display table, and (2) drawing meta-inferences as a result of assessing the relationship between the two types of RESULTS (i.e., convergence, divergence, expansion, or complementarity).
RESULTS
The findings reveal that greater gender equity in household food responsibilities correlates with improved child nutrition. Time constraints, exacerbated by sole female food gatekeepers, limit healthy food purchasing, increase reliance on unhealthy options, and hinder culinary skill development. Two pathways emerge: gender and time inequalities influence food purchasing decisions and meal preparation and consumption. Furthermore, households with a sole female food gatekeeper often lack the nutritional resilience to cope with additional intra-household challenges, compromising time management and jeopardizing children's dietary well-being.
CONCLUSIONS
Policies must consider the interplay between external food environments and intra-household gender-time realities. Short-term measures should increase access to nutritious food for time-constrained food gatekeepers, while long-term policies should promote cultural shifts towards equitable food responsibilities. Interventions should leverage the coping strategies of more resilient households to strengthen community capacity, fostering nutrition resilience among more vulnerable households.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

FROM MONITORING TO ACTION: ENHANCING SCHOOL FOOD ENVIRONMENTS BASED ON STUDENT INSIGHTS

Floortje Kanits[1]; Annick De Leeuw[1]; Amely Verreijen[1]; Annet JC Roodenburg[1]; Herman Peppelenbos,[1]
[1]Nutrition & Health, HAS university of applied sciences, 's-Hertogenbosch, Netherlands

BACKGROUND AND OBJECTIVES
School food environments significantly influence young people's eating behavior, yet they often promote unhealthy choices. This research aimed to monitor the food environment in and around schools, explore students' behavior and preferences, and test strategies to improve the food offerings in these environments.
METHODS
As part of the "Campus of the Future" project, multiple studies were conducted. First, the ready-to-eat food offerings within a 400-meter radius of schools in 's-Hertogenbosch, The Netherlands, were assessed for healthiness, categorized as either within or outside the Dutch *Schijf van Vijf* (Wheel of Five) [1]. Second, in a survey among vocational education students data was collected on their purchasing habits during school hours, also their food purchases were observed at the top three most visited ready-to-eat outlets near the school. Finally, in a survey among secondary school students their purchasing habits around school hours were recorded. These students also participated in a design sprint to co-create healthy food concepts for their school canteen.
RESULTS
Only 8% of analyzed ready-to-eat offerings around schools fit within the Wheel of Five. The survey among vocational education students showed that the most popular food locations were their own school canteen, Jumbo supermarket, AH to go and McDonald's. However, only 4% of the items purchased at the latter three locations met the Wheel of Five criteria.
The survey among secondary school students showed that 75% of these students buy food or drinks in or outside of school, with the most popular locations being their own canteen, Jumbo supermarket, and McDonald's. Key drivers of purchasing decisions included cost, taste, and proximity. The design sprint with these students led to innovative, student-endorsed food concepts for their own canteen, including culturally diverse healthy options.
CONCLUSIONS
Students in both vocational and secondary education often buy food during school hours, yet their food environment is mostly unhealthy. To improve the food environment, it is essential to focus on providing affordable an appealing healthy options, particularly within the school canteen, as it is the most convenient location for students. Co-creating healthy food concepts with students can be a way to achieve this.

HABITUAL SPERMIDINE INTAKE IN AN ELDERLY POPULATION WITH METABOLIC SYNDROME: LONGITUDINAL ASSOCIATIONS WITH CARDIOMETABOLIC MARKERS AND HEPATIC INDEXES

Andrés López González[1]; Esther Cuadrado-Soto[2]; Jose Antonio Celada[3]; Yolanda Jimenez Perez[3]; José María Ordovás[4]; Lidia Daimiel Ruiz[3]
[1]Nutritional Control of the Epigenome Group. Precision Nutrition and Obesity Program., IMDEA Food Institute, Madrid, Spain; [2]VALORNUT Research Group, Department of Nutrition and Food Science, Universidad Complutense de Madrid, Madrid, Spain; [3]NUCONEP, IMDEA Food, UAM + CSIC, Madrid, Spain; [4]Nutritional Genomics and Epigenomics Group, IMDEA Food Institute, Madrid, Spain

BACKGROUND AND OBJECTIVES
Polyamine and particularly spermidine (SPD) metabolism, have been identified as key pathways responsible for the autophagy enhancement observed during calorie restriction and fasting. Dietary SPD has been suggested to be associated with aging-related cardiometabolic traits such as glucose homeostasis, body weight or blood lipids. Additionally, relevant food groups such as mushrooms, legumes or nuts are rich sources of dietary SPD. However, little is known about the role of dietary SPD intake in metabolic syndrome (MetS). This analysis evaluated the longitudinal association between 1-year changes in dietary SPD intake, cardiometabolic traits and liver function indexes in overweight and obese elderly subjects with MetS.
METHODS
Baseline and 1-year follow-up data from 3639 participants of PREDIMED-Plus Trial were used for analysis. Dietary intake of SPD was estimated using the semi-quantitative food frequency questionnaire (SFFQ) validated for the Spanish population and consistent with this SFFQ, a nutrient database for SPD was compiled. Cross-sectional analyses were performed to assess baseline differences in cardiometabolic traits among tertiles of dietary SPD intake. Linear and logistic regression models were carried out to evaluate the association between tertiles of 1-year change in dietary SPD intake and 1-year changes in cardiometabolic traits and liver function indexes.
RESULTS
At baseline, higher dietary SPD intake was significantly associated with higher HDL-cholesterol, HbA1c and lower TG, ALT, GGT and fatty liver index. Compared to baseline, an increase in dietary SPD intake over 1-year was significantly associated with greater reductions in FPG, HbA1c, TG, TG/HDL, ALT and improvements in liver function indexes.
CONCLUSIONS
Collectively, an increase in dietary SPD intake was longitudinally related to significant improvements in cardiometabolic traits and liver function indexes.

SEASONALITY IN DIETARY PATTERNS AND DIET QUALITY IN BANGLADESH: A LATENT CLASS ANALYSIS OF URBAN ADOLESCENTS

Mahsina Syeda Akter[1]; Kim Maasen[1]; Jillian L Waid[2, 3]; Sabrina Rasheed[4]; Shakuntala H Thilsted[5, 6]; Zsuzsa Bakk[7]; Edith Feskens[1]; Elise Talsma[1]

BACKGROUND AND OBJECTIVES
Previous studies in low- and middle-income countries have explored dietary patterns, but very little is known about the seasonality of these dietary patterns. Moreover, most studies in Bangladesh focused on rural adolescents, and little is known about adolescents in low-income urban Bangladesh. We aimed to identify seasonality in dietary patterns and examine diet quality and sociodemographic predictors of these dietary patterns in this population.
METHODS
We analyzed data from 24-hour recalls collected in three seasons in 2015-2016; Spring (Feb–May), Summer-Fall (Jun–Oct), Winter (Nov–Feb) among adolescents (n = 483, 10–19 years) from low-wealth households, part of the urban food consumption survey in Dhaka city, Bangladesh. Latent Class Analysis (LCA) was used to identify dietary patterns based on food group consumption, separately for each season. Bivariate analyses were used to compare diet quality scores between patterns in each season, assessed as Global Diet Quality Scores (GDQS)-Healthy (range 0-32), GDQS-Unhealthy (0-17), and Food Group Diversity Score (FGDS, 0-10), higher score represents higher diet quality for all. Multinominal logistic regression was used to explore predictors of dietary patterns per season.
RESULTS
We identified four groups of adolescents with distinct dietary patterns for each season, naming them ‘Least Diverse’, ‘Moderate Diverse’, ‘Diverse’, and ‘Most Diverse’. These patterns showed small differences in GDQS-Healthy, GDQS-Unhealthy, and FGDS, reflecting some variations in both variety and quantity of food group consumption across seasons. GDQS-Healthy ranged between 6.9 and 9.0, while GDQS-Unhealthy ranged between 6.9 and 8.8, and FGDS ranged from 4.3 to 5.9, from the 'Least Diverse' to the 'Most Diverse' patterns over all seasons. Adolescents’ age predicted dietary pattern classification in Spring, no demographic characteristics predicted classifications in Summer-Fall, and both education and household wealth-tertiles were predictors in Winter.
CONCLUSIONS
Across three seasons, adolescents in low-wealth households were clustered into distinct dietary patterns, with limited variations in diet quality due to low consumption of healthy food groups, suggesting minimal seasonality in dietary patterns in urban Bangladesh. Tailored nutrition interventions are needed to increase healthy food consumption among adolescents in low-income urban Bangladesh, where year-round availability of different seasonal foods may play a role.

INCLUSION OF A PRE-BIOTIC (RICE BRAN) IN READY-TO-USE THERAPEUTIC FOOD SUPPORTS GROWTH AND TREATMENT OF ACUTE MALNUTRITION IN INDONESIAN CHILDREN: THE SOLUTIONS TO ENHANCE HEALTH WITH ALTERNATIVE TREATMENTS (SEHAT) TRIAL

Silvia Barbazza[1]; M. Weber Annika[2]; D. Fauzi Moretta[1]; K. Putri Fildzah; Zuhrina Ririh; Campos-Ponce Maiza[1]; Van Der Hoeven Marinka[1]; Sonia Fortin[3]; E. Giriwono Puspo[4]; Frank T. Wieringa[3]; P. Ryan Elizabeth[2]

BACKGROUND AND OBJECTIVES
Current ready-to-use therapeutic foods (RUTFs) aim for improving weight gain, but not gut microbiota, leaving children susceptibility to relapse. Rice bran, a nutrient-dense, prebiotic food ingredient, can influence the gut microbiome and support healthy growth in children. The study aimed to compare the treatment effectiveness of a locally produced RUTF (RUTF-), previously tested for its acceptability and efficacy, to an RUTF with 5% rice bran (RUTF+) in children with acute malnutrition. Primary outcomes were weight gain, mid-upper arm circumference (MUAC) and anthropometric *z*-scores.
METHODS
200 children aged 6–59 months with uncomplicated SAM (weight-for-height z-scores (WHZ) <−3, and/or mid-upper arm circumference (MUAC) <115mm, and or having bilateral pitting oedema +/++), or approaching SAM (WHZ<−2.5) were enrolled in a double-blinded randomized, controlled trial. Linear mixed models were applied across all ages and split by age group (6-23 months and 24-59 months) at weeks 0, 4, 8, 12, and 16 for intention-to-treat analysis (ITT) and per protocol analysis (PP).
RESULTS
Overall weight gain after 4 weeks was +390 g, but in children receiving RUTF+, weight gain tended to be greater (+430g) than in children receiving RUTF- (+349 g; p=0.059). The same trend was seen for children >24 mo of age (p=0.07; +458 and +359 g respectively), but not in younger children (p>0.2; +375 g and +337 g respectively). Differences in weight gain were less pronounced at week 8 (+527 g for RUTF+ and +447 g RUTF-, p=0.12) and disappeared in the follow-up period. There were no significant differences between treatment groups for the other anthropometric outcomes.
CONCLUSIONS
This study provides the first evidence for the benefits of using stabilized rice bran, a well-known pre-biotic, incorporated into products to treat acute malnutrition; larger studies are warranted. The findings have important implications for the treatment of acute malnutrition and emphasize the importance of considering the intestinal microbiome and the child's age (above and below 2 years old) when designing treatment programs.

SOCIAL DETERMINANTS OF ULTRAPROCESSED PRODUCTS AND SUGAR-SWEETENED BEVERAGES CONSUMPTION IN GUATEMALAN ADULTS: DATA FROM A NATIONAL REPRESENTATIVE SURVEY, SIVESNU 2022-2023

Denise Oliva[1]; Manuel Ramírez-Zea[1]; Brisa Sánchez[2]; Kevin Martínez-Folgar; Mireya Palmieri[3]; Karla Mesarina[1]; María Fernanda Kroker-Lobos[1]

[1]INCAP Research Center for the Prevention of Chronic Diseases, Institute of Nutrition of Central America and Panama (INCAP), Guatemala City, Guatemala; [2]Department of Epidemiology and Biostatistics, Dornsife School of Public Health, Drexel University, Philadelphia, PA, USA, United States of America; [3]Government of Guatemala, Secretariat of Food and Nutrition Security (SESAN), Guatemala City, Guatemala

BACKGROUND AND OBJECTIVES

In Guatemala, the magnitude and distribution of important dietary risk factors for non-communicable diseases (NCD) such as consumption of sugar-sweetened beverages (SSB) and ultra-processed products (UPP) remain unknown. This study aimed to 1) Estimate the distribution of SSB and UPP consumption and its association with sociodemographic characteristics (SC), and 2) Evaluate whether consumption is associated with excess weight in adults.

METHODS

Cross-sectional analysis of a nationally representative survey from the Epidemiological Health and Nutrition Surveillance System, 2022-2023 (SIVESNU). The percentage of energy from UPP and SSB relative to total calorie intake were assessed through a 30-day semi-quantitative food frequency questionnaire. NOVA classification was used to define UPP and consumption was categorized into quartiles. Regression models were used to evaluate the association of quartiles of SSB and UPP and SC (sex, age, socioeconomic status -SES-, education level, area, ethnicity). For aim 2, we evaluated BMI as continuous, overweight (BMI ≥25 and <29.9), obesity (BMI ≥30) and excess weight (BMI ≥25). Linear and logistic regression models were conducted to examine associations adjusting for SC and sitting time.

RESULTS

Guatemalan adults consumed on average, 17.4% of total energy intake from UPP and 6.2% from SSB. The highest intakes of UPP (Q4) were observed in the highest strata of SES, (46%, 95% CI 38.1-54.0; p<0.01), non-indigenous (72%, 95% CI 65.2-78.9; p<0.01), living in urban areas (53.9%, 95% CI 41.8-66.0; p<0.01), and had completed secondary education (44.9%, 95% CI 39.8-49.9; p<0.01). The same pattern was observed for SSB consumption. The population with the highest UPP consumption (38.6%, 95% CI 37.7-39.6; p<0.01) also consumed more calories from SSB (10.3%, 95% CI 9.6-11.0; p<0.01) compared to those in the lowest quartile. A positive association was observed between quartiles of SSB and BMI, kg/m² (p<0.001), obesity (p<0.05), and excess weight (p<0.05).

CONCLUSIONS

Consumption of UPP and SSB is associated with a sociodemographic gradient. Our findings highlight the need for an integrated policy approach to promote healthier food environments in Guatemala.

DESPITE ALARMING HOUSEHOLD FOOD INSECURITY, LACTATING MOTHERS CAN MEET THE MINIMUM DIETARY DIVERSITY: A COMMUNITY CROSS-SECTIONAL STUDY IN DEMOCRATIC REPUBLIC OF CONGO

Benito Kazenza[1]; Christiane Horwood[2]; Anne Hatloy[3]; Paulin Mutombo Beya Wa Bitadi[4]; Pierre Akilimali[5]
[1]Department of Nutrition, Kinshasa School of Public Health; University of Kinshasa, DRC, Kinshasa, Congo, Democratic Republic of the; [2]Centre for Rural Health, University of KwaZulu-Natal - Howard College, Durban, South Africa; [3]Fafo, University of Bergen, Bergen, Norway; [4]Nutrition, Kinshasa School of Public Health, Kinshasa, Congo, Democratic Republic of the; [5]Nutrition, School Of Public Health, Kinshasa, Congo, Democratic Republic of the

BACKGROUND AND OBJECTIVES
Lactation is a physiological status that requires high energy to fulfill the nutrient requirements of the mother and child. Several factors can affect maternal nutrient intake and lead to nutritional deficits among lactating mothers. However, studies exploring dietary practices among specific groups, such as lactating mothers (LMs), are limited. Therefore, this study aimed to quantitatively assess the dietary diversity of LMs in a food-insecure setting in the Democratic Republic of Congo (DRC).
METHODS
A community-based cross-sectional survey was carried out in 2024. A stratified multistage sampling technique was used to select 662/670 LM. Data were collected using a pre-tested and structured interviewer-administered questionnaire. Minimum dietary diversity for women (MDD-W) was computed from a single 24-hour recall. A cut-off value of 5 was used to classify the dietary diversity into achieving MDD-W or not. Household food insecurity level was assessed using the Household Food Insecurity Access Scale (HFIAS). Regression logistic was applied to identify associated sociodemographic, economic, and anthropometric factors.
RESULTS
The study recruited 662 LMs aged at least 18 years in western of DRC, 95.5% of whom were residing in severe food-insecure households. The overall minimum dietary diversity (MDD-W) prevalence was 49.4%. The mean dietary diversity score was 5.0 ± 2.8. Vegetables, roots/tubers, red palm oil, sugar/products, and fish were the main food items consumed. The acceptable MDD-W was neither associated with high LMs schooling, high BMI, household food source, high household SES, nor the proper water source.
CONCLUSIONS
Lactating mothers in food-insecure areas can access appropriate dietary diversity. The deepest learning from LM demonstrated good dietary habits is crucial to improving MDD scores in food-insecure settings.

MEASUREMENT OF TOTAL ENERGY EXPENDITURE, BASAL METABOLIC RATE, BODY COMPOSITION AND PHYSICAL ACTIVITY IN ELDERLY INDIVIDUALS: IMPLICATIONS FOR HEALTHY AGING

Aaminah Kausar[1]; Deepa Puttaswamy[1]; Sumithra Selvam[2]; Kishor G Bhat[1]; Anura V Kurpad[3]; Sumathi Swaminathan[1]; Rebecca Kuriyan[1, 3]
[1]Nutrition, St. John's Research Institute, Bangalore, India; [2]Epidemiology, Biostatistics and Population Health, St. John's Research Institute, Bangalore, India; [3]Physiology, St. John's Medical College, Bangalore, India

BACKGROUND AND OBJECTIVES
The proportion of elderly will be ~17% of the world's population by 2050. In the elderly, energy intakes are affected and energy expenditure (EE) decreases, along with decline in muscle mass and increase in adiposity. The primary objective of the study was to accurately measure the daily total energy expenditure (TEE), basal metabolic rate (BMR), body composition, and activity energy expenditure (AEE) in free-living, healthy, active, elderly population. The secondary objective was to compare the measured BMR with predicted BMR, derived using the Livingston equation.
METHODS
Healthy, active elderly individuals aged 65-80 years were recruited. Anthropometry, along with measurement of body cell mass (BCM), using a whole-body potassium counter was performed. The TEE and BMR were measured using the double-labelled water technique and indirect calorimetry respectively. AEE was measured using a triaxial accelerometer (GT3X+, Actigraph, USA). Independent t-test was used to assess difference between sexes, and paired t test was used to compare measured and predicted BMR values. Adjusted analyses were performed using multiple linear regression.
RESULTS
The mean age of the 42 participants (22 males and 20 females) was 71.2 ± 4.0 years. In the whole group, the mean body weight (kg), body mass index (BMI) (kg/m2) and % fat mass were 61.0 ± 8.9, 23.5 ± 2.2 and 39.5 ± 6.6 respectively. The mean TEE (MJ/d) was 7.42 ± 1.43, 95% C.I. [6.97, 7.86] and the BMR (MJ/d) was 5.58 ± 0.78, 95% C.I. [5.34, 5.82]. Although males (7.89 ± 1.56) had significantly higher TEE (MJ/d), compared to females (6.91 ± 1.10), when adjusted for age and weight, the significance disappeared. Adjusted for age and weight, BMR was significantly higher in males (6.03 ± 0.73), compared to females (5.11 ± 0.51), $p<0.01$. Significantly higher BCM (kg) and BCM (%) was observed in males (20.6 ± 2.4 kg and 31.6 ± 2.3%), compared to females (16.1 ± 2.2 kg and 28.7 ± 2.8%; $p<0.001$). AEE (MJ/d), adjusted for age, was significantly higher in males 1.39 ± 0.75 (~18% of TEE) compared to females 0.94 ± 0.55 (~14% TEE). In both sexes, the measured BMR was significantly higher compared to the predicted BMR (males: 5.71 ± 0.49 vs females: 4.57 ± 0.39), the underestimation being higher in females (10%).
CONCLUSIONS
Significant sex differences were observed in BMR, body composition, and physical activity among the elderly. The underestimation of the predictive equations for BMR particularly in females, highlights the need for accurate population specific estimates.

MICRONUTRIENT INTAKES AND THE PREVALENCE OF INADEQUATE INTAKES AMONG ADULTS AGED 65 YEARS AND OLDER IN IRELAND: FINDINGS FROM THE NATIONAL ADULT NUTRITION SURVEY II

Laura Kehoe[1, 2]; Maria Buffini[3]; O Sullivan Emma[1]; Breige Mc Nulty[3]; John Kearney[4]; Albert Flynn[2]; Janette Walton[1]
[1]Department of Biological Sciences, Munster Technological University, Cork, Ireland; [2]School of Food & Nutritional Sciences, University College Cork, Cork, Ireland; [3]Institute of Food & Health, University College Dublin, Dublin, Ireland; [4]School of Biological, Health & Sport Sciences, Technological University Dublin, Dublin, Ireland

BACKGROUND AND OBJECTIVES
Adequate nutrition is important at all life stages with micronutrients having an important role in long term health, cognition and ageing(1). The aim of this study was to estimate the intake of selected micronutrients and prevalence of inadequate intakes in males and females aged 65 years and over from a nationally representative sample of adults in Ireland.
METHODS
Analyses were based on a subsample of older adults (≥65y, *n* 282) from the Irish National Adult Nutrition Survey II (NANS II) (2020-21). Food & beverage intake data (incl. nutritional supplements) were collected via 2x24-hour telephone dietary recalls (≥7 days apart). Older adults were asked to record their foods the day before the recall and all participants were provided with a photographic food atlas. Nutrient intakes were estimated using Nutritics based on UK and Irish food composition data. Usual intakes of micronutrients were calculated via the NCI-method using SAS Enterprise Guide. The prevalence of inadequate intakes of micronutrients (excluding energy under-reporters)(2) was estimated using estimated average requirements (EARs) established by the US Institute of Medicine (IOM) (vitamin D)(3) and the European Food Safety Authority (EFSA) (all others)(4).
RESULTS

	Usual intake of micronutrients Mean (SD)		**% below the EAR**	
	Males	Females	Males	Females
Vitamin A (µg)	960 (896)	899 (841)	12.9	12.9
Vitamin D (µg)	15.9 (10.7)	19.0 (13.0)	55.6	41.4
Riboflavin (mg)	2.8 (2.3)	2.8 (2.3)	24.7	17.7
Vitamin B6 (mg)	2.6 (2.2)	2.4 (2.0)	35.5	23.1
Dietary folate equivalents (µg)	381 (332)	349 (305)	34.3	37.5
Vitamin C (mg)	137 (106)	131 (101)	46.6	40.9
Calcium (mg)	991 (934)	1002 (948)	33.2	29.3
Iron (mg)	11.2 (10.4)	10.0 (9.4)	7.4	12.8
Zinc (mg)	11.7 (10.8)	9.9 (9.2)	48.5	24.2

CONCLUSIONS
These findings indicate that based on current dietary patterns, significant numbers of older adults in Ireland have inadequate micronutrient intakes and highlight the need to investigate targeted dietary strategies to address these low intakes among this population group.

COVERAGE OF AND ADHERENCE TO MICRONUTRIENT SUPPLEMENTS IN PREGNANT WOMEN IN THREE PROVINCES IN THE DEMOCRATIC REPUBLIC OF THE CONGO

Zaynah Chowdhury[1]; Diana Allotey[1]; Jillian A. Emerson[1]; Mulamba Diese[1]; Abel Ntambue[2]; Kristen Hurley[3, 1]
[1]Programs Division, Vitamin Angel Alliance, Goleta, United States of America; [2]School of Public Health, Epidemiology and MNCH, Université de Lubumbashi, Lubumbashi, Congo, Democratic Republic of the; [3]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America

BACKGROUND AND OBJECTIVES
Maternal undernutrition is well-recognized as a driver of poor pregnancy outcomes and growth faltering among infants and children (1). Recent evidence has shown that multiple micronutrient supplements (MMS) containing iron and folic acid (IFA) and 13 other vitamins and minerals are more effective than IFA alone in improving birth outcomes and are equally effective in preventing anemia (2, 3). In the Democratic Republic of the Congo (DRC), 14% of women of reproductive age are underweight (BMI <18.5 kg/m2), and 38% are estimated to be anemic (4). The Ministry of Health is transitioning to provide MMS as the standard of care. MMS is currently being distributed in the DRC in areas where there is poor coverage of IFA, but the levels of coverage and adherence are unknown. The objectives of this study were to: 1) determine the coverage (having taken MMS or IFA at least once during pregnancy) and adherence (the extent to which they are taking it every day as indicated) to MMS and IFA among pregnant women in three provinces of the DRC and 2) assess the factors associated with the coverage of MMS.
METHODS
The study was cross-sectional, with a structured household questionnaire targeting pregnant women. Coverage and adherence were based on women's self-report. Data were collected from April to May 2022. Descriptive analyses were conducted and means/standard deviations for continuous variables and proportions for categorical variables were calculated. Bivariate logistic regression was used to determine any association between socio-demographic variables and the consumption of MMS (compared to MMS non-consumption).
RESULTS
Data were collected from 2,375 pregnant women, out of which 13.8% had consumed MMS only, 25.8% IFA only, 7.7% both MMS and IFA, and 52.7% neither at least once during their pregnancy. Compared to married women, those not married nor cohabitating were less likely to consume MMS (OR: 0.63; CI: 0.44-0.90). Compared to women with no living children, women with 3-4 (OR: 1.62; CI: 1.15-2.29) or ≥5 (OR: 2.39, CI: 1.63-3.52) living children were more likely to consume MMS, as were women living in urban areas (OR: 1.69, CI: 1.19-2.40) compared to rural areas. In addition, 88.3% and 80.8% of women reported consuming MMS and IFA, respectively, almost every day in the previous 30 days.
CONCLUSIONS
In three provinces in the DRC, overall MMS and IFA coverage were low, although a high percentage of women taking the supplements reported taking them daily. Next steps are to explore strategies to improve coverage as part of the government's MMS scale-up plan.

ASSESSMENT OF THE IMPACT OF THE NEW FRONT-OF-PACKAGE NUTRITION LABELING IN BRAZIL – DEVELOPING A CONCEPTUAL FRAMEWORK

Ana Paula Bortoletto Martins[1, 2]; Marília Tokiko Oliveira Tomiya[2, 3]; Beatriz Menezes De A. Torquato[2, 3]; Catalina Serrano,[4]; Camila Aparecida Borges[5, 6, 2]; Neha Khandpur[7, 2]
[1]Nutrition Department / School of Public Health, University of Sao Paulo, São Paulo, Brazil; [2]Center for Epidemiological Research in Nutrition and Health (Nupens/USP), University of Sao Paulo, Sao Paulo, Brazil; [3]Department of Nutrition of the Faculty of Public Health, University of São Paulo, São Paulo, Brazil; [4]Departamento de Nutrição, Faculdade de Saúde Pública USP, São Paulo, Brazil; [5]Food Science and Technology, University of Sao Paulo, São Paulo, Brazil; [6]Department of Food Science and Technology, University of São Paulo, São Paulo, Brazil; [7]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES
Several countries are implementing policies to improve food environments and support healthy eating, including food nutrition labeling measures . In Brazil, new regulations for the nutrition labeling of packaged foods, approved in 2020 and enforced in October 2023, include mandatory front-of-package nutrition labeling (FOPNL). This study aimed to develop a conceptual framework to evaluate the impact of the new FOPNL regulation on dietary behaviours, diet and health.
METHODS
The development of the conceptual framework was constructed using the qualitative method proposed by Jabareen (2009), based on a process of theorization using grounded theory methodology, divided in 8 phases. The phases included mapping and extensive reading of the selected data sources, identifying, naming and integrating concepts, synthesizing and validating the conceptual framework. The data sources included scientific papers, reports and policy briefs from international organizations on food nutrition labelling regulation impacts on dietary and health outcomes.
RESULTS
The conceptual model was structured into three main components: a) Exposure: captured consumers' contact with FOPNL regulation, in supermarkets, social media, or print media. This component evaluates attention to FOPNL and consumers' active engagement with the information; b) Cognitive and individual mediators: included sociodemographic factors, nutrition knowledge and attitudes towards food, and family context, which influence how consumers perceive and use FOPNL and changes in knowledge and perception regarding the FOPNL; c) Outcomes: included changes in purchasing behavior, dietary consumption, and ultimate health impacts. The model also accounts for impacts from food reformulation by the food industry.
CONCLUSIONS
The conceptual model provides a robust and integrated conceptual framework for analyzing the impact of FOPNL in Brazil. In addition to mapping the pathways through which FOPNL influences consumer behavior, it also guided the development of research tools, such as the questionnaire with indicators for impact evaluation and contributes to the improvement of labeling policies and the promotion of public health in Brazil.

IS VITAMIN A SUPPLEMENTATION STILL JUSTIFIED? A QUALITATIVE STUDY EXPLORING INSIGHTS FROM POLICY MAKERS AND PROGRAM PLANNERS

Landry Egbende[1]; Mala Ali Mapatano,[1]; Silondile Luthuli[2]; Pierre Akilimali[1]; Ingunn M. S. Engebretsen[3]
[1]Department of Nutrition, School of Public Health, University of Kinshasa, Kinshasa, Congo, Democratic Republic of the; [2]Center for Rural Health, University of KwaZulu-Natal, Durban, South Africa; [3]Department of Global Public Health and Primary Care, Centre for International Health, University of Bergen, Bergen, Norway

BACKGROUND AND OBJECTIVES
According to the last national survey conducted in 1998, the prevalance of vitamin A deficiency (VAD) was as high as 61% in children under five in the country, leading to the implementation of the vitamin A supplementation (VAS) program. The relevance of the VAS is currently at the centre of a debate. It is important to understand how policy makers and program planners perceive VAS. This study aims to explore insignts of policy and program planners of VAS in the country regarding its relevance and justification.
METHODS
This study used an exploratory qualitative design. Data were collected using key informants' interviews with policy makers and program planners. This study was carried out considering the policy makers and the program planners at the national, provincial and health zone levels and included a total of 25 participants. Data were analysed using a thematic analysis.
RESULTS
The participants recognized the relevance of VAS in reducing morbidity and mortality especially in children. However, there were challenges in communication and delivery mechanism such as insufficient supplement supply and lack of motivation of health providers. The participants opinions diverged for the justification of the VAS. For some participants, VAS was perceived as an essential strategy in the country due to its benefits, while other advocated for alternatives approaches that may be cost-effectiveness such as vitamin A through food. They emphasized the importance of adopting appropriate dietary practices to preserve and enhance the bioavailability of vitamin A in food.
CONCLUSIONS
Although VAS was considered important, our findings highlight the need to investigate alternative approaches, such as promoting vitamin A-rich foods. There is an urgent need for more objective information regarding the vitamin A status in the child population and research on VAD is necessary to evaluate the effect of the VAS

EFFECT OF ULTRA-PROCESSED FOOD CONSUMPTION DURING ADOLESCENCE AND FOOD ADDICTION IN EARLY ADULTHOOD

Ximena Díaz-Torrente[1, 2, 3]; Marcela Reyes[4]; Alvaro Vergés[5]
[1]Nutrition and Dietetics Career, Universidad del Desarrollo - UDD, Las Condes, Chile; [2]CIAPEC , Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile., University of Chile, Santiago, Chile; [3]Doctoral Program in Food and Nutrition, University of Chile, Santiago, Chile; [4]CIAPEC, Institute of Nutrition and Food Technology, University of Chile, Santiago, Chile; [5]School of Psychology, University Los Andes, Santiago, Chile

BACKGROUND AND OBJECTIVES
Ultra-processed food (UPF) consumption is associated with poor diet quality and chronic diseases, including obesity, diabetes, and cancer. Short-term exposure to ad libitum UPF diets increases caloric intake by 500 kcal/day, and prolonged exposure may contribute to food addiction (FA), particularly during critical developmental stages. This study examined the association between UPF consumption trajectories during adolescence (i.e., 13 to 16 years of age) and FA in early adulthood (i.e., 20-21 years)
METHODS
A prospective analysis of 488 adolescents from the Growth and Obesity Chilean Cohort Study (GOCS) cohort was conducted. We used dietary intake (24-hour recalls) from 3 evaluations during adolescence; UPFs were classified using the NOVA system, longitudinal data of dietary share of UPF was computed using mixed-effects linear regression models, and participants were grouped into High, Medium, and Low UPF trajectories based on tertiles of each assessment. The presence of FA was evaluated in early adulthood using YFAS 2.0-Chile. Logistic models assessed associations between diet and FA under four adjustments: (1) unadjusted, (2) sociodemographic variables, body mass index, and diet misreporting, (3) childhood eating behavior (CEBQ) and adolescent impulsivity (UPPS-P), and (4) combined covariates from models 2 and 3.
RESULTS
Fifty-three percent of the sample was female. At the beginning of the adolescent follow-up 45% were overweight or obese. During adolescence, the mean intake of UPF according to three dietary evaluations represented 45% of the total calories (range 42-48%). The intake of UPF differed significantly between trajectories (39.7%, 42.8% and 46.3%, $p<0.001$). FA prevalence was 12% in early adulthood. Compared to Low UPF trajectory, High UPF trajectory duplicated FA diagnosis in early adulthood, with borderline significance in fully adjusted models (OR 2.19; 95%CI 0.99–4.82; $p=0.050$).
CONCLUSIONS
These findings emphasize adolescence as a critical window for reducing UPF consumption to prevent FA and other associated health risks. Policies promoting healthier eating behaviors during adolescence are essential for long-term health outcomes.

FACTORS INFLUENCING CHILDHOOD OVERWEIGHT AND OBESITY IN THE PACIFIC ISLANDS: A SYSTEMATIC REVIEW

Rachel Novotny,[1]; Rica Delacruz,[1]; Ashley B. Yamanaka,[1]; Courtney Choy,[2]; Fiorenzo Toncan[1]; Pauline Mcfall[1]; Olivier Galy,[3]; Anthony Okely,[4]
[1]Department of Human Nutrition, Food and Animal Sciences, University of Hawaii at Manoa, Honolulu, United States of America; [2]Public Health, Yale University, New Haven, United States of America; [3]Interdisciplinary Laboratory for Research in Education, University of New Caledonia, Noumea, New Caledonia; [4]Public Health, University of Wollongong, Wollongong, Australia

BACKGROUND AND OBJECTIVES
Pacific island health has been influenced by socio-political changes with a rise in obesity in children, currently estimated at 24 to 30 percent. This systematic review examines factors influencing overweight and obesity among children in the Pacific Islands.
METHODS
A systematic search of peer-reviewed literature was conducted in PsycINFO, CINAHL, EMBASE, EBSCO/AGRICOLA, PROQUEST (includes ERIC), Web of Science, MEDLINE/PUBMED- MeSH, Scopus, SPORTDiscus) from inception to April 2024. Eligible studies included children aged birth to 12 years and that measured overweight or obesity with anthropometry in the Pacific Islands. Overweight and obesity prevalence by age and sex only were excluded (n=5). At least two team members screened, extracted, and synthesized data using Covidence, Qualtrics, and Excel, with disagreements resolved by consensus. Factors assessed in studies were grouped by types of influence and levels of the socioecological model (SEM). Quality was assessed with Joanna Briggs Institute (JBI) checklists.
RESULTS
Of 4985 papers identified through screening, 396 full texts were evaluated and 38 studies met criteria. Included studied were assessed as low bias by JBI. Majority were cross-sectional (30/38= 79%), with source data from 1974-2021 from 16 countries or territories - American Samoa, Commonwealth of the Northern Mariana Islands, Federated States of Micronesia (Chuuk, Kosrae, Pohnpei, Yap), Fiji, French Polynesia, Guam, Kiribati, Marshall Islands, New Caledonia, Palau, Papua New Guinea, Samoa, Tokelau, Tonga, Tuvalu, Vanuatu, and Wallis & Futuna, representing more than 122,000 children. Majority were conducted in or included Samoa (n=10) and American Samoa (n=8). Factors influencing overweight and obesity included: Ethnicity (n=6), Socio-Cultural (n=9), Geographic (n=15), Environmental (n=2), Infant Factors (n=6), Maternal Factors (n=7), Maternal Behaviors (n=2), Child Physical Activity level (n=5), Child Feeding and Diet (n=9), and Other Child Health Factors (n=3). Majority of studies focused on factors at the individual level of the SEM (n=30), followed by the interpersonal level (n=17), the community level (n=16), and the organization level (n=2). No studies addressed determinants at the policy level of the SEM.
CONCLUSIONS
Life course studies and actions addressing factors found at multiple SEM levels are needed to ameliorate childhood obesity in the Pacific Islands.

FEASIBILITY OF ADHERING TO A ONE-WEEK DIETARY APPROACHES TO STOP HYPERTENSION (DASH) EATING PLAN AMONG LOW-INCOME WOMEN RECEIVING FEDERAL FOOD ASSISTANCE IN THE UNITED STATES

Kendra OoNorasak[1]; Nadia Sesay[2]; Taylor Emerson[3]; Emma Smith[3]; Jayden Brewer[3]; Brandi White[3]
[1]Department of Kinesiology and Health Promotion, University of Kentucky, Lexington, United States of America; [2]Department of Communication, University of Kentucky, Lexington, United States of America; [3]Department of Health and Clinical Sciences, University of Kentucky, Lexington, United States of America

BACKGROUND AND OBJECTIVES
Hypertension affects almost half of American adults, with African American women having the highest rates compared to any other racial or ethnicity and biological sex group (1). The Dietary Approaches to Stop Hypertension (DASH) is an evidence-based eating plan for the treatment and/or prevention of hypertension (2). However, increasing food costs may present barriers to follow this heart-healthy eating plan for low-income at-risk populations, especially African American women. In 2022, women living alone made up the largest percentage of nonfamily households in the U.S. (3). This study assessed if an American woman in a one-person household receiving weekly, federal food assistance can afford a one-week DASH eating plan recommended to control, treat, and prevent hypertension.
METHODS
The publicly available, one-week DASH eating plan provided in a publication from the National Heart, Lung, and Blood Institute was used (4). This one-week plan provides a daily 2000-calorie menu for breakfast, lunch, dinner, and snacks with individual ingredients that fit with DASH nutritional guidelines. The cost of each ingredient was searched online during the months of October and November 2024 from two grocery store chains that are commonly utilized among households residing in an urban city of southern U.S. Daily grocery cost in U.S. dollars was calculated based on the type, weight, and cost of each ingredient listed in the DASH plan using Fillet, a user-friendly application used in research and the foodservice industry. The total grocery cost from the one-week plan was compared to the average weekly allotted federal food assistance U.S. dollars provided to eligible low-income women aged 20-50 years, determined by the 2021 U.S. Thrifty Food Plan (5).
RESULTS
Based on the October 2024 average food cost update published online (5), women in a one-person household would receive USD $67.92 per week on average for federal food assistance. In comparison, individuals following the one-week DASH plan would spend about USD $290 towards groceries initially, including condiments, spices, fruit juices, oil, nuts, and seeds that could last up to a month. The cost of this recommended DASH plan is more than four times greater than the average weekly federal food assistance U.S. dollars provided to a woman single-handedly experiencing challenges with food and nutrition security.
CONCLUSIONS
Findings suggest that adherence to the one-week DASH plan is not feasible for single American women receiving federal food assistance. Future research should explore ways to reduce costs and assess the cultural relevance of the one-week DASH eating plan.

THE STATE OF ANEMIA AMONG SENEGALESE WOMEN OF REPRODUCTIVE AGE AND CHILDREN 6-59 MONTHS OLD

Mane Hélène Faye[1]; Adama Diouf[1]; Soda Ndiaye[1]; Abdou Badiane[1]; El Hadj Momar Thiam[2]; Judith Nihorimbere[3]; Aminata Diop Ndoye[2]; Nicole Idohou-Dossou[1]
[1]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Universite Cheikh Anta Diop (UCAD), Dakar, Senegal; [2]Secrétariat Exécutif, Conseil National de Développement de la Nutrition, Dakar, Senegal; [3]PINGS, Nutrition International, Ottawa, Canada

BACKGROUND AND OBJECTIVES
Globally, anemia is a major public health problem among vulnerable groups such as women of reproductive age (WRA) and children aged 6-59 months (C6-59m). As the World Health Organization's (WHO) global target term for anemia (2025) approaches, Senegal does not have recent data to assess its progress, or the impact of the strategies implemented to date to address the problem. This study aimed to assess the prevalence of anemia among Senegalese WRA and C6-59m.
METHODS
One WRA and C6-59m were sampled from each household targeted through a stratified three-stage sampling method in a national cross-sectional survey on anemia among adolescents (10-19 years). Sociodemographic and socioeconomic data were collected. Hemoglobin concentration (Hb) was measured using an HemoCue® Hb 301 photometer. Hb cut-off defining anemia and its public health significance were from WHO's 2011 guidelines for comparability with former surveys. Data were weighted to account for the design complexity.
RESULTS
Data from 1,729 WRA and 841 children were analyzed. Mean Hb was 11.8±1.6 g/dL among WRA, and the prevalence of anemia was 47.6%. The prevalence of anemia was low among WRA aged 15-19, and 40-44 years compared with other age groups, except for 25-29 years ($P < 0.001$). The prevalence of anemia was higher among WRA living in households in the lowest wealth quintile (57.6%) compared with the second and middle ones (46.7% and 36.0%, respectively), $P < 0.05$). Among C6-59m, mean Hb was 10.5±1.5 g/dL. The prevalence of anemia was 59.8%, higher in children aged 24-35m (73.7% versus. 55.7% in other age groups, P=0.04), those living in rural areas (66% versus 50.3% in urban areas), in households in the lowest and second quintiles (71.7% and 68.5%, respectively). C6-59m living in the country's western area were least affected by anemia (43,1%) than those in other ethnocultural areas (67,5%, $P<0.05$). Mild and moderate anemia were more common than did severe anemia in both women and C6-59m.
CONCLUSIONS
Anemia remains a severe public health problem among both WRA and C6-59m in Senegal. Its prevalence differs according to specific socio-demographic and socio-economic characteristics. These RESULTS confirm that the country is not on track to meet the 2025 WHO's global target for anemia and probably needs to review its anemia control strategies.

SURVEY ON AWARENESS OF BREAST CANCER PREVENTION INFORMATION RELATED TO DIET AND NUTRITION IN TOKYO

Haruna Ogawa[1]; Kikuno Oneda[1]; Mitsuki Ohashi[1]; Hiyori Sato[1]; Manami Suzuki[1]; Reiko Suzuki[1]
[1]Nutrition, Japan Women's University Mejiro Campus, Bunkyo City, Japan

BACKGROUND AND OBJECTIVES
The objective was to conduct awareness activities about lifestyle habits considered to be related to breast cancer incidence, based on nutritional epidemiological evidence, and to analyze the awareness by gender and age group to aid in the dissemination of breast cancer prevention information.
METHODS
We displayed posters to introduce lifestyle habits related to diet and nutrition reported as risk/preventive factors for breast cancer, excerpted from sources such as the "World Cancer Research Fund Report" and "RESULTS from representative Japanese cohort studies". Simultaneously, awareness was surveyed among those who agreed to participate in the questionnaire. The questionnaire included: ① Breast cancer incidence rate among Japanese women(ref.1) ② Excessive alcohol consumption (ref.2) ③ living with overweight or obesity in young adulthood decreases the risk of pre-menopausal breast cancer(ref.3). ④ Postmenopausal weight gain(ref.3) ⑤ Miso soup (isoflavones)(ref.4) ⑥ Physical activity(ref.2) ⑦ Breastfeeding(ref.2). Statistical analysis was performed using the $\chi 2$ test by gender and age. P value < 0.05 was considered statistically significant.
This survey was approved by the ethics review committee of Japan Women's University (No. 621).
RESULTS
Of the 1,283 individuals who agreed to participate in the questionnaire, 1,199 individuals (388 males, 811 females) with the information of gender and age were included. Awareness rates were 32.1% for ⑤, 31.2% for ①, 30.6% for ②, 27.3% for ⑦, 23.0% for ⑥, 21.3% for ④, and 16.9% for ③.
CONCLUSIONS
The awareness of information on breast cancer prevention, which may be related to food and nutrition, ranged from 16.9 to 32.1%.

BACKGROUND AND OBJECTIVES
In recent years, nutrition policies have been promoted in various fields. Moreover, the presence of public health dietitians who play a supervisory role is expected to become more important in the future. However, few tools have been developed to enable public health dietitians who are expected to play a supervisory role to evaluate their own skills and other aspects. This study aimed to (1) review previous studies on the supervisory roles of other health professions in public health and self-assessment scales, (2) conduct a qualitative survey of public health dietitians who have supervisory roles, and (3) develop a draft self-assessment scale for public health dietitians who are expected to play supervisory roles.
METHODS
(1) Review previous studies on the supervisory role of other health professions (physicians, public health nurses, and so on) in public administration and evaluation scales, and survey the literature on scale development. (2) Conduct a qualitative study of public health dietitians with supervisory roles. Interviews were conducted with public health dietitians who have a supervisory role, the next generation of public health dietitians with a supervisory role, and supervisory public health nurses. (3) Consideration will be given to developing a draft self-assessment scale for public health dietitians who are expected to play a supervisory role.
RESULTS
(1) A total of 168 articles were extracted from medical journals, 11 articles from CiNii in Japanese and 14 articles in English, and 13 articles from Google Scholar. The exclusion criteria were those that were targeted at non-governmental organizations, those that did not seem to be related to human resource development, and others that were deemed not to be in line with the purpose of this study. (2) Interviews were conducted with public health dietitians with supervisory roles in several municipalities, dietitians with next-generation supervisory roles, and supervisory public health nurses to extract key words and essences for the development of a self-assessment scale for dietitians with supervisory roles. (3) We collected information on evaluation scales and contents that could be utilized for the scales, and organized perspectives on the proposed scales. In addition, we examined proposed validity verification methods based on past research.
CONCLUSIONS
It led to the development of a self-assessment scale for public health dietitians who are expected to play a supervisory role. This research was supported by a Grant-in-Aid for Scientific Research on Health, Labor and Welfare #24FA1010.

EPO5_569

CHARACTERISTICS OF INDEPENDENT EATING BEHAVIOR IN CHILDREN AT HOME RELATED TO INTERNATIONAL EDUCATION IN INTERNATIONAL PRESCHOOLS IN JAPAN

Sayuri Tokita[1]; Yoko Umeki[1]; Masanori Ohta[1]
[1]Graduate School of Health and Environmental Sciences, Fukuoka Women's University, Fukuoka, Japan

BACKGROUND AND OBJECTIVES
This study aims to identify the characteristics of independent eating behavior (IEB) associated with international education in international preschools in Japan.
METHODS
Data were collected from a 2024 survey on eating habits conducted at eight international preschools and one private kindergarten in Japan. The study targeted 359 parents of children aged 3–5 years. The survey included questions on demographics, a modified IEB scale for preschool children (adapted from an elementary school version), 16 items on interest in international understanding, and an independence and cooperativeness scale for preschool children. Parents responded on behalf of their children. Associations between the modified IEB scale and other items were analyzed using Spearman's rank correlation coefficient (*r*s).
RESULTS
The survey had 148 respondents (41.2% cooperation rate). A modified IEB scale for preschoolers, comprising 12 items grouped into three subscales, was developed: "Factor 1: communication about foods," "Factor 2: preparing and cleaning up after meals, and appreciation," and "Factor 3: eating manner." Correlation analysis of data from 93 children in international preschools revealed positive associations between scores on the modified IEB scale and items related to international understanding, including "global issues" (3 items), "foreign language" (4 items), "international exchange" (5 items), and "cross-cultural experience" (3 items) (*r*s=0.21–0.39, $p<0.05$). Twelve items were positively correlated with the total score of Factor 1 (*r*s=0.22–0.34, $p<0.05$). The item "Your child wants to eat traditional cuisines from different countries" was positively associated with scores across all three subscales of the modified IEB scale (*r*s=0.21–0.34, $p<0.05$). Additionally, two items, each from "foreign language" and "international exchange," were positively correlated with the total score of the independence and cooperativeness scale (*r*s=0.22–0.23, $p<0.05$).
CONCLUSIONS
Independent eating behaviors in children attending international preschool were linked to aspects of international education. Communication about foods was associated with interest in international understanding. Assisting with meals, showing appreciation, and demonstrating proper eating manners were connected to experiences of cross-cultural engagement.

DEVELOPMENT OF A JAPANESE VERSION OF THE NUTRITIONAL STATUS SCREENING QUESTIONNAIRE -A REVIEW OF THE VALIDITY OF THE DRAFT QUESTIONNAIRE'S CONTENT BY EXPERTS-

Yasuyo Wada[1]; Kemal Sasaki[2]; Yuki Tada[3]; Tomomi Kobayashi[4]; Tetsuji Yokoyama[1]
[1]Department of Health Promotion, National Institute of Public Health, Wako, Japan; [2]Department of Food and Health Sciences, Jissen Women's University, Hino, Japan; [3]Department of Nutritional Science, Tokyo University of Agriculture, Setagaya City, Japan; [4]Department of Food Science and Nutrition, Mukogawa Women's University, Nishinomiya City, Japan

BACKGROUND AND OBJECTIVES
A prominent assessment tool used to screen for nutritional risks, such as eating habits that may affect physical development, is the Nutrition Screening Tool for Every Preschooler (NutriSTEP), which has been developed in Canada. However, since the living environment and eating habits of parents and children differ greatly depending on the social environment and culture of each country and region, it is necessary to develop a unique assessment tool suitable for Japanese, and there is no similar tool that has been sufficiently validated in Japan. Therefore, we have been developing a simple tool to screen nutritional risk of preschool children in Japan since 2021. The purpose of this study is to determine the validity of the draft questionnaire we developed for a simple assessment of the nutritional status of preschool children.
METHODS
A total of 12 experts, including physicians, registered dietitians, public health nurses, epidemiologists, nursery teachers, and kindergarten teachers, were asked to evaluate and comment on each item of the draft questionnaire used in the simplified tool (for children aged 1 year 6 months to under 3 years and 3 to 5 years). The evaluation items were: 1) relevancy (1-not relevant, 2-items need modification, 3-relevant but needs some modification, 4-very relevant), 2) clarity (whether the questionnaire items are clear or not 1-not clear, 2-items need modification, 3-clear but needs some modification, 4-very clear), 3) simplicity (1-not easy, 2-items need revision, 3-easy but needs some revision, 4-very easy), with a score of 4 points for each indicator. In addition, after obtaining free-text responses for the entire questionnaire, the content validity index (CVI) of the content was calculated.
RESULTS
The CVI ranged from 0.83-1.00 for both the questionnaire for children aged 1 year 6 months to less than 3 years and the questionnaire for children aged 3 to 5 years, which was considered acceptable and valid as an index. In addition to the scores, the project members discussed and improved the tool based on the free-response statements.
CONCLUSIONS
The RESULTS showed that the questionnaire was highly valid, and further improvements were possible, leading to the next step of focus group interviews. The questionnaire could be further improved, leading to the next step of focus group interviews.

DISTORTED BODY IMAGE AND DESIRE FOR THINNESS AMONG UNDERWEIGHT AND NORMAL WEIGHT JAPANESE FEMALE HIGH SCHOOL STUDENTS

Mizuki Suga[1]; Fumi Oono[1]; Mai Matsumoto[1]; Mayu Kikukawa[1]; Yumi Ueyama[1]; Hiroko Ikeuchi[2]
[1]Center for Nutritional Epidemiology and Policy Research, National Institutes of Biomedical Innovation, Health, and Nutrition, Osaka, Japan; [2]Department of Health and Welfare Services, Health Promotion Division, Tochigi Prefectural Government Office, Utsunomiya, Japan

BACKGROUND AND OBJECTIVES
The prevalence of underweight among young Japanese women is remarkably high. Many young women, even those who are underweight or normal weight, perceive themselves as overweight and have a desire for thinness. Few studies have examined this issue among high school students. The purpose of this study was to describe body perception and the desire for thinness among underweight and normal weight female high school students in Japan.
METHODS
A questionnaire survey was conducted among female high school students in Tochigi Prefecture. Weight status was classified based on body mass index (BMI) into two groups: underweight (BMI < 18.5) and normal weight (18.5 ≤ BMI < 25). Individuals with a BMI of 25 or higher were excluded. The underweight group was further divided into three categories: grade I (17 ≤ BMI < 18.5), grade II (16 ≤ BMI < 17), and grade III (BMI < 16). Regarding the assessment of the desire to lose weight, participants were asked "Do you want to lose (or gain) weight now?", and chose from the following categories: want to lose weight, want to stay the same, want to gain weight, or don't know. The body perception and desire to lose weight were described across weight status.
RESULTS
In the normal weight group, 66% perceived themselves as slightly overweight or overweight. In the underweight group (grades I–III combined), 67% did not perceive themselves as underweight. When analyzed by grades, 75% in grade I, 42% in grade II, and 29% in grade III did not perceive themselves as underweight. The prevalence of the desire for thinness was 42% and 84% of the underweight group and the normal weight group, respectively. Within the underweight group, the desire to lose weight was observed in 48% of grade I, 20% of grade II, and 29% of grade III.
CONCLUSIONS
This study reveals that distorted body image and desire to lose weight were prevalent among underweight female high school students. Approximately 50% of individuals classified as Grade 1 underweight revealed a desire to lose weight. Furthermore, even among those with severe underweight status (BMI < 17), some still have a desire for further weight loss. Promoting accurate body perception and addressing psychological factors behind the desire for thinness may be necessary for health education and nutrition counselling.

ULTRA-PROCESSED FOOD CONSUMPTION AND MICRONUTRIENT INTAKES OF KOREAN YOUNG ADULTS

Minseo Choi[1]; Yun-A Lee[1]; Yun-Jung Bae[2]; Mi-Kyeong Choi[1]
[1]Food and Nutrition, Kongju National University, Yesan, Korea, Republic of; [2]Food and Nutrition, Korea National University of Transportation, Jeungpyeong, Korea, Republic of

BACKGROUND AND OBJECTIVES
Changes in food production and consumption patterns worldwide have led to an increase in the consumption of ultra-processed foods, which have been reported to be associated with poor nutrient intake and dietary quality. As ultra-processed foods, increased intake of carbohydrates, sugars, total fat, saturated fat, and sodium, while decreased intake of protein, fiber, and potassium have been reported. However, limited studies have reported on the association of ultra-processed food intake with micronutrient intake, such as vitamins and minerals. The purpose of this study was to investigate the association between ultra-processed food consumption and dietary quality focus on micronutrients in young adults.
METHODS
Among 468 Korean adults in their 20s and 30s, dietary intake survey was conducted using 24-h recall method from November 2022 to June 2023. Daily intakes of energy and nutrients, including vitamins and minerals, were analyzed using CAN-Pro (The Korean Nutrition Society, Seoul, Korea), and ultra-processed food intake was calculated using the NOVA food classification criteria. The subjects were categorized into two groups: those with more than 25% of ultra-processed food intake to total food intake (≥25% group) and those with less than 25% (<25% group). Differences of variables between two groups were verified by the unpaired t-test using SAS version 9.4, and significance was tested at the $p<0.05$.
RESULTS
Ultra-processed food intake of the subjects was 24.4% of total food intake and 26.0% of total energy intake. Daily energy and sodium intakes were higher in the ≥25% group than the <25% group. Ultra-processed food intake was significantly negatively associated with intakes of dietary fiber, protein, fat, and cholesterol after adjusting for covariates. Daily intakes of fiber and micronutrients, such as vitamins (vitamin A, vitamin E, vitamin K, folate, and vitamin C) and minerals (potassium and zinc), were lower in the ≥25% group than the <25% group. In addition, ultra-processed food intake was significantly negatively associated with intakes of vitamin A, vitamin E, vitamin K, phosphorous, potassium, magnesium, zinc, and iodine after adjusting for covariates.
CONCLUSIONS
These RESULTS advocate for association increased consumption of ultra-processed foods with lower overall dietary quality. Future studies are needed to clarify a causal association between ultra-processed food intake and dietary quality focus on micronutrient intakes.

OPTIMIZATION AND ORGANOLEPTIC EVALUATION OF NUTRIENT-DENSE COMPLEMENTARY FOOD MIXES USING D OPTIMAL MIXTURE DESIGN: ALIGNING WITH REVISED NATIONAL FOOD SECURITY ACT STANDARDS, INDIA

Sangita Thenarangam[1]; Prasanthi P S[1]; Shally Vishnoi,[1]; Shrunga Shree S[1]; Pavithra R C[1]; Prathyusha Vasireddy[1]; Srinivas E[1]; P Ravindranadh[2]; Radhika Madhari[1]
[1]Department of Dietetics, ICMR - National Institute of Nutrition, Hyderabad, India; [2]Drug Safety, National institute of nutrition, Hyderabad, Telangana, India, India

BACKGROUND AND OBJECTIVES
Proper nutrition during infancy is essential for growth and development. Complementary feeding meets the energy and nutrient needs of children 6–24 months beyond breast milk. This study optimized a nutrient-dense complementary food for children 6–35 months using locally sourced ingredients and a mixture design approach, to meet the Nutrition norms for Poshan 2.0 Program under the Schedule II of National Food Security Act, India to improve infant and young child feeding nutrition.
METHODS
The formulation was optimized using Stat-Ease Design-Expert® software (version 13) with a Mixture Design and special cubic model, incorporating wheat, pulses, milk powder, nuts/seeds, and plant-based oil. Constraints aligned with Poshan 2.0 and NFSA norms in India, targeting maximum nutrient content (iron, calcium, zinc) and minimal phytate-to-mineral molar ratios. The optimized mix served as a base for diverse product variations to enhance palatability and reduce monotony: Variation 1 (dry dates powder), Variation 2 (low refined sugar per WHO guidelines), and Variation 3 (spices/condiments). Sensory evaluation by 20 semi-trained panelists using a nine-point hedonic scale (acceptability >6) compared the variations to Telangana's "Balamrutham."
RESULTS
The optimized formulation consisted of 48g wheat, 24g pulses, 10g milk powder, 5g groundnuts, 5g gingelly seeds, and 8g of plant-based oil. The nutrient content per 100g of the formulation was as follows: iron content was 4.40 mg (73.3% of the Estimated Average Requirement, EAR), calcium content was 198.51 mg (49.7% of EAR), and zinc content was 2.78 mg (98% of EAR), all while maintaining acceptable phytate-to-mineral molar ratios. Among product variations, all three variations scored above the acceptability threshold during sensory evaluations, with "Variation 3: Spices/Condiments" receiving the highest preference (score 7.45). The date powder-based formulation of (score 7.05) showed similar acceptability to refined sugar (score 7.1), with the added benefit of enhancing the nutritional profile of the product. The control product, *"Balamrutham,"* achieved a score of 7.64
CONCLUSIONS
This study developed nutrient-dense complementary foods for children 6–35 months, meeting national standards. The formulations provided essential micronutrients, optimal phytate-to-mineral ratios, and high sensory acceptability using locally sourced ingredients, offering a sustainable solution to malnutrition in India.

RELATIONSHIPS BETWEEN CHEWING HABITS AND DIETARY AND LIFESTYLE HABITS IN ELEMENTARY SCHOOL CHILDREN

Noriko Tanaka[1]; Hisae Shinohara[2]; Toyoko Okuda[3]; Ikue Hamaguchi[4]; Jangmi Kang[5]; Reiko Heguri[6]; Yuko Higashine[5]; Daisuke Matsumoto[7]

[1]Faculty of Nursing, Kobe City College of Nursing, Kobe, Japan; [2]Faculty of Education, University of Miyazaki, Miyazaki, Japan; [3]Faculty of Human Sciences, Tezukayama Gakuin University, former professor, Sakai, Japan; [4]Faculty of Human Sciences, Konan Women's University, Kobe, Japan; [5]Faculty of Clinical Nutrition and Dietetics, Konan Women's University, Kobe, Japan; [6]Faculty of Health Science, Hyogo University, Kakogawa, Japan; [7]Sports Education Center, General Education Organization, Momoyama Gakuin University, Sakai, Japan

BACKGROUND AND OBJECTIVES

Experimental studies suggest that chewing benefits digestion and positively impacts mental and physical health. We conducted a questionnaire survey to clarify the relationships between chewing habits and dietary habits, as well as between chewing habits and aspects of school life, including mental states, learning attitudes, and sports habits.

METHODS

A questionnaire survey regarding lifestyle and eating habits was provided to upper-grade elementary school children from Osaka and Hyogo prefectures, and 592 participants (294 boys and 298 girls) who returned valid responses were included in the analyses. The relationships between chewing habits and dietary habits, learning attitudes, and sports enjoyment were examined using $\chi 2$ and logistic regression analyses.

RESULTS

Children who chewed well consumed more vegetables and fruits, fewer sweet drinks, and had more interest in cooking and healthy foods than those that chewed less. They exhibited better learning attitudes, more stable mental states, and greater sports enthusiasm, suggesting a better overall school life. Logistic regression analysis was used to clarify the factors related to chewing habit in dietary and life style habits. As a result, there were significant relationships between chewing habits and vegetable and fruit intake($p<0.001$), interest in cooking($p<0.001$), learning attitude($p=0.014$), and enthusiasm for sports($p=0.044$). Gender was not related to chewing habits, although girls tended to chew better than boys, and more interested in cooking and healthy foods than boys. Thus vegetable and fruit intake and interest in cooking may promote positive chewing habits, leading to positive learning attitudes and sports enthusiasm in elementary school children. Increased chewing is inferred to contribute to a positive school life.

CONCLUSIONS

This study suggests that promoting positive chewing habits among elementary school children by providing vegetables and fruits and encouraging interest in cooking can improve learning attitudes and sports enjoyment, contributing to a good school life.

ASSOCIATIONS OF GLYCEMIC INDEX AND GLYCEMIC LOAD WITH METABOLICALLY HEALTHY AND UNHEALTHY OBESITY IN THE FILIPINO WOMEN'S DIET AND HEALTH STUDY (FILWHEL)

Woo Min Seok[1]; Heejin Lee[2]; Grace H. Chung[3, 4]; Sangmo Hong[5]; Sung Hoon Yu[5]; Chang Beom Lee[5]; Jung Eun Lee,[1, 4]

[1]Department of Food and Nutrition, College of Human Ecology, Seoul National University, Seoul, Korea, Republic of; [2]Department of Nutrition, Harvard T.H. Chan School of Public Health, Boston, United States of America; [3]Department of Child Development & Family Studies, College of Human Ecology, Seoul National University, Seoul, Korea, Republic of; [4]Research Institute of Human Ecology, Seoul National University, Seoul, Korea, Republic of; [5]Division of Endocrinology and Metabolism, Department of Internal Medicine, Hanyang University Guri Hospital, Hanyang University College of Medicine, Guri-si, Korea, Republic of

BACKGROUND AND OBJECTIVES

Glycemic index (GI) and glycemic load (GL) are important indicators for assessing the quality of carbohydrates in diets. However, their associations with metabolically healthy obesity (MHO) and metabolically unhealthy obesity (MUO) remain unclear. This study investigated the cross-sectional associations of dietary GI and GL with metabolic obesity phenotypes among Filipino immigrant women in Korea.

METHODS

A total of 571 Filipino women married to Koreans were included in this cross-sectional analysis from the Filipino Women's Diet and Health Study (FiLWHEL). Dietary intake was assessed using a 24-hour recall method. Blood samples were taken from participants who had fasted for at least eight hours. Dietary glycemic load (DGL) was calculated by multiplying the GI value of each food by the amount of carbohydrates consumed from each food, summing these values, and dividing the total by 100. Participants were classified into MHO and MUO based on body mass index (BMI) and metabolic health indicators. MHO was defined as meeting at least four of the following five criteria: HOMA-IR ≤ 2.7, hs-CRP ≤ 3.0 mg/L, triglycerides ≤ 150 mg/dL, LDL-C ≤ 100 mg/dL, and HDL-C ≥ 50 mg/dL. Polytomous logistic regression was used to calculate odds ratios (ORs) and 95% confidence intervals (CIs) for the associations of dietary GI and GL with obesity categories.

RESULTS

The mean ± SD of dietary glycemic index (DGI) was 59.6 ± 6.3, and dietary glycemic load (DGL) was 149.2 ± 34.6. Statistically significant associations were not found between DGI or DGL and the prevalence of MHO or MUO. For DGI, ORs (95% CIs) for MHO were 0.77 (0.41–1.46) and 0.62 (0.31–1.23) for subsequent tertiles, using the 1st tertile as the reference (p for trend = 0.17); and ORs (95% CIs) for MUO were 0.77 (0.45–1.32) and 0.73 (0.42–1.28) for subsequent tertiles (p for trend = 0.26). For DGL, ORs (95% CIs) for MHO were 0.69 (0.34-1.39) and 0.96 (0.51-1.83) for subsequent tertiles (p for trend = 0.90); and ORs (95% CIs) for MUO were 1.49 (0.86–2.57) and 1.10 (0.62-1.94) for subsequent tertiles (p for trend = 0.70). Additionally, no significant associations were observed between carbohydrate intake or the percentage of energy from carbohydrates and MHO or MUO.

CONCLUSIONS

No significant associations were found between glycemic index (GI) or glycemic load (GL) and the prevalence of metabolically healthy obesity (MHO) or metabolically unhealthy obesity (MUO) in this study.

CAN VEGETARIAN DIETARY PATTERNS PROVIDE ADEQUATE PROTEIN BALANCE AND BIOAVAILABILITY FOR HEALTHY ADULTS?

Gamze Altintas[1, 2]; Aslı Uçar[3]
[1]Nutrition and Dietetics, Tarsus University Faculty of Health Sciences, Mersin, Türkiye; [2]Nutrition and Dietetics, Ankara University Graduate School of Health Sciences, Ankara, Türkiye; [3]Nutrition and Dietetics, Ankara University Faculty of Health Sciences, Ankara, Türkiye

BACKGROUND AND OBJECTIVES
Interest in plant-based diet models is increasing day by day due to reasons such as having a low ecological footprint, being economical, ensuring animal welfare and positive health effects. However, the lower protein content per serving in plant-based sources, their limited amounts of certain essential amino acids, and reduced digestibility raise concerns about whether such diets can ensure adequate protein balance and amino acid bioavailability. The aim of this study is to examine whether vegetarian and vegan diets provide adequate protein balance and amino acid bioavailability in healthy adults.
METHODS
To investigate this, the Web of Science, PubMed, Scopus, and Cochrane databases were searched for studies published in the last five years on vegetarian diet models and protein balance. Only research articles involving healthy adults were included in the study, and studies involving children, the elderly, various diseases and special conditions (e.g., pregnancy and athletes), congress abstracts, protocols and study records were excluded.
RESULTS
A total of 353 studies were reached. As a result, 18 studies were included in this review. Most of the studies focused on vegan individuals and evaluated protein intake. The findings indicate that the daily recommended protein intake can be achieved with vegetarian and vegan diets. However, insufficient protein intake may occur among vegan individuals with inadequate energy intake or those who rely on a limited variety of protein sources. It has been determined that even if sufficient protein intake and diversity are provided in vegans, the recommended intake level for some essential amino acids, especially lysine, may not be reached.
CONCLUSIONS
It is essential for individuals following or considering vegetarian or vegan diets to have sufficient knowledge or receive nutritional counseling on plant-based protein sources, suitable food preparation and cooking methods, and strategies to ensure protein diversity to meet daily requirements. While current studies focus primarily on protein intake, there is a lack of research on amino acid bioavailability. Further studies on this topic are needed.

DIETARY VITAMIN K INTAKE IN RELATION TO SKELETAL MUSCLE MASS AND STRENGTH AMONG ADULTS: A CROSS-SECTIONAL STUDY BASED ON NHANES

Qiong Wang[1]; Kang Yu[1]
[1]Clinical Nutrition, Peking Union Medical College Hospital, Beijing, China

BACKGROUND AND OBJECTIVES
Previous studies revealed that vitamin K might help maintain muscle homeostasis, but this association has received little attention. We aimed to explore the associations of vitamin K intake with skeletal muscle mass and strength.
METHODS
We included cross-sectional data from the U.S. National Health and Nutrition Examination Survey (NHANES, 2011-2018). Vitamin K intake was assessed via 24-hour recall. Covariate-adjusted multiple linear regression and restricted cubic splines were used to evaluate the associations of dietary vitamin K intake with skeletal muscle mass and strength, measured by dual-energy X-ray absorptiometry and handgrip dynamometer, respectively.
RESULTS
Dietary vitamin K intake was positively associated with skeletal muscle mass in males (β=0.05747, *P*=0.0204) but not in females. We also revealed a positive association between dietary vitamin K intake and handgrip strength within the range of 0-59.871 μg/d (*P*nonlinear=0.049). However, beyond this threshold, increasing vitamin K intake did not cause additional handgrip strength improvements.
CONCLUSIONS
We provided evidence for a positive relationship between dietary vitamin K intake and skeletal muscle mass in males. Moreover, our study revealed a nonlinear relationship between dietary vitamin K intake and handgrip strength, highlighting an optimal intake range.
CONFLICTS OF INTERESTS

IMPLEMENTATION OF A STUDENT CITIZENS' ASSEMBLY TO CO-CREATE NUTRITION INTERVENTIONS IN HIGHER EDUCATION SETTINGS

Alice Bellicha[1]; Benjamin Allès[1]; Julia Baudry,[1]; Lucile Bouré[2]; Henri Dehove[1]; Hajar El Karmouni[3]; Emilie Frenkiel[2]; Emmanuelle Kesse-Guyot[1]; Sandrine Péneau[1]; Malo Mofakhami[4]
[1]Centre of Research in Epidemiology and StatisticS, Nutritional Epidemiology Research Team (EREN), Université Sorbonne Paris Nord and Université Paris Cité, INSERM, INRAE, CNAM, Bobigny, France; [2]Laboratoire Interdisciplinaire d'Étude du Politique Hannah Arendt (LIPHA), Université Paris Est Créteil, Fontainebleau, France; [3]Institut de Recherche en Gestion, Université Paris Est Créteil, Créteil, France; [4]Institute for Interdisciplinary Research on Social Issues (IRIS), Center for employment and labor studies (CEET), Université Sorbonne Paris Nord, Villetaneuse, France

BACKGROUND AND OBJECTIVES
Higher education offers unique opportunities to promote healthy and sustainable diets among young adults. Engaging students in developing nutrition interventions is crucial to design relevant interventions addressing diverse dietary habits and their complex determinants. Citizens' assemblies increasingly serve as deliberative processes to co-create solutions to complex challenges. This study aimed 1) to design and implement a student citizens' assembly using participatory research methods, 2) to analyze the proposals in light of the main known determinants of the population's diet.
METHODS
This student citizens' assembly took place in November 2024 at a French university located in a disadvantaged area, with the aim to co-create concrete proposals likely to enhance students' access to healthy, sustainable diets. The student citizens' assembly gathered students who were randomly selected out of a pool of volunteers. The students put forward proposals after deliberations among themselves and with a co-creation team of academic and non-academic local partners involved in student life, nutrition, campus food distribution, or public policies. Students voted anonymously on each proposal (0 to 10-point Likert scale). Proposals were categorized into individual, interpersonal, environmental and policy interventions, according to the DONE framework.
RESULTS
Out of 140 students who volunteered to participate in the assembly, 95 students were randomly selected and invited to participate, 35 agreed to participate, and 27 actually took part in the assembly (48% women). The participation rate was 96%, 96% and 93% during the three assembly days. Among the 42 proposals made by the student citizens' assembly, 31 were related to diet, of which six were individual-level interventions (e.g. designing a digital guide with recipes and grocery shopping lists), two were interpersonal-level interventions (e.g. creating spaces and opportunities for conviviality within campuses) and 23 were environmental-level and policy interventions (e.g. extending the opening hours of the university restaurant so that students can have dinner there). Among the 10 most supported proposals, 9 were environmental and policy interventions.
CONCLUSIONS
Student citizens' assemblies are feasible and likely to result in diverse proposals that can be implemented at the individual, interpersonal, environmental and policy levels. Next steps will be to evaluate whether participating in this assembly changed students' dietary habits, knowledge and citizen practices.
CONFLICTS OF INTERESTS

EPO5_581

FACTORS INFLUENCING FRUIT INTAKE AMONG YOUNG ADULTS IN URBAN AND SUBURBAN AREAS, JAPAN

Kaori Mizumoto[1]; Tabata Haruka,[1]; Murata Hina[1]; Inaba Yui,[1]; Eguchi Ayaka,[1]
[1]Faculty of Nutritional Sciences, Nakamura Gakuen University, Fukuoka, Japan

BACKGROUND AND OBJECTIVES
According to the 2023 National Health and Nutritional Survey, the average amount of fruit consumed per day per person in Japan was 88.4g, and the data indicated that the average fruit intake across most age groups fell below the recommended daily intake of 200 grams per day, as stipulated by the Ministry of Health, Labour and Welfare. Notably, the intake of those in their 20s and 30s was reported to be the lowest compared to other age groups. The aim of this study was to clarify the factors influencing fruit intake among young people.
METHODS
A cross-sectional study was conducted between October and November 2024, targeting men and women in their 20s and 30s living in F City and its suburbs.Snowball sampling was employed to collect data using an electronic questionnaire. The questionnaire comprised 7 items on 'health orientation', 5 items on 'economic orientation', 7 items on 'convenience orientation', and 6 items on 'food environment', as well as self-reported daily vegetable intake. The responses were made on a 5-point scale.After univariate analysis, multiple regression analysis was employed to examine the influencing variables on fruit intake. The study was approved by the IRB of Nakamura Gakuen University (ETI-24-010).
RESULTS
A total of 199 valid responses were obtained. The median (Q1, Q3) of the self-reported intake of fruit was 100 (30.0, 150.0) g. Of the subject attributes, only 'gender' demonstrated a significant relationship with fruit intake ($p < 0.001$). Significant associations were identified in the 'health-consciousness' ($p < 0.001$), 'convenience-consciousness' ($p = 0.010$), and 'food environment' ($p < 0.001$) groups with fruit intake in univariate analysis, but not in the 'economic-consciousness' ($p = 0.467$) group. The findings of the multiple regression analysis indicated that the 'food environment group' (β [standardised coefficient] = 0.180, $p = 0.010$) and 'gender' (β = 0 .180, $p = 0.012$) were indicated to exert a substantial influence on fruit intake, followed by the influence of 'convenience orientation' (β = -0.152, $p = 0.027$). Conversely, no significant effect was observed for 'health orientation' (β = 0.134, $p = 0.057$) or 'economic orientation' (β = 0.028, $p = 0.696$) on fruit intake. There was no evidence of multiple collinearity between variables.
CONCLUSIONS
The present study suggested food environment and gender are the major factors influencing fruit intake among young people in Japan, while the influence of personal economic orientation on fruit intake was not significant.

TRANSFORMING SOUTH AFRICA'S FOOD ENVIRONMENT: PRESENT PRACTICES AND FUTURE PROSPECTS IN FOOD LABELLING REGULATION

Mariaan Wicks[1]; Christine Taljaard-Krugell[1]; Arné Naudé[1]
[1]Centre of Excellence for Nutrition, North-West University, Potchefstroom, South Africa

BACKGROUND AND OBJECTIVES
South Africa's nutrition landscape has undergone significant changes, resulting in a significant nutrition transition characterized by the coexistence of undernutrition, obesity, and nutrition-related non-communicable diseases. In April 2023, the Department of Health introduced the draft food labelling and marketing Regulation (R3337) to foster a healthier food environment. However, its potential impact remains uncertain. This study aimed to evaluate the possible effects of the draft regulation on pre-packaged foods and non-alcoholic beverages sold in South African supermarkets between 2020 and 2024.
METHODS
Pre-packaged food and non-alcoholic beverages from four South African supermarkets were selected using predefined criteria. Nutrient profiling models described in the draft Regulation (R3337) were applied to classify the healthiness of pre-packaged foods and non-alcoholic beverages. Descriptive statistics were used to describe nutrient content and the proportion of foods identified as less healthy, thus requiring mandatory front-of-package warning labels and being restricted from marketing to children. Cohen's κ (coefficient) was employed to assess the agreement between the draft regulation and the South African Food-Based Dietary Guidelines (SAFBDGs).
RESULTS
A total of 1,355 pre-packaged foods were analysed, with 79% classified as less healthy. Notably, 74% of non-alcoholic beverages and 54% of dairy products marketed to children contained artificial sweeteners. Substantial agreement ($\kappa > 0.61$) was observed between the draft regulation and the SAFBDGs for most food groups, except dairy, which showed only fair agreement ($\kappa = 0.35$).
CONCLUSIONS
Mandatory government-led food labelling and marketing regulations have the potential to guide healthier consumer choices and incentivize reformulation and improved packaging of pre-packaged foods. These findings provide valuable insights into establishing validity and support for proposed nutrition policies such as the draft Regulation (R3337).

PROBIOTIC-ASSISTED BISMUTH QUADRUPLE THERAPY FOR GASTROINTESTINAL SYMPTOMS OF HELICOBACTER PYLORI INFECTION:A RANDOMIZED, DOUBLE-BLIND, PLACEBO-CONTROLLED TRIAL

Liu Wenjun[1]; Xu Wenting[1]; Liu Yangling[1]; MUHAMMAD JAMAL KHAN[1]; Almab Zainab[1]; Lin Qian[1]
[1]Xiangya School of Public Health, Central South University, Changsha, China

BACKGROUND AND OBJECTIVES
To assess the effect of multiplex probiotic-assisted bismuth quadruple therapy on gastrointestinal symptoms during the treatment of people with Helicobacter pylori infection.
METHODS
This randomized, double-blind, placebo-controlled study recruited 174 adult H. pylori-infected patients aged 17 to 60 years who met the nadir criteria between July 2022 and December 2023, and randomized them into an intervention group (n = 89) and a placebo group (n = 85) to receive a 2-week bismuth quadruple therapy adjuncted by a 4-week multiplex probiotic preparation or a placebo. General demographic information of the study participants was collected through an electronic questionnaire;gastrointestinal symptoms were assessed by the Gastrointestinal Symptom Rating Scale (GSRS) and the Bristol Stool Classification Scale (BSFS). The observational indicators in this study included the occurrence and improvement of gastrointestinal symptoms in the study population at 2, 4, and 8 weeks of intervention, the type of feces in the study population, and the eradication rate of H. pylori in the study population. Intention-to-treat and Per-protocol analyses were performed.
RESULTS
(1) After intervention, GSRS scores for all dimensions and total scores decreased compared to pre-intervention. At 2 weeks of intervention, the reflux syndrome score ($P = 0.025$) was reduced to a much greater extent than in the placebo group. At 4 weeks of intervention, the GSRS total score ($P = 0.018$) and diarrhea syndrome score ($P = 0.014$) were reduced to a much greater extent than in the placebo group. At 8 weeks of intervention, the GSRS total score ($P = 0.023$) and dyspepsia score ($P = 0.017$) were reduced to a much higher degree than that of the placebo group, while the reduction in the scores of the remaining dimensions was not statistically significant between the two groups. (2) At 4 and 8 weeks of intervention, probiotics had a favorable protective effect on the occurrence of gastrointestinal symptoms. (3) After the intervention, both diarrhea-type and constipation-type feces decreased in both groups from the baseline level. (4) The difference in H. pylori eradication rates between the two study groups was not statistically significant.
CONCLUSIONS
Probiotic-assisted bismuth quadruple therapy clearly improved gastrointestinal symptoms in patients during H. pylori eradication therapy, but the effect of probiotics on H. pylori eradication rate was not observed.
CONFLICTS OF INTERESTS

INFANT GROWTH AND BODY COMPOSITION AT 12 MONTHS OF AGE IN RELATION TO AGE OF INTRODUCTION OF COMPLEMENTARY FEEDING: A PROSPECTIVE LONGITUDINAL COHORT STUDY

Birna Thorisdottir[1]; Tinna Odinsdottir[2]; Jonathan Wells,[3]; Geir Gunnlaugsson[4]; Mary Fewtrell[3]; Ronald E Kleinman[5]; Inga Thorsdottir[1]
[1]Faculty of Food Science and Nutrition, Unit for Nutrition Research, Health Science Institute, University of Iceland, Reykjavík, Iceland; [2]Health Science Institute, University of Iceland, Reykjavík, Iceland; [3]Population, Policy & Practice Research and Teaching Department, UCL Great Ormond Street Institute of Child Health, London, United Kingdom; [4]Faculty of Sociology, Anthropology and Folkloristics, University of Iceland, Reykjavík, Iceland; [5]Department of Pediatrics, Massachusetts General Hospital for Children, Harvard Medical School, Boston, United States of America

BACKGROUND AND OBJECTIVES
The optimal age of the introduction of complementary feeding (CF) is the subject of ongoing research, e.g., whether introduction around 3-4 months of age may increase the risk of childhood overweight. Current evidence suggests no clear association of the timing of introduction of CF with growth and adiposity. Our aim was to investigate infant growth and body composition at 12 months of age in relation to introduction of complementary feeding at 3-4 months vs. 6 months.
METHODS
This study included infants exclusively breastfed (EBF) until 6 months (EBF cohort, n=50) and infants exclusively breastfed until 3-4 months, and receiving complementary foods in addition to breastmilk at 6 months (CF cohort, n=50). Dietary intake was assessed for 72 consecutive hours at 6, 9 and 12 months with weighed food records and test-weighing of infants. Anthropometry data from birth to 12 months from health records were converted to WHO z-scores. At 12 months, body composition was assessed by deuterium dilution. The study was registered at: https://clinicaltrials.gov/ct2/show/NCT02586571.
RESULTS
At 6 months, CF infants received 62% of total energy from breast milk, 26% from baby porridge and other commercial baby products and 13% from other foods. At 9 and 12 months, breast milk intake was higher in the EBF cohort (medians: 363 and 93 g/d, respectively) than the CF cohort (88 and 0 g/d), while the CF cohort received more energy from other foods and drinks. Total energy, protein and carbohydrate intake did not differ between the cohorts. Both infant cohorts showed normal growth in the first year of life relative to the WHO Child Growth Standards as all measured values were within 2 SD of the mean. From birth until 3 months of age, weight-for-age z-score decreased in both cohorts, with a significantly greater decrease in the CF than EBF cohort (mean difference (95% CI): 0.41 (0.09, 0.73)). During the same period, length-for-age z-score increased in the EBF cohort (0.28 (0.03, 0.53)) but not in the CF cohort (-0.22 (-0.50, 0.06)). Changes in anthropometric scores between 3-6 and 6-12 months did not differ between the cohorts. At 12 months, no differences between cohorts were observed for anthropometric scores nor for fat mass or fat free mass.
CONCLUSIONS
In this longitudinal observational study, introduction of CF at 3-4 or 6 months of age had no effects on anthropometric measures in the second half of the first year of life or body composition at 12 months.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

EFFECTS OF DAILY AND WEEKLY IRON SUPPLEMENTATION ON IRON STATUS AND ANEMIA IN THAI INFANTS AGED 6 TO 9 MONTHS

Tippawan Pongcharoen[1]; Poonyanuch Chongjaroenjai[2]; Yaowalak Rooppat[1]; Pornpan Sukboon[1]; Thitima Rayaphet[3]; Nicharee Mungklang[4]; Pattanee Winichagoon[1]; Ladda Mo-Suwan[5]; Saipin Chotivichien[6]; Warinda Da-Am[6]; Teeraphat Attavinijtrakarn[6]
[1]Food and Nutrition Academic and Research Cluster, Institute of Nutrition, Mahidol University, Nakhon Pathom, Thailand; [2]OPDC9, The Office of Disease Prevention and Control 9th Nakhon Ratchasima, Nakhon Ratchasima, Thailand; [3]Faculty of Public Health, Nakhon Ratchasima Rajabhat University, Nakhon Ratchasima, Thailand; [4]Institute of Medicine, Suranaree University of Technology, Nakhon Ratchasima, Thailand; [5]Department of Pediatrics, , Faculty of Medicine, Prince of Songkla University, Songkhla, Thailand; [6]Bureau of Nutrition, Department of Health, Ministry of Public Health, Nonthaburi, Thailand

BACKGROUND AND OBJECTIVES
Iron deficiency anemia remains a significant public health issue among young children in Thailand. Before implementing the World Health Organization's recommendation of daily iron supplementation for infants, a study is needed to assess its impact on Thai children. This study aimed to compare the effects of daily and weekly iron supplementation on hemoglobin levels, serum ferritin levels, and anemia prevalence in infants aged 6 to 9 months.
METHODS
A double-blind randomized controlled trial was conducted to compare the effects of daily (12.5 mg/day) and weekly (12.5 mg/week) iron supplementation on 287 healthy, full-term infants aged 6–12 months with hemoglobin >105 g/L. Hemoglobin levels were determined using Fluorescent Flow Cytometry, while serum ferritin, soluble transferrin receptor, C-reactive protein, and α-1-acid glycoprotein levels were assessed using enzyme-linked immunosorbent assay (ELISA). Nutritional status was assessed using the WHO 2006 child growth standards, and dietary intake was analyzed from two 24-hour recalls using INMUCAL-Nutrients. The Mann-Whitney U test was employed to compare hemoglobin levels and iron biomarkers between the two groups, while the Chi-square test was used to evaluate differences in the prevalence of anemia and iron deficiency.
RESULTS
At 6 and 9 months, there were no differences in nutritional status or nutrient intakes between infants receiving daily and weekly iron supplementation. However, at 9 months, those receiving daily supplementation had significantly higher serum ferritin levels (45.5 [P25, P75: 28.5, 67.0] vs. 36.7 [P25, P75: 20.5, 54.9] µg/L). No significant differences were observed in hemoglobin, soluble transferrin receptor, anemia, or iron deficiency between the two groups.
CONCLUSIONS
The findings of this study indicate that initiating daily iron supplementation at 6 months of age for a 3-month duration may improve iron status in infants. However, no differences in anemia or iron deficiency were observed between the two groups at 9 months. Therefore, decisions regarding iron supplementation policies for infants should be deferred until the analysis of 12-month follow-up data is completed.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

RELATIONSHIPS BETWEEN UV RADIATION AND SUNSHINE HOURS AS PROXIES FOR VITAMIN D EXPOSURE AT CONCEPTION AND THE PREVALENCE OF OFFSPRING CONGENITAL HEART DISEASE. A TIME-SERIES STUDY IN DENMARK

Karen Christina Walker[1]; Fanney Thorsteinsdottir[1]; Vibeke Hjortdal[2]; Henrik T. Christesen[3]; Ina Olmer Specht,[1]; Berit Heitmann,[1]
[1]The Parker Institute, Frederiksberg Hospital, Frederiksberg, Denmark; [2]Department of Cardiothoracic Surgery, Rigshospitalet, Copenhagen, Denmark; [3]Hans Christian Andersen Children's Hospital, Odense University Hospital, Odense, Denmark

BACKGROUND AND OBJECTIVES
Background and objective: Maternal nutrition, including micronutrient status such as vitamin D levels, has been proposed as a potential risk factor for congenital heart disease (CHD). From laboratory and animal studies, vitamin D has been shown to be involved in heart development. However, human data on the role of vitamin D in CHD development are sparse, with mixed findings from small case-control studies. Vitamin D synthesis primarily depends on exposure to radiation from the sun, which fluctuates with seasons in temperate climates. The critical period for heart development occurs early in gestation, yet direct assessment of maternal vitamin D status during this vulnerable stage is logistically challenging. The aim of the study was to investigate the association between ambient UV radiation and sunshine hours around time of conception as proxies for 25(OH)D exposure and the prevalence of CHD.
METHODS
Methods: To address this, we gathered time-series data of the daily count of conceptions, including conceptions with CHD utilizing nationwide register data. Further, we gathered data from the Danish meteorological institute on two meteorological factors, UV radiation (MJ/m2) and sunshine hours as proxies for vitamin D exposure during periods ranging from 2001-2011. We conducted a time-series analysis using distributed lag models (DLM). DLMs allow for the examination of associations and lagged effects of environmental exposures. We analyzed daily conception data, including conceptions resulting in CHD diagnoses, along with meteorological data (UV radiation [MJ/m²] and sunshine hours) in DLMs over 0-14 lags.
RESULTS
RESULTS: We found no evidence of an association between the meteorological data on UV radiation or sunshine hours at the time of conception and offspring CHD diagnoses.
CONCLUSIONS
Conclusion: UV radiation and sunshine hours, as proxies for vitamin D, was not associated with CHD incidence. The study was, however, challenged by low day-to-day variation in the time-series data for CHD.

BODY COMPOSITION OF CHILDREN AGED 6-59 MONTHS ACCORDING TO THEIR NUTRITIONAL STATUS IN NORTHERN SENEGAL

Adji Mbene Ndiaye[1]; Abdou Badiane[1]; Laura Marcos Medialdea[2]; Olouwafemi Mistourath Mama[1]; Mane Hélène Faye[1]; Adama Diouf[1]; Nicole Idohou-Dossou[1]
[1]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Universite Cheikh Anta Diop (UCAD), Dakar, Senegal; [2]Recherche, Développement et Innovation, Action Against Hunger, Calle de Aravaca, Madrid, Spain

BACKGROUND AND OBJECTIVES
Malnutrition in children under 5 years of age remains a problem in Senegal despite sustain government partnerships to achieve better outcomes. Body composition Body composition patterns in childhood can have lifelong consequences in terms of overall health. Assessing the distribution of body composition (fat mass and fat-free mass) in relation to the nutritional status of children can play an important role in optimizing the health benefits of nutrition intervention during early life. This study aimed to assess the distribution of body composition according to the health and nutritional status of children under 5 years.
METHODS
A cross-sectional study was carried out in 71 children aged 6-59 months living in northern of Senegal. Weight, height, and upper arm circumference (MUAC) were measured, and anthropometric indicators were used to classify nutritional status of children according to WHO standards. Body composition (fat free mass, fat mass) was estimated using the deuterium dilution technique. Descriptive, correlation, bivariate, ANOVA, and ANCOVA analyses were conducted to compare means according to nutritional status.
RESULTS
Acute malnutrition had no, impact on fat-free mass (P=0.088), but did affect fat mass (P=0.007) in children living in the north of Senegal at this stage. We found that body fat loss was more significant in children under 24 months of age (1.62 kg; P=0.0053). Multiple comparisons of nutritional groups showed that the difference in fat mass from children with good nutritional status and those suffering moderate acute malnutrition (MAM) is 1.27 kg (P=0.011). it is 1.36 kg (P=0.042) in children suffering severe acute malnutrition (SAM). However, no difference was found when comparing children at risk of malnutrition with healthy children, or MAM with SAM.
CONCLUSIONS
Malnutrition affects adiposity but not lean body mass in children children living in the north of Senegal who are at risk of malnutrition. However, the fat mass loss is greater in children with moderate acute malnutrition and in children aged 6 -24 months.

NUTRITIONAL CARE IN GERMAN NURSING HOMES: CHALLENGES AND SUGGESTIONS FOR IMPROVEMENT FROM ONLINE DISCUSSIONS WITH MANAGERS AND EMPLOYEES

Linda Weber[1]; Ulrike Bornschlegel,[1]; Hanna Siebentritt[1]; Isabel Galicia Ernst,[1]; Silvia Tarantino[2]; Michael Hiesmayr[2]; Dorothee Volkert[1]
[1]Institute for Biomedicine of Aging, Friedrich-Alexander-Universität Erlangen-Nürnberg, Nuremberg, Germany; [2]Institute of Medical Statistics, Medical University of Vienna, Wien, Austria

BACKGROUND AND OBJECTIVES
Malnutrition is still a prevalent problem among nursing home residents. To improve this situation, practicable strategies are required for all persons involved in nutritional care.
METHODS
Nursing home managers and employees from all over Germany involved in nutritional care were recruited via newsletters and e-mails for two 2-hour online dialogues to discuss challenges and suggestions for improvement. Four topics were addressed: *cooperation/communication, documentation, resident participation, and sustainability*, based on presented RESULTS of an online survey in advance. Data were analyzed qualitatively with MAXQDA software. Contributions were categorized by topic, challenges and suggestions for improvement.
RESULTS
20 managers and 16 employees with different professional background from 24 institutions participated. Regarding *cooperation/communication* the most frequent challenge addressed was lack of priority for nutrition-related topics. For *documentation*, language barriers as well as lack of time accompanied by high work load, and insufficient interdisciplinary exchange were mentioned. With respect to *resident participation*, the high heterogeneity of residents was highlighted. Increased costs of food products and transport, together with dependency on budget negotiations limit promotion of *sustainability*. To improve the current situation, regarding *cooperation/communication* and *documentation* participants emphasized the need for more (interdisciplinary) training opportunities for staff, for increased staff capacity and budgets, and for standardized operating procedures. To improve *resident participation*, a more flexible and individualized food selection was proposed. For *sustainability* it was suggested to utilize leftovers and to improve waste management. Managers highlighted the need to harmonize and increase budgets for food products and nutritional care.
CONCLUSIONS
The online exchange of directly affected and responsible persons on site revealed a variety of challenges in the area of nutritional care in nursing homes. At an institutional level, the need to pay more attention to nutritional issues, to address them regularly and to create supportive and encouraging structures was highlighted. Beyond that, the importance of political changes in terms of harmonizing and increasing budgets was emphasized.

INTEGRATING NUTRITION INTO RMNCAH QUALITY OF CARE STANDARDS: TANZANIA'S EXPERIENCE WITH THE QOC LALA APPROACH

Brenda Mshiu[1]; Carolyn O'donnell[2]; Chrisogone German[3]; Joanita Aigi Muruve[4]; Victoria Marijani[5]; Lynn Kanyuuru[1]

[1]Program Development and Quality, Save the Children International, Dar es Salaam, Tanzania, United Republic of; [2]Global Health, Save the Children, New Orleans,LA,USA, United States of America; [3]Health Quality Assurance, Ministry Of Health, Dodoma, Tanzania, United Republic of; [4]Operation, Save the Children International Tanzania Programme, Dar es Salaam, Tanzania, United Republic of; [5]Advocacy, Communication , Campaign and Media (ACCM), Save the Children International Tanzania Programme, Dar es Salaam, Tanzania, United Republic of

BACKGROUND AND OBJECTIVES

Nutrition is a critical determinant of health, particularly within Reproductive, Maternal, Newborn, Child, and Adolescent Health (RMNCAH) services. However, inadequate integration of nutrition into health systems has limited its impact. To address this gap, Lishe Endelevu and Momentum, in collaboration with Tanzania's Ministry of Health (MoH), implemented the Quality of Care (QoC) LALA framework to integrate nutrition into RMNCAH standards, enhancing service quality and sustainability.

METHODS

The QoC LALA framework, emphasizing Leadership, Action, Learning, and Accountability, was used to drive sustainable health system improvements. Phase one involved reviewing and enhancing the star rating system for health facilities to include nutrition standards within RMNCAH services. This effort, conducted with the Health Quality Assurance Unit, aligned nutrition integration with the broader QoC framework. Nutrition was embedded in the national QI framework and incorporated into QI training and mentoring materials, developed jointly with the MoH. These updates equipped health workers with tools for nutrition-sensitive care while promoting sustainable leadership and accountability mechanisms.

RESULTS

Between November 2021 and March 2022, a star rating assessment of 2,583 primary health facilities identified gaps in RMNCAH and nutrition standards. Only 10.8% met RMNCAH quality standards, 79.6% adhered to maternal audit guidelines, and 37.6% achieved nutrition-related quality standards. Updated QI training improved health workers' capacity for nutrition-sensitive care, enhancing maternal and newborn health outcomes. Supportive supervision data highlighted progress, with nutrition indicators rising from 30.45% in 2023 to 59.97% by December 2024. These findings underscore the impact of integrating nutrition into QI frameworks and strengthening national systems.

CONCLUSIONS

The collaboration between Lishe Endelevu, Momentum, and the MoH showcases the QoC LALA approach's effectiveness in integrating nutrition into RMNCAH standards, fostering sustainable, high-quality healthcare through leadership, action, learning, and accountability.

LEVERAGING CERTIFICATION FRAMEWORKS TO IMPROVE MIYCN SERVICES ACROSS THE LIFECYCLE: THE MIYCN CERTIFICATION MODEL IN JORDAN

Doris Youngs[1]; lana Khoury[2]; Alessandro Iellamo,[3]; Mariam Abdoh,[4]
[1]Chief of Party/ Country Representative, Community Health and Nutrition Project- FHI 360, Amman, Jordan; [2]Director of Research, Monitoring and Evaluation, Community Health and Nutrition, FHI 360, Amman Jordan; [3]Nutrition Advisor, FHI 360, Durham, United States of America; [4]Project Management Specialist, Population and Family Health, US Agency For International Development USAID, Amman, Jordan, Amman Jordan

BACKGROUND AND OBJECTIVES
Access to maternal, newborn, and child health services in Jordan is high. Attendance at any ANC (97%) and facility delivery (99%) is almost universal. However, improving quality of health care services including maternal, infant and young child nutrition (MIYCN) services, is still a strategic priority for the Jordanian Ministry of Health. The USAID funded Community Health and Nutrition (CHN) Activity leveraged quality standards based on nationally recognized certification frameworks to design and implement an Optimal MIYCN Model to strengthen MIYCN services across the health system.
METHODS
The Optimal MIYCN Model introduces a standardized quality improvement (QI) certification approach that aligns with global nutrition standards and is contextualized and responsive to the needs of Jordan's healthcare landscape. CHN's design of the Optimal MIYCN Model, including minimum standards, scoring guidelines, and certification criteria, was informed by formative research and market analysis and conducted in collaboration with the Health Care Accreditation Council, a national body authorized to bestow accreditation to qualified health institutions. The Model supports creation of cohorts of public and private health institutions across antenatal, delivery, postnatal and well childcare points of service. The Model also includes a capacity strengthening component, comprising an online infant and young child feeding course and a counselling classroom training for health care personnel. CHN established a distinctive brand associated with attaining the MIYCN standards and seeded a social movement for demand of these quality standards.
RESULTS
To date, 21 health institutions achieved certification as Optimal MIYCN Model institutions and were awarded the distinctive brand. An additional 10 facilities have newly enrolled. The capacity of 759 health professionals was strengthened to provide quality MIYCN services; women clients of health centers (80%) and hospitals (93%) have received improved breastfeeding counseling. Additionally, 21 QI teams are working towards ensuring compliance and sustainability of the standards.
CONCLUSIONS
A systemic holistic process that comprises QI and capacity strengthening with focused community engagement efforts is an effective approach to increasing access to quality MIYCN services. A core component of the process was the development and marketing of a trusted brand that encourages women to prioritize utilizing branded optimal MIYCN services, responsive to their needs.

UTILIZING PROBLEM AND SOLUTION TREES TO IDENTIFY BARRIERS AND REMEDIES TO LOW DIETARY APPROACHES TO STOP HYPERTENSION (DASH) DIET ADHERENCE

Nadia Sesay[1]; Kendra OoNorasak[2]; Deidra Haskins[3]; Taylor Emerson[4]; Brandi White[4]
[1]Department of Communication, University of Kentucky, Lexington, United States of America; [2]Department of Kinesiology and Health Promotion, University of Kentucky, Lexington, United States of America; [3]Department of Dietetics and Human Nutrition, University, Lexington, United States of America; [4]Department of Health and Clinical Sciences, University of Kentucky, Lexington, United States of America

BACKGROUND AND OBJECTIVES
Hypertension is the leading global cause of premature cardiovascular death (1). In the United States (U.S.), low-income African American (LIAA) women present the poorest rates of hypertension control compared to other racial/ethnic groups (2). Dietary Approaches to Stop Hypertension (DASH) is an evidence-based eating plan proven to treat or prevent hypertension. Although DASH has shown a positive effect on reducing cardiovascular disease risk for women and African Americans (3), LIAA women living in subsidized housing encounter numerous structural barriers to acquiring DASH-friendly foods (4). Problem and solution tree (PAST) analysis has been used to examine reasons for suboptimal adoption of nutrition and ecological interventions (5-7). Thus, we utilized PASTs to identify barriers to DASH adherence among LIAA women and strategies to increase DASH adherence.
METHODS
We developed a project advisory board (PAB) of community stakeholders to inform the development of PASTs (8). Over quarterly PAB meetings, we systematically identified immediate, secondary, and tertiary causes of barriers to DASH adherence and constructed solution trees for each distinct cause. We adopted an iterative approach whereby subsequent meetings began with a review of PASTs previously constructed (5,7).
RESULTS
We developed five (5) PASTs that represented immediate barriers to DASH adherence among LIAA women. From a literature review we initially identified three primary causes to low adherence: cost, supply, and preference (4, 9-10). Input from the PAB revealed time and education as added barriers to adherence. The PAB identified second- and third-level causes for each root cause. For example, secondary cost-related barriers included federal reductions in COVID-19 emergency food assistance and the low cost of high-sodium foods in the U.S. Shelf stability of high sodium foods, a tertiary cost-related barrier, in turn serves as an attractive food purchase option for LIAA women. Solutions ranged from local-level adjustments like nutrition education for children and families to policy-level remedies like produce subsidies. PASTs also showed that certain singular solutions, like an increase of the minimum wage, could potentially remedy multiple barriers.
CONCLUSIONS
LIAA women have the highest hypertension prevalence among women of all other racial/ethnic groups in the U.S. (2). PASTs expanded the known barriers to adherence of DASH and revealed opportunities to customize DASH interventions that address these barriers for the health disparity group.

LONGITUDINAL STUDY OF NUTRITION AND ENERGY HEALTH STATUS IN PREGNANT WOMEN: PROTOCOL FOR A PROSPECTIVE COHORT STUDY (PANCAKE STUDY)

Yoichi Hatamoto[1]; Mai Matsumoto[2]; Mayu Kikukawa[2]; Naomi Sawada[3]; Yoshida Tsukasa[3]; Ono Rei[3]; Hidemi Takimoto[4]; Mieko Nakamura[2]
[1]Center for Clinical Nutrition, National Institutes of Biomedical Innovation, Health and Nutrition, Osaka, Japan; [2]Center for Nutritional Epidemiology and Policy Research, National Institutes of Biomedical Innovation, Health, and Nutrition, Osaka, Japan; [3]Center for Physical Activity Research, National Institutes of Biomedical Innovation, Health and Nutrition, Osaka, Japan; [4]National Institutes of Biomedical Innovation, Health and Nutrition, National Institute of Health and Nutrition, Osaka, Japan

BACKGROUND AND OBJECTIVES
Maternal diet during pregnancy significantly affects both maternal and offspring health outcomes. However, few studies have prospectively assessed weight gain, energy requirements, and additional nutrient needs using both the doubly labeled water (DLW) method and dietary records. The PANCAKE (Pregnancy And Nutrition Cohort At KEnto) Study is a prospective investigation designed to measure dietary intake, weight gain, and total energy expenditure, and to integrate pregnancy and infant health data from local health check-ups, thereby validating additional energy and nutrient requirements during pregnancy.
METHODS
In this prospective cohort study, we will recruit 1400 pregnant women who submit a pregnancy notification in Settsu City, Japan. Participants will provide information on pregnancy and infant health check-ups collected in Settsu City. Of these pregnant women, 600 women will be followed up using questionnaires (validated questionnaires on sleep and depression, physical activity questionnaires, and food frequency questionnaires) throughout all three trimesters of pregnancy and the postpartum period. In addition, 400 of these pregnant women will be asked to implement a three-day dietary record and an activity meter to measure their physical activity during the middle and late stages of pregnancy. In addition, body composition and skin carotenoid measurements will be taken for 200 of these women. And for 30 of these women, the DLW method, which can most accurately measure total energy expenditure, will be implemented.
RESULTS
The analysis, which is designed to gain a multifaceted understanding of the factors that affect maternal and child health, will analyze how dietary intake is related to maternal health indicators, such as weight gain during pregnancy and metabolic and physiological adaptations during pregnancy. In addition, this study will analyze how maternal energy intake and expenditure, according to maternal body size, affect fetal growth and the health of the newborn, and will evaluate the additional energy and nutrient intake required during three trimesters of pregnancy for the proper development of the fetus.
CONCLUSIONS
The PANCAKE Study's RESULTS may provide a basis for establishing reference values for pregnant women's dietary intakes, guide healthy weight gain recommendations, and inform revisions to dietary guidelines. Ultimately, this evidence-based approach can support women before and during pregnancy and contribute to improved nutritional policies.

Effect of fish consumption on the interactions between the gut microbiota and inflammatory markers: RESULTS from the iFISH study

Cealan Henry[1]; Emeir Mc Sorley[2]; Alison Yeates[2]; Maria S Mulhern[2]; Conall Strain[3]; Marie Conway[2]; Toni Spence[2]; Edwin Van Wijngaarden[4]; J J Strain[2]; Philip Allsopp[2]
[1]Public Health and Sports Sciences, University of Exeter St Luke's Campus, Exeter, United Kingdom; [2]Nutrition Innovation Centre for Food and Health (NICHE), Ulster University, Coleraine, United Kingdom; [3]APC Microbiome, Ireland, University College Cork, Cork, Ireland; [4]School of Medicine and Dentistry, University of Rochester, Rochester, United States of America

BACKGROUND AND OBJECTIVES
Dietary intake can influence immune function indirectly by affecting the gut microbiota composition and metabolism (1). Fish consumption has been shown to positively regulate the gut microbiota in humans (2, 3); albeit in those studies fish was consumed in high amounts (500-750g/week) and immune function was not investigated. This study investigated the effect of consuming the UK dietary recommendation for fish (4) (2 portions [140-280g/week], one of which is oily) on the gut microbiota alpha diversity. Further, we examined if changes (pre- to post-intervention) in the gut microbiota composition were associated with changes in immune cytokine concentrations.
METHODS
An 8-week randomised controlled trial in low fish consuming women of childbearing age (n=41; median age 23y) investigated the effect of consuming 1 or 2 portions of fish (tuna or sardines)/week compared to not consuming fish. A blood sample was collected to measure inflammatory cytokines (tumour necrosis factor-a, interleukin [IL]-1b, IL-5, IL-6, IL-17A and IL-22) pre- and post-intervention. Faecal samples were collected at both timepoints and extracted DNA was used to determine gut microbiota compositional profiles using 16S metagenomic sequencing (Illumina, USA). Statistical analysis investigated significant differences in changes in gut microbiota alpha diversity and compositional relative abundances between fish intervention (N=26) and control (N=15), then stratified by portion size (1 vs 2 portions) and type of fish (tuna vs sardines).
RESULTS
Fish consumption did not significantly affect gut microbiota alpha diversity indices (Chao1, Simpson, Shannon, phylogenetic diversity, observed species). Consumption of sardines significantly reduced Bacteroidetes (-4.77 ± 4.88%) when compared to control (+4.15 ± 7.58%). No significant differences were observed in genus-level relative abundances nor inflammatory cytokine changes. In the fish intervention group, increases in IL-17A, IL-22 and IL-6 concentrations were positively correlated with changes in *Alistipes*, *Rhodococcus*, *Haemophilus*, *Barnesiella* and *Akkermansia* relative abundances.
CONCLUSIONS
In this cohort, the UK recommendations for fish consumption has no significant impact on the gut microbiota diversity. Sardines, rich in n-3 polyunsaturated fatty acids, may have health benefits in disease states where Bacteroidetes is elevated; nevertheless, further research is required in a larger cohort over a longer period.

EPO5_602

CAN ANIMAL-SOURCED OR NUTRITIOUS PLANT-BASED FOODS REDUCE CHILD MALNUTRITION IN INDIA?

Jyothimol Joseph[1]; R Sendhil[1]
[1]Economics, Pondicherry University, Kalapet, India

BACKGROUND AND OBJECTIVES
Child undernutrition remains a critical public health concern across the Global South, especially in India, due to the substantial proportion of the world's stunted and wasted children. Malnutrition reflects linear growth retardation caused by persistent nutrient deficiencies, infections, and inadequate dietary diversity. In accordance with the significance of food intake on nutrition, this study aims to (1) evaluate the overall impact of Animal-Sourced Foods (ASF) and Nutritious Plant-Based Foods (NPBF) consumption on the child malnutrition index (2) identify the contributions of specific food items to child nutritional outcomes, and (3) explore the variations in these associations across different age cohorts of children.
METHODS
The study used the National Family Health Survey (NFHS) 5 (2019–21); for children aged 0–59 months. A malnutrition index was constructed using Principal Component Analysis (PCA), with three key indicators: stunting, wasting, and underweight. Food consumption variables were categorized into two groups: Animal-Sourced Foods (ASF), which include meat, fish, eggs, and dairy; and Nutritious Plant-Based Foods (NPBF), comprising legumes, vegetables, and fruits. The Ordinary Least Squares (OLS) method was employed to analyze the association between food consumption patterns and the malnutrition index.
RESULTS
The findings reveal that both ASF and NPBF consumption are significantly associated ($p<0.01$) with lowering the child malnutrition index by 2.7 per cent and 2.9 per cent, respectively, with NPBF having slightly more impact. Among ASFs, dairy consumption (2.4 per cent) showed the strongest association with reducing malnutrition, while eggs also had a negative but smaller effect. NPBFs such as legumes and fruits also demonstrated significant benefits. The RESULTS further underscore age-specific impacts, with dairy consumption showing adverse effects for infants under six months, likely due to improper breast milk substitution. In older children, legumes, fruits, and vegetables played a critical role in reducing malnutrition, while the effects of ASF varied across age groups. Furthermore, the study explains that maternal education and household wealth emerged as consistent factors in reducing the likelihood of malnutrition.
CONCLUSIONS
The findings highlight the need for comprehensive, age-specific nutrition interventions that address dietary diversity, cultural preferences, and socioeconomic disparities in India.

FACTORS ASSOCIATED WITH DIETARY DIVERSITY AMONG GHANAIAN INFANTS AND YOUNG CHILDREN (6-24 MONTHS): A CAREGIVER-REPORTED ANALYSIS

Phyllis Addo[1]; Patrick Suur-Ib[2]; Rose King[3]; Catherine Kakwara Zakari[4]; Abena Adoma[5]; Newland Ankudey Sedem[1]

[1]Family and Community Health Department, Fred N. Binka School of Public Health, University of Health and Allied Sciences, Ho, Ghana; [2]Nutrition Department, Yunyoo-Nasuan District Health Directorate, Yunyoo, Ghana, Ghana Health Service, Nalerigu, Ghana; [3]Nutrition Department, Abuakwa North District Health Directorate, Kukurantumi, Ghana, Ghana Health Service, Koforidua, Ghana, Ghana; [4]Nutrition Department, West Mamprusi Municipal Health Directorate, Walewale, Ghana, Ghana Health Service, Nalerigu, Ghana; [5]Nutrition Department, Ashaiman Municipal Health Directorate, Ashaiman, Ghana, Ghana Health Service, Accra, Ghana

BACKGROUND AND OBJECTIVES

Inadequate feeding practices in infants and young children can result in stunted growth, impaired cognitive development, heightened susceptibility to infections, and increased mortality rates [1]. The WHO recommends introducing complementary foods to infants at 6 months to meet their nutritional needs [2]. We examined the impact of caregivers' socio-economic status, dietary knowledge, attitudes, and practices on dietary diversity (DD) among infants and young children aged 6-24 months in four districts of Ghana.

METHODS

A total of 969 caregivers were selected using a multistage sampling method. Through face-to-face interviews, their knowledge and attitudes regarding DD, household income, child age, and feeding practices were evaluated. Ethical clearance was obtained, and informed consent was obtained from all participants before data collection. Statistical analysis was conducted using Stata version 17.0 with a significance level set at p-value of 0.05 or 5%. Descriptive analysis was performed for socio-demographic variables, while the relationship between independent variables and dietary diversity was assessed using the Chi-square test. Logistic regression analysis was utilized to identify predictors of DD.

RESULTS

Caregivers' dietary knowledge (AOR=14.90, 95% CI: 6.95-31.91), positive attitude towards DD (AOR=7.46, 95% CI: 4.31-12.92), child age (AOR=2.35, 95% CI: 1.51-3.66; p=<0.001), AOR=2.28, 95% CI: 1.49-3.51; p=<0.001), and monthly income (AOR=0.51, 95% CI: 0.31-0.86) were significantly associated with infants' and young children's DD. Additionally, married caregivers were 1.89 times more likely to provide diversified feeding for their children (AOR=1.89, 95% CI: 1.24-2.89; p=<0.003).

CONCLUSIONS

The findings emphasizes the importance of enhancing caregiver education and addressing financial constraints to improve childhood nutrition outcomes significantly. Targeted interventions focusing on these factors can play a pivotal role in promoting optimal growth, health, and development in young children. Further research and tailored interventions are essential to address existing disparities and enhance the overall well-being of children in this age group effectively

BACKGROUND AND OBJECTIVES
There is evidence suggesting that maternal depression may impair breastfeeding practices and childcare, which can negatively impact the child's nutritional status. However, findings are contradictory, with some studies failing to establish a significant association. This study aims to evaluate the impact of maternal depression on feeding practices of infants under 6 months of age in Southern Angola.
METHODS
The data analyzed comes from the MuCCUA trial, a community-based cluster-randomized controlled trial evaluating the cost-effectiveness of interventions to prevent chronic malnutrition during the first 1000 days. Pregnant women were recruited and are being followed every 3 months until their children reach 2 years of age. At the 3-month postpartum interview, child feeding practices were collected according to WHO and UNICEF guidelines, while maternal diet was assessed using the Minimum Dietary Diversity for Women (MDD-W) indicator. Maternal depression was measured with the Patient Health Questionnaire-8 (PHQ-8). Descriptive analysis and Chi-square tests were used to assess variable associations.
RESULTS
Among 1048 women interviewed, around 15% presented symptoms of depression according to the PHQ-8 indicator. Nearly all women (99%) reported breastfeeding their child at least once, 90% initiated breastfeeding early within the first hour after birth and 98% breastfed their children during the first day of life. Additionally, 68% of the children were exclusively breastfed. Only 8.4% of the women met the MDD-W. Overall, 0.7% of children had never been breastfed. This percentage increased to 1.7% among children of mothers with depression and decreased to 0.5% among those whose mothers did not have depression. Although no association was found between depression and breastfeeding initiation after the first hour postpartum (delayed initiation of breastfeeding), an association was observed with breastfeeding initiation after 24 hours of delivery (late initiation of breastfeeding), which was more frequent among mothers with symptoms of depression. No significant associations were found between maternal depression and MDD-W, nor with exclusive breastfeeding.
CONCLUSIONS
Depression appears to negatively impact breastfeeding practices, as mothers who experience depression are more likely to delay the initiation of breastfeeding after delivery. Furthermore, although not reaching statistical significance, a negative trend in breastfeeding practices was observed among mothers with depression.

SWEET TALK: APPLYING AND EXTENDING THE THEORY OF PLANNED BEHAVIOR IN EXPLORING THE PERCEPTIONS OF THE PROPOSED SUGAR TAX AMONG INDONESIAN CONSUMERS

Desy Putri Utami[1]
[1]Food Quality and Design, Wageningen University and Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES
Being the country with the third highest consumption of sugar-sweetened beverages (SSBs) in Southeast Asia, Indonesia's growing obsession with such beverages is easily seen in numbers, amounting to 20.23 liter/person. Commonly consumed by young children and adults, sugar consumption has emerged as a scourge of non-communicable diseases (NCDs), accounting for 73% of deaths and the highest insurance spending for diabetes in 2018. The government is proposing an SSB tax to be implemented in 2025 to reduce sugar consumption. This study aims to gain insight into the factors that shape key consumers' perceptions of the proposed sugar tax by investigating the awareness, belief, and attitudes.
METHODS
Research was based on the Theory of Planned Behavior modified to include the framework on acceptance of intervention strategies in the food domain and the motivation-opportunity-ability model. 14 participants were recruited with purposive sampling and divided into two groups: adults and parents (mothers) of children ages 3-11 years old, who purchase at least one SSB per week. Semi-structured interviews were conducted online and answers were coded inductively and deductively using Atlas.ti to create a thematic map.
RESULTS
(1) *Awareness*: Only 14% of the respondents were aware of the sugar tax, however, all were aware of health-related problems. More than half correlated it with the ongoing cigarette tax, that smokers are willing to pay higher prices, which could be the case with SSB consumers. (2) *Belief*: Adults show a more divided perception of fairness and effectiveness. 50% of parents perceived the tax to be fair and effective, considering it a good tool to teach children to drink more water and discourage SSB consumption, mostly packaged flavored milk. The discrepancy between low and high-income populations was linked to fairness, emphasizing the difference in purchasing power and level of education. The cultural and habitual context play a role and tax alone would not drive behavioral change. Restriction on sugar amount, reduced packaging size, and reformulation were stated to be more effective. (3) *Attitude*: 64% of respondents showed support depending on the tax rate and utilization of tax revenue (improving health insurance, welfare, and for the subsidy of staple foods.)
CONCLUSIONS
There was a low awareness of the SSB tax and divided beliefs and attitudes largely influenced by the perception of fairness and effectiveness. The perceived opportunity and ability to make choices when confronted with tax was highly related to financial status.

MATERNAL APPROACH TO FEEDING 6-23 MONTH OLD CHILDREN LIVING IN PERI-URBAN AREAS. A QUALITATIVE STUDY

Sissy Espinoza-Bernardo[1, 2]; Doris Delgado-Perez[1]
[1]Nutrition Department, National Major University of San Marcos, Lima, Peru; [2]Food and Public Nutrition Research Nucleus - NIANP, National Major University of San Marcos, Lima, Peru

BACKGROUND AND OBJECTIVES
Infant and young child feeding is critical to improve child survival, promote healthy growth and development. It is during the period between 6 and 23 months of age that children's nutritional status is most vulnerable and affected by access to food. For this reason, the mother's participation is extremely valuable, as her feeding practices are influenced by her social environment: beliefs; gender stereotypes and body image; parenting style; family structure; stress; eating habits, nutritional knowledge and food preparation skills. The aim of this study was to understand maternal approaches to feeding in children aged 6–23 months living in peri-urban areas of a LMIC.
METHODS
Qualitative, phenomenological study. Twenty mother-child dyads participated. Twenty semi-structured interviews and 12 observations were conducted, Braun's thematic analysis was used to construct 6 themes related to child feeding from the mothers' perspective. The information was processed using NVIVO 12 software
RESULTS
Mothers with an average age of 28 years and their children were 13,8 months old. The way they made decisions about infant feeding was understood in terms of their feeding practices and maternal sensitivity. For the former, maternal perceptions of as to what and how much to offer were influential; for the latter, responsiveness as to when and how to offer for limited responsive feeding in those older than 12 months.
CONCLUSIONS
Mothers' approach to infant feeding was influenced by personal and family environmental factors that conditioned their feeding practices and quality of care.

PUBLIC POLICIES IN FOOD SYSTEMS TO SUPPORT NUTRITION

Ana Romero[1]; Ríos-Castillo Israel[2]; Toppe Jogeir[3]; González Briones Jorge[3]; Renán De León José[4]; Mazariegos Manolo[4]
[1]Nutrición, INCAP - Instituto de Nutrición de Centro América y Panamá, Guatemala City, Guatemala; [2]Nutrition, Organización de las Naciones Unidas para la Alimentación y la Agricultura, FAO, Panama City, Panama; [3]Nutrition, FAO, Panama City, Panama; [4]Nutrition, INCAP, Guatemala City, Guatemala

BACKGROUND AND OBJECTIVES
From the State of Food Security and Nutrition in the World (SOFI) 2023, it is reported that undernourishment and hunger have not been eradicated and on the other hand, malnutrition in excess manifestations continue to increase, highlighting new challenges to achieve the SDG 2030, resulting from the fragility of global food systems.
Objective: Identify policies and measures in nutrition-sensitive food systems that can improve the nutrition status of Central American populations.
METHODS
The study was conducted during the year 2021-2022 looking for policies and measures in nutrition-sensitive food systems recommended by FAO in its report *"New Food Patterns, More Challenges for Food Systems. 2030 - Food, agriculture and rural development in Latin America and the Caribbean".*
Based on an exploratory search, official websites of legislative congresses, ministries or government agencies were reviewed to identify ordinances, laws, policies, programs and interventions that countries had planned and/or implemented in their countries. In addition, focus groups and interviews were conducted with key national stakeholders to understand and/or complete the information found in each of the countries.
RESULTS
States have made progress in achieving nutrition-sensitive policies and measures that favor the maintenance of the food system, especially to improve the problems of weight and micronutrient deficits, however, there are still challenges to implement interventions to reduce excess weight.
Implemented: Family farming incentives, Free fairs and short circuits, Food fortification, School Feeding Programs, Financial support for small and medium-sized enterprises, Food supply and price monitoring, Social protection systems.
To be implemented: Taxes on foods high in critical nutrients, Healthy food subsidy, Regulation of advertising, Front food labeling, Regulatory initiatives to reduce salt, sugar and fat in the food industry.

CONCLUSIONS
Public policies in food systems have a fundamental role in nutrition. The integration and application of each one of them has a fundamental impact on the nutritional and health status, so it is necessary to monitor and apply them according to the nutritional transition of the population.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

HAND GRIP STRENGTH AND ITS RELATIONSHIP WITH ULTRA-PROCESSED FOOD CONSUMPTION FROM THE MALAYSIAN HEALTH AND ADOLESCENTS LONGITUDINAL RESEARCH TEAM STUDY (THE MYHEART)

Hazreen Abdul Majid[1, 2]; Darwish Mohd Isa[1]; Ai Kah Ng[1]
[1]Social and Preventive Medicine, University of Malaya, Kuala Lumpur, Malaysia; [2]School of Health Rehabilitation Sciences, Health Sciences University, Bournemouth, United Kingdom

BACKGROUND AND OBJECTIVES
Adolescents obtain and maintain the appropriate lean body weight for better musculoskeletal health and other long-term health benefits is crucial. Studies on the association between hand grip strength (HGS) and ultra-processed food (UPF) consumption among adults were well documented, however, adolescents is not well understood. The objective of this study is to examine the association between HGS and UPF consumption.
METHODS
A cross-sectional analysis included 974 secondary school children from MyHeART cohort in 2016. A calibrated JAMAR handgrip dynamometer used to measure HGS. A seven-day diet history assessed UPF calorie intake, analyzed using the Nutrient Composition of Malaysian Food (4th edition) database. Generalized linear model was performed separately by gender, to examine the association between HGS and UPF consumption.
RESULTS
HGS was not associated with UPF energy intake in either gender. It appears male adolescents from rural schools demonstrated significantly higher HGS compared to their urban counterparts ($p<0.001$). Among females, Indian participants had significantly lower HGS than Malays ($p=0.007$). Additionally, each unit increase in waist circumference was associated with a 0.194 unit reduction in HGS ($p<0.05$), and rural school adolescents showed higher MS than those in urban schools ($p<0.001$).
CONCLUSIONS
While no association was found between UPF energy intake and HGS, prioritizing nutrition strategies to support adolescent musculoskeletal health remains essential.

DETERMINANTS OF DIET QUALITY IN PRECONCEPTION

Andreea Gherasim[1]; Andreea-Maria Mitran[2]; Laura Mihalache[1]; Otilia Nita[1]; Lidia Iuliana Arhire[1]; Alina Delia Popa[1]

[1]Internal Medicine / Diabetes, nutrition and metabolic diseases, Universitatea de Medicină și Farmacie „Grigore T. Popa" din Iași, Iași, Romania; [2]Faculty of Pharmacy, Universitatea de Medicină și Farmacie „Grigore T. Popa" din Iași, Iași, Romania

BACKGROUND AND OBJECTIVES

The preconception stage is of great importance for optimizing health and nutritional status. Despite its impact and priority, diet quality during preconception often remains underexplored, specifically in relation to education, income, living environment, and access to nutritional counseling.

METHODS

We conducted a study to analyze the association between various socio-economic and demographic factors with the Diet Quality Index (DQI) in a sample of 251 women. Data were collected using an anonymous web-based questionnaire that included sections on socio-demographic characteristics, nutritional knowledge, determinants of food choices and the International Federation of Gynecology and Obstetrics (FIGO) diet quality score (FIGO-DQS).

RESULTS

The frequencies showed that 74.9% of the participants obtained a high DQI score, with significant differences observed between different variables. The primary predictors considered were: level of education, income, living environment, nutritional counseling and parity status. Statistical tests revealed key findings: level of education significantly influenced diet quality (χ^2=10.6, p=0.001, OR=0.372, CI=0.203–0.683), as did living environment (χ^2=10.9, p<0.001, OR=2.63, CI =1.47–4.72). Multiparity was also a significant factor (χ^2=6.43, p=0.011, OR=3.34, CI=1.26–8.85). In contrast, nutritional counseling was not statistically significant in the impact of diet quality (χ^2=1.24, p=0.265). Logistic regression analysis confirmed these trends, highlighting the critical role of education (OR=2.04, CI=1.035–4.02) and living environment (OR=1.98, CI=1.056–3.71) in predicting superior diet quality. Multiparity had an odds ratio of 2.42, with no significance (p=0.084).

CONCLUSIONS

Our RESULTS highlighted certain determinants of diet quality, emphasizing the need for tailored interventions, particularly addressing educational and demographic differences.

CONFLICTS OF INTERESTS

DIFFERENCES IN RISK OF ORTHOREXIA NERVOSA AND DIET QUALITY BY DIFFERENT TYPES OF PHYSICAL ACTIVITY - A COMPARATIVE STUDY IN A GROUP OF POLISH AMATEUR TRAINING INDIVIDUALS

Hubert Dobrowolski[1]; Akop Szostak[1]; Konrad Janowski[2]
[1]School of Medical & Health Sciences, University of Economics and Human Sciences in Warsaw, Warsaw, Poland; [2]School of Human Sciences, University of Economics and Human Sciences in Warsaw, Warsaw, Poland

BACKGROUND AND OBJECTIVES
Orthorexia Nervosa (ON) is described as an obsession with healthy eating, characterised by a restrictive diet and avoidance of foods considered unhealthy, leading to nutritional deficiencies or medical complications. Although there are links between physical activity (PA) and the occurrence of orthorexia, research findings are still inconclusive and data on the association of orthorexia with different activities are still scarce. The aim of the study was to assess the risk of ON according to the different types of physical activity practiced, the time spent on physical activity and the connection with diet quality.
METHODS
The study, using the CAWI method, was conducted in September-October 2024. Participants were recruited using social media channels on the topic of healthy eating and/or physical activity. A total of 3981 exercising individuals and control, non-training group of 2763 participated in the study. The study group consisted mainly of women (92.4%). Participants were asked metric questions, questions about physical activity, frequency and duration of training, and the nature of exercise. Risk of ON was used with the Düsseldorf Orthorexia Scale (DOS). The KomPAN questionnaire was used to measure dietary quality (DQI).
RESULTS
The mean age of the study participants was 32±6 years, mean body mass 70.8±16.3 kg, mean body height 167.7±7.1 cm. Based on the declared nature of exercise, participants were divided into strength (ST; n=1011), endurance (ET; n=960) and endurance-strength (EST; n= 1985) training groups. The number of points on the DQI scale was correlated with the number of points on the DOS scale. Training participants scored significantly more points on the DOS ($p<0.001$, U-Mann-Whitney's test) and DQI ($p<0.001$, U-Mann-Whitney's test) compared to non-trainers. There were no differences between the ST and EST groups on the DOS and DQI scales ($p>0.05$), but both groups scored higher than the ET group ($p<0.002$). However, all 3 groups scored significantly higher than the non-training group ($p<0.001$). There was an association between weekly training time and the scores obtained on the DOS ($p<0.001$) and DQI scales ($p<0.001$).
CONCLUSIONS
The higher risk to have orthorexia were associated not only with the better quality of the diet, but also with the time spent on physical activity and its nature. Further research on the association between physical activity and orthorexia nervosa is needed to verify the effect of physical activity on the occurrence of individual symptoms of ON.
CONFLICTS OF INTERESTS

PHYSICAL ACTIVITY, SLEEP QUALITY, STRESS LEVELS, AND EATING HABITS OF NURSING STUDENTS IN PANAMA

Maria Echeverria,[1]; Alexandra Jaramillo,[1]; Victoria Valdes,[1]; Israel Rios Castillo[2]
[1]Nutrition School, University of Panama, Panamá, Panama; [2]Salud, FAO, Panama City, Panama

BACKGROUND AND OBJECTIVES
University students often face lifestyle changes that impact their health, including alterations in eating habits, sleep quality, and stress levels. In Panama, obesity and sedentary behavior are significant public health concerns, increasing the risk of non-communicable diseases. Students in the health field are expected to serve as role models for the population. Therefore, the objective of this study was to evaluate the levels of physical activity, sleep quality, stress, and eating habits among nursing students in Panama.
METHODS
This is a cross-sectional and analytical study including a sample of 171 nursing students from universities in Panama. Data collection was conducted from June to October 2024 through questionnaires assessing sociodemographic variables, body image perception, frequency of food consumption, physical activity using the Global Physical Activity Questionnaire (GPAQ), perceived stress using the Perceived Stress Scale (PSS), and sleep quality using the Pittsburgh Sleep Quality Index. Self-reported weight and height were used to evaluate nutritional status.
RESULTS
The sample consisted of 73.1% women, with an average age of 21.3 years. Among the participants, 66.7% were in their second year of study, and the majority (56.7%) resided in Panama's interior regions. Regarding body image perception, 46.2% perceived themselves as having normal weight, 37.4% as overweight, and 16.4% as underweight. A low level of physical activity was reported by 67.8% of participants, while only 3.51% reported high levels of activity. In terms of stress, 57.9% reported low stress levels, and 38.6% reported moderate stress. Low consumption of fruits (52%), vegetables (44%), and snacks (54%) was identified. Sleep quality was poor, with 67.3% requiring medical treatment, 22.8% requiring medical attention. According to anthropometric evaluations, 51.5% had a normal nutritional status, while 33.9% were overweight, and 9.4% were classified as obese.
CONCLUSIONS
The findings reveal a high prevalence of overweight and obesity, low physical activity levels, moderate stress, poor sleep quality, and suboptimal dietary habits. These RESULTS highlight the need for interventions targeting lifestyle changes and health promotion in this population to align their behaviors with their role as future health professionals.

NUTRITION, PHYSICAL ACTIVITY, AND DIETARY HABITS AMONG CHILDREN AGED 6–12 IN SPORTS AND NON-SPORTS CENTERS IN PANAMA

Miguel Gonzalez,[1]; Yariela Gante,[1]; Victoria Valdes,[1]; Rithela Gonzalez,[1]; Israel Rios Castillo[2]
[1]Nutrition School, University of Panama, Panamá, Panama; [2]Salud, FAO, Panama City, Panama

BACKGROUND AND OBJECTIVES
The prevalence of overweight and obesity in Panama has increased in recent years, associated with inadequate dietary habits and a lack of physical activity. These issues compromise children's proper development and elevate the risk of non-communicable diseases. This study aimed to determine the nutritional status, physical activity levels, and dietary habits of children aged 6 to 12 years attending sports and non-sports centers.
METHODS
This is a descriptive and cross-sectional study conducted with a sample of 113 school-aged children (6–12 years) from the Panama Oeste province. A sociodemographic survey was completed by parents, while children answered a food frequency questionnaire. Physical activity levels were assessed using the Physical Activity Questionnaire for Older Children (PAQ-C).
RESULTS
Of the total participants, 46% were classified as overweight or obese, with higher prevalence in non-sports centers (46.9%) vs sport center (44.9%). Children attending sports centers exhibited higher physical activity levels, with 38.8% classified as active or very active, compared to 51.6% of children in non-sports centers who were classified as sedentary. Additionally, 89.4% of children exceeded the recommended intake of free sugars, 36.3% exceeded fat intake, and 5.4% exceeded sodium intake.
CONCLUSIONS
The study highlights a significant prevalence of overweight and obesity among children, with higher rates in non-sports centers. Children attending sports centers demonstrated better weight distribution and abdominal circumference, yet neither group achieved the WHO recommendation of 60 minutes of daily physical activity. Additionally, excessive intake of free sugars, fats, and sodium was observed, indicating a need for interventions promoting structured physical activity and improved dietary habits to address overweight and reduce sedentary behavior.

RELATIONSHIP BETWEEN PRENATAL CARE, INADEQUACY OF GLYCEMIC CONTROL AND GESTATIONAL WEIGHT GAIN IN WOMEN WITH HYPERGLYCAEMIA IN PREGNANCY

Claudia Saunders[1]; Leticia Silva[2]; Ana Sophia Lacerda[2]; Katherine Jesus[2]; Karyne Silva[2]; Mirião Almeida[2]; Laisa Ramos[2]; Camille Sinquini[2]; Thais Marques[2]; Karina Dos Santos[3]; Karina Bilda[4]
[1]Instituto de Nutrição Josué de CAstro. , Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil; [2]Instituto de Nutrição Josué de CAstro., Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil; [3]Postgraduate Program in Molecular and Cellular Biology, Universidade Federal do Estado do Rio de Janeiro, Rio de Janeiro, Brazil; [4]Maternidade Escola, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil

BACKGROUND AND OBJECTIVES
Hyperglycaemia in pregnancy [HIP] is the most common metabolic dysfunction during this period [1]. Prenatal care [PC] is essential in protecting the health of pregnant women and their newborns [2]. In addition, studies point to the importance of specialized prenatal nutritional therapy in the prevention and control of complications commonly associated with HIP [3,4,5], such as inadequate glycemic control (the main factor impacting obstetric and perinatal outcomes), inadequate gestational weight gain [GWG], hypertensive disorders of pregnancy [6,7], and the delivery of macrosomic or large-for-gestational-age newborns [8]. Therefore, the aim of the study was to analyze the relationship between PC and inadequacy of glycemic control and GWG in women with gestational diabetes mellitus [GDM] and pre-gestational diabetes mellitus [PDM]
METHODS
A longitudinal study in which glycemic control was considered inadequate when fasting glycemia ≥95mg/dL or 1-hour postprandial glycemia ≥140mg/dL. Adequacy of GWG was classified according to the Institute of Medicine. The confounding factors were identified using the direct acyclic graph [9]: pre-pregnancy body mass index, education, occupation, maternal age and number of PC consultations. Multiple logistic regression was applied and adjusted odds ratios [ORa] were estimated with 95% confidence intervals [CI].
RESULTS
A total of 773 women were analyzed (GDM = 606; PDM = 164). The variables related to inadequacy glycemic control were: GDM maternal age ≥31 years in the second trimester (ORa = 1.68; CI:1.15–2.44); <8 PC consultations (ORa = 1.71; CI:1.04–2.81) and <4 consultations with a nutritionist in the third trimester (ORa = 2.20; CI:1.49–3.22); PDM: pre-pregnancy overweight/obesity (ORa = 2.10; CI:1.02–10.33) and <8 PC consultations in the second trimester (ORa = 9.29; CI: 1.02–84.29). Inadequacy GWG was related to pre-pregnancy overweight/obesity in patients with GDM (ORa = 2.59; CI = 1.70–3.94) and PDM (ORa = 2.54; CI: 1.16–5.59).
CONCLUSIONS
The factors indicated as predictors of the outcomes analyzed are potentially modifiable and point to the importance of intervention **s**pecialized PC, including nutritional therapy wich, when started early, can favor the adequacy of glycemic control and GWG in women with HIP.

EVALUATING THE HEALTHINESS OF INDUSTRIALLY-PROCESSED BEVERAGES FOR CHILDREN IN CAPE COAST: INSIGHTS USING THE WHO NUTRIENT PROFILING CRITERIA

Ruth Aidoo[1]; Kingsley Pereko[2]
[1]University of Cape Coast School of Medical Sciences, University Of Cape Coast, Cape Coast, Ghana;
[2]Community Medicine, University of Cape Coast School of Medical Sciences, Cape Coast, Ghana

BACKGROUND AND OBJECTIVES
Beverages are commonly consumed by children. Industrially processed beverages marketed to children are often high in sugars, fats, etc contributing to childhood obesity and non-communicable diseases (NCDs). The World Health Organization's Nutrient Profiling Model (WHO-NPM) for the African Region provides a framework to assess the nutritional quality of foods and beverages for children. This study evaluated industrially processed beverages sold in major supermarkets in Cape Coast, Ghana, using the WHO-NPM to determine their healthiness for children.
METHODS
A cross-sectional study analyzed 60 labeled beverages across five subcategories. Following a two-stage sampling procedure, the study estimated and sampled 3 major supermarkets in Cape Coast which the population frequents for food. Data collected included: the name of food product, food category by WHONPM, composition of total fat, sugar, sodium, and saturated fats per 100g of each product identified. Descriptive analyses were undertaken to describe the number of products from each food group and the proportion of products categorized as 'unhealthy' and 'healthy' by the WHONPM.
RESULTS
Out of 60 beverages,66.67% were classified as unhealthy, 10% as healthy, and 23.33% as inconclusive due to missing or unclear information. The highest proportions of unhealthy beverages were water-based drinks (83.3%) with average total sugars of 34.4g per 100g and Standard Deviation (SD) of 31.50, which is above the recommended threshold for total sugars of 0.0g. Milk-based drinks were 64.3% unhealthy with an average total fat of 11.2g per 100g (SD of 9.95), which is above the recommended threshold of 4.0g per 100g for total fat in this category. Juices were 66.7% unhealthy with average total sugars of 9.2g per 100g (SD of 3.96), which is above the recommended threshold for total sugars of 6.0g. All coffee substitutes and teas were classified as unhealthy, while 43% of cereal-based beverages were inconclusive, with average total sugars of 5.2g per 100g (SD of 4.78), which is below the recommended threshold for total sugars of 6.0g.

CONCLUSIONS
A significant proportion of industrially processed beverages in Cape Coast are unhealthy for children. Stricter regulations on beverage labeling and marketing, as well as public education, are recommended to promote healthier beverage choices for children.

VITAMIN E STATUS IN ADULTS AND ELDERLY IN THE CONTEXT OF THE POST-COVID-19 PANDEMIC: A CASE STUDY

Rayanne Oliveira Lopes,[1]; Karine Sena-Evangelista[2]; Severina Carla Vieira Lima[3]; Rayane Felipe França[1]; Amanda Freitas Oliveira[1]; Alanderson Alves Ramalho[4]; Clélia De Oliveira Lyra[3]; KARLA DANIELLY Ribeiro[5]
[1]Post gradute Program in Nutrition, Federal University of Rio Grande do Norte, Natal, Brazil; [2]Department of Nutrition, Federal University of Rio Grande do Norte, Natal, Brazil; [3]Departament of Nutrition, Federal University of Rio Grande do Norte, Natal, Brazil; [4]Programa de Pós-graduação em Saúde Coletiva, Federal University of Acre, Rio Branco, Brazil; [5]Departament of Nutrition, Federal University of Rio Grande do Norte, Parnamirim, Brazil

BACKGROUND AND OBJECTIVES
he COVID-19 pandemic exacerbated the food and nutritional situation of various populations, including an increase in the consumption of high-calorie, low-nutrient-dense foods, which may have contributed to the rise in malnutrition and potential micronutrient deficiencies. In this context, evidence shows a variation in the global prevalence of Vitamin E deficiency (VED) ranging from 0.6% to 55.5% in populations at risk for non-communicable chronic diseases (NCDs), resulting in the worsening of mechanisms promoting cardiovascular diseases (CVD). Therefore, this study aimed to assess Vitamin E (alpha-tocopherol) status in adults and elderly individuals with risk factors for NCDs in the post-COVID-19 context.
METHODS
This was a cross-sectional study of a sub-sample from a cohort of adults and elderly individuals monitored before and after the COVID-19 pandemic. Vitamin E status was determined by serum alpha-tocopherol levels, measured using Ultra High Performance Liquid Chromatography with a Photodiode Array. Alpha-tocopherol values ≤ 12 µmol/L indicated VED, and < 30 µmol/L reflected inadequate serum levels.
RESULTS
Overall, 63.2% of participants were of Black/Brown ethnicity, 45.6% had low educational levels, 17.6% were smokers, and 80.9% were overweight. The average alpha-tocopherol concentration was 12.1 (9.2) µmol/L, with no significant difference according to life stage. The majority of participants had VED (58.8%), and 97.1% did not have alpha-tocopherol levels indicative of cardiovascular protection.
CONCLUSIONS
The evaluated population is vulnerable to NCDs due to the high prevalence of VED and inadequate Vitamin E levels, suggesting low cardiovascular protection in these cases.

NUTRITIONAL STATUS OF CHILDREN LIVING IN URBAN AREAS OF CHIANG MAI, THAILAND: AN APPLICATION OF GLOBAL DIETARY RECOMMENDATIONS (GDR) SCORES

Piyanit Churak[1]; Fred Krueger[1]
[1]Institute of Geography, University of Erlangen-Nuremberg, Erlangen, Germany

BACKGROUND AND OBJECTIVES
Nutrition in childhood is a critical determinant of health, with both short-term development and long-term well-being affected. In urban areas of Thailand, such as Chiang Mai, children suffer from a double burden of malnutrition, where overnutrition and undernutrition coexist. Those lives in urban areas are likely to be at risk of malnutrition due to the easy availability of processed, energy-dense foods, limited access to diverse, nutritious meals, and socioeconomic factors that influence food security and dietary habits. While dietary habits are an increasing concern, comprehensive data on the nutritional status of children specifically in urban settings are lacking.
METHODS
This study fills the gap by assessing the dietary patterns of 279 children aged 9–12 years in Chiang Mai using GDR Scores for the first time, providing a new perspective on adherence to global dietary guidelines and its consequences on health. The Dietary Dieversity Score (DDS) was used to explore the variety of food groups consumed. Anthropometric status was also measured.
RESULTS
Overall GDR scores for children stood at 7.8 out of a total of 18 points and indicate moderate adherence to the global dietary guidelines. The NCD-Risk score was 4.6 out of 9, suggesting a high consumption of risk-enhancing foods, such as sugary snacks, fast food, and processed meats. In contrast, the NCD-Protect score of 3.4 out of 9 reflected a moderate intake of protective foods, including fruits, vegetables, and whole grains. Besides GDR scores, the DDS, which provides a glimpse of an ability to access food and is closely related to food and nutrition security, was found to be 6.35 out of 10. This score indicates a situation of moderate food security with a reasonably varied diet. However, the analysis also brought some important nutrition-related challenges: 95% of the children had normal height-for-age Z-scores, while 5% were stunted or severely stunted. Moreover, 18.3% of the children were overweight or obese, which reflects the increasing concern of overnutrition in urban areas.
CONCLUSIONS
The study points out that targeted interventions should be made to enhance healthier eating behaviors, improve access to more nutritious foods, and decrease the consumption of foods laden with risks. Public health policies can contribute to the reduction of the growing prevalence of NCDs and improve the health outcomes of future generations by aligning local dietary practices with global recommendations.

SOCIAL NETWORK AND INFLUENCE MAPPING OF STAKEHOLDERS INVOLVED IN ANAEMIA CONTROL PROGRAMMING AMONG WOMEN OF REPRODUCTIVE AGE IN GHANA

Afua Tetteh[1]; ; Richard M Adanu[1, 2]; Gloria K Folson[3]
[1]Department of Population, Family and Reproductive Health, School of Public Health, University of Ghana, Legon, Accra, Ghana; [2]Ghana, College of Physicians and Surgeons, Accra, Ghana; [3]Noguchi Memorial Institute for Medical Research, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES
In Ghana, anaemia among women of reproductive age (WRA) is high (41%), a decline from 59%. Sub-nationally, significant reductions were observed in the Upper West (UWR) and Eastern region (ER). This study mapped key stakeholders involved in anaemia programming, their roles, actions, connections and influence on anaemia decline among WRA in the two regions between 2009 and 2020.
METHODS
Seventeen stakeholders from the ER and 14 from the UWR participated in Network Mapping interviews in 2021, using IFPRI's Net-Map approach. Study participants were selected based on current or previous roles in anaemia programming in the two regions. Interview audio recordings were transcribed verbatim to verify the interview data. Analysis was conducted using VisuaLyzer, a visualised social networking mapping tool and Excel.
RESULTS
Thirty-nine stakeholders involved in WRA anaemia programming were identified in the ER. Stakeholders were connected by 275 links related to formal authority, funding, and information supply (advocacy, technical assistance, dissemination and informal) across actors. Ten stakeholders from government (National-levelled Ghana Health Service, Department of Agriculture), civil society organizations, and community-level beneficiaries were central within the network. The remaining were periphery stakeholders linked to the ten actors in the network. Thirty-five stakeholders were identified in the UWR and connected by 182 links. Eight actors, Ghana Health Service, community-based health Centres, Department of Agriculture, Ghana Education Service, the Environmental Health Department and Beneficiaries were central in the network with the remaining actors, periphery.
CONCLUSIONS
Both regions had actors from different multisectoral backgrounds closely linked in the networks working together to reduce anaemia among WRA. Government, donor and development partners were most influential in anaemia control programming in the regions. The findings could enable potential actors working on anaemia control to identify niche(s) to support anaemia programming in the regions. Evidence from the information networks may contribute to improved communication on anaemia among WRA control in the design of initiatives that encompass relevant stakeholders.

USING FORMATIVE RESEARCH TO IDENTIFY BARRIERS AND OPPORTUNITIES TO PROMOTE EXCLUSIVE BREASTFEEDING TO IMPROVE CARDIOMETABOLIC HEALTH AMONG WOMEN AND CHILDREN IN GALAPAGOS, ECUADOR

Ivonne Headley[1]; Amanda Thompson,[1, 2]; Stephanie Martin,[1]; Heather Wasser,[1]
[1]Nutrition, University of North Carolina at Chapel Hill, Chapel Hill, United States of America;
[2]Anthropology, University of North Carolina at Chapel Hill, Chapel Hill, United States of America

BACKGROUND AND OBJECTIVES
Exclusive breastfeeding [EBF] may be an important strategy for improving cardiometabolic health of women and children in the Galapagos. While the World Health Organization recommends EBF for the first six months, nearly two-thirds of women in the Galapagos use commercial milk formula by 3 months postpartum. To inform a co-designed intervention to improve EBF, we used formative research methods to understand EBF experiences and preferences for intervention among women living on the island of San Cristobal.
METHODS
We conducted 20 semi-structured interviews among mothers of infants ages 6-23 months recruited purposively through clinic referrals and WhatsApp channels of trusted community stakeholders. Audio recorded interviews were conducted in Spanish, transcribed and translated to English, and thematic analysis was used to identify themes in the data.
RESULTS
Mothers were motivated to EBF to provide their baby the best nutrition, but described insufficient milk, lack of confidence, not knowing how to address nipple pain, and the convenience of commercial milk formula as key barriers. Mothers also expressed feeling uncomfortable asking providers for advice due to lack of trust. To improve EBF, mothers recommended home visits during pregnancy and postpartum that contain topics directed at the nutrition and wellness of both infants *and* mothers, have a special focus on maternal mental health, and include family members who will directly care for the baby, namely the baby's father and grandmother. They expressed a need for improved government and healthcare provider support for EBF, creation of a human milk bank, and access to electrical breast pumps. Whatsapp and Tiktok were additional preferred channels for an EBF program.
CONCLUSIONS
Women on the island of San Cristobal agreed EBF is a critical component of infant health and development, regardless of whether they themselves EBF for the first 6 months. They described multiple, modifiable barriers and provided their own solutions for how to improve EBF practices in their community. Their recommendations centered around their own wellness and use of family-based approaches supported by the local government and healthcare system. Conducting key informant interviews with health professionals, local ministry of health leaders, and family members is therefore a critical next step in co-designing an intervention to promote EBF. Findings may be relevant to other Latin American and island communities, and may have implications for rural and Latino populations globally.

RELATIONSHIP BETWEEN TYPE OF DELIVERY AND GROWTH TRAJECTORY IN THE FIRST YEAR OF LIFE: THE ARARAQUARA COHORT STUDY

Roseanne Nobre,[1]; Paula L Silva,[2]; Leticia Carvalho[2]; Jessica Lacerda,[2]; Batista Livia,[2]; Ramos-Silva Tamiris,[2]; Pinheiro-Castro Natália,[2]; Luzia Liania,[2]; Patrícia H.C. Rondó[2]
[1]Enfermagem, Instituto Federal de Alagoas, Maceió, Brazil; [2]Nutrition, Faculdade de Saúde Pública USP, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
The relationship between cesarean delivery and infant obesity is controversial. Therefore, the aim of this study was to evaluate the association between type of delivery and growth trajectory of Brazilian infants in the first year of life.
METHODS
This was a prospective cohort study conducted between 2016 and 2021 as part of the Araraquara Cohort Study that assessed quarterly anthropometry of 719 and 667 infants to evaluate respectively the effects of type of delivery on weight gain velocity (WGV) and length gain velocity (LGV) using generalised estimating equations.
RESULTS
Higher mean WGV was observed among infants born to mothers with higher education ($p \leq 0.018$), male infants ($p \leq 0.001$), and formula-fed infants ($p=0.004$), while infants with lower birth weight ($p \leq 0.001$) and diarrhoea ($p = 0.041$) had lower mean WGV. Higher mean LGV was found among non-breastfed infants and infants born to taller mothers ($p \leq 0.001$), while shorter infants had lower LGV ($p \leq 0.001$).
CONCLUSIONS
The type of delivery was not associated with infant WGV or LGV in the first year of life. Nevertheless, significant associations with maternal education, maternal height, breastfeeding practices, infant sex, and morbidity were identified.

THE ASSOCIATION OF NUTRITION ON LONG COVID: A SYSTEMATIC REVIEW

Julie Long[1]; Christi Piper,[2]; Shari Sibenge,[3]; Lauren Grossman,[4]; Kyle Leggott,[5]; Myra Muramoto,[5]; Louise King,[3]; Douglas Taren[1]

[1]Section of Nutrition - Department of Pediatrics, University of Colorado School of Medicine, Aurora, United States of America; [2]Strauss Health Sciences Library, University of Colorado Anschutz Medical Campus, Aurora, United States of America; [3]Department of Medicine - Division of General Medicine and Clinical Epidemiology, UNC School of Medicine, Chapel Hill, United States of America; [4]Medicine - Primary Care and Population Health, Stanford University School of Medicine, Stanford, United States of America; [5]Department of Family Medicine, University of Colorado School of Medicine, Aurora, United States of America

BACKGROUND AND OBJECTIVES

Long COVID is a consequence of acute COVID-19 that is often underdiagnosed and poorly recognized. Ten percent of people diagnosed with COVID-19 will develop Long COVID. As of April 2024, 6.9% of US adults were actively living with Long COVID. The US National Academy of Sciences, Engineering and Medicine defines Long COVID "as an infection-associated chronic condition (IACC), lasting a minimum of 3 months, that incorporates common symptoms and diagnosable conditions characteristic of Long COVID." Nutritional interventions have been identified as an important treatment for many of the Long COVID conditions. However, there has not been a comprehensive review of the impact of nutritional interventions on Long COVID. This systematic review aimed to identify the impact and gaps on nutritional studies on Long COVID.

METHODS

This systematic review was registered with PROSPERO (# CRD42023472403). Five databases were used to identify potential papers for the review (MEDLINE, Embase, Cochrane Library, Web of Science, and PsycINFO). Papers were limited to English, and abstracts, commentaries, editorials, letters, and personal narratives were excluded. The initial review searched for papers from inception of COVID-19 to October 2023. A second review identified additional papers in October 2024. Studies were assessed for potential bias. COVIDENCE was used to manage the review process.

RESULTS

5750 papers were identified with 12 duplicates. 5730 titles and abstracts were screened. 268 full texts were assessed for eligibility, and 50 studies were included in the final analysis. Most studies were observational. The most common Long COVID outcomes reported were fatigue, brain fog, and olfactory disfunction. A variety of nutrition components were studied including diet patterns, supplements, micronutrients, and fatty and amino acids. Additionally, many studies had multi-factorial interventions that incorporated nutrition. Vitamin D deficiency and malnutrition were the most studied nutrition components and were associated with long COVID.

CONCLUSIONS

This systematic review of nutrition and Long COVID found large heterogeneity between study protocols. Because many interventions were multi-factorial, it is difficult to identify nutrition's exclusive effect on Long COVID. Future randomized controlled trials with larger sample sizes that look at individual nutrition topics are needed to improve the quality of data related to nutrition and Long COVID.

IS FOOD PROMOTION AND MARKETING IN THE SCHOOL FOOD ENVIRONMENT CONDUCIVE TO HEALTHY CHOICES FOR ADOLESCENTS? EVIDENCE FROM WEST AFRICA COUNTRIES

Fifali Sam Ulrich Bodjrenou[1, 2]; Yévèdo Déo Grathias Kossa[2]; Melina Maureen Houndolo[1, 2]; Djawou Nadège Gnacadja[3]; Waliou Amoussa Hounkpatin[2]
[1]Food Environment and Consumer Behaviour, Alliance of Bioversity International and Ciat, Cotonou, Benin; [2]Human nutrition and Food sciences, FSA/UAC, Abomey Calavi, Benin; [3]ESTCTPA, UNA, Sakete, Benin

BACKGROUND AND OBJECTIVES
Food advertising is a key component of food environment (FE) which helps driving consumer demand for sustainable and healthy food options while reducing demand for unhealthy. This study analysed how far marketing aspects of the FE of public elementary schools (PES) in Benin and Ivory Coast is conducive to healthy choices for adolescents.
METHODS
Data were collected to allow comparison North-South and Urban-Rural in Benin as well as Benin-Ivory Coast. In each locality, one PES was randomly selected, and the FE was assessed considering 1km radius around the school. All food marketing elements available in the FE were geocoded. Foods promoted were categorized considering NOVA classification and the Global Diet Quality Questionnaire. Claims and strategies used for promotion were also analysed using predefined classifications.
RESULTS
Food marketing elements density in the FE increased with the level of urbanization. Ultra-processed foods were predominant, accounting for 62.5% of promoted foods in Benin rural area in the North, 53.5% in Benin urban area in the North, and 56.6% in Benin urban area in the South, and 67.9% in urban area in Ivory Coast. Alcoholic beverages, sweetened beverages, dairy products and oils were the most promoted food groups; nutritious foods like pulses, fruits and vegetables were almost absent. Marketing strategies are dominated by brand, differentiation and segmentation strategies. Nutritional and health claims were common, particularly for ultra-processed foods.
CONCLUSIONS
School FE is dominated by ultra-processed foods marketing. This highlights the need of measures to regulate food advertising and facilitate adolescents' exposure to adequate food and nutrition messages.

DIETARY BEHAVIORS AND PERCEPTIONS OF THE LOCAL FOOD ENVIRONMENT AMONG ADOLESCENTS IN A LOW-INCOME NEIGHBORHOOD

Doris Delgado-Perez[1]; Ivonne Bernui-Leo[2]
[1]Instituto de Investigación en Bioquímica y Nutrición, National Major University of San Marcos, Lima, Peru; [2]Nutrition, National Major University of San Marcos, Lima, Peru

BACKGROUND AND OBJECTIVES
The adolescent population consumes energy-dense, nutrient-poor foods. More information is needed on the local environmental factors that contribute to this consumption. The objective was to assess the relationship between dietary behaviour and perceived factors of the local food environment among adolescents.
METHODS
In a study involving 245 adolescents. The qualitative 24-hour recall method was used to measure dietary behavior. The perceptions of the food environment were measured in three dimensions of factors: the social, the physical and macro environment, with a validated questionnaire. Spearman's coefficient was used to analyse correlations between dietary behaviour and environmental factors.
RESULTS
RESULTS showed: that 58% of the adolescents were female. About 50% of the adolescents were regular consumers of fruit and vegetables, and 80% reported consumption of fried foods and sugar-sweetened beverages on the survey day. Only 10% consumed fish. In all cases, the correlations found were weak. A significant correlation ($p<0.05$) was observed between perception of food availability and fruit and vegetable consumption, while the social factor was positively correlated ($p<0.01$) with consumption of ultra-processed foods.
CONCLUSIONS
Adolescents' dietary behaviour is significantly influenced by social and physical factors in their environment. Access to healthy food and social influences are important determinants of eating habits.

MALNUTRITION AND OBESITY IN PUBLIC SAFETY PERSONNEL: A CALL FOR COMPREHENSIVE HEALTH POLICY INTERVENTIONS IN PANAMA

Israel Rios Castillo[1]; Victoria Valdes,[2]; Flavia Fonte,[2]; Saday Batista,[2]; Merelyn Jaen,[2]; Aly Burgos,[2]; Ismary Ortega,[2]; Deisybeth Herrera,[2]; Cristel Ng,[2]; Paul Francis,[2]; Noel Jaramillo,[2]; Brayant Worrel,[2]
[1]Salud, FAO, Panama City, Panama; [2]Nutrition School, University of Panama, Panamá, Panama

BACKGROUND AND OBJECTIVES
Malnutrition, including obesity, poses significant challenges to public health, affecting individuals across all demographics. Within public safety institutions, such as police, firefighters, and emergency response units, the issue is particularly concerning due to the physical and mental demands of their roles. This work aims to analyze the nutritional status, dietary habits, sleep quality, stress levels, and physical activity of public safety personnel in Panama between 2017 and 2024.
METHODS
This analysis is based on multiple cross-sectional studies conducted between 2017 and 2024, involving 538 public safety personnel, including police officers, firefighters, emergency responders, and private security agents in Panama. The studies assessed nutritional status, dietary habits, physical activity, sleep quality, and stress levels using standardized questionnaires and anthropometric measurements such as BMI, waist circumference, and waist-height ratio. Data were grouped by year of study (2017, 2019, 2022, 2023, and 2024) for comparative analysis.
RESULTS
The findings revealed high rates of overweight and obesity, affecting over 80% of participants, with obesity ranging from 37% to 58%. Abdominal obesity and cardiovascular risk exceeded 50% in several groups. Dietary patterns showed frequent consumption of fried foods (97%) and sugary beverages (94%), with low intake of fruits (16%-20%) and vegetables (20%-44%). Poor sleep quality affected 56%-94% of participants, while 19%-43% reported insomnia. Physical activity levels were insufficient (67%-85%), and stress affected 57.9%-89.6%.
CONCLUSIONS
The findings underscore the urgent need for comprehensive health interventions in public safety institutions. Addressing poor dietary habits, promoting structured physical activity, and improving sleep and stress management are critical to mitigating the high prevalence of obesity and related health risks. Tailored programs focused on nutrition education, occupational wellness, and policy reforms are essential to improving the health and operational readiness of public safety personnel.

SITUATION OF THE POPULATION IN FRANCE WITH RESPECT TO NUTRITIONAL RECOMMENDATIONS: APPROACHES BY REGIONS AND OVERSEAS TERRITORIES

valerie deschamps[1]; Julie Boudet-Berquier[1]; Charlotte Verdot[1]
[1]Direction des Maladies Non Transmissibles et des Traumatismes, Santé publique France, Saint-Maurice, France

BACKGROUND AND OBJECTIVES
Diet is a modifiable risk factors for many non-communicable diseases. In France, the Programme National Nutrition Santé (PNNS) aims to improve the health of the entire population by acting on this determinant since 2001. Monitoring diet recommendation's in the population is necessary to assess their health impact and adapt prevention to the needs of the population. This work presents the frequency levels of consumption of some food groups: fruits, vegetables, whole starches, pulses and sugary drinks in the adult population in France in 2021.
METHODS
The main data source was the 2021 Health Barometer survey of Santé publique France, the national public health agency. This survey was conducted on a random sample of the French population aged 18 to 75 years living in mainland France and the French overseas departments and regions. The survey methodology is based on a random generation of fixed and mobile phone numbers. Participants are selected via a two-stage random survey on a fixed line (random selection of an eligible individual per household) and a survey of the person who answers on a mobile line. The analyses consisted of comparing regional prevalences of food consumption. Logistic regressions were used to study the link between food consumption and region of residence as well as social inequalities.
RESULTS
In 2021, 19% of men and 25% of women were meeting the health recommendations for fruits and vegetables. Nearly 23% of adults consumed pulses twice a week or more, while 29% of men and 26% of women reported daily consumption of whole starches. Moreover, 18% of men and 1% of women consumed more than one glass of sugary beverages a day. Non-compliance with the recommendations, whether in terms of insufficient consumption of fruits and vegetables or consumption of sugary drinks, concerned men more than women. The prevalence of meeting recommendations improved with age and level of education except for the consumption of whole foods. Associations were also shown with the occupational status, income level, family structure and size of urban area. The regions of Hauts de France, Normandy and Grand Est had a prevalence meeting recommendation significantly lower than the hexagonal France level. The over sea territories also presented situations that differed from hexagonal France.
CONCLUSIONS
This study shows that public health nutrition policies must be adapted to the most socio-demographic characteristics and territories.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

FOOD AND NUTRITION EDUCATION FOR DIABETIC MELLITUS TYPE 2 PATIENTS: A NARRATIVE REVIEW

Sheila Cerezo,[1]; Israel Rios Castillo[2]
[1]Nutrition School, Interamerican University of Panama, Panama City, Panama; [2]Salud, FAO, Panama City, Panama

BACKGROUND AND OBJECTIVES
Type 2 Diabetes Mellitus (T2DM) is a chronic condition with rising global prevalence, posing significant public health challenges. Effective management relies on patient education, particularly in food and nutrition. This narrative review aims to evaluate the impact of food and nutrition education programs on the metabolic control of T2DM patients, highlighting effective strategies and identifying gaps in implementation.
METHODS
This review synthesizes findings from various international studies published between 2014 and 2024. The selection criteria included randomized controlled trials, quasi-experimental studies, and observational studies focusing on education programs for T2DM management. Key outcomes analyzed were changes in HbA1c, fasting glucose levels, and adherence to dietary recommendations.
RESULTS
Personalized education programs, culturally adapted interventions, and the integration of technological tools such as continuous glucose monitoring and SMS reminders significantly improved metabolic control. Common improvements included reductions in HbA1c levels, increased adherence to low-glycemic diets, and better self-management practices. However, heterogeneity in methodologies and resource availability limited the replicability of RESULTS in low-resource settings.
CONCLUSIONS
Food and nutrition education programs are pivotal in enhancing T2DM management. Effective interventions are characterized by personalization, cultural adaptation, and ongoing patient engagement. Standardization of methodologies and the development of cost-effective strategies are necessary to expand the reach of these programs, particularly in underserved areas. Long-term follow-up is essential to assess the sustainability of improvements and the impact on quality of life.

ASSOCIATIONS BETWEEN EATING BEHAVIOR AND BODY COMPOSITION IN CHILEAN COLLEGE STUDENTS: ESTUDIO CESAC

Catalina Ramírez-Contreras[1]
[1]Department of Nutrition and Public Health, University of Bio-Bio, Chillán, Chile

BACKGROUND AND OBJECTIVES
Eating behavior plays an important role in the development of obesity, even in young adulthood. Nevertheless, the relationship between eating behavior and body composition at this stage has not yet been sufficiently clarified. The aim was to investigate the relationship between eating behavior and body composition in Chilean college students.
METHODS
Fifty-nine college students (19 – 26 years; 59.3% female) were included in this cross-sectional study. Data collected included body composition (InBody 120): Percent body fat and skeletal muscle mass; and eating behavior (AEBQ), which considered 8 dimensions: Enjoyment of food, food responsiveness, emotional over-eating, hunger, satiety responsiveness, slowness in eating, emotional under-eating and food fussiness. Pearson correlations were tested to assess the association between eating behavior and body composition.
RESULTS
RESULTS showed that of the 8 dimensions, participants (n=59; 22 ±1.5 years) with higher scores on emotional over-eating were associated with higher percent body fat (r= 0.326; p= 0.012). On the other hand, participants with lower scores for hunger (r= -0.370; p= 0.004) and lower scores for satiety responsiveness (r= -0.310; p= 0.017) were associated with higher skeletal muscle mass.
CONCLUSIONS
Identifying dimensions of eating behavior in college students that are related to body composition could provide effective obesity prevention strategies and weight management programs that focus on emotional and physiological aspects such as hunger and satiety and could contribute to a healthy distribution of body composition.

NUTRITIONAL ASSESSMENT OF CHILEAN AND IMMIGRANT CHILDREN AND ADOLESCENTS EVALUATED BY THE NATIONAL BOARD OF SCHOOL AID AND SCHOLARSHIPS (JUNAEB) FROM 2013 TO 2023

Edson Bustos-Arriagada[1]; Fabián Vásquez[1]; Karina Etchegaray-Armijo[1]; Sandra López-Arana[1]
[1]Faculty of Medicine, Nutrition and Dietetics School, Universidad Finis Terrae, Providencia, Chile

BACKGROUND AND OBJECTIVES
Over the past decade, the immigrant population in Chile has significantly increased, now representing 8.6% of the country's total population. Within this demographic, children and adolescents constitute approximately 13%. Our objective was to evaluate the nutritional status among Chilean and immigrant children and adolescents attending JUNAEB schools between 2013 and 2023.
METHODS
Descriptive study, analyzed individual, anonymous and de-identified data on the nutritional assessment of Chilean and immigrant children and adolescents assessed by JUNAEB. Anthropometric data, nutritional status, height diagnosis, sex, and nationality were collected from students in Pre-Kindergarten, Kindergarten, 1st grade, 5th grade, and 1st year of high school, using the JUNAEB Nutritional Map. Nutritional status categories were defined according to the WHO 2006 and 2007 criteria using the Body Mass Index-for-age z-scores (zBMI/A), grouping them into Malnourished (MN) -thinness(zBMI/A ≤ -2) and risk of thinness (zBMI/A ≤ -1)-, normal weight (zBMI/A > -1 and < 1) and Overnutrition (ON) -overweight (zBMI/A ≥ 1), obesity (zBMI/A ≥ 2) and severe obesity (zBMI/A ≥ 3)-. The diagnosis of stunting was defined with a Height-for-age z-scores (zH/A) ≤ -2.
RESULTS
The sample consisted of 8,128,014 children and adolescents, 4,002,190 (49.2%) were girls and 4,125,824 (50.8%) were boys. In 2013, immigrants represented 0.4% (n=2,463) of the total number of children evaluated, and by 2023 this percentage increased to 7.9% (n=41,230). When grouping the data, it was observed that Chilean children and adolescents had a lower proportion of MN, stunting and normal weight, but a higher proportion of ON compared to immigrants.
CONCLUSIONS
The considerable increase in immigrant children and adolescents in the Chilean school system, together with the nutritional differences between both groups, highlights the need to consider these particularities when designing public policies at the educational and health sectors focused on physical activity and healthy eating to combat malnutrition in all its forms.

BRIDGING DATA AND NUTRITION: VISUAL ANALYTICS OF SCHOOL MEAL MENUS

Angélica Oliveira[1]; Isabela Martins[2]; Rafaella Camargo[3]; Semíramis Martins Álvares Domene[4]; Evandro Ribeiro[1]

[1]Department of Administration, School of Economics, Administration and Accounting of Ribeirão Pr, USP Campus de Ribeirão Preto, Ribeirao Preto, Brazil; [2]Postgraduate Program in Nutrition, Federal University of São Paulo Unifesp, São Paulo, Brazil; [3]Interdisciplinary Postgraduate Program in Health Sciences, Universidade Federal de São Paulo - Campus Baixada Santista - Edifício Acadêmico I, Santos, Brazil; [4]Department of Public Policies and Collective Health, Institute of Health and Society, Universidade Federal de São Paulo - Campus Baixada Santista - Edifício Acadêmico I, Santos, Brazil

BACKGROUND AND OBJECTIVES

Established in 1955, the National School Feeding Program (PNAE) promotes food and nutritional security to support students' physical, cognitive, and social development in Brazilian public schools [1]. However, few tools exist to assess menu quality within the program, with the Revised Quality Index for School Meal Menus (IQCAE-R) being one of the few initiatives [2]. Therefore, this research aims to develop visual analytical tools to support the scientific study of school menu quality within the IQCAE-R framework.

METHODS

This quantitative study integrates data visualization concepts to develop an interactive Power BI dashboard. The tool allows users to cross-reference information on menu quality, analyzing variations based on region, biome, population size, education level, and the Municipal Human Development Index (IDHM). The dataset comprises 557 weekly menus (2,785 total) from Brazilian municipalities between 2022 and 2024, collected via municipal portals and school nutritionists. The sample represents 10% of municipalities in each Brazilian State, focusing on those that publicly disclose menus and on elementary education. Limited menu availability introduces potential bias.

RESULTS

Analysis revealed key regional trends. The Southeast region of Brazil, characterized by larger population sizes, outperformed others in average IQCAE-R scores, with a more consistent distribution among municipalities, as opposed to the Northeast. Southeast menus showed high average frequencies of "Cereals and Tubers", "Fruits", "Legumes", and "Vegetables", alongside low frequencies of "Sweets and Sweet Dishes", "Processed Foods", "Ultra-Processed Foods", and "Regional Sweet Dishes." However, red meat consumption remained high, while dairy product consumption was low. Other regions had lower frequencies of "Vegetables" and "Legumes" and higher frequencies of processed and ultra-processed foods. Variability was particularly evident in the frequency of the following components: (a) "Legumes" in the South and Midwest, (b) "Vegetables" in the North and Northeast, (c) "Eggs, Poultry, and Fish" in the Southeast and Northeast, (d) "Regional Foods" in the South and Southeast, and (e) "Ultra-Processed Foods" and "Red Meat" in the South.

CONCLUSIONS

Higher IQCAE-R scores were associated with regions demonstrating a more balanced food distribution, while regions with greater disparities in food access exhibited lower scores and higher consumption of processed and ultra-processed foods. These findings underscore the value of data-driven insights for public policy and broader menu disclosure.

EFFECTIVENESS OF POWDERED MICRONUTRIENTS IN COMPLEMENTARY FEEDING FOR ANEMIA PREVENTION IN PRIMARY HEALTH CARE: A PRAGMATIC CLINICAL TRIAL

Ana Raquel Ernesto Manuel Gotine[1, 2]; Marly Augusto Cardoso[3]
[1]Postgraduate Program in Public Health, School of Public Health , University of São Paulo (USP), Sao Paulo, Brazil; [2]Faculty of Health Sciences, Lurio University, Nampula, Mozambique; [3]Department of Nutrition, Universidade de São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
Anemia continues to be a significant public health issue among children, particularly in vulnerable populations, requiring the evaluation of strategies for its prevention and control. Aim: To assess the effectiveness of micronutrient powders (MNP) for preventing anemia during the first year of life, distributed by health professionals at primary health care
METHODS
This pragmatic clinical trial was conducted across two health centers, involving 275 infants who were randomly assigned to either the intervention group (IG, n=135) or the control group (CG, n=135). The IG received 90 sachets of MNP to be consumed once daily for up to 180 days. Data were collected through a sociodemographic questionnaire, hemoglobin (Hb) measurements (HemoCue®), and rapid malaria tests (First Response® Malaria Antigen P. falciparum Card Test). Intention-to-treat statistical analyses were performed using Stata 18, with t-tests, Pearson's chi-square tests, and adjusted linear regression for Hb mean differences (before and after the intervention), with significance set at $p < 0.05$.
RESULTS
At baseline, infants aged 6 to 8 months had a mean Hb of 102.0 g/L (SD 11.0) in the IG and 104.0 g/L (SD 11.0) in the CG. Anemia rates (Hb <110 g/L) were 74% (95% CI 66–80) in the IG and 66% (95% CI 58–74) in the CG. After the intervention, at 12 to 14 months, the IG had a mean Hb of 106.2 g/L (SD 10.6) and an anemia prevalence of 56% (95% CI 48–66), while the CG had a mean Hb of 99.5 g/L (SD 11.7) and an anemia rate of 79% (95% CI 70–85). After adjusting for variables such as child's age, wealth index, maternal age and education, prenatal visits, and stunting at baseline, the IG showed an increase in the adjusted mean Hb difference of 0.28 g/L (95% CI 0.02–0.55), while the CG showed a decrease of -0.43 g/L (95% CI -0.72 to -0.15).
CONCLUSIONS
The findings suggest that MNP supplementation, when distributed by health professionals, has a positive impact on hemoglobin levels, underscoring the importance of nutritional interventions in regions with high anemia prevalence during infancy.

NUTRITIONAL STATUS AND MENARCHEAL AGE OF ADOLESCENT GIRLS

Temitope Oriola[1]; Oluseye Olusegun Onabanjo[2]
[1]Human Nutrition and Dietetics, University of Ibadan, Ibadan, Nigeria, Federal Republic of; [2]Nutrition and Dietetics, FEDERAL UNIVERSITY OF AGRICULTURE ABEOKUTA, Abẹ́òkúta, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
The Nutritional status of adolescent plays an important role in determining the maturation status. The mean age of menarche has declined over the last century, but the magnitude of the decline and the factors responsible remains subjects of contention. This study assessed the nutritional status of adolescent girls within the age range of 10 to 18 years and their mean menarche age determined.
METHODS
In this descriptive cross sectional study, the total sample size of three hundred (300) girls were selected using a convenience sampling technique and subjected to anthropometric assessment by taking measurements of their weight to the nearest 0.1kg using a calibrated mechanical weighing scale, height using a stadiometer, waist circumference and hip circumference using a non-stretchable measuring tape. Each measurement was repeated twice and the average calculated also the Body Mass Index (BMI) and the Waist to Hip Ratio (WHR) were calculated. A semi structured questionnaire was used to collect data on menarche status which included demographic information and socioeconomic data. A 24-hour multi-pass diet recall method was used to assess the dietary intake. The estimation of nutrient intake was analyzed using the Total Dietary Assessment (TDA) software and the World Health Organisation (WHO) anthroplus. Data gathered were coded and analyzed using the IBM-Statistical Package for Social Sciences (SPSS) version 20 and Microsoft Excel 2007.
RESULTS
The mean age of menarche was 13.4± 1.4 years and a median of 14years. The mean waist circumference and Hip circumference were significantly higher among girls that have started menstruating as compared to the non-menstruating. Only 11.1% of the females were menstruating and those who attained menarche showed a higher significant mean percent of body weight 72% as compared to the non-menstruating ones 28%. Dietary intake showed that the respondents met more than 100% for carbohydrates, fat, vitamin A and iron while Protein, calories, fibres, vitamin C, and calcium are below RDA. The respondents consumed more of roots and tubers, Cereals, less of protein rich foods and less of fruits and vegetables.
CONCLUSIONS
The nutritional status of adolescent girls had a significant relationship with the onset of menstruation and the menarche age. Therefore, there is a link between the nutritional status of the girls and attainment of menarche hence, a database on the health and nutritional status of adolescents should be established.

CHARACTERISTICS OF JAPANESE JUNIOR RUGBY TEAMS PROVIDING NUTRITION SUPPORT: AN INTERNET SURVEY

Ryoko Mizushima[1]; Yuko Oguma[2]; Chihiro Ota[2]; Shinya Nakajima[3]; Yasuyo Yoshizawa[4]; Jiawei Wan[5]; Yoshio Nakata[1]

[1]Institute of Health and Sport Sciences, University of Tsukuba, Tsukuba, Japan; [2]Sports Medicine Research Center, Keio University, Yokohama, Japan; [3]School Division, Hirosaki Sakura Ovals, Hirosaki, Japan; [4]Faculty of International Liberal Arts, Juntendo University, Bunkyo-ku, Japan; [5]Graduate School of Comprehensive Human Sciences, University of Tsukuba, Tsukuba, Japan, Japan

BACKGROUND AND OBJECTIVES

In 2021, we conducted an internet-survey of coaches and families of Japanese junior rugby players regarding conditioning support. This study aimed to investigate the characteristics of teams providing nutrition support to Japanese junior rugby players.

METHODS

This web-based cross-sectional study recruited participants using snowball sampling, informed them of the URL to access the survey screen, and asked them to respond. The evaluation items included the coach's age, team's competitive goal level, region, player's grade, number of players, and implementation of non-nutritional conditioning support. Non-nutritional conditioning support comprised of 13 categories: first aid; condition management and infectious disease control; anti-doping; medical check-up; strength training; injury prevention; rehabilitation for injury recovery; biomechanics; performance assessment; psychological; sleep; countermeasures for heat, cold, and high altitude; and female-specific health problem.

RESULTS

The survey included 778 participants (531 men) comprising 338 coaches, 324 families, and 116 participants in both roles. In total, 212 (27.2%) participants answered that they provided nutrition support, whereas 566 (72.8%) answered that they did not. The higher the competitive goal level, the higher the percentage of nutrition support provided ($p<0.001$). In Tokyo, team provided more nutrition support than those from other regions ($p<0.01$). Teams that included high school students were more likely to provide nutrition support ($p<0.001$), whereas teams that included junior high school or younger students were less likely to provide nutrition support ($p<0.001$). Those who responded providing nutrition support provided other conditioning support, with significant differences ($p<0.001$) across the 12 items except for female-specific health problem.

CONCLUSIONS

Our findings showed that nutrition support status differs depending on team characteristics. Team characteristics may be necessary to increase nutrition support for junior rugby players.

CONFLICTS OF INTERESTS

REGIONAL AND ULTRA-PROCESSED FOOD CONSUMPTION: IMPACTS ON LIPID PROFILES OF AMAZONIAN CHILDREN

Ana Carolina Hovadick[1]; Isabel Giacomini[1]; Caroline Zani Rodrigues[1]; Marly Augusto Cardoso[1]
[1]Department of Nutrition, Universidade de São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
The Brazilian Amazon has experienced a significant nutritional transition characterized by increased consumption of ultra-processed foods (UPFs) and reduced intake of regional foods. Given the robust evidence linking UPF consumption to adverse health outcomes, this study aimed to investigate the associations between the consumption of regional foods, UPFs, and the lipid profiles of school-aged children in Western Amazonia.
METHODS
We conducted a cross-sectional study of 245 children aged 7–8 years. Dietary data, collected via a tailored food frequency questionnaire, categorized foods into UPFs, regional foods, and fruits, vegetables, and legumes (FVL). Regional foods included açaí, buriti, tapioca, and manioc flour; UPFs included soft drinks, packaged snacks, and instant noodles. Composite scores for each food group were generated. Lipid profiles—total cholesterol, LDL cholesterol, and HDL cholesterol—were assessed using fasting venous blood samples (8–10 hours). Associations between dietary patterns and lipid profiles were analyzed using multiple linear regression, adjusting for confounders.
RESULTS
Dyslipidemia was prevalent among participants, with 47% of children had elevated total cholesterol (≥170 mg/dL), 35% had elevated LDL (≥110 mg/dL), and 23% showed HDL insufficiency (<40 mg/dL). Dietary patterns reflected a broader nutritional transition: 46% consumed fewer than one regional food item daily, while 98.5% consumed at least one UPF daily, and 62% had no daily intake of vegetables or legumes. Higher FVL consumption was linked to reduced LDL (−3.39 mg/dL; $p<0.05$) and total cholesterol (−3.91 mg/dL; $p<0.05$). Greater regional food intake was associated with reduced LDL (−2.38 mg/dL; $p<0.05$) and total cholesterol (−2.46 mg/dL; $p<0.05$). Higher UPF consumption (≥75th percentile) correlated with lower HDL levels (−2.40 mg/dL; $p<0.01$).
CONCLUSIONS
Dietary patterns emphasizing regional foods and FVL and reducing UPFs were associated with improved lipid profiles in school-aged children from Western Amazonia.
CONFLICTS OF INTERESTS
The authors have no conflict of interest.

EPO5_642

KHAT USE, DIETARY PRACTICES, AND NUTRITION AMONG PREGNANT WOMEN IN ETHIOPIA

Heather Stark[1]; Tara Wilfong[2]; Elizabeth Wood[3]
[1]Epidemiology, University of Florida, Gainesville, United States of America; [2]College of Health and Medical Sciences, Haramaya University, Haramaya, Ethiopia; [3]Eck Institute of Global Health, University of Notre Dame, Notre Dame, United States of America

BACKGROUND AND OBJECTIVES
Khat has long been consumed in East Africa for its psychoactive effects and social practices. Although use is more prevalent among men, consumption among women is rising. In certain regions, khat use during pregnancy has become socially accepted. Studies in Ethiopia reported between 19% to 66.9% of pregnant women surveyed used khat. Khat use is known to suppress appetite in animals and humans. Consumption during pregnancy is associated with adverse outcomes including anemia, low birth weight, and perinatal mortality. Adequate nutrition during pregnancy is critical for maternal and child health. In Ethiopia, where maternal and infant mortality rates are high, khat use may further contribute to these issues. This study explores relationships between khat use, dietary practices, and nutrition among pregnant women in the Oromia region of Ethiopia, where khat consumption is prevalent and nutritional challenges are significant.
METHODS
This cross-sectional mixed methods study was conducted in Haramaya District of Ethiopia using questionnaires and focus group discussions in July 2023. Questionnaires assessed socio-demographic information and diet, including khat use. Diet was assessed using the Minimum Dietary Diversity for Women (MDD-W). Data were analyzed using SPSS v28 and NVivo 14. Thematic analysis was conducted to capture salient themes within the FGDs.
RESULTS
In this study of 444 pregnant women, 66.9% reported consuming khat while pregnant. MDD-W scores ranged from 1 to 6 (median 3). No significant difference in MDD-W scores was found between women who use khat and those who do not. Five themes manifested from data around nutrition: Substitution of Khat for Meals, Maternal Nutrition, Child Malnutrition, Skipping Meals for Economic Survival, and Health Risks from Khat Use.
CONCLUSIONS
Khat use among pregnant mothers in these communities contributes to significant nutritional challenges, as it often substitutes for meals and exacerbates deficiencies such as anemia. Dietary diversity is low in this region, and measures like the MDD-W are limited, as they do not assess quantity or frequency of food consumed. If khat suppresses appetite, the quantity and frequency of food intake may be even lower among women who use khat, further increasing their risk of micronutrient deficiencies. Economic reliance on khat for income limits access to adequate food, negatively impacting maternal and child nutrition.Despite its role as a stimulant, khat dependency perpetuates a cycle of poor health, inadequate dietary intake, and compromised maternal and child well-being.

ASSOCIATION BETWEEN CHRONONUTRITION AND PARAMETERS FOR ASSESSING GLYCEMIC CONTROL IN PREGNANT WOMEN WITH PREGESTATIONAL DIABETES MELLITUS

Claudia Saunders[1]; Ana Sophia Lacerda[2]; Karina Dos Santos[3]; Leticia Silva[2]; Katherine Jesus[2]; Karyne Silva[2]; Laisa Ramos[2]; Ana Luísa Da Silva Carvalho[4]; Laura Camelo[2]; Jennifer Gomes[2]
[1]Instituto de Nutrição Josué de CAstro. , Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil; [2]Instituto de Nutrição Josué de CAstro., Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil; [3]Postgraduate Program in Molecular and Cellular Biology, Universidade Federal do Estado do Rio de Janeiro, Rio de Janeiro, Brazil; [4]Instituto de Nutrição Josué de Castro, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil

BACKGROUND AND OBJECTIVES
Diabetes Mellitus (DM) confers a higher risk of adverse maternal and fetal outcomes, mainly related to the degree of hyperglycemia. In order to achieve glycemic targets, strategies are used that take into account, in addition to nutritional composition, the interaction between the circadian cycle and nutrition, an interaction defined as chrononutrition [1,2,3,4]. Therefore, the aim of this study was to investigate the association between chrononutrition and glycemic outcomes throughout the pregnancy of women diagnosed with pre-gestational DM.
METHODS
This was a cross-sectional study nested in a randomized clinical trial with 117 pregnant women with pre-gestational DM, assisted by a public maternity hospital between 2016 and 2024. Dietary intake was assessed using 24-hour recalls in the second and third trimesters of pregnancy. Chrononutrition parameters were: number of eating episodes, eating pattern, meal times and total daily, daytime, nighttime and per-meal calorie intake. The glycemic outcomes were: fasting plasma glucose and glycated hemoglobin in the second and third trimestres [5]. After the normality test, the Mann-Whitney U-test and the Kruskal-Wallis test were used to test the difference between the medians of the independent variables. Multivariate linear regression models evaluated the associations between chrononutrition and glycemic indicators in each trimester.
RESULTS
As a result, a higher evening calorie intake was associated with an increase in fasting glycemia in the 2nd trimester (adjusted ß=0.05;p=0.006) and in the 3rd trimester (p=0.027). Pregnant women with a higher calorie intake at dinner in the 2nd (p=0.006) and 3rd trimesters (p=0.049) had fasting hyperglycemia. In the 3rd trimester, the nocturnal eating pattern was positively correlated with an increase in glycemia (adjusted ß= 23.77; p= 0.008). A greater number of evening meals had a protective effect on glycemia in the 2nd trimester (p=0.033). A higher calorie intake, day or night, total or by meals, was related to an increase in fasting glycemia in both trimesters. The proximity between a snack and a meal with more calories seemed to help control glucose and glycated hemoglobin in the 2nd and 3rd trimesters. These RESULTS suggest the importance of an adequate distribution of calories throughout the day associated with a lower caloric intake at night.
CONCLUSIONS
The findings suggest that chrononutrition has an influence on the glycemic control of pregnant women with pre-gestational DM.

ADVANCING PUBLIC HEALTH AND NUTRITION THROUGHOUT THE LIFECYCLE THROUGH PUBLIC-PRIVATE PARTNERSHIPS

Rohini Saran[1]; Sirimavo Nair,[2]; Anita Makhijani,[3]
[1]Nutrition and Health, Vedanta Limited, New Delhi, India; [2]Nutrition and Fortification, Food Safety and Standards Authority of India (FSSAI), New Delhi, India; [3]Nutrition, NIPCCD, New Delhi, India

BACKGROUND AND OBJECTIVES
The role of nutrition in achieving Sustainable Development Goals (SDGs) requires urgent acceleration. While progress has been made through human rights and development agendas, persistent public health nutrition challenges in the Global South call for innovative solutions. Public-private partnerships (PPPs) are crucial for aligning public sector goals with private sector resources and expertise to address service delivery gaps and promote sustainability. These partnerships aim to enhance Public health and nutrition (PHN) outcomes across the lifecycle in line with global priorities.The role of nutrition in achieving Sustainable Development Goals (SDGs) requires urgent acceleration. While progress has been made through human rights and development agendas, persistent public health nutrition challenges in the Global South call for innovative solutions. Public-private partnerships (PPPs) are crucial for aligning public sector goals with private sector resources and expertise to address service delivery gaps and promote sustainability.
METHODS
This study evaluates key public-private partnership case studies in health initiatives, with a focus on India, to assess their impact on public health and nutrition outcomes.
RESULTS
PPPs in India have successfully delivered lifecycle-based health and nutrition services through:

- **Poshan 2.0 (Saksham Anganwadi Services Scheme):** Enhanced supplementary feeding, referral services for children and pregnant women using private sector support and digital monitoring.
- **Fortified Rice Initiative:** Improved fortified rice supply chains via the Public Distribution System, addressing micronutrient deficiencies among vulnerable population.
- **National Health Mission:** Expanded access to healthcare in remote areas through telemedicine and mobile health vans, improving maternal and child health.
- **Eat Right India:** Promoted healthy, sustainable diets through food fortification, labeling, and public awareness campaigns.

CONCLUSIONS
Strengthening PPPs in the Global South is vital for scalable, sustainable solutions that enhance Public health nutrition outcomes across the lifecycle while addressing poverty, health inequities, and climate resilience.

IMMIGRATION AND NUTRITIONAL DISPARITIES: A MULTILEVEL ANALYSIS OF CHILD BMI-FOR-AGE IN CHILE

Sandra López-Arana[1]; Edson Bustos-Arriagada[1]; Fabian Vasquez[1]
[1]Faculty of Medicine, Nutrition and Dietetics School, Universidad Finis Terrae, Providencia, Chile

BACKGROUND AND OBJECTIVES
Over the past decade, Chile has witnessed a significant increase in international immigration. Immigrant children and adolescents face unique health challenges, particularly when exposed to insecure or adverse social conditions. This study aimed to assess the influence of immigration status on Body Mass Index-for-age z-scores (zBMI/A) among Chilean and immigrant boys, girls, and adolescents (BGA) attending schools evaluated by the National Board of School Aid and Scholarships (JUNAEB) in 2023.
METHODS
This cross-sectional study included 523,899 BGA. A multilevel hierarchical linear model was employed to account for the nested data structure, with individual observations (level 1) grouped by school grade (Pre-Kindergarten, Kindergarten, 1st grade, 5th grade, and 1st year of high school) across public and subsidized private schools in Chile (level 2). Statistical significance was set at $p < 0.05$ for all two-sided tests.
RESULTS
The median age of participants was 7.2 years (IQR: 5.9–11.4), with 49.1% females and 7.9% identified as immigrants. The overall mean zBMI/A was 1.03 (95% CI: 1.02–1.03). Chilean BGA presented a mean zBMI/A of 1.07 (95% CI: 1.06–1.07), whereas immigrant BGA had a mean of 0.53 (95% CI: 0.52–0.55). Immigration status was significantly associated with lower zBMI/A ($\beta = -0.56$; 95% CI: -0.57 to -0.54; $p < 0.01$).
CONCLUSIONS
Immigrant BGA in Chile exhibit significantly lower zBMI/A compared to their Chilean peers. These findings underscore the need for inclusive public health policies tailored to the nutritional and physical activity needs of both Chilean and immigrant schoolchildren. Strengthening school-based programs promoting healthy eating and physical activity is essential to address malnutrition in all its forms.

SLEEP DURATION AND DIETARY INTAKE IN MEXICAN ADULTS

Luz Muñoz-Aispuro[1]; Perla Gamez-Valdez[1]; Itzel Nieto-Marin[1]; Veronica Lopez-Teros[2]; Mayra Vera-Aviles[3]; Humberto Astiazaran-Garcia[4]; Wendy L. Hall[5]; Monica L Castro-Acosta[1]
[1]Facultad de Ciencias de la Nutrición y Gastronomia, Universidad Autonoma de Sinaloa, Culiacán Rosales, Mexico; [2]Departamento de Ciencias Quimico Biologicas, Universidad de Sonora, Her, Mexico; [3]Department of physiology, anatomy & genetics, University of Oxford, Oxford, United Kingdom; [4]DCQB-Nutrition, Universidad de Sonora, Hermosillo, Mexico; [5]Department of Nutritional Sciences, King's College London Waterloo Campus, London, United Kingdom

BACKGROUND AND OBJECTIVES
Sleep is considered one of the three main components of the lifestyle, which, together with diet and physical activity, is essential for the maintaining of health, and it is recognized as a modifiable risk factor involved in the aetiology of obesity and cardiometabolic diseases. Short sleep has been associated with a higher intake of less healthy foods and beverages and a lower intake of healthier foods. Sugar-sweetened beverage (SSB) intake in Mexico is among the highest worldwide (163 L/per capita), while corn is the primary staple food (346 kg/per capita). Because of the carbohydrate content in SSB and refined corn products, there is concern about their relationship with sleep duration in Mexican adults.**Objective:** To analyse the relationship between dietary intake and sleep duration in Mexican adults.
METHODS
This one-month study includes 72 healthy, diet and weight-stable adults (37 women and 35 men, BMI ≥ 18.5 kg/m2, aged 18 - 50 y). At enrolment, information on lifestyle variables was collected through a questionnaire. Anthropometric measurements were performed weekly, and dietary intake was reported by four non-consecutive 24 four dietary recalls, three on different weekdays and one on weekends. Participants completed a 7-day actigraphy record, and sleep duration was objectively assessed using MotionWare software. The parameters evaluated were time in bed, sleep period, sleep duration and latency in minutes, percentage of sleep duration and efficiency, and sleep fragmentation index.
RESULTS
Sleep duration was 6:07 ± 0:51 h: mm. Median (IQR) intake were: total energy 2037 kcal/d (1559, 2341 kcal/d), fat 80 g/d (62, 97 g/d), total sugar 82 g/d (62, 105 g/d), added sugar 55 g/d (30, 75 g/d), corn 111 g/d (77, 166 g/d), sugar-sweetened beverages 333 ml/d (113, 665 ml/d), and red meat 78 g/d (34, 112 g/d). Multivariate regression analysis showed a predictive model including energy intake, fat, total sugar, added sugar, plant protein, corn, poultry, dairy, fish, and red meat significantly impacting sleep duration (adjusted R2= 0.310).
CONCLUSIONS
Sleep duration is shorter than recommended (7 – 9 hr). Predictive variables for sleep duration include healthier and less healthy food. These findings will provide valuable data to comprehend the relationship between sleep duration and dietary intake in Mexican adults.
CONFLICTS OF INTERESTS

USING THE DIFFUSION OF INNOVATION THEORY TO UNDERSTAND HOW LACTATING MOTHERS WITHIN SIX-MONTH AFTER DELIVERY WERE EXPOSED TO INFANT FORMULA INFORMATION WHICH INFLUENCED INFANT FORMULA ADOPTION IN PALAWAN, THE PHILIPPINES

Zeyuan Wang[1, 2]; Erica Di Ruggiero[1, 3, 4]; Lincoln Lau[5, 6]; Mary L'abbe[7]
[1]Social and Behavirol Health Sciences, University of Toronto, Toronto, Canada; [2]Culinaria Research Center, University of Toronto Scarborough, Toronto, Canada; [3]Center for Global Health, University of Toronto, Toronto, Canada; [4]Institute of Health Policy, Management & Evaluation, University of Toronto, Toronto, Canada; [5]Clinical Public Health Division, Dalla Lana School of Public Health, University of Toronto, Toronto, Canada; [6]Research, International Care Ministries, Manila, Philippines; [7]Nutritional Sciences, University of Toronto, Toronto, Canada

BACKGROUND AND OBJECTIVES
Exclusive breastfeeding (EBF) is essential for both maternal and infant health. However, the EBF rate in the Philippines is only 29%. Infant formula (IF) marketing and communication channels have been reported to influence EBF.
METHODS
To understand how IF information is disseminated through different communication channels and how social systems influence exposure to IF information and adoption through the Diffusion of Innovation Theory (DoI), this study used maximum variation sampling to select 16 communities in both urban and remote areas in Palawan. Interviews were conducted with 104 lactating mothers and key informants such as IF sellers, community leaders, and health workers. The interviews were coded inductively first and then categorized deductively by DoI.
RESULTS
The RESULTS show that while TV remained the most popular communication channel for IF information, urban areas have better infrastructure, such as the internet and transportation, allowing more access to online and face-to-face IF information than remote areas. Social systems drove more women to work outside of the home due to poverty and inflation, making urban working mothers the most vulnerable group to be exposed to and adopt IF.
CONCLUSIONS
This study is only partially consistent with existing literature, which is mostly conducted in urban settings. The rapid development of communication channels has reduced the role of print media in IF information dissemination. Samples from remote areas and those in poverty have reduced access to infrastructure for receiving IF information. Policymakers should consider the significant gaps between remote and urban areas when promoting EBF. Scholars should consider infrastructure gaps when applying DoI.

ADAPTATION AND DESCRIPTION OF A DIET QUALITY INDICATOR FOR APPLICATION IN NURSING HOMES AND DAY CARE CENTERS IN GUATEMALA: QUALITY INDEX FOR NUTRITION IN NURSING HOMES AND DAY CARE CENTRES, QUINNDC-GUATEMALA

Angela Hernández-Ruiz,[1]; Gabriela Sagastume-Rodríguez[2]; Lorena López Donado[2]; Claudia Mazariegos[2]; Jennifer Bernal-Rivas[1]; María José Soto-Méndez[1]; Reyes Artacho[3]; María Dolores Ruiz-López[4]; José Antonio López-Trigo[5]; Marta Pérez-Domenech[6]; Rosa López-Mungil
[1]Scientific Project Development Area, Fundación Iberoamericana de Nutrición (FINUT), Granada, Spain; [2]Nutrition School, Mariano Gálvez University, Guatemala City, Guatemala; [3]Department of Nutrition and Food Sciences, Granada University, Granada, Spain; [4]Nutrition and Food Technology Institute "José Mataix", Granada University, Granada, Spain; [5]Service of Geriatry and Social Services, Ayuntamiento de Málaga, Málaga, Spain; [6]Nutrition, Valencia University, Valencia, Spain

BACKGROUND AND OBJECTIVES
A balanced diet is crucial for maintaining the health of the elderly, as it prevents nutritional deficiencies, mitigates the risk of chronic diseases, and enhances their overall quality of life. In Latin America, particularly in Guatemala, no indicator is specifically designed to evaluate nutritional quality in care institutions. This study aimed to adapt the Dietary Quality Indicator (DQIn) to assess the nutritional standards of institutions serving the elderly in Guatemala.
METHODS
Based on the original QUINN (developed and applied in a Nursing Home, NH in Spain), an adaptation, Quality Index for Nutrition in Nursing Homes and Day Care Center, QUINNDC-Guatemala, was proposed. A Rapid Review of dietary guidelines for the elderly in Latin America was conducted. The main findings were reported according to PRISMA (2020) guidelines. The MEDLINE database (PubMed) retrieved the main references and Google Scholar for the gray literature.
RESULTS
After screening the main references (N=44 MEDLINE, and N=165 Google Scholar), dietary reports and guidelines from different Latin American countries were selected (N=24, articles, dietary guidelines, and scientific-technical reports). Four dietary guidelines from Mexico, Bolivia, Colombia, and Argentina were selected to adjust the frequency of consumption and portion size. The QUINNDC-Guatemala included 15 components: 11 were basic (vegetables, fruits, legumes, cereals, dairy products, white fish, white meat, and eggs; positive; and oils and other fats, sweets and red meat and meat products, negative) and 4 special and positive components (variety of vegetables and fruits, blue fish, whole grains and olive oil; it was included in this category due to its low frequency in the usual diet of this country). For the scoring system, the consumption frequencies of the components were adapted (number of servings), with changes towards a higher consumption of legumes and cereals and a decrease in the frequencies of white fish, seafood, and oily fish, to the original QUINN. Each component was classified into 4 categories (0, 1, 2, or 3 points, with a total score 0-45 points). The categories proposed, based on the original QUINN are: "very low" (0 to 8 points), "low" (9 to 17 points), "moderate" (18 to 26 points), "good" (27 to 35 points) and "very good" (≥36 points).
CONCLUSIONS
The adaptation of the new DQIn, QUINNDC-Guatemala might offer a more effective means of assessing dietary quality and implement nutrititon interventions for elderly in Guatemala.

EVALUATION OF NUTRITIONAL PROFILE IN A GROUP OF WOMEN WITH DIABETES AT TWO MONTHS POSTPARTUM

haifa Abdesselem[1]; Chaima Sdiri[1]; Emna Bornaz[1]; Fatma Boukhayatia[1]; Kamilia Ounaissa[1]; Chiraz Amrouche[1]
[1]Nutritional Diseases "D", National Institute of Nutrition , Tunis, Tunisia

BACKGROUND AND OBJECTIVES
Breast milk remains the ideal food for infants. The mother's diet may have an impact on milk production. Hence the importance of nutritional education for all breastfeeding women with diabetes. The aim of our study was to evaluate the nutritional profile of a group of diabetic women at two months postpartum (T2).
METHODS
We conducted a descriptive observational cross-sectional study in women with type 1 or type 2 diabetes, followed at the Department of Nutritional Diseases "D" of the National Institute of Nutrition of Tunis, attending a follow-up consultation T2 and accepted to join the study. We collected data through anamnesis, clinical examination, and each patient completed a food questionnaire.
RESULTS
Fifty-two patients were included in the study. The mean age of patients was 35.4±0.4 years, with extremes ranging from 23 to 44 years. The majority (80%) had type 2 diabetes, while 20% had type 1 diabetes, diagnosed before pregnancy. At T2, we noted exclusive and partial breastfeeding rates of 44% and 33%, respectively. The average caloric intake was 2086 kcal/day, with extremes ranging from 1240 to 3820 kcal/day. Women who exclusively breastfed their babies had a lower caloric intake compared to women who did not breastfeed or partially breastfed their babies ($p<0.001$). Nearly half of the women had a hypercarbohydrate and hyperprotein diet, regardless of breastfeeding modality. Half of the non-breastfeeding women had a hyperlipidic diet, whereas only 25% of the breastfeeding women had an excessive lipid intake. Women who did not breastfeed their babies had an insufficient daily intake of phosphorus ($p=0.03$). Regarding the other micronutrients, we did not find any statistically significant differences. We did not identify a statistically significant association between average dietary fiber intake and breastfeeding practices.
CONCLUSIONS
These findings highlight the importance of nutritional education for all breastfeeding diabetic women to ensure sufficient intake of both micro- and macronutrients and to prevent weight gain.

STRENGTHENING DOCTORAL TRAINING IN AFRICA: INSIGHTS FROM A NUTRITION-FOCUSED PROGRAM

Robin Dolman-Macleod[1]; Claudine Jordaan[1]; Lizelle Zandberg[1]; Frank Hayford[2]
[1]Centre of Excellence for Nutrition, North-West University, Potchefstroom, South Africa; [2]Department of Dietetics, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES
Doctoral training in Africa is expanding, but challenges such as insufficient funding and a lack of researchers in many fields persist. Navigating the PhD journey is demanding, with mentorship, supervision, and guidance playing pivotal roles in student success. A Support Program for PhD Students was established in 2019, offering complementary training to first-year PhD students in human nutrition across Africa. The program equips participants with essential research skills and prepares them to navigate the complexities of their academic journey effectively.
The program focused on critical research components, including protocol development, research methodology, population and sampling, data capturing and analysis, presentation skills, and scientific writing. These competencies were delivered through a 10-week online program, accompanied by weekly virtual face-to-face sessions, followed by a six-day intensive in-person workshop held in October in Potchefstroom, South Africa.
METHODS
The evaluation of the program spanned its four iterations (2019, 2022, 2023, and 2024). Data were collected on participant demographics and progress. Descriptive feedback from the participant's evaluation of the program was analysed quantitatively and qualitatively.
RESULTS
Since its inception, 79 participants from 15 African countries have completed the program, with Ghana, South Africa, Kenya, and Nigeria contributing the highest numbers. The mean age of participants was 36.8 years, and 57% were female. Notably, nine participants have successfully completed their PhDs since attending the program.
Descriptive feedback from participants highlighted the program's value, with words such as informative, insightful, challenging, practical, interactive, and fun recurring frequently. These reflections underscore the program's ability to foster personal and professional growth while maintaining an engaging and supportive environment. The need for continued mentoring and support after the program was a common request from participants.
CONCLUSIONS
The Support Program for PhD Students in Africa has proven to be an effective initiative, addressing critical gaps in doctoral training. By providing robust methodological training and fostering a collaborative network of early-career researchers, the program enhances the capacity for high-quality, impactful research. Future iterations will continue to build on participant feedback and explore expanded access to further amplify its reach and impact.
CONFLICTS OF INTERESTS
No conflict of intererst for any of the authors. Declaring that funding for this program has come from various funders, including North-West University, The Nutricia Research Foundation, Gioventu Foundation, Van Dam Foundation and partial self-funding by the participants and their institutions.

MOTHERS' DIETARY BELIEFS ABOUT COMPLEMENTARY FEEDING IN HIGH ANDEAN AREAS IN AN UPPER MIDDLE-INCOME COUNTRY

Mercedes Maravi Castro[1]; Rocio Vasquez-Rojas[1]; Wendy Arquinigo-Cueva[1]; Camila Travezaño-Ambrosio[1]; María Miranda-Romero[1]; Sissy Espinoza-Bernardo[1]
[1]Departamento de Nutricion, Universidad Nacional Mayor de San Marcos, Lima, Peru

BACKGROUND AND OBJECTIVES
Currently, social and cultural beliefs (symbolisms), related to food, are studied, as they influence the choice and exclusion of food. The beginning of children's nutrition should be understood in its context (cultural and ethnic), mainly in the value attributed to food. It is important to study beliefs, since they generate resistance to the recommendations given on infant feeding. The aim of the study was to identify the dietary beliefs of mothers of children aged 6 to 23 months attending health facilities in high Andean areas of an upper middle-income country
METHODS
Qualitative, descriptive study with mother-child dyads, developed between October 2023 to January 2024. Twenty semi-structured interviews were applied to mothers of children aged 06 to 23 months in health facilities in high Andean areas of a LIMC
RESULTS
Dietary beliefs regarding complementary feeding were positive and negative. The former were related to the well-being of the organism, offering granadilla and chairo (based on dehydrated tuber) as stomach protector at the beginning of feeding, and other foods considered to have healing properties.
In the negative beliefs, they avoided citric fruits and eggs, because of possible damage to teeth and colic respectively; also Andean grains treated with lime because of damage to bones; foods such as sangrecita, cheese and banana because they affected the development of speech. Before 6 months they introduced liquid foods early due to possible cravings or hunger.
CONCLUSIONS
In the positive beliefs, foods were considered for their attributes (nutritional value, physical aspects and healing effects). In the negative beliefs, foods were avoided because they could affect the organism or its development

MEDITERRANEAN DIETARY PATTERN IS ASSOCIATED TO MENTAL HEALTH SYMPTOMS IN A BRAZILIAN SAMPLE OF ADULTS: CROSS-SECTIONAL ANALYSIS FROM CLINICAL CARE SETTING

Lara Cristine Natacci[1]; Ana Carolina Leme[1]; Leonardo Dias Negrão[1]; Daniela Hessel Olivetti[1]; Flavia Mori Sarti[2]; Elizabeth Aparecida Ferraz Da Silva Torres[1]
[1]Nutrition, Universidade de São Paulo, São Paulo, Brazil; [2]School of Arts, Science and Humanities, Universidade de São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
The Mediterranean dietary pattern has been associated with positive mental health symptoms outcomes, however, studies from countries that are not from the Mediterranean region showed mixed RESULTS. Thus, evaluating the Mediterranean dietary patterns with mental health in a country other than the Mediterranean region, i.e., Brazil, can provide direction to target strategies.
METHODS
A cross-sectional study with 199 (71.36% females; Mage= 31.34±9.12yo) individuals from a clinical care setting in São Paulo, Brazil, was carried out. Anxiety and depression were evaluated using the Becky inventories and sleepiness with the Epworth Sleepiness Scale. A 78-item food frequency questionnaire was used to calculate the Mediterranean dietary score (MDS). Descriptive statistics and linear regression models were used to verify possible associations. The significant tests were set at $p<0.05$ and performed in R Studio (version 2023).
RESULTS
Participants' mean score for MDS was 4.89/9 showing that younger adults presented better adherence than older adults. Individuals in the highest vs. lowest tercile for total MDS provided an increased prevalence for meeting fruits (51.52 vs. 22.22%), vegetables (52 vs. 26%), beans (49 vs. 23%), cereals (46 vs. 34%), mono-unsaturated/saturated ratio (54.46 vs. 20.79%) and dairy products (45 vs. 30%). After adjustment for potential confounding factors, individuals in the highest tercile of adherence to MDS were less likely to have depressive symptoms (ß = -2.99; 95%CI -5.61; -0.39). For anxiety and sleepiness symptoms, respectively, non-significant negative (ß = -2.52; 95%CI -5.35; -0.30) and positive (ß = -0.59; 95%CI -0.62; 1.78) associations were found with total MDS.
CONCLUSIONS
The Mediterranean dietary pattern, when assessed among Brazilian adults, showed associations consistent with findings from studies conducted in the Mediterranean regions, particularly in the protective potential role against depressive symptoms. This could be explained by similarities in dietary habits, such as the widespread availability and consumption of fruits and vegetables in Brazil, which contribute to a higher-quality diet and favourable mental health outcomes. However, to strengthen these findings and explore potential cultural and regional differences further, future research with larger, more diverse samples and longitudinal designs is essential.

INNOVATIVE LASER HEIGHT AND LENGTH MEASURING DEVICE FOR CHILDREN TESTED IN VIETNAM

Diane Baik[1]; Anh Vu Nguyen[2]; Thanh Nguyen[2]
[1]Health and Nutrition, World Vision International, Monrovia, United States of America; [2]Health and Nutrition, World Vision Viet Nam, Hanoi, Vietnam

BACKGROUND AND OBJECTIVES
Accurate anthropometric measurements are essential for proper nutrition assessments, and timely referral of malnourished children to health services. Height/length measurement is important for indicating if a child is wasted and/or stunted. Height/length has always been the most difficult anthropometric measurement to take accurately because children sometimes refuse to be placed on the gold standard wooden height boards, young children cannot stand still, tape measurements are difficult to read, and measurers lack capacity to ensure all steps are followed in measuring height or length accurately. The wooden height boards are also large and heavy to carry in the field. To date, different technologies were used to improve accuracy of height/length measurement, but none have been successful in ensuring ≥99% accuracy and precision. A patented innovative triple laser technology was used to develop a prototype laser device (LD) and was tested in Vietnam in this validation study.
METHODS
With proper training, one group of master measurers and one group of CHVs (3 people each) took length/height measurements two separate times with a wooden height board (WHB) and LD at a growth monitoring and promotion site and a third time when the difference between the first and second measurement was greater than 0.7 cm (1). A total of 85 children 6-59 months was measured in Dakrong and Huong Hoa community. Inter-Technical Error of Measurement (TEM) and Intra-TEM was measured using the Bland-Altman Bias and Lin's Concordance Correlation Coefficient to measure accuracy and precision, respectively.
RESULTS
The correlation between the WHB and LD was very high (OCCC≥0.997) showing greater than 99% precision when using both the WHB and laser device to measure length and height. For accuracy, the inter-TEM and intra-TEM were all within the acceptable threshold of 0.7cm difference for length and height measurements for both the expert and CHW measurements. The laser device further saved about 30% time in height and length measurements per child.
CONCLUSIONS
The triple laser technology shows promising accuracy and precision in measuring lengths and heights of children in low- and middle- income countries even when CHVs are measuring. The new LD design is much lighter in weight, easy to transport, and lower in cost than the WHB. Thus, the LD seems to be a viable alternative to the WHB. Further research with a larger sample size would help the validation of the device further.

MOBILE PHONES REDUCE VOLUNTEER WORKLOAD AND CHILD MALNUTRITION IN PERI-URBAN CAMBODIA'S POSITIVE DEVIANCE HEARTH PROGRAM

Diane Baik[1]; Melissa Young[2]; Kathryn Reinsma[1]; Chhorvann Chhea[3]
[1]Health and Nutrition, World Vision International, Monrovia, United States of America; [2]Hubert Department of Global Health, Rollins School of Public Health, Emory University, Atlanta, United States of America; [3]Public Health, National Institute of Public Health, Phnom Penh, Cambodia

BACKGROUND AND OBJECTIVES
Child undernutrition in Cambodia is a persistent public health problem requiring low-cost and scalable solutions. Rising cellphone use in low-resource settings represents an opportunity to replace in-person counseling visits with phone calls; however, questions remain on relative effectiveness. Our objective was to evaluate the impact of two options for delivering a World Vision infant and young child feeding (IYCF) counseling program: 1) traditional Positive Deviance/Hearth (PDH) program with in-person visits or 2) PDH with Interactive Voice Calling (PDH-IVC) which integrates phone calls to replace 62.5% of face-to-face interaction between caregivers and volunteers, compared to the standard-of-care (SOC).
METHODS
A longitudinal cluster-randomized controlled trial was conducted with 361 children aged 6-23 months. An adjusted difference-in-difference approach was used comparing baseline with midline (3 months) and endline (12 months) surveys to evaluate impact on child growth among the three groups.
RESULTS
At baseline, nearly a third of children were underweight and over half were food insecure. At midline the PDH group and the PDH-IVC groups had improved weight-for-age z-scores (0.13 DID, p=0.011; 0.13, p=0.02, respectively) and weight-for-height z-score (0.16 DID, p=0.038; 0.24, p=0.002), relative to SOC. There were no differences in child height-for-age z-scores. At endline, impact was sustained only in the PDH-IVC group for weight-for-age z-score (0.14, p=0.049) and the prevalence of underweight declined by 12.8 percentage points (p=0.036), relative to SOC.
CONCLUSIONS
Integration of phone-based IYCF counseling or follow-up for nutrition programs may potentially be a promising solution to reduce the burden of in-person visits by community health workers. Furthermore, with the program impact pathway analysis conducted for this study, caregiver mental health may have resulted in the modest improvements in child nutrition suggesting the need to combine PDH with other mental health interventions in Cambodia's setting to improve child nutrition.

ASSOCIATIONS BETWEEN LIVE DIETARY MICROBE INTAKES AND HEALTH OUTCOMES, ANALYSES OF THE KHANES 2016-2020 DATA

Yue Zhan,[1]; Naisi Zhao,[2]; Jihee Choi,[3]; Hae-Jeung Lee,[3]; Mei Chung[1]
[1]Friedman School of Nutrition Science and Policy, Tufts University, Boston, United States of America; [2]Department of Public Health and Community Medicine, School of Medicine, Tufts University, Boston, United States of America; [3]Department of Food and Nutrition, Gachon University, Seongnam-si, Korea, Republic of

BACKGROUND AND OBJECTIVES
The consumption of live microbes, beyond probiotics, is associated with health benefits (1,2). This study aimed to quantify live microbe intake in 2016-2020 Korea National Health and Nutrition Examination Survey (KNHANES), and to investigate the associations between live microbe intake and health outcomes.
METHODS
We developed a KNHANES live microbe classification system based on the Sanders system (3) and divided KNHANES food codes that overlapped with NHANES into four categories: no live microbe or low (<10^4 CFU/g), medium (10^4–10^7 CFU/g), and high (>10^7 CFU/g) levels. Microbe data on various types of kimchi were obtained from World Kimchi Institute and data on other non-overlapping food codes were determined based on literature and authoritative reviews. We performed descriptive analyses on live microbe intakes among adults aged 19 years and older. We then conducted survey-weighted adjusted regression analyses to evaluate the relationship between live microbe intake and cardiometabolic health outcomes (cholesterols, tryglycerides, blood pressure, fasting blood sugar, C-reactive protein, and waist circumference), controlling for age, sex, body mass index, household income, physical activity level, current smoking status, and alcohol intake.
RESULTS
The mean daily intake of medium live microbe foods was 179.48 g in Korean population, while high live microbe foods averaged 122.49 g. Kimchi contributed a significant portion, with a mean intake of 102.44 g. An additional 100-g intake of medium or high live microbe–containing foods was associated with a lower C-reactive protein (coefficient: -0.006; 95% CI: -0.01, -0.002 mg/dL). The association was larger for kimchi foods (coefficient: -0.044; 95% CI: -0.05, -0.039 mg/dL). No significant associations were found with other outcomes.
CONCLUSIONS
This study provides new data on dietary intakes of live microbes and their potential health benefits in a nationally representative data set of Korean adults.

Table 1. Adult intake of foods with live microbes (g/d), KNHANES 2016-2020

Food category	No. of subjects	Mean	Median	75th %tile	90th %tile
Medium	24,505	179.48	38.30	223.85	594.66
High	24,291	122.49	86.00	173.20	281.00
Kimchi	23,336	102.44	73.28	145.50	243.00
Non-kimchi High	5,741	20.05	0.00	0.00	72.61

EPO5_664

PREVALENCE OF VITAMIN A DEFICIENCY AND ASSOCIATED RISK FACTORS IN MONGOLIAN CHILDREN AGED 6-59 MONTHS: FINDINGS FROM MONGOLIA'S VI NATIONAL NUTRITION SURVEY, 2023

Tsend-Ayush Munkhsaikhan[1]; Amarsanaa Byambadorj[1]; Bolormaa Norov,[1]; Bayasgalan Jambaldorj,[1]; Batjargal Jamiyan,[1]; Delgermaa Dashzeveg[1]; Ganzorig Tumurkhuyag[1]; Oyundelger Dechinjamts[1]; Tuul Bayarmagnai[1]; Tuvshinbayar Bayaraa[1]; Unursaikhan Surenjav,[2]
[1]Department of Nutrition and Food Safety, National Center for Public Health, Ulaanbaatar, Mongolia; [2]Director, National Center for Public Health, Ulaanbaatar, Mongolia

BACKGROUND AND OBJECTIVES
Vitamin A deficiency (VAD) is a significant public health concern, particularly in low- and middle-income countries. It is the leading preventable cause of childhood blindness and a major factor influencing the overall health, growth, and survival of children. Insufficient levels of Vitamin A adversely affect growth and development, leading to stunting and other long-term health and developmental challenges (1). This study aimed to determine the prevalence of Vitamin A deficiency among Mongolian children aged 6-59 months, as well as the risk factors associated with that prevalence.
METHODS
The Sixth National Nutrition Survey, conducted in 2023, was a cross-sectional study encompassing all 21 provinces and 8 districts of Ulaanbaatar, Mongolia. A two-stage cluster sampling approach was employed, with households containing at least one child under the age of five serving as the random sampling unit. A total of 1,271 children aged 6–59 months participated in the blood test analysis. Serum retinol levels below 0.7 µmol/L were used to define Vitamin A deficiency. Data were analyzed using descriptive statistics and logistic regression models.
RESULTS
The prevalence of Vitamin A deficiency was 7.1%, and insufficiency was 57.9%. Children aged 6–23 months had a significantly higher risk of Vitamin A deficiency compared to those aged 24–59 months (AOR 1.704). Male children (AOR 1.813) and children from minor ethnic groups (AOR 1.752) were also more susceptible. Furthermore, Vitamin A deficiency was associated with an elevated risk of cough (AOR 1.657). Children who had not received high-dose Vitamin A supplementation were at an increased risk of deficiency (OR 1.704). Compared to global prevalence (19.53%) of under-five Vitamin A deficiency in 2019, Mongolian children had lower prevalence (7.1%).2 Specifically, the prevalence was notably lower than low socio-demographic index (SDI) regions (29.67%) and comparable to high-middle SDI regions (5.17%).
CONCLUSIONS
According to Mongolia's Fifth National Nutrition Survey (2017), the prevalence of Vitamin A deficiency was 9.3%, and insufficiency was 61.9%. These figures have decreased in subsequent surveys, likely due to the implementation of the nationwide high-dose Vitamin A supplementation program since 2013.3 Evaluating the accessibility and coverage of national Vitamin A supplementation distribution, as well as assessing the actual intake by children, is necessary to ensure the effectiveness of the intervention.

USE OF LINEAR PROGRAMMING FOR OPTIMIZING THE FOOD BASKET TO IMPROVE THE MICRONUTRIENT INTAKE OF CHILDREN AGED 6 TO 59 MONTHS IN THE NIAYES AGRO-ECOLOGICAL ZONE IN SENEGAL

Cheikhou Tidiane Willane[1]; Papa Mamadou Dit Doudou SYLLA[2]; Mbeugué Thiam[1]; Babacar Mbaye Ndiaye[3]; Laure Tall[4]; Olouwafemi Mistourath Mama[1]; Nicole Idohou-Dossou[1]; Adama Diouf[1]
[1]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Universite Cheikh Anta Diop, Dakar, Senegal; [2]Departement de Technologies Agro-alimentaires, Université Gaston Berger, Saint-Louis, Senegal; [3]Laboratoire de Mathématiques de la Décision et d'Analyses Numérique/FASEG, Université Cheikh-Anta-Diop, Dakar, Senegal; [4]Initiative Prospective Agricole et Rurale, Initiative Prospective Agricole et Rurale, Dakar, Senegal

BACKGROUND AND OBJECTIVES
Micronutrient deficiencies are a public health problem worldwide. In Senegal, children are especially affected particularly in rural setting. Household diets are often insufficient to cover children's daily nutrient requirements. The aim of this study was to assess the adequacy of micronutrient intakes among children 6-59 months and use linear programming to develop a food basket low cost and nutritionally adequate for these children in the Niayes agro-ecological area.
METHODS
A cross-sectional study targeting 15 children aged 6-59 months randomly selected from the Niayes household was conducted. All foods consumed (morning to bedtime) by the child were weighed using a precision food scale. The composition of mixed dishes was recorded and the ingredients weighed before and after cooking. The quantities of food consumed were obtained by multiplying the weight of a standard handful/spoon (with all the ingredients usually consumed by the child) by the total number of handfuls/spoons ingested. Food intakes were estimated on a raw weight basis and nutrient intakes were determined using the West African food composition table FAO/INFOODS. Micronutrient intake adequacy (MIA) was assessed based on FAO/WHO and Institute Of Medicine reference standards. Foods available were listed from different food retailers. Between 1 to 3 different prices (per kilogram or liter) were collected for each food (99 items), and the average price was used to create the food basket. Linear programming method was used to optimize food basket.
RESULTS
The household diet covers more than 50% energy and protein, 50% iron and 100% vitamin A requirements of the children 6-59 months. While daily median intakes of calcium, zinc and vitamin B9 were lower than the Recommended Dietary Allowances and cover only around 30% of these micronutrients requirements. The optimized food basket was composed of 11 items and costs 359 XOF (~0.59 USD). It covers 100% of energy (1491 kcal) and 100% of calcium (500 mg) requirements and more than 150% of protein (281 g), iron (8 mg) and zinc (6 mg) daily requirements.
CONCLUSIONS
Inadequacy of several nutrients intakes were apparent among Niayes households. Linear programming can provide guidelines for promoting affordable, healthy, and sustainable diets. In addition, the integration of community-based nutrition interventions targeting dietary diversification and nutrition-related knowledge and attitudes is essential for improving complementary feeding practices among 6-59 months.

IMPACT OF MULTIMODE SYSTEMIC PRE-CONCEPTION NUTRITION EDUCATION ON IMPROVING DIETARY INTAKE AND NUTRIENT STATUS IN WOMEN UNDERGOING FERTILITY TREATMENT AT A TERTIARY CARE CENTRE

Janaki Srinath Puskuri[1]; Prachi Gattani[1]; Sucharita Devi T[1]; Prasuna M.[1]; Vyjayanthi Srinivasan[2]
[1]Department of Foods & Nutrition , Faculty of Community science, Professor Jayashankhar Telangana Agriculture University, Hyderabad, India; [2]Department of Reproductive medicine and surgery, Krishna Institute of medical sciences, Hyderabad, India

BACKGROUND AND OBJECTIVES
Developmental biology research and epidemiological evidence indicate that improving women's nutritional status before pregnancy benefits both maternal and infant health I Women undergoing fertility treatment often experience nutritional inadequacies, despite the fact that they are always in prenatal state,increasing the risk of adverse pregnancy outcomes. Present study aims to evaluate the impact of multimode systemic pre-conception nutrition education interventions on food group and nutrient intake.
METHODS
A quasi-experimental study was conducted with 100 women undergoing fertility treatment at a Fertility Centre, randomly divided into control (n=50) and experimental (n=50) groups. Dietary intake was assessed using 24-hour recall and a 3-day food record. Over five months, the experimental group received multi mode systemic pre-conception nutrition education, through booklets, nutrition sessions, diet displays, personal counseling, tailored diet palns and reviews, while the control group followed routine hospital care.
RESULTS
: Significant improvements were observed in the experimental group following nutritional intervention when compared to control group. Using 24 hrs recall method, the intake of all 9 food groups was increased in experimental group while in control group the intake of only 6 food groups was increased and intake of 3 food groups was decreased, intake of 23 nutrients was increased in experimental group and only 1 nutrient intake was decreased while in the control group increase in intake of only 10 nutrients was observed, decrease in intake of 12 nutrients was seen and similar intake was observed in 2 nutrients. Using 3 day food record, the experimental group saw an increase in intake 8 food groups except fats and oils whose intake was reduced while in control group only 5 food groups were increased and 4 food groups were decreased, in experimental group increase in intake of all 23 nutrients and only a nutrient was decreased as compared to control group where only 7 nutrients were increased and 11 nutrients were decreased while no change was observed in intake of 6 nutrients.
CONCLUSIONS
The findings indicate that pre-conception nutritional intervention executed using nutrition booklets, nutrition sessions, diet display, diet counselling and diet reviews significantly improved both food group and nutrient intake Such systemic interventions during the preconception and prenatal phases can help address nutritional deficiencies and support better health outcomes having trans generational impact.

RELATIONSHIP BETWEEN ALTERATIONS IN BODY IRON STATUS AND NUTRIENT INTAKE IN FEMALE FOOTBALLERS WITH IRON DEFICIENCY

Yuki KOKUBO[1]; Hiroka Ohno[1]
[1]Food and Health Sciences, Aichi Shukutoku University, Aichi, Japan

BACKGROUND AND OBJECTIVES
Iron deficiency (ID) is a long-standing health issue in athletes, affecting performance and health. Studies on dietary measures for ID in female athletes recommended adequate energy, protein, and iron intake. Most of these studies focused on aesthetic and endurance athletes, with few involving other athletes. Dietary approaches to ID may differ based on athletic characteristics. This study assessed the relationship between alterations in body iron status and nutrient intake in female football players with ID.

METHODS
The study involved 36 Japanese amateur football players (mean±standard error; age: 23.4±2.8 years; years of athletics: 16.3±2.7; and body mass index: 21.3±2.0 kg/m^2), who volunteered from 2022 to 2024. Each year, body composition, dietary surveys, and haematological parameters were measured in March before the league started and in July during the league. The dietary survey used was a brief, self-administered diet history questionnaire. In March, the subjects were divided into two groups: ID group (n = 12) and normal (N) group (n = 24). Their nutrient intakes were compared. Alterations over a 4-month period were calculated, and the relationship between ferritin levels and nutrient intake was examined in the ID and N groups. The presence of ID was defined as either a haemoglobin level < 12 g/dL or a ferritin level < 35 ng/mL.

RESULTS
Twelve participants (33 %) had ID before the start of the league. Of these, six (17 %) had returned to the normal range of body iron status after 4 months. There were no significant differences in energy, protein, or iron intake between the two groups before the league began. No significant correlation was observed between ferritin levels and nutrient intake in terms of alterations over the 4-month period. However, in the ID group, a trend was observed between alterations in ferritin levels and protein intake (r = 0.556, p = 0.055). A comparison of nutrient intake in the ID group that was subdivided into six participants whose body iron status recovered after four months (ID-N group) and six participants who remained ID (ID-ID group), revealed that the alterations in protein intake were significantly higher in the ID-N group than that in the ID-ID group (0.31 g/kg BW vs. -0.145 g/kg BW, p = 0.015). No significant differences in alterations in iron intake were observed between the two groups.

CONCLUSIONS
The increased protein intake is likely associated with the restoration of body iron status in female footballers with ID.

OBSERVATION OF DIURNAL VARIATION IN SALT EXCRETION USING A SALT EXCRETION SELF-MEASURING DEVICE

Nozomi Morikawa[1]; Kotaro Yamasue,[2]; Osamu Tochikubo,[2]
[1]Food and Health Sciences, Jissen Women's University, Hino, Japan; [2]Public Health, Yokohama city university, Yokohama, Japan

BACKGROUND AND OBJECTIVES
We have developed a salt excretion self-measuring device (hereafter referred to as “salt monitor”) and have reported that it can assess salt excretion over 24 hours, similar to the conventional urine storage method. This device can measure the urine volume and salt excretion during urination in a short time. In this study, we attempted to use this method to determine diurnal variations in urinary salt excretion.

METHODS
Data from a salt monitoring validation study involving 20 healthy Japanese female volunteers were analyzed in detail. Participants measured and recorded urinary salt excretion, urine volume, and urinary time over 24 hours from the second urination after waking up on the measurement day to the first urination the next morning on eight non-consecutive days. Salt concentration (mmol/L) was calculated based on the amount of salt excreted and urine volume. In addition, to account for the urinary interval, salt excretion per hour (g/h) was calculated by dividing the amount of salt excreted during urination by the time elapsed since the previous urination. Observations of these indices focused on 1) all urination points hourly and 2) four points of urination for each participant: the second urine after arising, third urine after arising, final urination before bedtime, and first urine the next morning (nighttime urine). The study protocol was approved by the Ethics Committee of the Jissen Women’s University (approval no. H2021-05).

RESULTS
A total of 875 urinary data points for 157 days were analyzed. The 20 participants had a mean frequency of urination of 5.6 ± 1.6 times, a mean daily urine output of 1,201 ± 365 mL, and a mean salt excretion of 7.0 ± 1.8 g. The mean urine output per urination was 247 ± 54 mL, salt excretion was 1.38 ± 0.42 g, and salt concentration was 101 ± 28 mmol/L. The mean urine volume and salt excretion for all urine samples peaked early in the morning, whereas salt excretion per hour of urine storage (g/h) was higher in the early afternoon. The same trend was observed at the four main measurement points, with higher salt excretion (g/h) in the third urine samples after arising.

CONCLUSIONS
Diurnal variation in salt excretion could be observed by combining the urinary data obtained using the new salt monitor with the recording of the time of urination. In the study participants, urinary salt excretion in a single urination session was highest in the early morning and, when urinary storage elapsed time was considered, in the early afternoon. The salt monitor is expected to be useful for observing an individual's salt excretion rhythm.

DESIGN AND VALIDATION OF DRUG DELIVERY SYSTEM INCORPORATING GYMNEMA SYLVESTRE FOR DIABETES MELLITES

Uthra B[1]; Raajeswari Paramashivam[1]
[1]Food Science and Nutrition, Avinashilingam University, Coimbatore, India

BACKGROUND AND OBJECTIVES

Diabetes mellitus is a global health challenge requiring innovative therapeutic strategies to improve glycemic control and enhance patient compliance. This study aims to develop and evaluate a novel drug delivery system that integrates the antidiabetic properties of *Gymnema sylvestre* with the functional benefits of resistant starch extracted from barnyard millet.

METHODS

Gymnema sylvestre leaves were processed into aqueous extracts, and their antidiabetic and functional properties were analyzed. Resistant starch type 3 (RS3) was enzymatically extracted from barnyard millet, and its amylose content and functional properties were evaluated. Films and capsules containing RS3 and *Gymnema sylvestre* extract were fabricated using casting and dipping methods, followed by controlled drying. In silico studies examined interactions between gymnemic acid and sweet taste receptors (T1R2, T1R3) and diabetes-related proteins (INSR, IRS, PI3K, GLUT-4, AMPK). The release profile of gymnemic acid was assessed using simulated gastrointestinal fluids (SGF and SIF) to mimic physiological conditions.

RESULTS

Aqueous extracts of *Gymnema sylvestre* leaves showed potent antidiabetic activity, inhibiting alpha-glucosidase (IC50=55.35±1.22) and alpha-amylase (IC50=53.9±3.15), helping reduce postprandial glucose spikes. Proximate analysis revealed nutritional content, including 9.94% protein, 10.7% fiber, 752 mg calcium, antioxidant activity (57.1±2.17%) and phenols (18.9±1.93mg/g). FTIR and XRD confirmed key functional groups in resistant starch from barnyard millet, while FESEM showed structural modifications. In silico studies highlighted strong interactions between gymnemic acid and sweet taste receptors and key proteins. Gymnemic acid released in SGF(pH 1.2) was minimal (10%) at 1 hour, but in SIF(pH 6.8) the cumulative release reached 80% after 4 hours. Sensory analysis indicated a significant reduction in sweetness perception from 8.2 ± 0.5 to 2.1 ± 0.3 after exposure to the Gymnema-based film.

CONCLUSIONS

This study lays the foundation for using *Gymnema sylvestre* and resistant starch in novel drug delivery systems. The dual-action approach, combining targeted intestinal release via capsules and taste receptor modulation through films, offers a promising strategy to improve glycemic control and patient compliance.

DIETARY POLYPHENOL INTAKE AND RISK OF OVERALL AND SITE-SPECIFIC CANCERS: THE JAPAN PUBLIC HEALTH CENTER-BASED PROSPECTIVE STUDY

Madoka Kishino[1]; Rieko Kanehara[1]; Nagisa Mori[2]; Junko Ishihara[3]; Ribeka Takachi[4]; Taiki Yamaji[5]; Motoki Iwasaki[6]; Shoichiro Tsugane[5]; Norie Sawada[5]
[1]Division of Cohort Research, National Cancer Center Institute for Cancer Control, Chuo City, Japan; [2]Stony Brook Cancer Center, Stony brook University, New York, United States of America; [3]Graduate School of Environmental Health, Azabu University, Sagamihara, Japan; [4]Department of Food Science and Nutrition Faculty of Human Life and environment, Nara Women's University, Nara, Japan; [5]Institute for Cancer Control, National Cancer Center Japan, Chuo, Japan; [6]Division of Epidemiology, National Cancer Center Japan Institute for Cancer Control, Tokyo, Japan

BACKGROUND AND OBJECTIVES
Polyphenols may play a protective role in carcinogenesis through a wide range of properties, including antioxidant and anti-inflammatory. Although several studies have investigated the association between polyphenol intake and cancer risk in Western populations, there is limited evidence in Asian populations, where different food sources of polyphenols, such as soy and green tea, are consumed. This population-based prospective study aimed to investigate the association between polyphenol intake and risk of overall and site-specific cancers among Japanese.

METHODS
Participants were 42,012 men and 48,337 women aged 45-74 years with no history of cancer diagnosis in the Japan Public Health Center-based (JPHC) Prospective Study. Dietary polyphenol intake was estimated by a 147-item food frequency questionnaire administered in 1995-1998. Participants were divided into quintiles (Q) according to intakes of total polyphenol and polyphenol from foods without high-polyphenolic beverages (tea, coffee, and alcoholic beverages). Hazard ratios (HRs) and 95% confidence intervals (CIs) for cancer risk were estimated using Cox proportional hazard regression models adjusted for potential confounders.

RESULTS
During a median of 15.8 years of follow-up, 16,319 incident cancer cases (9,960 men and 6,359 women) were identified. We did not observe associations of lower risk of overall cancer with polyphenol intake. For site-specific cancers, as compared with the lowest quintile (Q1), higher total polyphenol intake was associated with a lower risk of liver cancer in men (HR for Q5=0.62, 95% CI=0.46-0.84, p-trend<0.001) and women (HR for Q5=0.59, 95% CI=0.37-0.95, p-trend=0.002), while higher polyphenol intake from foods without tea, coffee and alcoholic beverages was associated with a lower risk of colon cancer in men (HR for Q5=0.71, 95% CI=0.54-0.94, p-trend=0.04).

CONCLUSIONS
The RESULTS of the present study do not support a substantial role for dietary polyphenols in overall cancer prevention. Total polyphenol may reduce the risk of liver cancer, and polyphenol intake from foods without tea, coffee, and alcoholic beverages may reduce the risk of colon cancer.

ASSOCIATIONS BETWEEN DIETARY PATTERNS AND PSORIASIS RISK: A PROSPECTIVE COHORT STUDY FROM THE UK BIOBANK

Ruotong Zhang[1]; Yifan Xu[1]; Bochen Li[1]; Rachel Gibson[1]; Alexandru Dregan[2]; Sylvia Zanesco[1]; Thivi Maruthappu[1]; Wendy L. Hall[1]
[1]Department of Nutrition, King's College London Waterloo Campus, London, United Kingdom; [2]Department of Psychological Medicine, King's College London Waterloo Campus, London, United Kingdom

BACKGROUND AND OBJECTIVES
Psoriasis is an inflammatory skin disease, presenting as elevated and red cutaneous lesions, adversely impacting people's quality of life. Given the link between diet and inflammation and the unclear role of diet quality in the onset of psoriasis (1), this study used the large-scale UK Biobank to explore the association between dietary patterns and psoriasis incidence (2).

METHODS
The study included UK Biobank participants who were initially free of psoriasis and followed for an average of 14 years. Participants in this analysis were free from chronic inflammatory infectious disease (HIV and chronic viral hepatitis) and had completed at least two 24-hour dietary recalls. Nine diet quality indices were computed, including the Low Carbohydrate Diet Score (LCDS), Alternative Mediterranean Diet (aMed) Score, Eatwell Score, Alternative Binary Eatwell Score, Alternative Graded Eatwell Score, Healthy Diet Index (HDI), Alternative Healthy Eating Index (aHEI), Dietary Approaches to Stop Hypertension Score (DASH), Dietary Inflammatory Index (DII), and Plant-Based Diet Index (PDI) to account for the known link between alcohol and psoriasis risk (3). The primary outcome of this study was the incidence of psoriasis, determined through self-reported diagnosis, primary care records, and hospital admission data.

RESULTS
Among the 121,584 participants, 1,073 developed psoriasis, yielding an incidence rate of 0.88%. The mean age (SD) was 56.2 (7.8) years, with 54.8% (n = 60,341) being female, and the majority of participants (96.8%) identifying as White. In the multivariable model adjusted for age, sex, Townsend deprivation index, SES, physical activity, smoking, alcohol use, supplement intake, comorbidities, and BMI (Model 2), higher PDI scores (range: 18–90), specifically within the highest quartile (Q4: 58–80), were associated with an 18% reduced risk of incident psoriasis (HR: 0.82, 95% CI: 0.67–1.00, P = 0.045) compared to the lowest quartile (Q1: 29–51). Each 1-point increase in PDI was linked to a 2% lower psoriasis risk (HR: 0.98, 95% CI: 0.97–1.00, *P* = 0.008). Other diet quality indices were not associated with psoriasis incidence.

CONCLUSIONS
In this large cohort, greater adherence to the PDI was associated with lower risk of psoriasis, suggesting the potential benefits of plant-based diets in reducing psoriasis risk. Future research should prioritize randomized controlled trials to confirm this relationship.

UNHEALTHY EATING BEHAVIOR AFFECTING DYSLIPIDEMIA OF FAMILY CHEFS: AN EMPIRICAL STUDY IN BEIJING, CHINA

Jiali Duan[1]; Liyu Huang[1]; Yiran Li[2]; Bo Yu[1]; Yan Zhang[1]
[1]Institute for Nutrition and Food Hygiene, Beijing Center for Disease Prevention and Control, Beijing, China; [2]School of Public Health, Hebei Medical University, Hebei province, China

BACKGROUND AND OBJECTIVES
This research aims to investigate the relationship between unhealthy eating behavior and dyslipidemia in family chefs and to provide the scientific basis for formulating and implementing relevant behavioral interventions.

METHODS
A cross-sectional study was conducted in Beijing from May to November 2023.Demographic characteristics,the prevalence of dyslipidemia and bad eating behaviors were collected through a self-reported questionnaire.Multivariate unconditional logistic regression wasused to analyze the impact of poor dietary behavior by family chefs on blood lipid abnormalities.

RESULTS
A total of 1037 family chefs were included,of which 237 reported dyslipidemia,the prevalence rate was 22.9%.Moreover,after adjusting for gender, region, education level, age, overweight and obesity, hypertension, diabetes, and concern about nutrition and health, the participants wish to understand the dietary Guidelines for hyperlipidemia.The RESULTS of multivariate Logistic regression analysis indicated that the risk of dyslipidemia of family chefs with overeating behavior was less (*OR*=0.533,95%*CI*:0.301-0.945),eating more meat (*OR*=1.529,95%*CI*:1.031-2.267), eating less aquatic products (*OR*=1.683,95% *CI*:1.206-2.348),eating less vegetables (*OR*=1.676,95%*CI*:1.099-2.557).The risk of dyslipidemia was higher in family chefs with a high salt diet (*OR*=2.871,95% *CI*:1.924-4.284), with statistical significance (*P*<0.05).

CONCLUSIONS
Unhealthy eating behaviors of family chefs are common.Specifically, the behavior of eating more meat, less aquatic products, less vegetables, and a high salt diet can affect the incidence of dyslipidemia, hence targeted behavioral intervention should be carried out.

UNDERSTANDING THE RELATIONSHIP BETWEEN DIETARY NUTRIENTS AND METABOLIC SYNDROME: A NEW PERSPECTIVE FROM NETWORK ANALYSIS

Jiali Duan[1]; Jiajie Yu[2, 3]; Ningsu Chen[2]; Liyu Huang[1]; Kai Zhao[2]; Yimei Sha[1]; Mengnan Zhao[2]; Yihong Yao[1]; Yana Qi[2]; Yan Zhang[1]; Bo Yu[1]; Hairong He[1]
[1]Institute for Nutrition and Food Hygiene, Beijing Center for Disease Prevention and Control, Beijing, China; [2]Department of Clinical Nutrition, West China Hospital,Sichuan University, Chengdu, China; [3]Center of Clinical Epidemiology and Evidence-Based Medicine, West China Hospital,Sichuan University, Chengdu, China

BACKGROUND AND OBJECTIVES
Metabolic syndrome (Mets) is a major public health challenge, closely linked to dietary energy intake, eating behaviors, and nutrient composition. Traditional linear models, which assume independence of effects, are suboptimal due to the interdependent nature of nutrient consumption. The associations between Mets and individual nutrient remain underexplored.

METHODS
We employed data from the China Nutrition and Health Surveillance (CNHS), a national survey on nutrition and chronic diseases. A semiparametric Gaussian copula model was used to estimate nutrient interactions related to metabolic syndrome across three cross-sectional datasets from Beijing.

RESULTS
A total of 4062 individuals were included (1185 in 2010; 1648 in 2015; and 1229 in 2022), with 1360 diagnosed with Mets. The median age-sex-race-specific metabolic syndrome score was 0.36, and the median total energy intake was 1924 kcal. Strong associations were observed between various nutrients and metabolic syndrome indicators, with over 70% non-zero edges in each network. Non-parametric and case-drop bootstrapping tests confirmed the stability and accuracy of these networks, with a correlation stability coefficient above 0.75. 'Energy' was the most central nutrient with a node Expected Influence Index of 1.59, 1.68, and 1.77 in 2010, 2015, and 2022 waves, respectively, followed by ash, riboflavin, protein, and minerals such as potassium and phosphorus.

CONCLUSIONS
Our findings suggested that energy restricting and balanced supplementation of riboflavin and minerals are important for managing metabolic syndrome.

[1]Department of Food and Nutrition, College of Human Ecology, Seoul National University, Seoul, Korea, Republic of; [2]College of Nursing, Ewha Research Institute of Nursing Science, Ewha Womans University, Seoul, Korea, Republic of; [3]Research Institute of Human Ecology, Seoul National University, Seoul, Korea, Republic of

BACKGROUND AND OBJECTIVES
Gastroesophageal reflux disease (GERD) is a common clinical condition characterized by heartburn or regurgitation. High intakes of acidic beverages, such as coffee, green tea, soda, or juice, have been suggested to be associated with the risk of GERD, whereas dairy intake may reduce the risk. However, prospective studies to confirm these associations are limited. This study aimed to investigate the associations of coffee, green tea, soda, juice, milk, soy milk, and yogurt drinks intakes with GERD incidence using data from the Korea Nurses' Health Study (KNHS).

METHODS
The KNHS included 8,086 women aged 21-50 years who completed a web-based food frequency questionnaire (FFQ) between 2014 and 2019. The participants were followed up through subsequent surveys, which continued until the 11th phase. Intakes of coffee, green tea, soda, juice, milk, soy milk, and yogurt drinks (g/day) were categorized into non-drinkers and quintiles. GERD was defined as a self-reported physician diagnosis. Cox proportional hazards regression model was used to estimate relative risks (RRs) and 95% confidence intervals (CIs).

RESULTS
During a mean follow-up of 5.4 person-years, we identified 1,406 women who reported a diagnosis of GERD. In the multivariable models, we found no associations of coffee, green tea, soda, juice, milk, soy milk, and yogurt drinks intakes with GERD risk. The RRs (95% CIs) for the top quintile of beverage intake compared to non-drinkers were: 0.82 (0.66-1.01) for coffee (*P* for trend = 0.22), 1.12 (0.93-1.34) for green tea (*P* for trend = 0.16), 0.93 (0.74-1.17) for soda (*P* for trend = 0.71), 1.07 (0.84-1.35) for juice (*P* for trend = 0.56), 1.06 (0.87-1.29) for milk (*P* for trend = 0.59), 0.89 (0.74-1.08) for soy milk (*P* for trend = 0.43), and 1.00 (0.84-1.20) for yogurt drinks (*P* for trend = 0.81). In a sensitivity analysis, we included 6,462 participants who completed at least one survey from phases 8 to 11. The associations remained non-significant.

CONCLUSIONS
Intakes of coffee, green tea, soda, juice, milk, soy milk, and yogurt drinks were not associated with the incidence of GERD among Korean women.

EVALUATING ANIMAL MODELS FOR DIABETIC MYOPATHY: COMPARISON OF SKELETAL MUSCLE FUNCTIONS IN TWO DIFFERENT STREPTOZOTOCIN-INDUCED DIABETIC MODELS

Rahmawati Aisyah[1]; Mion Kamesawa[1]; Mayu Horii[1]; Daiki Watanabe[2, 3]; Yuki Yoshida[1]; Kenshu Miyata[1]; Thanutchaporn Kumrungsee[1]; Masanobu Wada[3]; Noriyuki Yanaka[1]

BACKGROUND AND OBJECTIVES
Diabetes is a major cause of mortality globally, and one of the common complications in diabetes is impaired muscle function, also known as diabetic myopathy. Despite being a common complication, the pathophysiology of diabetic myopathy remains unclear. Streptozotocin (STZ) is a commonly used agent to induce diabetes in animal models. Owing to the nonspecific cytotoxicity at high doses, alternative models employing moderate doses or combining low doses of STZ with a high-fat diet (HFD) have been established. Both models are used arbitrarily to study diabetic complications. However, the outcomes of these models on skeletal muscle function are unknown. Thus, this study aimed to investigate the effects of these models on muscle function.

METHODS
Either moderate-dose STZ (100 mg/kg, twice) or a combination of low-dose STZ and high-fat diet (50 mg/kg for 5 consecutive days + 45% high-fat diet) were used to induce diabetic state in mice, and skeletal muscle functions were examined using in vivo electrical stimulation. Biochemical and gene expression analysis were conducted on the skeletal muscles immediately after the stimulation.

RESULTS
Both models yield similar RESULTS in the contractile force compared to respective controls. However, moderate-dose STZ mode showed a more severe fatigue and blunted exercise-induced glycogen degradation. Gene expressions analysis reveals that the distinct fatigability phenotype of moderate-dose STZ is possibly attributed to downregulations of oxidative phosphorylation- and vascularization-related genes.

CONCLUSIONS
This study provides valuable considerations for the selection of suitable STZ models in diabetic myopathy research, especially for the development of treatment using nutrition and food factors to improve skeletal muscle function in diabetes.

STUDY OF DIETARY PRACTICES AND LIFESTYLE OF THE SUB-SAHARAN POPULATION IN MOROCCO: DESCRIPTIVE CROSS-SECTIONAL STUDY

Deprince Nakensy N'dri[1]; KARIMA MOHTADI[2]; Ali Jafri[3]; Abdelfettah Derouiche[2]
[1]Interdisciplinary Laboratory of Biotechnology and Health, Université Mohammed VI des Sciences et de la Santé - UM6SS - Anfa City, Casablanca, Morocco; [2]Biology and Health Laboratory, Université Hassan II de Casablanca, Faculté des Sciences BenM'sick, Casablanca, Morocco; [3]Mohammed VI Higher Institute of Biosciences and Biotechnology, Université Mohammed VI des Sciences et de la Santé, Casablanca, Morocco

BACKGROUND AND OBJECTIVES
Migration often leads to changes in diet, physical activity, and exposure to certain risk factors, which can contribute to the development of non-communicable diseases (NCDs) such as cardiovascular diseases, diabetes, cancer, and chronic respiratory diseases. This study aims to examine the dietary habits, lifestyle, and risk factors for NCDs among sub-Saharan migrants in Morocco.

METHODS
We carried out an analytical cross sectional survey in the city ofCasablanca in Morocco from January 2023 to January 2024. Altogether 272 migrants from the Africa sub-Saharan meet the inclusion criteria and agree to participate. We used astandardized questionnaire with the following headings: socio-demographic characteristics,dietary knowledge and practices, lifestyle and anthropometric measurements.

RESULTS
The study involved 272 participants, with 48.97% men and 51.03% women, and an average age of 25.4 ± 6.6 years. The majority were single (82%) and had a university degree (95.6%). Regarding the length of stay, 58.39% had been in Morocco for 6 months to 4 years, while 41.61% had been there for more than 4 years. In terms of dietary habits, only 27.6% followed the WHO recommendations for vegetable intake (400g per day), and 26.5% followed the recommendations for fruit intake. 33.8% consumed one serving of cereals per day, and 32.4% consumed more than one serving, while 33.8% consumed fewer than 5 servings of cereals per week. More than half (53.7%) ate dairy products daily, but 27.9% consumed fewer than 5 servings per week. Regarding protein sources, 64% primarily consumed poultry, eggs, and fish, while 15.4% mostly ate red meat, and 20.6% obtained protein from vegetables and legumes.Regarding meal frequency, 22.1% reported never or rarely having 3 meals per day, and 55.1% did so occasionally, while 22.8% consistently had 3 meals per day. The analysis revealed an association between the frequency of consumption of dairy products, vegetables, fruits, and cereals, and the number of years spent in Morocco. Regarding lifestyle, 83.3% were non-smokers, 72.2% did not consume alcohol, 23.9% did not engage in any physical activity, 52.2% engaged in light physical activity, and 23.9% participated in vigorous physical activity.

CONCLUSIONS
The association between the frequency of fruit, vegetable, and cereal consumption and the length of stay in Morocco reflects the impact of migration on the dietary habits of this sub-Saharan population. Overall, this population has a diet low in fruits, vegetables, and cereals according to WHO recommendations, which makes them vulnerable to infectious diseases, nutrient deficiencies, and non-communicable diseases in the long term.

CIRCULATING 25-HYDROXYVITAMIN D CONCENTRATION, VITAMIN D-RELATED GENE POLYMORPHISMS, AND MORTALITY: A SYSTEMATIC REVIEW AND META-ANALYSIS OF PROSPECTIVE STUDIES

Yukai Lu[1]; Yuki Homma[2]; Shiori Nakano[2]; Taiki Yamaji[2]; Motoki Iwasaki[2, 1]
[1]Division of Cohort Research, National Cancer Center Japan Institute for Cancer Control, Tokyo, Japan;
[2]Division of Epidemiology, National Cancer Center Japan Institute for Cancer Control, Tokyo, Japan

BACKGROUND AND OBJECTIVES
Previous studies have suggested an inverse association between circulating 25-hydroxyvitamin D (25[OH]D) concentration and mortality, but RESULTS among Asians remain inconsistent. The association of individual vitamin D-related genetic polymorphisms, as well as their combined effects, with mortality is unclear. This study aimed to summarize and quantify the evidence on these associations.

METHODS
A systematic search of PubMed and Web of Science was conducted through September 2024. Prospective studies from the general population reporting relative risks (RRs) and 95% confidence intervals (CIs) were included. A random-effects model was used to calculate pooled RRs.

RESULTS
A total of 62 prospective studies comprising 1,531,216 participants and 111,294 deaths were included in the meta-analysis: 54 (9 from Asia) on all-cause mortality, 20 (5) on cancer mortality, 31 (3) on cardiovascular disease (CVD) mortality, and 6 (0) on respiratory disease (RD) mortality. In the categorical analysis, the lowest 25(OH)D concentration group had significantly higher risks of all-cause and cause-specific mortality compared to the highest group. The findings remained consistent when analyses were restricted to Asian populations; pooled RRs (95% CIs) were 1.18 (1.10–1.26) for all-cause, 1.25 (1.11–1.40) for cancer, and 1.17 (1.06–1.30) for CVD mortality. In the continuous analysis, a 25 nmol/L decrease in 25(OH)D concentration was associated with a 6% higher risk for all-cause, cancer, and CVD mortality and a 15% higher risk for RD mortality. Only one study from China examined the continuous association with all-cause mortality, reporting an inverse association. Additionally, seven studies assessed the association between vitamin D pathway genetic polymorphisms and mortality, but due to the limited number of studies, a meta-analysis could not be performed. No studies were conducted among Asian populations.

CONCLUSIONS
Circulating 25(OH)D concentrations are inversely associated with all-cause and cause-specific mortality, including among Asian populations. Evidence on vitamin D-related genetic polymorphisms and mortality remains limited, highlighting the need for further research. We also plan to update this meta-analysis with findings from our study in the Japanese population.

HOW DO PLANT BASED MEAT ANALOGUES AND VEGETARIAN DIETARY PATTERNS COMPARE WITH RED-MEAT CONTAINING DIETS?

Andrea Braakhuis[1]; Nicola Gillies[1]; Pham Toan[1]; Morton Lillian[1]; Worthington Anna[1]; Knowles Scott[2]; David Cameron-Smith[3]; Bermingham Emma[4]; O'conner Tamlin[5]
[1]Nutrition, University of Auckland, Auckland, New Zealand; [2]Bioproducts, AgResearch Ltd, Palmerston North, New Zealand; [3]Nutrition, Singapore Institute of Food and Biotechnology Innovation (SIFBI), A*STAR, Singapore, Singapore; [4]Research and Development, Fonterra Co--operative Ltd, Palmerston North, New Zealand; [5]Psychology, Otago University, Dunedin, New Zealand

BACKGROUND AND OBJECTIVES
A flexitarian diet primarily focuses on plant-based foods but allows for occasional consumption of meat or animal products. In contrast, a vegetarian diet excludes all meat and fish but may still include dairy and eggs, along with meat alternatives. A newer type of meat alternative on the market are plant-based meat analogues (PBMAs) which can be included in both vegetarian and flexitarian diets. Research by Braakhuis and colleagues have explored the impact of individual meat, PBMAs, flexitarian and vegetarian diets on digestion and health. We will also present data on dietary adherence.

METHODS
The methodology covers two key randomised controlled trials and details can be sourced via clinical trial registrations:1) Acute red meat and meat analogue mixed meal challenges 2) red meat versus vegetarian diet intervention in young adults: Clinicaltrials.gov registration NCT4545398 & NCT04869163

RESULTS
Both vegetarian and flexitarian dietary patterns were no different regarding health markers after 10 weeks. PBMAs have a lower protein absorption response and different lipidomic and fatty acid absorption profile to red meat. Participants did struggle to adhere to a vegetarian diet, when compared to the flexitarian diet, despite an interest in changing habits.

CONCLUSIONS
There was no superiority when comparing vegetarian and flexitarian diets on health. However, PBMAs did not mimic the nutrition profile of red meat. Changing dietary habits is best supported using behaviour change techniques.

FEASIBILITY AND PRELIMINARY EFFECTS OF THE PLANETARY HEALTH DIET ON OBESITY-RELATED OUTCOMES: A PILOT RANDOMIZED CONTROLLED TRIAL

Lin Xu[1]; Tingyu Lu[1]
[1]School of Public Health, Sun Yat-sen University, Guang Zhou Shi, China

BACKGROUND AND OBJECTIVES
Observational studies reported the associations between planetary health diet (PHD) and health-related outcomes, but randomized controlled trials (RCTs) are lacking. This first pilot RCT assessed the feasibility of implementing the PHD and explored effects on health-related outcomes.Observational studies reported the associations between planetary health diet (PHD) and health-related outcomes, but randomized controlled trials (RCTs) are lacking. This first pilot RCT assessed the feasibility of implementing the PHD and explored effects on health-related outcomes.

METHODS
A total of 24 participants aged 18+ years were enrolled and randomly allocated (1:1) to either the intervention (PHD for eight weeks) or a control group (conventional diet). Data were collected at baseline and post-intervention, with anthropometric parameters assessed biweekly. The primary aim was on the feasibility of trial procedures. Secondary outcomes included anthropometric, biochemical and gut microbiome indicators. The trial was registered at ClinicalTrials.gov (ChiCTR2400083254).

RESULTS
The intention-to-treat (ITT) analysis included 24 participants while per-protocol (PP) analysis included 23 participants (1 in control group dropout). Feasibility outcomes demonstrated successful implementation, with 60% recruitment, 95% retention, high adherence and low difficulty to the PHD intervention. Preliminary exploratory analysis indicated greater reductions in body fat mass (adjusted β (95% confidence interval (CI)) in ITT: -1.25 (-2.41, -0.10) kg), waist circumference (adjusted β (95% CI): -2.58 (-4.67, -0.49) cm), waist-to-height ratio (adjusted β (95% CI): -0.02 (-0.03, -0.01)), and body roundness index (adjusted β (95% CI): -0.26 (-0.46, -0.05)). PP analysis showed similar RESULTS. No significant differences were observed for biochemical or gut microbiome indicators.

CONCLUSIONS
The PHD intervention was feasible in recruitment, retention and adherence. PHD showed potential benefits for obesity-related outcomes, but larger, fully powered RCTs are needed to assess the definitive effects of PHD on biochemical and gut microbiome indicators.

EPO6_033

EXPLORING THE GAP BETWEEN KNOWLEDGE AND PRACTICE IN ADOLESCENT BEVERAGE CHOICES

Avita Usfar[1]; Nadhila Beladina[1]; Azka Fitri[1]; Esther Novalia[1]; Iwan Ariawan[1]
[1]Research, Reconstra Utama Integra, Jakarta, Indonesia

BACKGROUND AND OBJECTIVES
Adolescence is a critical period for developing lifelong dietary habits, yet the increasing availability and consumption of sugar-sweetened beverages (SSBs) pose significant health risks. Understanding knowledge, attitude, and adolescents' actual consumption behaviors can provide valuable insights for targeted public health interventions and policies.

METHODS
Four small Focus Group Discussions (FGDs) were conducted with two groups of junior and two groups of senior high school students in November 2024, involving 20 students. The schools were purposively selected, and each FGD lasted approximately 1.5 hours.

RESULTS
Some adolescents were aware of nutrition labels in packaged beverages and recognized the 'healthier choice' logo. Although the 'nutri-level' labelling is not regulated yet, they recognized it as well from other country through TikTok. None of the adolescents could identify the maximum recommended daily intake of sugar, salt, and fat, as their judgments were based on subjective perceptions. They acknowledged food safety concerns and the impact of overconsumption of high sugar, salt, and fat, such as obesity, diabetes, and high cholesterol through real-life experiences of family members. Healthy drinks were perceived as more expensive and less accessible. The three major considerations of students in purchasing beverages are the price, taste, and its visual. Despite understanding the need to reduce sugar content in drinks, they continued to consume the over-sweetened beverages if it is already purchased. The main source of sugar-sweetened beverages was from the school canteens, due to their long hours in school.

CONCLUSIONS
This study highlights the gap between knowledge and practice among adolescents, underscoring the need for improved education and accessible healthy options. It is essential to implement nutrition education in schools and utilize targeted marketing strategies, including social media campaigns featuring influencers. Increasing the availability and affordability of healthy drinks, offering promotional discounts, and incentivizing retailers to stock nutritious options are crucial. Community engagement, parental involvement, and government policies further reinforce these efforts.

BACKGROUND AND OBJECTIVES
Acquired Hypothalamic obesity (HO) is caused by physical, tumor and/or treatment-related damage or developmental abnormalities to the hypothalamus which can lead to impaired melanocortin-4 receptor (MC4R) pathway signaling, and is characterized by excessive and often rapid weight gain following the injury. Here, we report real-world experiences of adult patients with acquired HO with a minimum of 3 months of setmelanotide treatment in France under pre-marketing early access authorization.

METHODS
Patients with acquired HO, aged ≥18 years, were treated with setmelanotide in 5 different hospitals in France. This analysis reports hunger scores, weight-related outcomes and adverse events.

RESULTS
Eight patients, 50% male, with a previous resection for craniopharyngioma (n=7) or rathke cleft cyst (n=1) were included. A BMI decrease of 5.6% (2.3 kg/m2), 12.8% (5.7 kg/m2) and 21.3% (9.9 kg/m2) after 1-month, 3-months and 6-months (n=5) of treatment, respectively, was observed, corresponding with a mean decrease in weight of 6.9 kg, 16.8 kg and 29.0 kg, respectively. Patients achieved a ≥5% and ≥12% reduction in weight at 3 months and 6 months, respectively. Hunger scores were reduced for all patients. During treatment, patients reported injection-site pruritus, asthenia, frequent non-prolonged erections, headache, hyperpigmentation, nausea, anorexia, bacterial angina, bloating, decreased morning erections, diarrhea, erythema, flatulence, increased depressive syndrome, unilateral testicular pain.

CONCLUSIONS
This real-world data of 8 patients with acquired hypothalamic obesity who received ≥3 months of setmelanotide under pre-marketing early access authorization showed consistent improvements in hunger scores and weight outcomes with no new safety signals.

ASSOCIATION BETWEEN MEAL DURATION AND GASTROESOPHAGEAL REFLUX DISEASE AMONG KOREAN WOMEN: THE KOREA NURSES' HEALTH STUDY

Minhee Cho[1]; Chae-Eun Jeong[1]; Chiyoung Cha[2]; Jung Eun Lee[1, 3]
[1]Department of Food and Nutrition, College of Human Ecology, Seoul National University, Seoul, Korea, Republic of; [2]College of Nursing, Ewha Research Institute of Nursing Science, Ewha Womans University, Seoul, Korea, Republic of; [3]Research Institute of Human Ecology, Seoul National University, Seoul, Korea, Republic of

BACKGROUND AND OBJECTIVES
Gastroesophageal reflux disease (GERD) is a common chronic condition where stomach contents flow back into the esophagus, causing heartburn and regurgitation. The evidence of the association between meal duration and GERD remains limited, especially from longitudinal cohort studies. This study aims to investigate the association between meal duration and GERD risk in the Korea Nurses' Health Study (KNHS).

METHODS
In the KNHS, a total of 9,423 women aged 21-50 years were included. The participants completed surveys from baseline up to the 12th survey. Meal duration was categorized into five groups; <5 minutes, 5 to <10 minutes, 10 to <15 minutes, 15 to <20 minutes and ≥20 minutes. GERD cases were determined based on self-reported physician diagnosis. Multivariable Cox proportional hazard models were employed to estimate Relative Risks (RRs) and 95% confidence intervals (CIs). Sensitivity analysis included 7,600 participants, including those who participated in at least one survey from the 8th to the 12th surveys.

RESULTS
During a mean follow-up of 5.9 person-years, a total of 1,751 cases of GERD were identified. In the multivariable models, meal duration was inversely associated with GERD risk. Compared to the group with a meal duration of 10 to <15 minutes, RRs (95% CIs) were 1.41 (1.09-1.83) for <5 minutes, 1.13 (1.02-1.26) for 5 to <10 minutes, 1.05 (0.91, 1.20) for 15 to <20 minutes, and 0.74 (0.57-0.96) for ≥20 minutes, (*p* for trend <0.001). In a sensitivity analysis, the association remained similar.

CONCLUSIONS
This study provides the evidence that meal duration is inversely associated with GERD risk among Korean women. These findings underscore the importance of identifying healthy eating behaviors for preventing GERD.

CAN FURAN FATTY ACID SUPPLEMENTATION COUNTERACT MUSCULOSKELETAL DISORDERS AND IMPROVE HEALTHY AGEING?

Christelle Bertrand-Gaday[1]; Beatrice Bonafos[1]; Erwann Durand[2]; Georges Maroun[3]; Laurent Vaysse[4]; Laurence Pessemesse[1]; Thomas Brioche[1]; Siriluck Liengprayoon[5]; Benedicte Goustard[1]; Jean-Marc Brondello[3]; Francois Casas[1]; Christine Feillet-Coudray[1]

[3]IRMB, INSERM, Montpellier, France; [4]UPR BioWooEB, CIRAD, Montpellier, France; [5]Kasetsart agricultural and agro-industrial product improvement institute, Kasetsart University, Bangkok, Thailand

BACKGROUND AND OBJECTIVES
Sarcopenia and osteoarthritis are major factors in functional decline, risk of falls, disability and mortality in the elderly. In a global context of ageing populations, particularly in France, the prevalence of these diseases, which affect quality of life, is becoming a major public health issue. The common etiologies of these tissue degenerations are oxidative stress, inflammaging and a reduction in the regenerative capacity of these tissues. *In vitro* studies have shown that furan fatty acids (FuFAs), bioactive lipids found in fish, dairy products, fruits and vegetables, have antioxidant and anti-inflammatory properties. Initial preclinical studies in muscle cells and healthy or obese mice suggest that FuFAs improve insulin sensitivity and increase muscle mass, partly mimicking the effects of exercise.
This study explores the potential benefits of FuFAs supplementation in slowing age-related musculoskeletal disorders, and improving mobility, well-being and longevity in mice.

METHODS
40 male and 40 female C57BL/6J mice aged 16 months were fed their respective diets (standard diet or standard diet enriched with 0.05% FuFA-F2/kg diet) for 6 to 8 months. Their physical performance, behavior and physiological status (lean and fat mass, well-being, motor test, grip strength test, endurance test, behavioral test) were evaluated throughout the study. At the end of the diet, the mice were placed in respiratory metabolic cages to calculate the respiratory exchange ratio (RER). Finally, mice were euthanized and the tissues (muscles and leg joints) were collected for analysis.

RESULTS
Our preliminary RESULTS show that aged male and female mice have a different physiological state. In fact initial body weight and weight gain are lower in female mice and skin disorders (dermatosis) are observed only in females. In addition we observed favourable effect of FuFAs supplementation on the well-being of both male and female mice, with greater weight gain in males (p=0.0001) and females (0.0456) and fewer skin disorders and mortality in females. An improvement of physical performance was also observed in male mice.

CONCLUSIONS
These RESULTS show that chronic supplementation with FuFAs could help to limit age-related decline in musculoskeletal function. FuFAs could be used as a food supplement to promote healthy ageing, contributing to a solution for sarcopenia and osteoarthritis.

FURAN FATTY ACIDS SUPPLEMENTATION IN OBESE MICE REVERSES HEPATIC STEATOSIS AND PROTECTS AGAINST CARTILAGE DEGRADATION

Mathys Chaslin[1]; Georges Maroun[2]; Erwann Durand[3]; Beatrice Bonafos; Said Assou[2]; Laurent Vaysse[4]; Siriluck Liengprayoon[5]; Laurence Pessemesse[1]; Christelle Bertrand-Gaday[1]; Jean-Marc Brondello[2]; Francois Casas[1]; Christine Feillet-Coudray[1]

BACKGROUND AND OBJECTIVES
Obesity is a major global health problem associated with numerous metabolic dysfunctions, an increased risk of developing Metabolic Associated Steatotic Liver Disease (MASLD) and osteoarthritis. Recently, we demonstrated that a preventive furan fatty acids (FuFA-F2) supplementation, a natural compounds found in many foods, reduced the onset of metabolic disorders. This study aimed to determine whether a short FuFA-F2 supplementation is capable of reversing metabolic disorders and limiting cartilage degradation in already 6-month-old obese C57Bl/6J mice.

METHODS
Ten 6-month-old C57Bl6 mice were fed a control diet all along the study; twenty 6-month-old C57Bl6 mice were fed a high-fat diet (HFHS) for 20 weeks and were fed for a further 4 weeks one of 2 semi-purified diets: HFHS diet or HFHS + FuFA-F2 (0.048% FuFA-F2/kg diet). We monitored the animals longitudinally (weight, body composition, energy expenditure and metabolic test) and then analysed the phenotype of two major tissues involved in energy homeostasis, skeletal muscle and liver. Moreover the whole joint structure of bone (cartilage and synovitis) was assessed.

RESULTS
Liver triglyceride content and histologic analysis revealed that 4 weeks of FuFA-F2 supplementation fully reversed hepatic steatosis in obese mice. Liver RNA-sequencing analysis highlighted that FuFA-F2 partly reversed the gene expression signature induced by the HFHS diet and favorably changed the expression of many genes known to be involved in the development of hepatic steatosis such as *Pcsk9*, *Stard4*, *Insig1* and *Sulf2*. We also found that FuFA-F2 supplementation increased skeletal muscle mass and protected against cartilage degradation and synovitis induced by obesity.

CONCLUSIONS
Our findings showed that FuFA-F2 supplementation in obese mice reversed the development of MASLD, protected against the onset of osteoarthritis and promoted muscle mass. This study highlights that nutritional supplementation with FuFA-F2 could be an effective approach to treat obesity-related disorders.

MEASURES TO PREVENT LIFESTYLE-RELATED DISEASES BY IMPROVING FOOD ENVIRONMENTS OF FRUIT INTAKE FOR UNIVERSITY STUDENTS –ENVIRONMENTAL ANALYSIS BASED ON SOCIAL MARKETING–

Yasuyo Ebihara[1]; Yoshimi Nakamura[1]
[1]Nursing and Nutrition, Shukutoku University Chiba second campus, Chiba, Japan

BACKGROUND AND OBJECTIVES

Research using meta-analysis on fruit intake and prevention of NCDs has shown that fruit intake up to 200 g a day reduces the risk of developing hypertension, obesity, and type 2 diabetes. In Japan, the Ministry of Health, Labour and Welfare (Health Japan 21 (the third term), 2024) has established goals aimed at extending healthy life expectancy, including a target of 200g/day for fruit intake. This study surveyed university students on fruit intake opportunities with the purpose of preventing future lifestyle-related diseases. Using the findings, the first step of health education based on social marketing, "environment analysis," was conducted.

METHODS

A questionnaire survey was conducted using Google Forms, distributed by handouts with a QR code. Descriptive statistics and chi-square test were analyzed using IBM SPSS Statistics 24.Survey subjects: 300 students in the School of Nursing and 230 students in the School of Nutrition.Survey period: August 8, 2024 to October 14, 2024 Ethical considerations: Approved by the Research Ethics Review Committee, Schools of Nursing and Nutrition of Shukutoku University. (Approval number F24-02) Disclosure of conflicts of interest: None

RESULTS

1. Demographic environment: Of 247 total respondents (46.6% response rate), 26 were male, 210 were female, and 11 chose not to disclose their gender or department. The average fruit intake were male,157.6g were female 124.0g. 2. Economic environment: 47 respondents (19%) do not eat fruits even once a week. The most cited reason was a “fruits are expensive” (29 respondents, 61.7%). 3. Physical environment: For “opportunities to eat fruit,” 106 (42.9%) answered “dinner” and 11 (4.5%) responded “lunch”. On-campus facilities, including one store and a cafeteria, do not offer fruit, making fruit intake during lunch challenging. 4. Technical environment: The university subsidizes part of the cost of operating the cafeteria, which is managed by an external contractor. Changes to the cafeteria menu and pricing needs consultation. 5. Political and legal environment: No issues. 6. Sociocultural environment:169 respondents (68.4%) have intention to increase their fruit intake.

CONCLUSIONS

Increasing fruit availability in the cafeteria and subsidizing costs may encourage more fruit intake by university students.

FURAN FATTY ACID SUPPLEMENTATION PROTECTS AGAINST MUSCLE WASTING IN MOUSE MODELS OF CANCER CACHEXIA

Anais Deglos[1]; Christelle Bertrand-Gaday[1]; Erwann Durand[2]; Beatrice Bonafos[1]; Laurent Vaysse[3]; Siriluck Liengprayoon[4]; Laurence Pessemesse[1]; Charles Geminard[5]; Charles Coudray[1]; Christine Feillet-Coudray[1]; Alexandre Djiane[5]; Francois Casas[1]
[1]UMR DMEM, INRAE, Montpellier, France; [2]Qualisud, CIRAD, Montpellier, France; [3]UPR BioWooEB, CIRAD, Montpellier, France; [4]Kasetsart agricultural and agro-industrial product improvement institute, Kasetsart University, Bangkok, Thailand; [5]IRCM, INSERM, Montpellier, France

BACKGROUND AND OBJECTIVES

Cancer cachexia is a global metabolic syndrome characterized by rapid, involuntary weight loss associated with muscle wasting and adipose tissue loss. It diminishes response to chemotherapy, leads to deterioration in general condition and increased mortality. However, there is currently no effective treatment. Recently, we demonstrated that a preventive furan fatty acids (FuFA-F2) supplementation, a natural compound found in many foods, increased muscle mass in healthy or obese mice. This study aimed to determine whether FuFA-F2 supplementation is capable of counteracting or slowing the onset of muscle wasting *in vitro* and *in vivo* in different models of cancer cachexia in mice.

METHODS

As an *in vitro* cachexia model, we used TNF-α/IFNγ-treated C2C12 myotubes. On these atrophied myotubes, treated or not with FuFA-F2 (10µM), we assessed myotube size by immunofluorescence and protein synthesis and degradation pathways were analyzed. To study the influence of FuFA-F2 on cancer cachexia in vivo, we used colon-26 carcinoma tumor-bearing mouse a model. We monitored the longitudinal condition of the animals (weight, body composition, tumor size, locomotor activity, etc.). After sacrifice, muscles were weighed and protein synthesis and degradation pathways were studied.

RESULTS

In TNF-α/IFNγ-treated C2C12 myotubes, we found that preventive addition of FuFA-F2 abolished muscle wasting, whereas treatment of already atrophied myotubes resulted in partial size recovery. In C-26 mouse model, we observed that preventive FuFA-F2 supplementation avoided muscle wasting and improved spontaneous locomotor activity. However, it had no effect on tumor development or fat loss. When FuFA-F2 was given after the pre-cachexic phase, it limited muscle wasting. Synthesis and degradation pathway analysis by western-blot revealed the specific role of FuFA-F2 in in vitro and in vivo models.

CONCLUSIONS

Our findings showed that FuFA-F2 supplementation effectively prevents muscle wasting *in vitro* in a model of atrophic C2C12 myotubes, and *in vivo* in colon-26 carcinoma tumor-bearing mouse a model. This study highlights that nutritional supplementation with FuFA-F2 could be an effective approach to reduce cancer cachexia and preserve muscle mass.

RELATIONSHIP BETWEEN EATING SPEED AND OBESITY OR FOOD INTAKE IN THE WORKING GENERATION: A CASE STUDY OF JAPANESE MALES

Kimi Sawada[1]; Michiko Tsuji[2]; Kotone Shimomura[1]
[1]Department of Health and Nutrition, Tokiwa University, Mito, Japan; [2]Department of Health and Nutrition, Nagoya Women's University, Nagoya, Japan

BACKGROUND AND OBJECTIVES
Obesity (Body mass index [BMI (kg/m2)]) rates have been reported to be high among people who have the habit of eating fast. This study aimed to clarify the relationship between eating speed and lifestyle diseases or usual food intake among working men.

METHODS
A food frequency questionnaire was conducted with employees in manufacturing companies, the data from regular checkups for responders were combined, and data from 299 male employees were analyzed. The relationship between eating speed (fast, normal, and slow) and age, BMI, blood pressure level, or food intake was examined using the Kruskal–Wallis test. This study was approved by the Ethics Review Committee. Statistical analysis was performed using the analysis software IBM SPSS Statistics 29. The significance level was set at 5%.

RESULTS
The fast-eating, normal-speed eating, and slow-eating groups consisted of 104 (34.8%), 169 (56.5%), and 26 (8.7%) people, respectively. Furthermore, people with the habit of slow eating were younger, less obese (BMI ≥ 25 kg/m2) ($p = 0.046$), and consumed more fish and shellfish ($p = 0.038$), and side dishes (dishes prepared with vegetables, potatoes, mushrooms, and seaweed as the main ingredients) ($p = 0.028$) than those in the other groups. In the subgroup analysis by age category, no significant differences in all parameters in people aged at least 40 years were found between the groups. However, differences in BMI ($p = 0.017$) and side dishes ($p = 0.015$) were still significant between the groups aged no more than 39 years. Moreover, those who ate more slowly had a higher consumption of vegetables ($p = 0.027$) and seaweed ($p = 0.011$).

CONCLUSIONS
Fewer working men in their mature years eat slowly, and young people (≤39 years old) with the habit of slow eating have a higher vegetable intake and are less obese, suggesting that eating speed is associated with obesity and vegetable intake.

CELIAC DISEASE: EPIDEMIOLOGICAL AND CLINICAL PERSPECTIVES IN ALGERIA

Hanaa Merzougui[1]; Bouamama Anis Ould[2]
[1]FACULTY OF MEDECIN PHARMACY's departement, Blida University 1, Ouled Yaïch, Algeria;
[2]Pharmacy, Faculté de Pharmacie, El Biar, Algeria

BACKGROUND AND OBJECTIVES
Celiac disease has seen significant progress in its epidemiological, clinical, and pathophysiological understanding. It is no longer considered exclusively a childhood disease, and its clinical manifestations extend beyond digestive symptoms. The lifelong gluten-free diet, especially in Algeria, presents numerous challenges that hinder adherence.
Objective: This study aimed to explore the clinical and epidemiological dimensions of celiac disease and critically assess the challenges faced by patients and the management difficulties encountered by doctors.

METHODS
Two surveys were conducted using online questionnaires: one targeted celiac disease patients, and the other targeted doctors. These surveys evaluated the prevalence, clinical features, and the challenges related to the management of celiac disease.

RESULTS
Our findings reveal a clear predominance of female patients (83%), with the most affected age group being 21–30 years (40%), though cases were also observed in individuals aged 61–80 years. Autoimmune diseases were associated with 8% of patients, and 84% of doctors reported screening for such conditions after a celiac disease diagnosis. Symptoms were highly diverse, with a predominance of digestive signs, anemia, weight loss, and anxiety.Patients reported numerous difficulties, particularly the high cost of gluten-free products, cited by 113 respondents as a significant barrier.

CONCLUSIONS
This study confirms that celiac disease affects all age groups and manifests through a variety of symptoms, which are increasingly recognized by healthcare providers. It also underscores the significant challenges posed by adherence to a gluten-free diet in Algeria.

PREVALENCE OF RISK AND PROTECTIVE FACTORS FOR NON-COMMUNICABLE DISEASES AMONG UNIVERSITY STUDENTS IN BRAZIL: NATIONAL HEALTH SURVEY 2013 AND 2019

Maria Emilia Pereira[1]; Daniela Canella[2]
[1]Programa de Pós-Graduação em Alimentação, Nutrição e Saúde, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil; [2]Nutrição Aplicada, Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil

BACKGROUND AND OBJECTIVES
The global increase in the prevalence of non-communicable diseases (NCDs) is linked to behaviors related to diet, physical activity, and alcohol consumption. The academic period emerges as a transitional phase in life that can impact these behaviors, which can either increase or decrease the risk of NCD occurrence. Therefore, this study aimed to was to assess the evolution of risk and protective factors among Brazilian university students.

METHODS
Data from Brazilian adult students (≥18 years) from the two editions of the National Health Survey (PNS), conducted in 2013 and 2019, were used. Participants reported being enrolled in a degree program at the time of the interviews. Risk factors included markers of unhealthy eating, insufficient physical activity, and excessive alcohol consumption, while protective factors involved markers of healthy eating and physical activity during leisure time. Descriptive analysis was performed on all indicators, stratified by survey year and sex. Significant differences were observed through the non-overlap of 95% confidence intervals (CI 95%).

RESULTS
A reduction was observed in the prevalence of regular consumption of soft drinks (27.9% to 12.5% ─ men; 22.8% to 10.7% ─ women), regular consumption of sweets (27.1% to 17.6% ─ men; 33.2% to 20.4% ─ women), and insufficient physical activity (37.6% to 22.7% ─ men; 57.7% to 37.3% ─ women). There was an increase in the regular consumption of fruits and vegetables (16.1% to 27.2% ─ men; 22.6% to 34% ─ women) and physical activity during leisure time among women (28.3% to 37.3%). Excessive alcohol consumption remained stable over the years.

CONCLUSIONS
The RESULTS indicate that most risk indicators for NCD occurrence decreased over the years. However, the frequency of regular consumption of fruits and vegetables and recommended physical activity remains low among most students, and the percentage of excessive alcohol consumption remains high. Therefore, it is essential to strengthen measures to reduce alcohol consumption, as well as create spaces that enable healthy food choices and physical activity in universities, to contribute to better living and health conditions for students.

ASSOCIATIONS BETWEEN POLYPHENOL INTAKE AND PSORIASIS RISK: A PROSPECTIVE COHORT STUDY FROM THE UK BIOBANK

Ruotong Zhang[1]; Yifan Xu[1]; Ana Rodriguez-Mateos[1]; Bochen Li[1]; Alexandru Dregan[2]; Rachel Gibson[1]; Thivi Maruthappu[1]; Wendy L. Hall[1]
[1]Department of Nutrition, King's College London Waterloo Campus, London, United Kingdom; [2]Department of Psychological Medicine, King's College London Waterloo Campus, London, United Kingdom

BACKGROUND AND OBJECTIVES

Psoriasis is an inflammatory skin disease affecting quality of life. Polyphenols, bioactive compounds found in various plant-based foods, known for their anti-inflammatory and antioxidant properties, may influence risk of psoriasis onset (1). This study investigated the association between dietary polyphenol intakes and psoriasis incidence using the UK Biobank cohort (2).

METHODS

The study included participants from the UK Biobank who were initially free of psoriasis and followed for an average of 14 years. Participants with chronic inflammatory infectious diseases (HIV or chronic viral hepatitis) were excluded. Participants who completed at least two 24-hour dietary recalls were included; polyphenol intakes were estimated from foods such as tea, coffee, chocolate, wine, juice, cereal, bread, fruits, vegetables, snacks, legumes, and nuts. Polyphenol composition data were derived from a combined database integrating the USDA and Phenol-Explorer databases(3). Flavonoid subcategories included anthocyanins, flavanones, flavan-3-ols, flavonols, flavones, and polymers, while total polyphenol intake was derived from the sum of flavonoids, stilbenes, phenolic acids, and lignans. The primary outcome was the incidence of psoriasis, identified through self-reported diagnoses, primary care records, and hospital admission data.

RESULTS

Among the 121,584 participants, 1,073 developed psoriasis, yielding an incidence rate of 0.88%. The mean age (SD) was 56.2 (7.8) years, with 54.8% (n = 60,341) being female, and the majority of participants (96.8%) identifying as White. After adjusting for potential confounders, including age, sex, Townsend deprivation index, socioeconomic status, physical activity, smoking status, alcohol frequency, supplement use, red and processed meat intake, free sugar intake, BMI, and energy intake, higher flavonoid intake (Q4: 1890–8032 mg/d) was associated with a 23% reduced risk of incident psoriasis (HR: 0.77, 95% CI: 0.64–0.94, *P*trend = 0.016) compared to lower flavonoid intake (Q1: 0–921 mg/d). However, no significant association was observed for total polyphenol intake.

CONCLUSIONS

In this large cohort study, higher flavonoid intake was associated with a reduced risk of psoriasis, highlighting the potential protective benefits of flavonoid-rich foods. Future research should focus on randomized controlled trials to establish causality and explore underlying mechanisms.

ASSOCIATIONS BETWEEN FOOD INTAKE, ACNE, AND ACNE-RELATED COMORBIDITY: A CROSS-SECTIONAL SECONDARY ANALYSIS USING UK BIOBANK DATA

Bochen Li[1]; Xu Yifan,[1]; Ruotong Zhang[1]; Alexandru Dregan[2]; Rachel Gibson[1]; Thivi Maruthappu[1]; Wendy L. Hall[1]
[1]Department of Nutrition, King's College London Waterloo Campus, London, United Kingdom; [2]Department of Psychological Medicine, King's College Hospital, Denmark Hill, London, UK, London, United Kingdom

BACKGROUND AND OBJECTIVES
Acne, one of the most common inflammatory skin diseases, affects around 9.4% of the global population (1). Its significant global health burden extends beyond physical symptoms to include comorbidities such as metabolic disorders and depression (2, 3). While diet is considered an approach to managing acne and its comorbidities, evidence-based dietary guidelines remain lacking, and large-scale studies exploring diet-acne associations are scarce. This study aims to investigate the dietary intake patterns of individuals aged 40–69 with acne and to evaluate their associations with the development of acne and related comorbidities, utilizing data from the UK Biobank.

METHODS
This study included 5,709 participants with a current or prior history of acne (acne group) and 493,515 without a history of acne (non-acne group) at baseline, identified through self-reported diagnoses, primary care records, and hospital admission data. Participants with underlying diseases linked to hormonal dysregulation and acne-like manifestations were excluded. Dietary intake was assessed using a baseline Food Frequency Questionnaire (FFQ), covering 16 food groups (e.g., vegetables, fruits, fish, meat, bread, cereal and cheese). Multiple logistic regression was applied to assess associations between food intake and acne development.

RESULTS
The acne group (mean age = 52 years) was, on average, five years younger than the non-acne group and had a higher proportion of females (64% vs. 54%). In the regression analysis of food intake and acne (n = 499,224), significant associations were observed between acne and the intake of specific foods, quantified by their respective units: cooked vegetables (tablespoons/day, adjusted OR = 0.96 [0.95–0.98], adjusted P = 0.002), non-oily fish (times/week, aOR = 1.04 [1.01–1.08], adjusted P = 0.035), and cheese (times/week, aOR = 0.96 [0.94–0.97], adjusted P < 0.001), after adjusting for BMI, age, sex, ethnicity, physical activity, socioeconomic status, smoking, alcohol, sleeplessness, and supplement use (Model 2). These findings remained consistent across Model 1 (without BMI adjustment), Model 3 (Model 2 with interaction terms for age and sex), and sensitivity analysis (no diet changes in the past 5 years' subgroup).

CONCLUSIONS
Cooked vegetables and cheese may have a protective effect against acne and its comorbidities; however, this association could also reflect dietary changes made by acne patients. Further cohort and RCTs are warranted to confirm these findings.

ANALYSIS OF THE EFFECTS OF DIETARY CHANGES ON THE GUT IMMUNE SYSTEM

Miho Chikazawa[1]; Ken-Ichiro Minato[1]
[1]Agriculture department, Meijo University - Tempaku Campus, Nagoya, Japan

BACKGROUND AND OBJECTIVES

The body contains B cells that produce antibodies with diverse specificities, forming a diverse population known as the “antibody repertoire.” The antibody repertoire is influenced by various factors such as diet and gut microbiota, and it is believed to be closely related to health conditions and the onset of diseases. In this study, we aimed to investigate the potential involvement of the gut immune system and antibody repertoire in the development of lifestyle-related diseases by examining changes in a lifestyle-related disease model mouse.

METHODS

Previous studies have shown that the antibody repertoire of intestinal IgA antibodies undergoes significant changes in mice fed high-sucrose diets (HS diet, 70 kcal% sucrose) and high-fat diets (HF diet, 45 kcal% fat), which are thought to induce the onset of lifestyle-related diseases. This suggests that dietary changes may affect the IgA specificity in the gut. Based on these findings, we investigated the potential impact of changes in gut components on immune cells by using bone marrow-derived dendritic cells (BMDC).

RESULTS

When the intestinal lavage fluid (gut fluid) from mice fed three different diets was administered to BMDCs, an increase in activation markers of dendritic cells and enhanced production of inflammation-related cytokines were observed.

CONCLUSIONS

This study suggested that dietary intake influences the gut environment, leading to an increase in molecules that stimulate dendritic cells. Future research will focus on further analyzing the mechanisms by which dendritic cells are stimulated and the related factors.

ALCOHOL AND CANCER: POLICY RECOMMENDATIONS TO REDUCE THE HEALTH IMPACTS OF ALCOHOL

Kendra Chow[1]; Kate Oldridge-Turner[1]; Panagiota Mitrou[2]; Helen Croker[2]; Elio Riboli[3, 2]
[1]Policy & Public Affairs, World Cancer Research Fund International, London, United Kingdom; [2]Science and Policy, World Cancer Research Fund International, London, United Kingdom; [3]Cancer epidemiology and prevention, Imperial College London, London, United Kingdom

BACKGROUND AND OBJECTIVES
In some instances alcohol is still included as part of dietary guidelines or recommendations, despite being non-nutritive, often highly caloric, and the potential to be nutrient-displacing. Furthermore, the carcinogenic mechanisms of alcohol are well established and there is strong evidence that consuming alcohol increases the risk of seven types of cancer, including common cancers like breast and colorectal.

Without clear nutrition and health messaging, public awareness of the links between alcohol and cancer remain very low, and many countries lack national alcohol strategies or policies that support population-level reduction of alcohol consumption.

WCRF International has developed the Alcohol and Cancer Risk policy position to provide policymakers and governments with best-practice alcohol-control policies. When implemented, these evidence-based policies can help reduce the risk of cancer as well as contribute to a reduction in other health, social and economic harms caused by alcohol.

METHODS
A review of evidence, global recommendations, and existing and proposed policies was conducted to determine a set of best-practice policies. Recommendations were reviewed by public health and alcohol policy experts.

RESULTS
WCRF International's alcohol policy recommendations were developed to consider a multisectoral approach and include four policy areas: 1) implementing fiscal measures to make alcohol less affordable and accessible; 2) restricting the physical availability of alcohol; 3) implementing mandatory health warning labels; and 4) restrictions on promotions, advertisements and marketing of alcohol products.

CONCLUSIONS
WCRF International's alcohol policy recommendations provide concise guidance on four policy priority areas for governments and policy advocates to improve alcohol control and increase public awareness. It also offers guidance on important considerations around implementing these measures, such as language, conflicts of interest, and no- and low-alcohol products—all of which are very important to consider alongside advocacy for nutrition policy such as marketing restrictions, fiscal policies, labelling, and dietary guidelines.

ASSOCIATION BETWEEN ALPHA-1-ACID GLYCOPROTEIN AND NON-ALCOHOLIC FATTY LIVER DISEASE AND LIVER FIBROSIS IN ADULT WOMEN: EVIDENCE FROM NHANES 2017–2023

Yansong Fu[1]; Siyi Zhang[2]; Hong Qin[1]
[1]Department of nutrition and food hygiene, Central south university, changsha, China; [2]Xiangya School of Medicine, Central south university, changsha, China

BACKGROUND AND OBJECTIVES
Alpha-1-Acid Glycoprotein (AGP) is one of the plasma proteins synthesized by the liver, which is mainly secreted by hepatocytes. As an acute phase glycoprotein, its serum level plays a regulatory role in the processes of inflammation and metabolic disorders. Nonalcoholic fatty liver disease (NAFLD) and liver fibrosis (LF) are closely associated with inflammation and metabolic disorders. However, the relationship between AGP and NAFLD and LF remains unclear. Due to the limitations of liver biopsies, more non-invasive serum biomarkers are needed to assess the progression of hepatic steatosis and fibrosis. The objective of this study was to examine the potential correlation between AGP and NAFLD and LF.

METHODS
The data employed in this cross-sectional survey were derived from the 2017-2023 National Health and Nutrition Examination Survey (NHANES). NAFLD was defined as controlled attenuation parameter (CAP) ≥274 dB/m, and LF was defined as liver stiffness measurement (LSM) ≥8.0 kPa. Non-linear relationships were described by fitting smoothed curves and using threshold effect analysis. Subgroup analyses were also performed, including stratification by different characteristics such as race, education, body mass index (BMI), and lipid levels, etc., in order to assess potential regulatory factors of the association between AGP and NAFLD and LF.

RESULTS
This population-based study included 2,270 females aged 20-49 years. In logistic regression analyses, AGP was found to be significantly and positively associated with NAFLD [OR = 13.86, 95% CI (8.94, 21.46), $p < 0.001$] and LF [OR = 3.08, 95% CI (1.58, 6.00), $p < 0.001$]. Subgroup analyses demonstrated that hypertension modified the correlation between AGP levels and NAFLD ($p < 0.05$ for interaction), with positive associations between AGP and NAFLD and LF observed in all subgroups. Additionally, the relationship between AGP and CAP exhibited nonlinear characteristics. Using a two-stage linear regression model, we found an inverted U-shaped relationship between AGP and NAFLD, with an inflection point at 1.20 g/L.

CONCLUSIONS
Our findings revealed a significant positive correlation between elevated AGP levels and both NAFLD and LF. This highlights the potential of AGP as a non-invasive diagnostic marker for NAFLD and LF, helping clinicians improve the diagnosis and treatment of chronic liver disease.

FOOD QUALITY CONSUMPTION AND METABOLIC SYNDROME COMPONENTS ACCORDING TO TASTE PERCEPTION IN UNIVERSITY STUDENTS

Karla Araceli Solórzano Castanedo[1]; José Gerardo Mora Almanza[1]; Pablo Alejandro Nava Amante[1]; Bárbara Vizmanos Lamotte[2, 3]; Alejandra Betancourt Núñez[3, 4]; Enya Ramirez Ramirez[3]; Miriam Martín Alvarado[3]; Diana Ortega Leon[3]; María Fernanda Bernal Orozco[5, 3]

[1]Doctorado en Ciencias de la Nutrición Traslacional, Centro Universitario de Ciencias de la Salud; Universidad de Guadalajara, Guadalajara, Mexico; [2]Departamento Clínicas Reproducción Humana, Crecimiento y Desarrollo Infantil,, Universidad de Guadalajara, Guadalajara, Mexico; [3]Centro Universitario de Ciencias de la Salud, Universidad de Guadalajara, Guadalajara, Mexico; [4]Departamento de Disciplinas Filosófico, Metodológicas e Instrumentales, Universidad de Guadalajara, Guadalajara, Mexico; [5]Departamento de Clínicas de la Reproducción Humana, Crecimiento y Desarrollo Infantil, Centro Universitario de Ciencias de la Salud; Universidad de Guadalajara, Guadalajara, Mexico

BACKGROUND AND OBJECTIVES

University students deal with challenges that affect food quality consumption (FCQ), and early presence of metabolic syndrome's components (MSC). Although FQC might be linked to MSC, taste perception could be a factor influencing both. This study aims to analyze FQC and MSC according to taste perception in university students.

METHODS

We included university students 18 years old or older, non-lactating or non-pregnant, and without taste alterations, after signing a consent form. After completing questionnaires on sociodemographics, lifestyle, and FQC (Mini ECCA v2), participants underwent assessments for anthropometrics, blood pressure,and blood samples. Participants rated taste intensity (0-5 points) for bitter (PROP), sweet (sucrose), salty (NaCl), sour (citric acid) and umami (monosodium glutamate), at five different concentrations. A Total Taste Score was determined with the sum of the perceived taste perception at the maximum concentration of each taste, and subjects were classified as having high perception (equal or greater than the median) or low perception (lower than the median). FQC and MSC frequency were compared according to taste perception (chi-square, $p<0.05$ considered as significant).

RESULTS

We involved 330 participants (63% women + 21.3 years); 54.5% did not present MSC, while 30.6% presented one component; 8.2%, two, and 6.7%, three or more components, being abdominal obesity the most frequent (36%). In FQC, 28.2% had healthy habits, 27.6% needed improvement, and 44.2% had unhealthy habits. A subsample of 49 participants underwent taste tests perception. Trends between taste perception and MSC were observed for hyperglucemia ($p=0.064$) and abdominal obesity ($p= 0.080$). Although there was a higher proportion of subjects with healthy habits in the high taste perception group vs. the low perception (30.8%), these differences were not significant ($p=0.174$).

CONCLUSIONS

Taste perception may influence MSC in university students, and although no differences were found for FQC, a larger sample is needed to identify possible associations in this population, in order to

PREVALENCE OF MULTIMORBIDITY AMONG GUATEMALAN WOMEN: ASSESSMENT OF SOCIAL, DIETARY AND REPRODUCTIVE FACTORS

Daniela Da Costa[1]; Mónica Mazariegos,[2]
[1]Centro de Investigación del INCAP para la Prevención de las Enfermedades Crónicas (CIIPEC), INCAP - Instituto de Nutrición de Centro América y Panamá, Guatemala City, Guatemala; [2]Research Center for the Prevention of Chronic Diseases, Institute of Nutrition of Central America and Panama, Guatemala City, Guatemala

BACKGROUND AND OBJECTIVES
Guatemala's ongoing epidemiological and nutritional transition may be reshaping morbidity patterns, especially among women exposed to social, reproductive, and dietary risk factors. This study aimed to: 1) estimate the prevalence of multimorbidity and 2) identify its key determinants among Guatemalan women of reproductive age (20-49 y).

METHODS
We conducted a cross-sectional secondary data analysis of the 2017 Epidemiological Health and Nutrition Surveillance System (SIVESNU). Multimorbidity was defined as the presence of two or more chronic diseases (hypertension, obesity and/or diabetes) in an individual. Descriptive statistics and ordinal logistic regression models were conducted to examine associations with early-life conditions (short-stature), social (ethnicity, education, socioeconomic status, household area), dietary (a 24 hour-recall of ultra processed food consumption and minimum diet diversity) and reproductive factors (parity and age of first birth).

RESULTS
Among 1,151 women included, 18.5% (95% CI 15.8-21.6) had multimorbidity, with obesity and hypertension co-occurring most frequently (75%). Women with short stature (<149 cm) were 35% more likely to acumulate an additional chronic condition compared to taller women (OR: 1.35, 95% CI 1.08-1.97). No associations were found between multimorbidity and reproductive or dietary factors.

CONCLUSIONS
Approximately one in five Guatemalan women of reproductive age lives with multimorbidity, predominantly involving obesity and hypertension. This highlights the need for targeted intervention addressing chronic conditions from a life-course perspective.

CORTISOL AND CARDIOMETABOLIC HEALTH IN WORKING-CLASS WOMEN: ASSOCIATION WITH DIETARY PATTERN AND STRESS

Peace Ani[1]; Ngozi Mercy Nnam[1]; Scholastica Eze,[1]; Chiemerie Nwemere,[1]
[1]Department of Nutrition and Dietetics, University of Nigeria, UNN Nsukka, Nsukka, Nigeria, Federal Republic of

BACKGROUND AND OBJECTIVES
Chronic stress and elevated cortisol levels are linked to cardiometabolic risks, but their relationship with dietary patterns in working-class women is understudied. Dietary habits and stress are critical determinants of metabolic health, particularly in populations balancing the demands of professional and personal responsibilities. The study investigated the association between cortisol levels, cardiometabolic risk factors, and dietary pattern among working class women.

METHODS
A cross-sectional study design was employed to assess working-class women aged 18-65 years in three occupational sectors: banks, private hospitals and factories. A total of 400 participants were selected using a multi-stage sampling technique. Data was collected using a structured and validated questionnaire, biochemical analysis (cortisol and blood glucose levels), blood pressure and anthropometric measurements (weight, height and body mass index (BMI). The collected data were analyzed using IBM-SPSS software, version 23. Descriptive statistics were used to summarize the data, while inferential statistics were applied to identify significant relationships between variables. A significance level of $p < 0.05$ was set for all statistical analysis.

RESULTS
Most of the participants were aged 26–35 years (40.5%), with 55.8% being single. A small proportion reported experiencing low stress (2.0%) and high stress (4.7%) levels. Overweight was prevalent among the study population (41.5%) and majority (74.5%) reported skipping meals, with 64.3% having a medium dietary diversity score. A significant association was found between cortisol and blood glucose levels ($p < 0.05$). However, no significant relationships ($p > 0.05$) were observed with body mass index (BMI), blood pressure, or meal frequency.

CONCLUSIONS
The study revealed a high prevalence of poor dietary pattern and overweight among participants, with a significant association between cortisol and fasting blood glucose levels. There is a need for targeted interventions addressing dietary habits and stress management to improve the metabolic health of this population.

CONFLICTS OF INTERESTS

Android to Gynoid Fat Ratio (AOI), Gut Microbiota, and Hyperuricemia: RESULTS from two large human cohort studies

Nuo Xu[1, 2, 3]; Wenjie Wang[1, 2, 3]; Jiaqi Hong[1, 2, 3]; Yuwei Li[1, 2, 3]; Xinmei Li[1, 2, 3]; Boya Zhao[1, 2, 3]; Mengyan Gao[1, 2, 3]; Wei He[1, 2, 3]; Shankuan Zhu[1, 2, 3]

[1]Department of Nutrition and Food Hygiene, Children's Hospital, Zhejiang University School of Medicine, National Clinical Research Center for Child Health, Hangzhou, China; [2]Chronic Disease Research Institute, School of Public Health, School of Medicine, Zhejiang University, Hangzhou, China; [3]Binjiang Institute of Zhejiang University, Zhejiang University, Hangzhou, China

BACKGROUND AND OBJECTIVES

The prevalence of hyperuricemia (HUA) in China has reached 17.7%. Understanding the impact of fat distribution and its interaction with gut microbiota on the risk of incident HUA is critical for HUA prevention.

METHODS

This study included 2,026 Chinese adults from the Lanxi Cohort. We used Android to gynoid fat ratio (AOI) as indicator of abdominal fat distribution, which was measured by a dual-energy X-ray absorptiometry (DXA) scan. 16S rRNA sequencing was performed on stool samples from 1,561 participants. Multivariable linear regression and logistic regression models were used in all analyses. And replications were performed in another independent cohort, the WELL-China Cohort, with 6,990 participants.

RESULTS

During the follow-up period of 4 years, 199 participants developed HUA. Compared to participants in the lowest tertile of AOI at baseline, the OR(95%CI) for incidence of new-onset HUA in the middle and highest tertiles were 2.02(1.22-3.36) and 1.94(1.22-3.09), respectively. For each additional 1 standard deviation of changes in AOI during follow-up, the HUA risk increased by 18% (p=0.03). Gut microbial analyses showed that participants with higher AOI exhibited decreased α-diversity and altered β-diversity. Fifteen genera were found to be linked to AOI, and the AOI-microbial index (AMI) constructed by them was positively associated with HUA risk (p=0.003). Similar RESULTS were obtained in the validation cohort.

CONCLUSIONS

Abdominal fat accumulation is an independent risk factor for new-onset of HUA, and monitoring dynamic changes in AOI may help predict HUA. Additionally, the interaction between AOI and gut microbiota further contributes to the incidence of HUA.

APPLE CIDER VINEGAR ATTENUATES HEART DAMAGE AND OXIDATIVE STRESS IN RATS INDUCED METABOLIC SYNDROME

Imene Labadie[1]; Hadjer Bouderbala[2]; Debbagh Ismahan Bouayad[1]; Djamel Saidi[3]; Hanane Kaddouri[1]
[1]Laboratory of Physiology of Nutrition and Food Safety, University Oran 1 Ahmed Ben Bella, Oran, Algeria; [2]Higher School of Biological Sciences of Oran, Higher School of Biological Sciences of Oran, Oran, Algeria; [3]Laboratory of Physiology of Nutrition and Food Safety, Higher School of Biological Sciences of Oran, Oran, Algeria

BACKGROUND AND OBJECTIVES
Heart failure (HF) is a critical health issue with no effective current treatment. Metabolic syndrome (MetS) is a major risk factor for HF. Oxidative stress (OS), a key factor in the progression of MetS, contributes to endothelial dysfunction, inflammation and apoptosis of cardiac cells. Antioxidant dietary supplements may counteract the harmful effects of MetS. Although apple cider vinegar (ACV) is known for its antioxidant properties, its impact on cardiovascular lesions in MetS has not been thoroughly studied and requires further research. Thus, this work aimed to evaluate the antioxidant activity of ACV on heart tissue in Wistar rat used as an experimental model of MetS.

METHODS
Eighty male Wistar rats weighing about 185 ± 10 g were divided into 3 equal groups and fed for 5 months of experimentation either the standard laboratory diet (RS) or the cafeteria-fructose diet (RCF), supplemented or not with ACV (RCFV) at a rate of 3,5 ml/kg/day by intragastric gavage for 30 days from the 4th month of experimentation. Body weight was monitored throughout the experiment. Subsequently, oxidative stress biomarkers were identified in the cardiac tissue, and a histological examination was carried out.

RESULTS
ACV treatment effectively reversed heart changes observed in the RCF group. It had a significant protective effect against lipid peroxidation and increased the levels of glutathione (GSH), and the activities of superoxide dismutase (SOD), glutathione peroxidase (GPx), and catalase (CAT) in heart tissue. Moreover, ACV improved cardiac structure which showed a regular organisation of muscle fibres and a reduction in fatty infiltration.

CONCLUSIONS
In conclusion, ACV prevented cafeteria-fructose diet induced heart damage throught its antioxidant activity. The RESULTS obtained could therefore open up promising prospects for the use of ACV in the management of MetS and its cardiovascular complications.

THE PRIME DIET QUALITY SCORE (PDQS), MORTALITY AND CHRONIC MORBIDITY IN UK BIOBANK: A PROSPECTIVE STUDY

Selma Kronsteiner Gicevic[1, 2]; Alysha S. Thompson[3]; Reynalda Cordova[4]; Martina Gaggl[5]; Jayne Woodside[6]; Cassidy Aedin[7]; Sabine Rohrmann[8]; Kühn Tilman[2, 1, 9]

[1]Department of Nutritional Sciences, School of Life Science, University of Vienna, Vienna, Austria; [2]Center for Public Health, Medical University of Vienna, Vienna, Austria; [3]Institute for Global Food Security & Co-Centre for Sustainable Food Systems, Queen's University Belfast, Belfast, United Kingdom; [4]Department of Nutritional Sciences, University of Vienna, Wien, Austria; [5]Center for Public Health, Medical University of Vienna, Wien, Austria; [6]School of Medicine, Dentistry and Biomedical Sciences, Queen's University Belfast, Belfast, United Kingdom; [7]Institute for Global Food Security, Queens University Belfast, Belfast, United Kingdom; [8]Epidemiology, Biostatistics and Prevention Institute,, University of Zurich, Zürich, Switzerland; [9]Institute for Global Food Security & Co-Centre for Sustainable Food Systems, Queen's University Belfast, Belfast, United Kingdom

BACKGROUND AND OBJECTIVES

The Prime Diet Quality Score (PDQS) is a global food-based metric for assessing diet quality. We conducted a comprehensive evaluation of the PDQS-measured diet quality with mortality and major chronic morbidity outcomes among UK adults.

METHODS

This was a population-based cohort study of UK Biobank participants (aged 40-69) recruited in 2006-2010 and followed up until 2021. The PDQS was calculated from two or more 24-hour diet recall assessments. We used multivariable Cox regression to estimate hazard ratios (HRs) and 95% confidence intervals (CIs) for associations with total and cause-specific mortality, cardio-metabolic disease outcomes including type 2 diabetes (T2D), cardiovascular disease (CVD), myocardial infarction (MI), ischemic and haemorrhagic stroke, respiratory diseases (total chronic, chronic obstructive pulmonary disease/COPD, asthma), cancers (total, lung, colorectal, oesophageal, postmenopausal breast and prostate), neurodegenerative diseases (total, Parkinson's, dementia including Alzheimer's, depression and anxiety), non-alcoholic fatty liver disease (NAFLD), chronic kidney disease (CKD), eczema, psoriasis, fracture and osteoporosis.

RESULTS

The final analytical sample included 124,851 participants with mean (SD) age of 59(8) at baseline. Participants in the top quartile (Q4) of the PDQS had a lower risk of mortality compared to those in the lowest quartile with HRs (95%CIs) of 0.84 (0.78, 0.91) for total mortality, 0.88 (0.80, 0.97) for cancer mortality and 0.66 (0.47, 0.93) for respiratory mortality. The HRs for chronic morbidity were: 0.73 (0.66, 0.81) for type 2 diabetes, 0.80 (0.71, 0.90) for myocardial infarction, 0.86 (0.74, 1.00) for ischemic stroke, 0.80 (0.69, 0.94) for COPD, 0.94 (0.88, 0.99) for total cancer, 0.75 (0.58, 0.97) for lung cancer, 0.85 (0.78, 0.92) for anxiety, 0.66 (0.56, 0.77) for non-alcoholic fatty liver disease and 0.74 (0.69, 0.80) for chronic kidney disease.

CONCLUSIONS

A high-quality diet, as measured by the PDQS, is associated with reduced risks of mortality and major chronic disease morbidity. The PDQS, as a simple and practical metric, holds significant potential for measuring diet quality and promoting healthier dietary patterns.

IDENTIFICATION OF EARLY-RISK FACTORS AND THEIR ASSOCIATION WITH CARDIOMETABOLIC OUTCOMES IN CHILDREN AND ADOLESCENTS

Marco Brandimonte-Hernández[1]; Sophia M Blaauwendraad[2]; Arwen Sj Kamphius[2]; Ilsi Consortium Group[3]; Romy Gaillard[2]; Angel Gil[1]; Francisco Javier Ruiz-Ojeda[1]
[1]Department of Biochemistry and Molecular Biology II, University of Granada, Granada, Spain, University of Granada (UGR), Granada, Spain; [2]The Generation R Study Group Erasmus MC, University Medical Center, Rotterdam, the Netherlands, Erasmus University Medical Center, Rotterdam, Netherlands; [3]ILSI Europe, Avenue E. Mounier 83, Box 6, B-1200 Brussels, Belgium, International Life Sciences Institute Europe, Bruxelles, Belgium

BACKGROUND AND OBJECTIVES
Various alterations in maternal metabolic and endocrine status before and during gestation may increase the risk of cardiometabolic outcomes, including glucose intolerance, dyslipidemia and hypertension, which frequently lead to metabolic syndrome and type 2 diabetes (T2D) later in childhood and adolescence. Therefore, the aim of the present study was to identify and evaluate early-life risk factors during preconception, pregnancy and birth, and early infancy periods for cardiometabolic outcomes in childhood and adolescence.

METHODS
We selected electronic database (Medline, EMBASE, WEB OF SCIENCE, SCOPUS, and Cochrane CENTRAL) to identify longitudinal studies published between the database's inception and July 26, 2024. We only included articles that studied risk factors in mothers, fathers and infants, from preconception to infancy <2 years, associated with cardiometabolic outcomes later in life between 2 and 18 years.

RESULTS
67 studies were included and 163 positive associations were found between early life risk factors and cardiometabolic outcomes, especially with hypertension, glucose intolerance, metabolic syndrome and T2D, later in childhood and adolescence. Low and high birth weight, gestational diabetes and sociodemographic factors were the most frequent risk factors associated with higher risk cardiometabolic outcomes.

CONCLUSIONS
Multiple early-life risk factors were associated with cardiometabolic outcomes during childhood and adolescence. These RESULTS are useful for predicting the risk for childhood cardiometabolic outcomes and for identifying modifiable factors. They may facilitate the design of approaches aimed at alternating several behaviors from birth to infancy, including maternal and paternal habits, as well as the preconception to infancy transition period.

NUTRITION SUPPLEMENTATION COMBINED WITH EXERCISE VERSUS EXERCISE ALONE IN TREATING KNEE OSTEOARTHRITIS: A DOUBLE-BLINDED, RANDOMIZED, PLACEBO-CONTROLLED TRIAL

Wei Liu[1]; Yingxiang Yu[1]; Zhida Zhang[1]; Zhongxia Li[2]; Yanpu Wu[2]; Lan Xie[1]; Ziyi Xu[2]; Cuiqing Chang
[1]Department of Sports Medicine, Peking University Third Hospital, Institute of Sports Medicine of Peking University, Beijing, China; [2]Institute of Nutrition & Health, BYHEALTH, Guangzhou, China

BACKGROUND AND OBJECTIVES
To investigate the effectiveness of formula nutrition supplementation (mainly containing glucosamine sulfate, chondroitin sulfate, rhizoma drynariae) plus supervised exercise versus exercise alone for the treatment of knee osteoarthritis (OA).

METHODS
This was a double-blinded, single-center, randomized, placebo-controlled trial. The study recruited 65 participants (40-75 years) with knee OA. Participants were randomly allocated to nutrition supplementation plus exercise (N+E) group or placebo plus exercise (P+E) group. The intervention lasted for 6 months. The primary outcome was Western Ontario and McMaster Universities osteoarthritis index (WOMAC). Secondary outcomes included physical function and performance scores, lower extremity strength, and serum biomarkers.

RESULTS
Among the 65 randomized patients, 56 (86%) completed the trial. At 3 months, more participants in N+E group than in P+E group achieved minimum clinically important difference (MCID) in WOMAC total score (19/30 [63.3%] vs 8/26 [30.8%]; $P < 0.01$). At 6 months, more participants in N+E group than in P+E group achieved MCID in WOMAC stiffness score (19/30 [63.3%] vs 10/26 [38.5%]; $P < 0.05$). Meanwhile, at 6 months the decreased percentages of WOMAC stiffness score in N+E group was greater than in P+E group ($P < 0.05$). The flexor peak torque at 120°/s and 180°/s in N+E group were significantly higher than those in P+E group at 3 months ($P < 0.05$). Moreover, compared with baseline, improvements in the WOMAC overall and pain score, visual analogue scale pain and 30-second chair stand test were observed in both groups at 6 months. However, these indicators in N+E group were improved as early as 3 months ($P < 0.05$).

CONCLUSIONS
The improvement effects of nutrition supplementation plus exercise were superior to those of exercise alone, and the improvement occurred earlier. Nutrition supplementation plus exercise would be a more efficient strategy for knee OA.

PREVALENCE AND RISK FACTORS FOR OVERWEIGHT AND OBESITY AMONG AFRICAN MEN AND WOMEN: A SYSTEMATIC REVIEW AND META-ANALYSIS

Robert Apkaribo[1]; Hibbah Osei-Kwasi[2]; Paschal Apanga[3]; Albert Kwansa[4]; Evans Asamane Atiah[5]; Sawudatu Zakariah-Akoto[6]; Joseph P. Mensah[7]; Eunice Nago[8]; Issac Boadu[9]; Laura Gray[7];
[1]School of Medicine and Population Health, The University of Sheffield, Sheffield, United Kingdom; [2]School of Sports Exercise and Health Sciences, Loughborough University, Loughborough, United Kingdom; [3]The Jenner Institute, Nuffield Department of Medicine, University of Oxford, Oxford, United Kingdom; [4]Health, African-Caribbean Health, Manchester, United Kingdom; [5]Institute for Applied Health Research, University of Birmigham, UK., Birmingham, United Kingdom; [6]Noguchi Memorial Institute for Medical Research, University of Ghana, Accra, Ghana; [7]School of Medicine and Population Health, University of Sheffield, Sheffield, United Kingdom; [8]Agriculture and Nutrition, Université d'Abomey-Calavi, Cotonou, Benin; [9]School of Public Health, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES
This systematic review and meta-analysis assessed the prevalence and risk factors associated with overweight and obesity among African men and women.

METHODS
A systematic search was performed across multiple databases: MEDLINE, EMBASE, CINAHL, Web of Science, Scopus, Google Scholar, African Index Medicus, and African Journals Online, to identify studies reporting the prevalence and risk factors of overweight and obesity in both men and women in Africa. Two independent reviewers conducted study selection, data extraction, and quality assessment. The pooled prevalence of overweight and obesity was calculated using a random-effects meta-analysis, and heterogeneity among studies was assessed using the I^2 statistic. Thematic analysis was employed to summarize the risk factors associated with overweight and obesity

RESULTS
The search yielded a total of 1,897 studies, of which 68 met the eligibility criteria— all of which were cross-sectional studies. Among these, 23 studies on overweight and 28 studies on obesity were included in the meta-analysis. The overall prevalence of overweight was found to be 26.58% (95% CI: 21.80–31.35). The pooled prevalence of overweight was 29.89% (95% CI: 23.67–36.11) in women and 23.09% (95% CI: 16.29–29.90) in men. The overall prevalence of obesity was 18.91% (95% CI: 16.22–21.61). The pooled prevalence of obesity was 26.43% (95% CI: 21.03–31.83) in women and 10.46% (95% CI: 8.34–12.59) in men. The factors significantly associated with overweight and obesity were categorized into three themes: socio-economic and demographic (gender, age, education, ethnicity, marital status, employment, monthly income, residential status, family history of overweight/obesity, and other non-communicable diseases); lifestyle, dietary, and behavioural (alcohol and food consumption, smoking, physical inactivity, lack of exercise, and contraceptive use); and reproductive factors (contraceptive use, parity, and multiple births).

CONCLUSIONS
The findings reveal a high prevalence of overweight and obesity among African men and women, posing a significant threat to the already vulnerable healthcare systems in African countries. This high prevalence underscores the urgent need for effective policies and interventions to tackle overweight and obesity across the continent.

LINKING SUSTAINABLE DIETARY PATTERNS TO GENERAL AND CENTRAL ADIPOSITY: INSIGHTS FROM THE PORTUGUESE POPULATION

Mariana Rei[1, 2]; Catarina Campos Silva[3]; Duarte Torres[1, 2]; Colin Sage[1]; Sara Rodrigues[1, 2]
[1]FCNAUP, University of Porto, Porto, Portugal; [2]ISPUP, University of Porto, Porto, Portugal;
[3]FMUP, University of Porto, Porto, Portugal

BACKGROUND AND OBJECTIVES
The increasing prevalence of obesity, particularly central adiposity, poses significant public health challenges due to its strong association with non-communicable diseases. In Portugal, central obesity affects over half of the adult population. While unhealthy dietary patterns are key to obesity, sustainable diets may offer protective effects. This study examines the relationship between the Diet Sustainability Score (DSS) and obesity indicators, including body mass index (BMI) and waist-to-height ratio (WHtR).

METHODS
Data from 2287 participants in the National Food, Nutrition, and Physical Activity Survey (IAN-AF 2015-2016) were analyzed. The DSS was derived from four dimensions: nutritional quality, environmental impact, economic affordability, and sociocultural acceptability. Logistic regression models assessed the associations between DSS and both general adiposity (BMI: under/normal weight vs. overweight/obesity) and central adiposity (WHtR: healthy vs. unhealthy central adiposity), adjusting for sex, age, education, and physical activity.

RESULTS
Higher DSS is associated with greater nutrient density, lower intake of ultra-processed foods, reduced environmental impacts (in terms of greenhouse gas emissions and land use), lower diet-related expenses, and greater cultural acceptability of diets. Furthermore, a higher DSS is linked to lower odds of overweight/obesity (OR=0.91, 95% CI=0.88–0.94) and unhealthy central adiposity (OR=0.91, 95% CI=0.87–0.95), suggesting that more sustainable dietary choices are associated with a reduced risk of adverse health outcomes.

CONCLUSIONS
These findings underscore the role of sustainable dietary practices in addressing obesity and highlight their relevance for integrated public health strategies. Incorporating nutritional, environmental, economic, and cultural dimensions can support long-term improvements in population health.

CONFLICTS OF INTERESTS
The authors have no conflict of interest.

ASSOCIATION BETWEEN DIETARY PATTERNS, STRESS AND RISK OF METABOLIC SYNDROME AMONG FINANCIAL BANK WORKERS IN A METROPOLITAN CITY IN GHANA

Sylvia Asantewaa Ocran[1]; Frank Hayford[1]; Brodrick Yeboah Amoah[2]
[1]Dietetics, University of Ghana, Accra, Ghana; [2]Medical Laboratory Sciences, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES
Metabolic syndrome (MetS) constitutes a cluster of cardiovascular risk factors that have profound implications for health. An increasing body of evidence underscores the association between MetS and various dietary habits and lifestyle factors, including stress. The financial banking sector, characterised by extended working hours and sedentary behaviours, may exacerbate these risk factors, thereby heightening the susceptibility to MetS. Hence the study aimed to investigate the relationships between dietary patterns, stress, and the risk of MetS among financial bank employees within a Metropolitan Assembly.

METHODS
This cross-sectional study focused on bank employees in a Metropolitan city in Ghana. Data collection was conducted using structured questionnaires alongside assessments of anthropometric, clinical, and biochemical markers. A multi-stage sampling method was employed to select 200 participants. Stress and dietary patterns were valuated using the Perceived Stress Questionnaire (PSQ) and a food frequency questionnaire, respectively. Data analysis was performed using SPSS version 27.0, and logistic regression was employed to ascertain associations between dietary patterns, stress, and MetS.

RESULTS
Approximately half of all participants (51.5%) reported experiences of stress. Dietary patterns were almost evenly distributed, with 47.7% adhering to an unhealthy diet and 52.3% adherence to healthy diet. The prevalence of MetS markedly different based on diagnostic criteria: 6.3% according to WHO standards, 1.6% per NCEP criteria, and 20.3% as per IDF standards. No significant association with MetS was found concerning sex (aOR=3.41, 95% CI: 0.723–16.07, p=0.121) or unhealthy diet (aOR=2.46, 95% CI: 0.53–11.53, p=0.254). However, stress was identified as a significant predictor of MetS (aOR=4.79, 95% CI: 1.09–21.12, p=0.039).

CONCLUSIONS
This study identified stress as a significant risk factor for development of MetS within the financial banking institutions. Advocacy and implementation of stress management programmes is therefore strongly recommended to mitigate the potential risk of MetS among such sedentary workers.

DIETARY INTAKE OF POLYBROMINATED DIPHENYL ETHERS (PBDES) AND THE RISK OF OBESITY IN THE FRENCH E3N COHORT

Xuan Ren[1]; Pauline Frenoy[1]; Fanny Artaud[1]; Chloé Marques[1]; Gianluca Severi[1]; Geneviève Nicolas[2]; Inge Huybrechts[2]; Francesca Romana Mancini[1]
[1]Université Paris-Saclay, UVSQ, Inserm, Gustave Roussy, Inserm, Villejuif, France; [2]Nutrition and Metabolism Branch, International Agency for Research on Cancer, lyon, France

BACKGROUND AND OBJECTIVES
Polybrominated diphenyl ethers (PBDEs) are organic, lipophilic, and persistent environmental pollutants, with the primary exposure pathway for the general population being the consumption of contaminated food (1). Human exposure to PBDEs has been reported to adversely affect glucose metabolism, thyroid, and ovarian function, potentially increasing the risk of obesity (2). Therefore, the main objective of this study was to investigate the association between dietary intake of PBDEs and the risk of obesity/overweight or weight gain in the French *Etude Epidémiologique auprès des femmes de l'Education Nationale* (E3N) prospective cohort study.

METHODS
The present study included 66,467 women with a mean age of 52.47 years who were followed over 20 years. Cox proportional hazard regression models were used to estimate hazard ratios (HRs) and 95% confidence intervals (CIs) for associations between the dietary intake of PBDEs and the risk of obesity (BMI>30kg/m2), overweight (BMI>25 kg/m2) and gain more than 10 kg during follow-up. The main model was adjusted for age, education level, smoking status, silhouette at puberty, alcohol consumption, total energy intake without alcohol, physical activity and BMI.

RESULTS
Higher dietary intakes of PBDEs were related to an increased risk of overweight (HR overweight (I SD increment) =1.07 (1.05-1.09), HR overweight (Q4 vs Q1) =1.13 (1.07-1.19), P-trend overweight <0.001) and weight gain of more than 10 kg (HR weight gain (I SD increment) =1.12 (1.09-1.14), HR weight gain (Q4 vs Q1) =1.28 (1.21-1.37), P-trend weight gain <0.001). In addition, a non-linear association (P non-linearity=0.0014, Poverall<0.001) between the dietary intake of PBDEs and the risk of obesity (HR obesity (Q4 vs Q1) =1.25 (1.15-1.37), P-trend obesity <0.001) was identified. The associations remained consistent when adjusting in addition separately for total fat, PUFA, n-3 PUFA, the main food sources of PBDEs and PCBs and dioxins intake as well as when running stratified analyses based on the follow-up duration.

CONCLUSIONS
The present prospective study identified a positive association between dietary intake of PBDEs and the risk of overweight, obesity and weight gain. These associations remained significant in multiple sensitivity and subgroup analyses. Further efforts, such as reinforcing public awareness and strengthening regulatory measures, are needed to reduce PBDEs contamination in food and lower exposure levels in the general population.

SINGLE CENTER OBSERVATIONAL STUDY OF EFFECTS OF ACARBOSE ALONGSIDE STANDARD OF CARE WEIGHT LOSS INTERVENTIONS ON METABOLIC PROFILE IN PATIENTS WITH OBESITY

Ashwinkumar Dabhi[1]; Leena Dabhi[2]
[1]Consulting and Counseling Physician and Freelance Physician Nutritionist, Sujivan Hospital, Ahmedabad, India; [2]Medicine, L G HOSPITAL, Ahmedabad, India

BACKGROUND AND OBJECTIVES
The prevalence of obesity has increased exponentially over last 2 decades and more so after COVID pandemics along side numerous weight loss inteventions with both favourable and adverse health outcomes.

METHODS
Adults aged more than 18'th birthday were screened and diagnosed as a patient with obesity according to WHO criteria with Asian cut off. On enrollment brieft history about trajectories of weght changes and intercurrent medical illnesses since birth including use of medications, medical/surgical interventions and all attempts to loose weight with and without success were noted. Anthropometric indices including height, weight, BMI, WHR were measured before and after 3 months of intervention. All paticipants underwent 3 samples OGTT with insulin levels in all 3 samples alongside many other biochemistry tests in a NABL accredited laboratory. Estimations and analysis of the current dietary intakes were calculated and defined by inhouse distitians.
All enrolled participants underwent one on one diet and nutrition counseling including about health scenario of obesity and were explained in detais about the roadmap ahead including pharmacy and supplement presription and start up meal plan with briefing about grocery purchase, cooking techniques and physical activities.

RESULTS
There were significant reductions in weight and metabolic profiles including lipid profile, HS CRP, Hepatic transaminemis and glycemic parameter across wide range of metabolic derange ments. Amongst patients with dyslipidemia there were significant reductions in triglycerides and borderline elevations in HDL. To conclude there is a potential for optimising use of acarbose alongside dietary and lifestyle changes for medical weight loss in countries with low to very high consumptions of calories from junk food and due to its multimodal actions and safety profile it is assumed that majority of patients will need such approaches.

CONCLUSIONS
Asian Indian populations genetically differs from caucasians and subsequently at higher risk of diabetes and CVD adverse outcomes. Indians consume very high carbohydrate containg meals and associated with high prevalences of obesity with and without metabolic syndrome. Efforts are needed to raise awareness of the impact of lifestyle educations on metabolic derangements including metabolic syndrom, DM and CVD.The inerventions with lifestyle changes in patients with MS can decrease weight alongside visceral obesity and reductions in inflammatory/CVD markers including CRP and also increases HDL

HEALTHYW8 PROJECT – MULTI-MODAL (BIO-)MARKERS AND RISK OF OBESITY – A COMPREHENSIVE SCOPING REVIEW

Farhad Vahid[1]; Josep Tur[2]; Cristina Bouzas[2]; Yvan Devaux[1]; Laurent Malisoux[1]; Elsa Lamy[3]; Gitte Ravn-Haren[4]; Rikke Andersen[4]; Sarah Forberger[5]; Maria Giovanna Onorati[6]; Daniela Rodrigues[7]; Torsten Bohn[1]
[1]Department of Precision Health, Luxembourg Institute of Health, Strassen, Luxembourg; [2]IDISBA & CIBEROBN, University of the Balearic Islands-IUNICS, Palma, Spain; [3]Mediterranean Institute for Agriculture, University of Evora, Evora, Portugal; [4]National Food Institute, Technical University of Denmark, Kongens Lyngby, Denmark; [5]BIPS, Leibniz Institute for Prevention Research and Epidemiology, Bremen, Germany; [6]Sociology of Cultural and Communicative Processes, University of Gastronomic Sciences, Bra, Italy; [7]Research Centre for Anthropology and Health (CIAS), University of Coimbra, Coimbra, Portugal

BACKGROUND AND OBJECTIVES

Obesity has been related to a number of chronic diseases, especially non-communicable ones, as well as related co-morbidities (1). It is a complex and multi-factorial complication, and many factors play a role, including age, gender, diet, physical activity (PA), psychological and emotional status, genetic make-up, epigenetics, and gut microbiota (2). One isolated biomarker could therefore not enable optimal risk stratification and prognosis for the individual. Rather, a combined set or multi-modal approach is required, integrating (bio-)markers from various domains, such as more classical markers (insulin, leptin), multi-omics (e.g., genetics, epigenomics, transcriptomics, proteomics, metabolomics), behavioral attributes (dietary and sleep patterns), psychological traits (mental health, eating disorders), and gut-microbiota into a combined interpretation (3-6). The aim of this scoping review is to explore the literature on multicomponent (bio)markers related to obesity risk, mapping the current state of knowledge while identifying gaps and potential ways forward. It focuses on studies and strategies combining at least two markers from diverse fields, such as nutrition, PA, and multi-omics, to predict the risk of developing overweight or obesity.

METHODS

This scoping review is part of the EU Horizon HealthyW8 project. The review adheres to the PRISMA-ScR guidelines. Four major databases (PubMed, Embase, Scopus, and CINAHL) were searched without language restriction until January 2024, following a pre-published protocol (7). After a two-stage screening process done by individual reviewers, data were extracted using a standardised, predefined and pretested coding scheme.

RESULTS

The search identified 1927 records with N=296 articles meeting the inclusion criteria. These were grouped into marker combinations including 1) diet (in 273/296 articles); 2) PA (in 194 articles); 3) omics (in 67 articles); 4) genetics (in 52 articles); 5) traditional markers (in 120 articles); 6) mental health (in 116 articles). Most common combinations of (bio-)markers were: Diet, PA and mental aspects (n=58 articles), diet, PA and any other marker (n=48), diet, omics & any other marker (n=43) and any combination of 4 markers (n=43). Studies incorporating >3 components exhibited the highest proportion of statistically significant findings relative to the total articles within this group (0.90).

CONCLUSIONS

We explored, mapped, and summarized approaches in multi-model biomarkers related to obesity prediction, allowing for a more holistic understanding of obesity's complex nature. Multi-modal (bio-)markers are promising strategies in future obesity prediction approaches.

CONFLICTS OF INTERESTS

FOOD INSECURITY AND ADIPOSITY RISK AMONG YOUNG ADULTS LIVING IN URBAN SLUMS IN A METROPOLITAN CITY IN GHANA

Thelma Esther Lewis[1]; Frank Hayford[1]; Emmanuel Kwaku Ofori[2]
[1]Department of Dietetics, University of Ghana, Accra, Ghana; [2]Department of Chemical pathology, University of Ghana, Accra, Ghana

BACKGROUND AND OBJECTIVES

Urban slums are densely populated areas facing significant health and nutrition challenges. A primary concern is the coexistence of food insecurity and an increased risk of obesity among adults. Limited access to affordable, high-quality food leads to reliance on energy-dense, nutrient-poor diets, raising the risk of obesity and related non-communicable diseases like diabetes and cardiovascular diseases. The study sought to examine the link between food insecurity and obesity risk, along with lipid profiles, in young adults in urban slums, to assess their impact on body composition and metabolic health.

METHODS

A cross-sectional study involving 200 young adults aged 18 to 49 was conducted in three urban slum communities in a metropolitan city in Ghana. A structured questionnaire was used to gather socio-economic information and food insecurity status was assessed using the Household Food Insecurity Access Scale (HFIAS). Anthropometric measurements, including Body Mass Index (BMI), Waist Circumference (WC), Waist-Hip Ratio (WHR), and Mid-Upper Arm Circumference (MUAC) were taken. Body composition metrics such as body fat percentage, visceral fat, and muscle mass were evaluated with Bioelectrical Impedance Analysis (BIA). Additionally, venous blood samples (5 mL) were collected for lipid profile analysis. Data was analyzed using SPSS version 27, and the relationships between adiposity indicators and food insecurity were examined with Chi-square tests and regression models.

RESULTS

The study found that 42% of participants were at high risk for adiposity, with females showing a significantly higher risk than males (39.5% vs. 3.0%, $p<0.05$). Females also had higher rates of overweight (22.5%) and obesity (23.5%) compared to males (10% and 4%). Additionally, 32.5% of females had elevated waist circumference, and 36% had a high waist-to-hip ratio, indicating a greater prevalence of central obesity. In lipid profile analysis, 55.7% had normal HDL levels, while 71.7% were at moderate coronary risk. Elevated LDL and triglycerides were significantly linked to increased adiposity risk ($p<0.05$). No significant correlation was found between food insecurity and high adiposity risk (adjusted odds ratio = 0.090; $p = 0.078$).

CONCLUSIONS

The findings show a high prevalence of excess body fat and lipid abnormalities among young adults in urban slums, particularly among women. Significant differences in body fat risk highlight the need for targeted interventions to improve nutritional awareness, promote healthy lifestyles, and address socioeconomic barriers contributing to these health issues.

EVALUATION OF SALT CONSUMPTION AMONG DIABETICS: DIETARY SURVEY VS NATRIURESIS

Sarra Ben Salah[1]; rym ben othman[1]; Emna Talbi[2]; Ramla Mizouri[1]; Faten Mahjoub[3]; Rim Rachdi[1]; Olfa Berriche[1]; Henda Jamoussi[3]
[1]A, institut national de nutrition et de technologie alimentaire de tunis, tunis, Tunisia; [2]Biologie, institut national de nutrition et de technologie alimentaire de tunis, tunis, Tunisia; [3]Service "A" of Nutritional Diseases, National Institute of Nutrition & Food Technology of Tunis, Tunis, Tunisia

BACKGROUND AND OBJECTIVES
Excessive salt intake is a major risk factor for hypertension and cardiovascular complications, especially in diabetic patients. Accurate assessment of salt consumption is crucial for tailoring dietary recommendations and improving management.
Objective
To compare the effectiveness of dietary surveys and natriuresis measurement in evaluating salt intake among diabetic patients.

METHODS
106 type 2 diabetic patients consulting the National Institute of Nutrition and Food Technology in Tunis were recruited. Urine samples were collected to determine salt intake as predicted by natriuresis. Dietary intake was also assessed using food surveys.

RESULTS
The mean age of the population was 55.46 ± 7.51 years, and the salt intake predicted by natriuresis was 6.22 ± 3.73 g/day, with 4 patients having excessive salt consumption. The 24-hour natriuresis was 106.45 ± 63.82 mmol/24h for the total population, 114 ± 74.7 mmol/24h for men, and 99.63 ± 52.45 mmol/24h for women. Salt intake predicted by natriuresis was 6.22 ± 3.73 g/day for the total population, 6.66 ± 4.36 g/day for men, and 5.82 ± 3.06 g/day for women. The glomerular filtration rate (GFR) was 109.65 ± 35.73 ml/min for the total population, 109.94 ± 31.79 ml/min for men, and 109.4 ± 39 ml/min for women. 3% of the population had a sodium intake greater than 2000 mg/day. The median sodium intake was 4385 mg/day, with a range from 296 to 7899 mg/day.

CONCLUSIONS
Monitoring and adjusting salt intake could be crucial for improving patient outcomes, particularly in diabetic individuals.

EPO6_072

ADVANCING OBESITY TREATMENT IN THE UNDERSERVED

Courtney DeCan[1]; Katie Thure[2]
[1]Clinical Nutrition, UCLA Medical Center, Los Angeles, CA, United States of America; [2]Internal Medicine, University of California, Los Angeles, CA, United States of America

BACKGROUND AND OBJECTIVES

Disparities in obesity and related cardiometabolic disease prevalence and treatment are widespread. Driven in-part by social determinants of health (SDOH), there is also limited access to intensive lifestyle programs that address these factors in underserved, diverse populations. These disparities are evident in Los Angeles where the average obesity rate is 28.5%, but in one sample safety net hospital the rate is 48% for those seen in primary care with 11% having class III obesity (BMI>40 kg/m^2) and 53% reporting food insecurity. Few interdisciplinary lifestyle programs have been studied for their feasibility and effectiveness in this population which this study aims to do.

METHODS

A pilot interdisciplinary weight management program was started for patients with obesity and cardiometabolic disease (diabetes, hypertension, hyperlipidemia). Patients participated in 12 in-person group medical visits over 6 months led by a team of kinesiologists, dieticians, physicians, and social workers. Visits focused on exercise, nutrition, and lifestyle medicine instruction with adjunctive medications if clinically indicated. Patients underwent monitoring of metabolic comorbidities, including HbA1C, SBP, and LDL-cholesterol along with BIA body composition (waist circumference, fat and skeletal muscle mass). Patients also completed pre/post surveys including the CHIS dietary screener and WHOQOL-BREF for quality of life.

RESULTS

A total of 68 patients aged 20-75 years old (average 49), 82% of whom identified as Latino were enrolled in the first year of the pilot clinic. Out of the 12 visits, patients attended an average of 60% of the visits, with transportation, work schedule, and illness as the most common barriers to attendance. The average quality of life rating improved as did dietary quality across many categories such as fresh fruit intake. The majority of patients achieved clinically meaningful improvements with a total percent weight loss average of 6.3% (-17.6%, +1.9%) and average reductions in HbA1C and LDL of 0.5 and 11.7 respectively.

CONCLUSIONS

Patients in the safety net have higher rates of obesity and related cardiometabolic disease along with poor health outcomes and quality of life. They also have limited access to treatments that have been proven to be successful. These preliminary RESULTS show that interdisciplinary weight management programs can be successfully implemented in an underserved setting and lead to improved cardiometabolic health along with improved dietary quality and quality of life. The program can serve as a model for broader implementation to mitigate health disparities in under resourced settings.

CONFLICTS OF INTERESTS

The authors have no conflict of interest.

APPLICATION OF A POSITIVE DEVIATOR APPROACH TO THE NATIONAL DATASET ON OBESITY AND NUTRITION-RELATED CARDIOMETABOLIC DISEASES IN THE UNITED STATES (US)

Mika Matsuzaki[1]; Carla Tarazona-Meza[1]; Rodrigo M. Carrillo-Larco,[2]
[1]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States of America;
[2]Hubert Department of Global Health, Emory University, Atlanta, United States of America

BACKGROUND AND OBJECTIVES
Type 2 diabetes (T2D) and hypertension (HTN) present a major public health challenge worldwide. The prevalence of obesity is >40% among adults in the US, contributing to high prevalence of T2D and HTN. Prevention and mitigation of obesity, T2D, and HTN can alleviate the burden of diseases and premature deaths and yet, every country struggles to address these challenges. This warrants exploration of novel strategies. Positive deviance approach has long been used in nutrition—mostly in the context of undernutrition. We applied this approach in the context of obesity and nutrition-related cardiometabolic diseases.

METHODS
We used the Center for Disease Control and Prevention PLACES dataset (Greenlund et al, 2022) and the census data from the American Community Survey to identify positive deviator (PD) census tracts who had much lower prevalence in 2020. We ran multilevel multivariable regression models to assess association between median household income levels and prevalence of obesity, T2D, or HTN, adjusting for age and racial/ethnic composition at the census tract level and state-level clustering. We identified PD census tracts who had extremely low residuals in the fully adjusted models for each outcome. We assessed preventive care practice and behavioral factors.

RESULTS
Out of 60,945 census tracts, we identified 6 PDs from T2D and 7 each from obesity and HTN from 8 states. There were 3 census tracts that deviated in two of the conditions and 1 census tract that deviated in all three conditions. Among these 4 census tracts, two had relatively low median household income levels (21,624 and 39,041USD). Both of these census tracts had similarly higher proportions of older women and older men's visiting clinics for core preventive services and routine dental care in comparison to the matched census tracts. However, other factors like insurance status, general routine care and sleeping <7 hours were more variable.

CONCLUSIONS
The identification of only 7 PD census tracts highlights that obesity, T2D, and HTN are pervasive issues across the US. While common practice of routine care among older populations may have contributed to this deviation, thorough evaluation of policies, the built environment, and other environmental risk factors in these PD census tracts is essential to uncover the factors contributing to such low prevalences. Insights from these evaluations could inform strategies to adapt and replicate these conditions more broadly in the US.

MEDITERRANEAN DIETARY PATTERN AND BEHAVIOURAL INTERVENTION IN A NEW ZEALAND POPULATION AT INCREASED CARDIOMETABOLIC RISK: WHOLE OF HOUSEHOLD DATA; HE ROUROU WHAI PAINGA

Amber Parry Strong[1]; Fiona Lithander[2]; Richard Gearry,[3]; Andrea Braakhuis,[4]; Anna Worthington,[4]; Denise Conroy,[5]; Troy Merry,[4]; Mark Weatherall,[6]; Meika Foster,[7]; Anna Rolleston,[8]; Jeremy Krebs,[6]
[1]Centre for Endocrine, Diabetes and Obesity Research, Te Whatu Ora Health New Zealand Capital, Coast and Hutt Valley, Wellington, New Zealand; [2]Liggins Institute, University of Auckland, Auckland, New Zealand; [3]Department of Medicine, University of Otago, Christchurch Campus, Christchurch, New Zealand; [4]Department of Nutrition, University of Auckland, Grafton Campus, Auckland, New Zealand; [5]Food Innovation, Plant & Food Research, Sandringham, New Zealand; [6]Department of Medicine, University of Otago, Wellington, New Zealand; [7]Director, Edible Research;Ohoka, New Zealand, Christchurch, New Zealand; [8]Director, The Centre For Health; Tauranga, Tauranga, New Zealand

BACKGROUND AND OBJECTIVES
Cardiometabolic disease including type 2 diabetes and cardiovascular disease (CVD) is common in New Zealand. Dietary patterns including the Mediterranean diet (MedDiet) are associated with a reduced risk of CVD. Study objectives a) test a New Zealand food-based Mediterranean diet (NZMedDiet) in a whole household, and b) characterise household participation.

METHODS
This was a randomised, controlled, multi-centre trial comparing 12 weeks of NZMedDiet to usual diet in participants with increased CVD risk. In a novel design household members were included in the intervention and measurements. The NZMedDiet group was provided with food, recipes and behavioural change support. The primary outcome measure after 12 weeks was the metabolic syndrome severity score (MetSSS) and secondary outcomes were quality of life (QoL, SF36); body composition; HbA1c, lipids and Mediterranean diet score (PyrMDS).

RESULTS
Two hundred adults from a non-Mediterranean, multi-ethnic population took part along with at least one and up to 5 other members of their household (259 household members, total n = 459). At baseline 22 household members were aged under 11; 75 aged 11 – 24; and 162 aged 25 – 81. Household members completed questionnaires and 132 consented to blood sampling.
At the end of 12 weeks, there was no significant difference in mean MetSSS between the NZMedDiet and the usual diet group with an estimate (95% CI) of the difference between groups 0.03 (-0.06 to 0.13) p=0.5. None of the individual components of the MetSSS were different between groups at the end of 12 weeks. The difference in diet score between the NZMedDiet and control favoured a more Mediterranean dietary pattern at 12 weeks ($p<0.001$). This was driven by small increases in fish, fruit, legumes, olive oil, vegetables and nuts. Weight reduced in the NZMedDiet group compared with control (-1.0 (-1.7 to -0.3) p = 0.004) and QoL, assessed by the SF-36 quality of life questionnaire, improved in eight of ten domains ($p< 0.05$).

CONCLUSIONS
There was no improvement in the MetSSS in response to the NZMedDiet intervention over 12 weeks, despite moving to a more Mediterranean dietary pattern. However, there was a significant improvement in quality of life with the NZMedDiet across the whole household, and a small reduction in weight.

CONFLICTS OF INTERESTS

EPO6_076

THE METABOLITE RISK SCORE AS AN AUXILIARY MOLECULAR DIAGNOSTIC TOOL FOR OBESITY TO COMPLEMENT ANTHROPOMETRIC STANDARDS

Dahee Ryu[1]; Hye Jin Yoo[2, 1]
[1]Department of Biomedical Science, BK21 FOUR Program in Biomedical Science and Engineering, Inha University, Incheon, Korea, Republic of; [2]Institute for Specialized Teaching and Research (INSTAR), Inha University, Incheon, Korea, Republic of

BACKGROUND AND OBJECTIVES
The primary method for diagnosing obesity is the anthropometric measurement of body mass index (BMI). However, BMI does not account for body fat distribution and fat mass, which are more physiologically relevant factors of obesity. Therefore, this study aimed to investigate whether the metabolite risk score (MRS) can effectively diagnose obesity and serve as a useful molecular diagnostics tool for obesity in Korean population.

METHODS
A total of 100 plasma samples were used in the discovery phase to construct the MRS, with 50 samples from individuals without any diseases and the remaining 50 from obesity patients. An additional 100 plasma samples, categorized in the same manner as the discovery set, served as an independent validation set to assess the efficacy of the MRS. Metabolomics was performed using ultra/high-performance liquid chromatography-tandem mass spectrometry (UHPLC-MS/MS), and key metabolites were identified through statistical screening. The MRS was then calculated using the equation $\sum \beta i \mathrm{M}i$, where βi indicates the beta coefficient from a linear regression model incorporating the key metabolites, and Mi indicates the z-score of each key metabolite.

RESULTS
A total of 197 metabolites were identified in the discovery set. Among them, 12 metabolites showed variable importance in projection (VIP) scores greater than 1.5 and a false discovery rate (FDR)-adjusted p-value of less than 0.05. These metabolites were further examined for their potential in diagnosing obesity, with bilirubin and oleic acid emerging as key metabolite for this purpose. The MRS for obesity was calculated using these two metabolites using the equation, $\sum \beta i \mathrm{M}i$. When the MRS was applied to the validation set to evaluate its potential as a molecular diagnostic tool for obesity, it demonstrated an accuracy of 74.8% (p=0.005). Furthermore, when the MRS was combined with established general markers related to obesity, such as systolic blood pressure, tumor necrosis factor-α, and interleukin-6, the accuracy increased up to 81.6% (p <0.001).

CONCLUSIONS
The MRS is a scoring system that uses key metabolites associated with a specific phenotype of interest, in other words the MRS takes into account the collective effects of metabolites rather than focusing solely on identifying the most effective metabolite biomarker. This approach could advance molecular diagnostics methods for obesity, addressing the limitations of current obesity evaluation standards. Ultimately, this study demonstrates that the MRS can serve as a valuable adjunct in molecular diagnostics for obesity in Koreans.

THE POTENTIAL OF WEDANG UWUH EXTRACT AS ANTICANCER OF MCF-7 BREAST CANCER CELL IN VITRO

Siti Zurriyatul Ifadah[1]; Fatma Zuhrotun Nisa[1]; Tyas Utami[2]
[1]Health and Nutrition, Universitas Gadjah Mada, Yogyakarta, Indonesia; [2]Department of Food and Agriculture Products Technology, Gadjah Mada University, Yogyakarta, Indonesia

BACKGROUND AND OBJECTIVES
Breast cancer is a major non-communicable disease with a sizable cause of death in the world. Wedang uwuh has been widely used by the community as a traditional drink that is beneficial to health. The ingredients in wedang uwuh are known to contain high antioxidants that have the potential to prevent cancer. Several studies have shown that the active compound components contained in wedang uwuh material have anticancer activity. However, research related to the anticancer activity of the combination of wedang uwuh ingredients has never been conducted. The purpose of this study is to determine the potential of wedang uwuh extract as an anticancer agent against MCF-7 breast cancer cells in vitro.

METHODS
This study is an experimental study that uses post-test only with the control group design method. The antiproliferation test was carried out on MCF-7 breast cancer cell culture using the MTT test method. Apoptosis tests were performed on MCF-7 breast cancer cells that had been incubated for 24 hours with the test compound (doxorubicin as a positive control) and analyzed using flow cytometry with the addition of Annexin-V FITC.

RESULTS
The RESULTS showed that wedang uwuh extract had an antiproliferation effect in vitro against MCF-7 breast cancer cells by 50% at a concentration of 3489.594 µg/mL. Wedang uwuh extract can also induce apoptosis in MCF-7 breast cancer cells by 12.6% and 17.4% respectively at concentrations of 872.39 µg/mL (¼ IC_{50}) and 1744.797 µg/mL (½ IC_{50}).

CONCLUSIONS
Base on the result, this study can be conclude that Wedang Uwuh extract have potent as anticancer of breast cancer in vitro

TRAJECTORIES OF ENERGY FROM MACRONUTRIENTS AND SUBSEQUENT RISK OF OVERWEIGHT/OBESITY AMONG CHINESE ADULTS: A 28-YEAR FOLLOW-UP STUDY

Jiguo Zhang[1]; Huijun Wang[1]; Zhihong Wang[2]; Hongyun Fang[3]; Aidong Liu[4]
[1]Nutrition Monitoring Department, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China; [2]Public Nutrition Department, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China; [3]Student Nutrition, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China; [4]Nutrition, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China

BACKGROUND AND OBJECTIVES
Overweight and obesity is becoming a major public health problem in China.This study aimed to explore the trajectories of energy from macronutrients and investigate their prospective associations with overweight and obesity among Chinese adults.

METHODS
We used data of the China Health and Nutrition Survey (CHNS) conducted in 1991, 1993, 1997, 2000, 2004, 2006, 2009, 2011, 2015, and 2018. Adults aged 18 and above years were included in the present analysis, for whom dietary data was collected during at least three waves. The total number of participants was 9428. We assessed dietary energy intake by applying three consecutive 24 h dietary recalls (two weekdays and one weekend day) in each wave of the survey. Body mass index (BMI) was calculated using height and weight measurements. Overweight/obesity was defined as BMI ≥ 24 kg/m2. We used group-based trajectory modeling to identify trajectories of energy from macronutrients between 1991 and 2018. The number of groups was determined based on their interpretability and using the Bayesian information criterion (BIC) approach. We constructed three-level mixed-effect logistic regression models to assess the risk of overweight/obesity in relation to trajectories of of energy from macronutrients.

RESULTS
Three trajectories groups of energy from macronutrients were identified. Participants who followed the low-carbohydrate high-fat high-protein diet trajectory (OR = 1.28; 95% CI: 1.08, 1.52) were positively associated with higher risk of overweight/obesity after adjusting for potential confounding factors. Participants with high-carbohydrate low-fat low-protein diet trajectory were not associated significantly with overweight/obesity.

CONCLUSIONS
Macronutrient intake is inextricably linked to health and diets of different proportional macronutrients can have profound implications for obesity prevention.

KNOWLEDGE, ATTITUDES, AND PRACTICE OF LOW SODIUM SALT IN 9 PROVINCES IN CHINA: A NATION-WIDE COMMUNITY-BASED SURVEY

Gao Chao[1]; Ge Zeng[2]; Long Jiewei[3]; Li Hanning[1]; Lv Wanting[1]
[1]Department of Food Nutrition Assessment, Chinese Center for Disease Control and Prevention, Beijing, China; [2]Director of Nutrition Program/ Chief Technical Officer, Sodium Reduction., Vital Strategies, Inc. (USA) Jinan Representative Office, Jinan, China; [3]Department of Clinical Nutrition, The Second People's Hospital of Nanning City, Guangxi, China

BACKGROUND AND OBJECTIVES
Substituting regular salt with low sodium salt (LSS) is an effective strategy for reducing blood pressure and preventing cardiovascular events. This study aims to investigate the knowledge, attitude, and practice (KAP) of Chinese consumers on salt reduction and low-salt diets, analyze the influencing factors of buying low sodium salt, provide feasible suggestions and technical support for the intake and promotion of low salt diet in China, and provide reference recommendations for the government.

METHODS
This multi-center nationwide survey was conducted from April 2023 to July 2023 in nine provinces in China, utilizing a multi-stage stratified sampling method. The survey was using the Knowledge Attitude Practice (KAP) questionnaire about salt reduction and low sodium salt, and the counting data were described in the form of number of cases (percentage), and the comparisons between two and more groups were made using the c2 test. Logistic regression modeling was used to explore the relationship between KAP and different characteristics of salt reduction and low sodium salt. The correlation between reduced salt and low sodium salt KAP was analyzed by Pearson correlation coefficient.

RESULTS
A total of 5534 valid questionnaires were collected. In the KAP of salt reduction, the awareness rate of "5g daily salt intake for adults" was 29.6%. 4,695 (84.8%) supported the low-salt diet, 74.5% of the participants took salt reduction measures. The main factors affecting the KAP score of salt reduction were gender, age, educational background, frequency of meals at home and food taste. In the KAP of low sodium salt, the LSS knowledge rate was 57.9%. The proportion of consumers who bought LSS was 77.5%. Among those who are aware of low sodium salt, more than 80 percent of respondents supported the use of LSS instead of regular salt by food and beverage companies. The factors influencing the KAP score of low sodium salt included gender, residence, monthly family income and the frequency of meals at home.

CONCLUSIONS
We found that better salt reduction knowledge and attitude can encourage consumers to take the initiative to reduce salt intake. However, there are still several challenges in promoting LSS. Further progress on LSS would require multi-party cooperation, strengthened health education, and further cultivation of consumers' awareness of low salt and low sodium habits.

IDENTIFICATION OF ANTIOXIDANT ACTIVITY AND BIOACTIVE COMPOUND IN COMMERCIAL WEDANG UWUH, A TRADITIONAL BEVERAGE IN INDONESIA

Nafisa Rahma Khairani[1]; Fatma Zuhrotun Nisa[1]; Agus Santosa[2]
[1]Health and Nutrition, Universitas Gadjah Mada, Yogyakarta, Indonesia; [2]Nutrition, Dr. Sardjito General Hospital, Yogyakarta, Indonesia

BACKGROUND AND OBJECTIVES
Non-Communicable Diseases (NCDs) develop in a state of oxidative stress that can damage the human body. The antioxidant content in functional foods plays a role in handling oxidative stress. Wedang uwuh which contains several kinds of spices with various bioactive components has the potential as an antioxidant that is good for health. Differences in composition and quantity in some commercial wedang uwuh have the potential to cause differences in antioxidant activity content. This study aims to determine the antioxidant activity of several commercial wedang uwuh and identify the quercetin compounds of selected commercial wedang uwuh.

METHODS
This study was conducted using laboratory experimental analysis method, with the analysis of antioxidant activity in the five types of wedang uwuh infused samples carried out using the DPPH method and the identification of quercetin compounds in selected samples using the HPLC method.

RESULTS
The infusion of wedang uwuh in each sample had an average antioxidant activity in the form of a percent DPPH radical scavenging ability of 67.28%; 59,5%; 64,67%; 63,48%; and 65.34%. Selected commercial wedang uwuh infusion contain the quercetin compound of 22.81 ppm.

CONCLUSIONS
B*ase on the result can be concluded that commercial wedang uwuh have antioxidant activity and the higest antioxidant activity of wedang uwuh contain quercetin.*

EFFECT OF THE CONSUMPTION OF MILK WITH BETA-CASEIN A2A2, MILK WITH BETA-CASEIN A1A2 AND A PLANT-BASED DRINK ON METABOLIC HEALTH IN ADULTS. RANDOMIZED CONTROLLED IMPA-CT: PROTOCOL STUDY

Jadwiga Hamulka[1]; Magdalena Górnicka[2]; Dawid Madej[3]; Adam Kalinowski[4]; Anna Berthold-Pluta[5]
[1]Department of Human Nutrition, Warsaw University of Life Sciences (SGGW-WULS), Warszawa, Poland; [2] Department of Human Nutrition, Warsaw University of Life Sciences (SGGW-WULS), Warszawa, Poland; [3]Department of Human Nutrition, Warsaw University of Life Sciences (SGGW-WULS), Warsaw, Poland; [4]Health Centre (SGGW-Health Centre), Warsaw University of Life Sciences (SGGW-WULS), Warsaw, Poland; [5]Department of Food Technology and Assessment, Warsaw University of Life Sciences (SGGW-WULS), Warsaw, Poland

BACKGROUND AND OBJECTIVES
Milk with A2 β-casein (A2 milk) is currently the subject of numerous studies on the effects of its consumption on health. Commonly consumed milk contains a mixture of β-casein of different genetic variants (most often A1 and A2). In the polypeptide chain of A2 β-casein, proline occurs at position 67, while in β-casein A1 - histidine. Main goal of the dietary intervention will be to identify and compare the effects of consuming A2 milk, conventional milk and cow's milk substitute(s) (selected plant-based drink) on body composition, parameters of carbohydrate and lipid metabolism, metabolic rate and immune system function, and markers of bone turnover in adults.

METHODS
The controlled IMPA-CT (Investigating Milk and Plant Alternatives-Clinical Trial) Study is an observational, prospective and randomize study with three groups (A2Milk group, ConvMilk group, and PlantDrink group). The study will include 150 adults with normal and/or overweight, without coexisting chronic diseases, aged 20-60 years. The intervention study will consist of the consumption of at least 250 ml of an appropriate product (A2 milk / convmilk / plant drink) daily for a period of 3 months. After qualification of the subjects (T0), before the start of the study (T0'), in the 4th week of the study (T4), in the 8th week of the study (T8) and at the end of the study, after 12 weeks (T12), an assessment of the diet and nutritional status is planned. Body composition, bone mineral density (DEXA) and biochemical tests will be done as a marker of metabolic health, as well as an assessment of the metabolic rate (RMR) will be performed.

RESULTS
We expect that after 12 weeks the effect of consuming A2 or conventional milk or plant drink will be visible in markers of metabolic health such as: lipid profile, insulin and postprandial glycemia, IGF-1, IGFBP-3; casein allergy marker - sIgE; markers of immune system function - IL-2, IL-6, IL-10, TNF-α (tumor necrosis factor); immunoglobulins: IgA, IgG; bone turnover markers: including: beta-Crosslaps (beta-CTX), bone resorption marker - telopeptide - of type 1 collagen (CTx); bone formation markers - procollagen type 1 propeptide (P1NP), bone alkaline phosphatase isoenzyme, P1CP). Additionally, urinary calcium; pyridinoline (Pyr) and deoxypyridinoline (DPyr) will be assessed.

CONCLUSIONS
The study design, including extensive follow-up and robust endpoint measures, will contribute to understanding the therapeutic potential and safety profile or otherwise of β-casein A2 milk and plant-based drinks.

LOW CONSUMPTION OF FISH, FERMENTED MILK BEVERAGES AND PLANT BIOACTIVE COMPONENTS MAY BE THE PREDICTORS OF RISK OF MORE SEVERE FORMS OF METABOLIC SYNDROME (METS)

Magdalena Górnicka[1]; Jadwiga Hamulka[1]; Agnieszka Białkowska[2]; Monika A. Zielinska-Pukos[1]
[1]Department of Human Nutrition, Warsaw University of Life Sciences (SGGW-WULS), Warsaw, Poland;
[2]Internal Department, Czerniakowski Hospital, Warsaw, Poland

BACKGROUND AND OBJECTIVES
Diet-therapy of Metabolic Syndrome (MetS) and your components is of great importance due to significant health and social consequences. The aim of this study was to (1) determine dietary patterns (DPs) and (2) determine the association between selected plasma antioxidants (carotenoids, polyphenols) and the severity of MetS and MetS components in Polish adults with metabolic disorders.

METHODS
The study was designed as a cross-sectional. The study group was 276 adults with metabolic disorders. Data about the frequency of consumption of selected food groups were collected. Anthropometric measurements: body height, body weight, waist, and hip, as well as body composition were taken. Blood samples were obtained for measurements of glucose and lipids, as well as carotenoids and polyphenols. The obtained biochemical and anthropometric parameters were used to calculate the anthropometric and metabolic dysfunction indices.

RESULTS
Three dietary patterns were identified in our study group: Western, Prudent and Low Food. RESULTS of logistic regression analysis indicated rare consumption of fish and fermented milk beverages as a predictor of risk of more severe forms of MetS. In our study group, no relationship was found between the dietary antioxidant intensity and the variables studied, which may be attributed to the low frequency of consumption of the sources of bioactive compounds, such as carotenoids and polyphenols, but also to the metabolic disorders. A low concentration of carotenoids and polyphenols in the plasma of adult with MetS was associated with an improper diet with a low consumption of plant products, including vegetables and fruit.

CONCLUSIONS
In the treatment of MetS, the development of effective strategies to reduce the risk of more severe forms of MetS should focus on increasing the consumption of fish, fermented milk beverages, and vegetables and fruits. Further studies are needed to determine whether the observed associations and low plasma levels of antioxidants are causally related to the metabolic syndrome or are a result of the pathology of the syndrome or an inappropriate diet.

DEVELOPING EVIDENCE-BASED PUBLIC HEALTH GUIDANCE ON DIET AND RELATED FACTORS FOR PEOPLE LIVING WITH AND BEYOND CANCER

Helen Croker[1]; Ellen Copson[2]; Edward Giovannucci[3]; Ellen Kampman[4]; John Krebs[5]; Andrew Renehan[6]; Matty Weijenberg[7]; Nigel Brockton[8]; Vanessa Gordon-Dseagu[1]; Sarah Kefyalew[1]; Martin J Wiseman[1]; Panagiota Mitrou

[1]Science and Policy, World Cancer Research Fund International, London, United Kingdom; [2]Faculty of Medicine, University of Southampton, Southampton, United Kingdom; [3]Departments Nutrition and Epidemiology, Harvard T.H. Chan, Boston, United States of America; [4]Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [5]Department of Biology, University of Oxford, Oxford, United Kingdom; [6]Faculty of Biology, Medicine and Health, University of Manchester, Manchester, United Kingdom; [7]Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands; [8]Science, American Institute for Cancer Research, Washington, United States of America

BACKGROUND AND OBJECTIVES

The global burden of cancer is increasing due to a growing and aging population alongside increasing lifestyle-related risk factors. Concurrently, enhanced and early detection of cancer along with improved treatment has resulted in greater numbers of people living with and beyond cancer (LWBC) globally. This has increased demand from health professionals and people LWBC for reliable evidence-based information about diet and other lifestyle factors. World Cancer Research Fund (WCRF) International's Global Cancer Update Programme aimed to fill this gap with evidence-based guidance developed by experts.

METHODS

WCRF International worked with experts who first judged the strength of the available evidence [1,2,3] on how diet, nutrition and physical activity influence survival and quality of life in people after a diagnosis of colorectal and breast cancers. Evidence was graded using pre-determined criteria designed to judge the certainty of an effect from exposure to a particular risk factor [4]. Due to nature of the limitations in the cancer survivorship literature, it was necessary to take a different approach, so we worked with experts (scientists, health professionals and patients) to develop a new framework for producing guidance [5,6]. This guidance considered the unique complexities of the cancer survivorship evidence compared to incidence and was a way of providing public health information in areas where evidence is weaker based on the judgement criteria. Recommendations for future research were also developed.

RESULTS

A substantial amount of research was included in the reviews. As this came mainly from observational studies, residual confounding and reverse causation could not be excluded. Guidance was developed to encourage people LWBC to consider making specific lifestyle changes. For diet, this included increasing dietary fibre (breast cancer) and increasing wholegrains and coffee, and reducing sugary drinks (colorectal cancer). The findings also provided confirmation that following WCRF International's existing Cancer Prevention Recommendations is likely to be beneficial for this group.

CONCLUSIONS

There is increasing evidence on the role of lifestyle for people LWBC but there were limitations in the strength of the evidence. Working with experts allowed us to develop guidance representing the best currently available evidence, this can be used by patients, health professionals and policy makers to improve cancer care.

THE POTENTIAL OF A SUSTAINABLE INNOVATIVE PREBIOTIC AS A CO-TREATMENT TO METFORMIN IN THE MANAGEMENT OF TYPE 2 DIABETES

Lieselotte Cloetens[1]; Mona Landin-Olsson[2]
[1]Biomedical Nutrition, Pure and Applied Biochemistry, Lund University, Lund, Sweden; [2]Clinical Sciences, Diabetology and Endocrinology, Lund University, Lund, Sweden

BACKGROUND AND OBJECTIVES
Type 2 diabetes (T2D) patients are often treated with metformin, the most widely used oral glucose lowering agent. However, the adherence to the treatment is usually poor with gastrointestinal complaints and gut dysbiosis as a major cause. The intake of prebiotics promotes the growth of health-beneficial bacteria and could thus help to prevent gut dysbiosis. In this study, we investigated the potential of arabinoxylan-oligosaccharide rich fibre extract (AXOS), an innovative sustainable prebiotic, to co-treat T2D thereby improving gut health and increasing adherence to metformin.

METHODS
A blinded, parallel, randomised, controlled 4-month intervention study in T2D patients taking metformin was carried out to investigate the effect of AXOS on glucose metabolism and gut health. AXOS from maize was produced from a side stream from the ethanol industry, which is very cost-effective and sustainable process. The soluble fibres were extracted and treated by unique enzymes to yield AXOS. A daily of 10g of AXOS or control (maltodextrin) was consumed. At the start, month 2 and month 4 of the study, blood samples were collected for measurement of clinical markers and fecal samples for gut microbiota analysis. Intestinal microbial community analysis was performed by high-throughput NGS of 16S rRNA and quantitative PCR (Bifidobacterium spp, F. prausnitzii, P.copri). The “Fibre loving bacteria (FLB) index” was calculated based upon short chain fatty acid levels.

RESULTS
Sixty-six T2D patients started and 54 (72±5y, 27±4 kg/m2; n=27 AXOS, n=27 control) completed the study. Mean fasting glucose, insulin, HbA1c, blood lipid levels, vitamin D and vitamin B12 did not significantly change during the study ($p>0.05$). The PCR RESULTS showed that 20% of patients who consumed AXOS had an upregulation of the FLB index together with increased level of HBA1c ($p=0.08$).

CONCLUSIONS
AXOS show the potential to improve gut microbial composition in patients with T2D taking metformin. However, more research is needed to confirm these RESULTS and to further explore the interindividual differences to be able to develop sustainable personalized prebiotics targeted for T2D patients taking metformin.

PULMONARY FUNCTION IN RELATION TO THE ADEQUACY OF TOTAL DAILY PROTEIN INTAKE IN MIDDLE-AGE PATIENTS WITH COPD

Alda Ranogajec[1, 2]; Ana Ilić[2]; Vesna Vukičević Lazarević[3]; Snježana Benko Meštrović[1, 4]; Ivana Rumbak[2]
[1]Department of Endocrinology, Special Hospital for Pulmonary Diseases, Zagreb, Croatia; [2]Department of Food Quality Control, University of Zagreb, Faculty of Food Tecnology and Biotechnology, Zagreb, Croatia; [3]Department of Allergology and Immunology, Special Hospital for Pulmonary Diseases, Zagreb, Croatia; [4]Physiotherapy Department, University North, Varaždin, Croatia, Croatia

BACKGROUND AND OBJECTIVES
Chronic obstructive pulmonary disease (COPD) is often linked to nutritional depletion, adversely impacting outcomes. Alongside with the daily energy intake, an adequate protein intake is essential for COPD patients. The present study observed the differences in weight status, skeletal muscle index, respiratory function and inspiratory muscle strength and function between patients with stable COPD toward daily protein intake.

METHODS
The cross-sectional study was conducted on 71 COPD patients (53.3% men; 66.5 ± 8.4 years) participating in pulmonary rehabilitation (September 2023 – May 2024). Dietary intake was determined using three 24-hour recalls. Patients were divided into two groups according to the British Dietetic Association recommendation for protein intake in stable COPD (0.8 – 1.5 g/kg/day). The first group consists of patients who had protein intake less than 0.8 g/kg/day (NMR group), and the second group consists of patients who had an intake of more than 0.8 g/kg/day (MR group). Anthropometric measurements, respiratory function and inspiratory muscle function and strength were assessed according to standard protocols.

RESULTS
Overall, 47.8% of patients did not meet the recommended protein intake (NMR: 0.59 ± 0.13 g/kg), while of the remaining 37, 34 met the recommendations and 3 exceeded them (MR: 1.08 ± 0.28 g/kg). The MR group had a higher daily energy intake (1724 ± 390 kcal vs. 1317 ± 305 kcal; $p<0.001$) compared to the NMR group. In the MR group, patients had a higher proportion of daily energy from proteins, while there were no significant differences in fats and carbohydrates. The majority ($p<0.001$) of patients in the MR group had an adequate weight status (67.6%), while in the NMR group 50.0% of patients were obese. No difference was found between the groups in the proportion of patients with an adequate skeletal muscle mass index. In addition, no significant differences were observed in FEV1, FVC, or MIP between groups. However, the MR group exhibited lower diaphragm thickness at the end of inhalation (2.3 ± 0.5 mm vs. 2.6 ± 0.6 mm; $p<0.001$) and exhalation (1.6 ± 0.5 mm vs. 2.8 ± 0.5 mm; $p<0.001$).

CONCLUSIONS
Nearly half of the patients did not reach the recommended protein intake, emphasizing the need for targeted nutritional and functional assessment and support. The MR group had better energy balance and weight status, but had lower diaphragm thickness, which warrants further investigation.

EVALUATION OF GLUTEN-FREE DIET BALANCE IN PATIENTS WITH CELIAC DISEASE

Kinga Skoracka[1, 2]; Michał Michalak[3]; Anna Maria Rychter[2, 4]; Alicja Ratajczak-Pawłowska[4, 2]; Agnieszka Zawada[2]; Agnieszka Dobrowolska[2]; Iwona Krela-Kaźmierczak[4, 2]
[1]Doctoral School, Poznan University of Medical Sciences, Bukowska 70, 60-812 Poznan, Poznań, Poland; [2]Department of Gastroenterology, Dietetics and Internal Diseases, Poznan University of Medical Sciences, Poznań, Poland; [3]Department of Computer Science and Statistics, Poznan University of Medical, Poznań, Poland; [4]Laboratory of Nutrigenetics, Department of Gastroenterology, Dietetics and Internal Diseases, Poznan University of Medical Sciences, Poznań, Poland

BACKGROUND AND OBJECTIVES
Celiac disease (CD) is a condition for which the only current therapeutic solution is a strict gluten-free diet (GFD). The nutritional profile of gluten-free foods has been increasingly questioned by the scientific community. It seems crucial to ensure not only that gluten is excluded from the diet, but also that it is properly balanced. Our study aimed to assess habitual intakes of energy, macronutrients, vitamins, and minerals in patients with CD and the extent to which these cover recommended dietary allowances (RDA).

METHODS
A total of 60 participants, 40 of whom (32 women, 8 men, mean age = 36.19) were diagnosed with CD and had followed the GFD for an average of 10.2 years, and 20 healthy people (16 women, 4 men, mean age = 36.22) stated the control group (CG) and followed the traditional diet.
Participants were asked to follow their usual diet to assess intakes of energy, carbohydrate, protein, fat, fibre, potassium (K), sodium (Na), calcium (Ca), phosphorus (P), magnesium (Mg), iron (Fe), zinc (Zn), vitamin A, B1, B3, B6, B12. Furthermore, the extent to which participants covered the RDA was evaluated. Dietary intake was assessed by 4-day food records analysed (Diet 6.0, Poland).

RESULTS
There were significant differences in the intake of fiber (16.6 vs. 20.51 g/day), Na (2151.46 vs. 3275.15 mg/day), Mg (277.55 vs. 331.93 mg/day), Fe (9.185 vs. 11.95 mg/day), vitamin A (1048,223 vs. 322,254 uq/d) between both groups. There were no significant differences in energy, carbohydrate, protein, K, Ca, P, Mg, Zn, vitamin B1, B2, B6, B12, but patients with CD did not meet the RDA for Ca (77.84% RDA), Mg (83.56% RDA), Zn (98.93% RDA), Fe (71.99% RDA), vitamin B1 (87% RDA) and D (17.35% RDA), while controls did not meet the RDA for Ca (88.85% RDA), Mg (96.8% RDA), Fe (83.37% RDA), thiamin (90.44% RDA), vitamin D (20.42% RDA). Despite the lack of statistically significant differences in energy intake, patients with CD presented lower body mass than CG (61.64 vs. 71.15 kg).

CONCLUSIONS
The diet of patients with CD is deficient in Ca, Mg, Fe, vitamin B1 and D. CD patients consume less dietary fibre, Mg and Fe than healthy individuals. This study emphasises the importance of providing appropriate education to patients with CD, which should extend beyond gluten restriction and put more focus on the nutritional value of the diet.

ASSESSMENT OF BODY COMPOSITION IN PATIENTS WITH CELIAC DISEASE IN RELATION TO ENERGY SUPPLY, PROTEIN, FAT AND CARBOHYDRATE INTAKE

Anna Maria Rychter[1, 2]; Kinga Skoracka[3, 1]; Michał Michalak[4]; Alicja Ratajczak-Pawłowska[2, 1]; Agnieszka Zawada[1]; Agnieszka Dobrowolska[1]; Iwona Krela-Kaźmierczak[2, 1]
[1]Department of Gastroenterology, Dietetics and Internal Diseases, Poznan University of Medical Sciences, Poznań, Poland; [2]Laboratory of Nutrigenetics, Department of Gastroenterology, Dietetics and Internal Diseases, Poznan University of Medical Sciences, Poznań, Poland; [3]Doctoral School, Poznan University of Medical Sciences, Poznań, Poland; [4]Department of Computer Science and Statistics, Poznan University of Medical, Poznań, Poland

BACKGROUND AND OBJECTIVES
Celiac disease (CD) is a condition characterised by the atrophy of intestinal villi in response to gluten consumption. Following the introduction of a strict gluten-free diet (GFD), except for rare cases of CD refractory to dietary treatment, the intestinal villi are rebuilt, resulting in a more efficient absorption of nutrients. We therefore assessed the differences in body composition between the two groups and investigated whether the GFD of patients with CD differs from that of healthy people in terms of energy and macronutrient balance.

METHODS
We recruited a total of 60 participants, 40 of whom (32 women, 8 men, mean age = 36.19) were diagnosed with CD and followed the GFD for an average of 10.2 years, and 20 healthy individuals (16 women, 4 men, mean age = 36.22) stated the control group (CG) and followed the traditional diet. We examined body composition - body mass, body mass index (BMI), fat-free mass (FFM), % of FFM in soft tissue, fat mass (FM), and % of FM in soft tissue - by dual-energy X-ray absorptiometry (DXA) using the Lunar DPX-Plus (Lunar, Inc. Madison, Wisconsin, USA). Participants were asked to follow their usual diet to assess their intake of energy, carbohydrate, protein, fat, fibre, saturated fatty acids (SFAs), polyunsaturated fatty acids (PUFAs), monounsaturated fatty acids (MUFAs) and cholesterol. Dietary intake was assessed by analysing 4-day food records (Diet 6.0, Poland).

RESULTS
We observed statistically significant differences between patients with CD and CG in body mass (61.58 vs. 71.5 kg), FM (15.92 vs. 23.39 kg), % of FM in soft tissue (25.43 vs. 34.65 %), and % of FFM in soft tissue (72.26 vs. 62.74 %). No statistically significant differences were found for BMI (22.4 vs. 24.18 kg/m2) and FFM (44.08 vs. 46.17 kg). Individuals with CD consumed statistically significantly less fiber (16.16 vs. 20.51 g/d) but showed no significant differences for energy and other dietary components. We observed statistically significant positive correlations between body mass and energy, protein, fat, and fiber intake in CD patients, and in the CG between body mass and protein and fat intake.

CONCLUSIONS
Individuals with CD tend to present lower body mass, FM, and % of FFM in soft tissue, but there are no differences in energy and macronutrient intake. However, patients with CD have been observed to consume less fibre than CG. These RESULTS emphasize the importance of taking a personalized approach to the care of patients with CD, with a focus on developing tailored management plans based on comprehensive health and nutritional interviews and, when possible, body composition measurements.

BACKGROUND AND OBJECTIVES

Gut microbiota may contribute to the higher disease risk associated with adiposity, but human studies reported inconsistent associations of adiposity with gut microbiota composition, possibly due to between-study heterogeneity. In order to clarify observed inconsistencies, we examined associations of body mass index (BMI) with gut microbiota alpha diversity and relative microbial abundance at the phylum and genus taxonomic level alongside variation in fiber intake among adults in a joint federated analysis of harmonized data from European observational studies participating in the Knowledge Platform Intestinal Microbiomics (INTIMIC-KP).

METHODS

Eight studies harmonized cross-sectional data, including BMI (kg/m2), self-reported dietary intake, and microbiota composition based on high-throughput measurement. Generalized linear models and logistic regression were used in study-level meta-analysis of individual participant data using R-based DataSHIELD. Models were adjusted for age and sex and additionally for fiber and energy intake.

RESULTS

Among 7,415 participants from eight studies, higher BMI (per 5 kg/m2) was associated with lower alpha diversity (β: -0.05; 95%CI -0.07, -0.03) and with higher relative abundance of the phylum Proteobacteria (β: 0.05; 95% CI 0.01, 0.09), but no associations were observed for the phyla Firmicutes and Bacteroidetes, with high between-study heterogeneity. Higher BMI was inversely associated with the relative abundance of *Faecalibacterium* (Firmicutes) (β -0.11, 95% CI -0.14, -0.07) as well as with lower odds of presence of *Blautia* (Firmicutes) and *Akkermansia* (Verrucomicrobia) and when *Akkermansia* was present, with lower *Akkermansia* relative abundance. Adjustment for dietary fiber did not substantially change observations.

CONCLUSIONS

This federated analysis of multiple studies on gut microbiota profiles found lower alpha diversity, higher Proteobacteria relative abundance, alongside depleted *Faecalibacterium*, *Blautia* and *Akkermansia* with higher adiposity. By combining data from diverse study populations using harmonized data and statistical methods, our analysis partly overcomes sources of heterogeneity that may explain previously observed inconsistent findings.

Low polyphenol content is on the pathway between ultra-processed food consumption and low-grade inflammation: cross-sectional RESULTS from the Moli-sani Study

Emilia Ruggiero[1]; Augusto Di Castelnuovo[1]; Simona Costanzo[1]; Simona Esposito[1]; Giuseppe Di Costanzo[1]; Amalia De Curtis[1]; Chiara Cerletti[1]; Maria Benedetta Donati[1]; Giovanni De Gaetano[1]; Licia Iacoviello,[1]; Marialaura Bonaccio[1]
[1]Epidemiology and Prevention, IRCCS Neuromed Mediterranean Neurological Institute, Pozzilli, Italy

BACKGROUND AND OBJECTIVES
Low-grade inflammation is one of the potential mechanisms linking ultra-processed foods (UPFs) to poor health outcomes. Besides having low nutritional composition, UPFs also lack bioactive compounds, such as polyphenols. We tested the hypothesis that low polyphenol content could be on the pathway of the previously documented association between UPFs and low-grade inflammation.

METHODS
Data were from the Moli-sani Study established in 2005–2010, and comprising 22,939 men and women (mean age 55 y ± 12). Dietary data were collected using a 188-item food frequency questionnaire, and polyphenol intake was calculated by matching food consumption data with the Phenol-Explorer database on the polyphenol content of each reported food. UPF was defined according to the Nova classification, and calculated as the proportion (weight ratio; %) between UPF (g/d) and the total food eaten (g/d). Low-grade inflammation was assessed by a composite INFLA-score including C-reactive protein levels, leukocyte and platelet counts and the granulocyte to lymphocyte ratio.

RESULTS
The average (SD) weight contribution of UPFs to the diet was 10.8% (±6.7), the mean intake of polyphenols was 449 (±218) mg/d. In multivariable-adjusted linear regression analyses, higher UPF intake (Q4) was associated with lower dietary polyphenol content (β = -149.5; 95% CI: -156.3 to -142.8 mg/d), compared to the bottom category, and this inverse association was consistent for main polyphenol classes. The inclusion of total dietary polyphenols into the multivariable model explained about 20% of the direct relationship of UPFs with the INFLA-score (p-value < 0.001), and this association was particularly evident for lignans (proportion explained = 38.1%; p-value <0.001).

CONCLUSIONS
A higher dietary share of UPFs would provide lower amounts of polyphenols in the diet. The poor polyphenol content of highly processed foods explains a good proportion of the direct association of UPFs with low-grade inflammation. These findings suggest that reducing UPFs could possibly increase the amount of polyphenols in the diet and contribute to lower inflammation.

GASTROINTESTINAL SYMPTOMS IMPROVE WITH A MEDITERRANEAN DIETARY PATTERN AND BEHAVIOURAL INTERVENTION IN A NEW ZEALAND POPULATION AT INCREASED CARDIOMETABOLIC RISK; HE ROUROU WHAI PAINGA

Fiona Lithander[1]; Ella Silk,[2]; Amber Parry Strong[3]; Richard Gearry[2]; Anna Worthington,[4]; Anna Rolleston,[5]; Denise Conroy,[6]; Troy Merry,[4]; Mark Weatherall,[7]; Meika Foster,[8]; Andrea Braakhuis[9]; Jeremy Krebs,[7]
[1]Liggins Institute, University of Auckland, Auckland, New Zealand; [2]Department of Medicine, University of Otago, Christchurch Campus, Christchurch, New Zealand; [3]Centre for Endocrine, Diabetes and Obesity Research, Te Whatu Ora Health New Zealand Capital, Coast and Hutt Valley, Wellington, New Zealand; [4]Department of Nutrition, University of Auckland, Grafton Campus, Auckland, New Zealand; [5]Director, The Centre For Health; Tauranga, Tauranga, New Zealand; [6]Food Innovation, Plant & Food Research, Sandringham, New Zealand; [7]Department of Medicine, University of Otago, Wellington, New Zealand; [8]Director, Edible Research;Ohoka, New Zealand, Christchurch, New Zealand; [9]Nutrition, University of Auckland, Auckland, New Zealand

BACKGROUND AND OBJECTIVES
The increase in ultra-processed and western dietary patterns is associated with an increase in gastrointestinal (GI) issues. As GI health is directly impacted by dietary pattern, it is unsurprising that the Mediterranean diet (MedDiet) is associated with positive symptom outcomes in patients with conditions that can impact GI symptoms such as irritable bowel syndrome. However, there are currently limited data on the potential benefits of the MedDiet on GI function in individuals with no diagnosed GI disorders or diseases. The objective was to examine the impact of a New Zealand food-based Mediterranean diet (NZMedDiet) with behavioural intervention on GI symptom severity.

METHODS
This is a multi-centre, randomised control trial, which compared the effects of a 12 week (w) NZMedDiet to usual diet in participants at increased cardiometabolic risk. Household members were also invited to participate with index participants. The NZMedDiet group was provided with food, recipes and behavioural change support. To assess GI symptoms, the Gastrointestinal Symptom Severity Score (GSRS) was provided to participants at 0 and 12w. The GSRS scores are obtained by combining 15 items into 5 symptom clusters; abdominal pain, reflux, diarrhoea, indigestion and constipation. The higher the score of each cluster, the more severe the symptom. Comparisons between groups were made using t-tests.

RESULTS
Two-hundred adults from a non-Mediterranean, multi-ethnic population participated. Baseline mean ages of index participants were 49.8y and 49.9y, in the NZMedDiet and control groups, respectively. GSRS variable scores were compared between groups and the intervention group had a statistically significant reduction ($p<0.05$) in all five GSRS variables compared to the control group. Abdominal pain and diarrhoea were the most significantly improved symptoms in the intervention group, compared to the controls. Furthermore, the index participants tended to have higher baseline GSRS scores compared to the household members in the study, indicating that they had slightly worse GI symptoms in general.

CONCLUSIONS
Although the participants were not considered to have severe GI symptoms at baseline, their severity score had decreased after 12w on the NZMedDiet, indicating its potential benefits in the general GI health of participants. Some of the potential reasons for this benefit are increases in fibre rich foods and their role in shaping the microbiome and reducing inflammation within the gut.

THE IMPACT OF A WEIGHT GAIN OF 10 KG OR MORE AFTER AGE 20 ON THE HEALTH STATUS OF JAPANESE MEN

Katsushi Yoshita[1]; Atsuki Sakai[1]; Tomoe Fukumura[1]; Masaji Tabata[2]
[1]Department of Nutrition, Osaka Metropolitan University Graduate School of Human Life and Ecology, Osaka, Japan; [2]Department of Health Checkup, Ishikawa Health Service Association, Kanazawa, Japan

BACKGROUND AND OBJECTIVES
In recent years, the health effects of overnutrition have become a problem in Japan. In particular, in middle-aged men, excessive weight gain associated with aging has been strongly linked with the onset of hypertension, dyslipidemia, and diabetes. Therefore, we investigated the extent to which a weight gain of 10 kg or more after age 20 affects health status.

METHODS
The study included 54,908 Japanese men, aged 30 to 69 years, who underwent health checkups at medical institutions in Japan in 2019. They were not receiving medical care. The participants were asked to fill out a questionnaire to determine whether they had a weight gain of 10 kg or more after the age of 20 years to the time of their health checkup. For blood pressure, risk was defined as meeting at least one of the following criteria: a systolic blood pressure of 130 mmHg or higher or a diastolic blood pressure of 80 mmHg or higher. For serum lipids, risk was defined as a high-density lipoprotein-cholesterol concentration less than 40 mg/dL. For glucose tolerance, risk was defined as a fasting blood glucose concentration of 100 mg/dL or higher or HbA1c level of 5.6% or higher. Logistic regression analysis was used to calculate the odds ratios and 95% confidence intervals, adjusted for associated factors for the three risks of having a weight gain of 10 kg or more after age 20, compared with not having a weight gain of 10 kg or more after age 20.

RESULTS
The age composition of the population was as follows: 32.1% in their 30s, 36.0% in their 40s, 21.6% in their 50s, and 10.3% in their 60s. The overall physical condition [expressed as the mean (standard deviation)] was based on age [45.3 (9.8) years], height [171.5 (6.0) cm], weight [69.9 (11.7) kg], and body mass index [23.7 (3.6) kg/m2]. The adjusted odds ratios (95% confidence interval) for individuals who had gained 10 kg or more after age 20, compared with individuals who had not gained weight, were as follows: blood pressure, 1.847 (1.783-1.914); serum lipids, 3.197 (2.984-3.425), and glucose tolerance, 1.801 (1.738-1.866).

CONCLUSIONS
This study confirmed that, in Japanese men, a weight gain of 10 kg or more after the age 20 clearly increases the risk of developing noncommunicable diseases such as high blood pressure, dyslipidemia, and diabetes. For individuals found to have risk factors during health checkups, actively encouraging them to improve their daily eating habits and lifestyle disorders via nutritional and health guidance is necessary.

THE BURDEN OF CARDIOVASCULAR DISEASE ATTRIBUTABLE TO DIETARY RISK FACTORS AMONG FIVE HEALTH AREAS IN CHINA, 2002-2018

Yuna He[1]; Yuehui Fang[1]; Yiyao Lian[1]; Zengwu Wang[2]; Maigeng Zhou[3]
[1]Department of Public Nutrition and Nutrition Policy, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China; [2]Division of Prevention and Community Health, National Center for Cardiovascular Disease, Beijing, China; [3]National Center for Chronic Noncommunicable Disease Control and Prevention, Chinese Center for Disease Control and Prevention, Beijing, China

BACKGROUND AND OBJECTIVES
The burden of cardiovascular diseases (CVDs) is rising in China and showed regional difference. Our study is aiming to provide a comprehensive depiction of the burden of CVDs attributable to dietary risk factors across China's five health areas from 2002 to 2018.

METHODS
Data from the China National Nutrition Surveys, the China Chronic Disease and Risk Factor Surveillance, the Hypertension Survey, and the Chinese Centre for Disease Control and Prevention cause-of-death reporting system were used to estimate the intake of dietary factor, the number of deaths, and disability-adjusted life-years (DALYs), age-standardized mortality rate (ASMR), for ischemic heart disease (IHD), ischemic stroke (IS), hemorrhage and intracranial hemorrhage (IH) attributable to dietary factors in China from 2002 to 2018. According to previous studies in China, this study categorizes the 31 provinces into five health areas.

RESULTS
Inadequate fruit, whole grain, and vegetables intake were the leading dietary risk factors for IHD, IS and IH in China, while nuts, soybean and SSB were only associated with IHD mortality. In 2018, low whole grain intake was responsible for the highest CVDs deaths in health area one, two and five, which responsible for 44.0, 148.6 and 49.0 thousand deaths respectively. Low fruit intake was responsible for the highest CVDs deaths in health area three and four, which responsible for 320.0 and 105.7 thousand deaths respectively. From 2002 to 2018, the highest ASMR for CVDs attributable to suboptimal diet was found in health area three and changed from 179.67 to 138.30 per 100 000 population respectively. In 2018, the highest attributable ASMR IHD and IS was found in health area three, which was 77.62 and 30.70 per 100 000 population and the highest attributable ASMR for IH was found in health area four, which was 37.34 per 100 000 population. In 2018, suboptimal diet was responsible for 16.0 million (95%UI, 13.8 to 18.4) DALYs for stroke, and 13.9 million (95%UI, 11.8 to 16.3) DALYs for IHD in China. Health area three had the highest burden of CVDs, accounting for 46.2% and 51.2% DALYs for stroke and IHD in 2018.

CONCLUSIONS
This study provides a comprehensive picture of the geographic variation and temporal trends of the burden of CVDs attributable to dietary risk factors according to health area from 2002 to 2018 in China and showed that low whole and fruit intake were the main dietary risk factors among China, highlighting the need for geographically targeted intervention strategies to improve the quality of diet and reduce the diet-related burden of CVDs.

ASSOCIATION BETWEEN SUCROSE CONSUMPTION AND IMMUNOGLOBULIN PRODUCTION IN WOMEN WITH TYPE 2 DIABETES MELLITUS

Beatriz Elina Martinez-Carrillo[1]; G Rillo Arturo[1]; Valdés-Ramos Roxana[1]
[1]Nutrition Research Laboratory, Universidad Autónoma del Estado de México Facultad de Medicina, Toluca de Lerdo, Mexico

BACKGROUND AND OBJECTIVES
Type 2 diabetes mellitus (T2DM) is a systemic disease. Carbohydrate consumption causes complications in the disease. The role of immunoglobulin production in T2DM is still unclear. The objective was to evaluate the association between sucrose consumption and immunoglobulin production in women with and without type 2 diabetes mellitus.

METHODS
Two groups were included in the study: 1) women with T2DM (n=22) and 2) healthy women without T2DM (n=22). In both groups, the following were determined: body mass index (BMI), total cholesterol, triglycerides, pre- and postprandial glucose, serum concentration of immunoglobulins A, G and M, as well as 2 24-h recalls determining sucrose consumption per week.

RESULTS
In both groups, the mean age was 40 years, 12 with normal weight, 6 with overweight and 4 with obesity. 59% of women with T2DM had elevated cholesterol, triglycerides and serum glucose, in contrast to 40% of women without T2DM who showed elevation in these parameters. Women with T2DM consumed a higher amount of sucrose (4,837 mg per week) in contrast to the group with T2DM (1,876 mg per week). There was a difference in sucrose consumption ($P<0.002$), IgG production ($P<0.001$) and IgM ($P<0.002$), with a significant correlation between age and sucrose consumption with IgG and IgM production in the group with T2DM.

CONCLUSIONS
There is a positive association between sucrose consumption and the modification in the production of IgG and IgM immunoglobulins.

WHICH INTERVENTIONS TO PROMOTE HEALTHY DIETARY AND/OR PHYSICAL ACTIVITY BEHAVIOURS COULD WORK BEST AMONG ADOLESCENTS IN SUB-SAHARAN AFRICA? A REALIST SYNTHESIS

Gideon Amevinya[1]; Nora Lorenzo[2]; Pam Kingma[3]; Rebecca Pradeilles[1]; Edwige Landais[1]; Erik Beune[3]; Lauren Sherar[4]; Amos Laar[5]; Gershim Asiki[6]; Charles Agyemang[3]; Andrew Booth[7]; Michelle Holdsworth[1]
[1]UMR MoISA, Research and Development Institute IRD Montpellier, Montpellier, France; [2]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium; [3]Department of Public & Occupational Health, Amsterdam Public Health Research Institute, Amsterdam UMC, University of Amsterdam, Amsterdam Netherlands; [4]School of Sport, Exercise and Health Sciences, Loughborough University, Loughborough, United Kingdom; [5]School of Public Health, University of Ghana, Accra, Ghana; [6]Chronic Diseases Management Unit, African Population and Health Research Center, Niarobi, Kenya; [7]School of Medicine & Population Health, The University of Sheffield, Regent Court, 30 Regent Street, Sheffield, S1 4DA, Sheffield, United Kingdom

BACKGROUND AND OBJECTIVES
Like many Sub-Saharan African (SSA) countries, Ghana and Kenya are experiencing a rapid nutrition transition due to unhealthy food environments and decreased physical activity opportunities for adolescents. Effective interventions to promote healthy diet and physical activity among adolescents requires an understanding of the underlying mechanisms that contribute to behaviour change. We aimed to identify programme theories (PTs) that capture key context-mechanism-outcome patterns so as to help pinpoint theoretical components of a multi-component intervention to improve adolescent diet and physical activity in SSA.

METHODS
A realist synthesis was conducted using a 5-stage iterative process. *Stage 1:* a rough PT was generated based on synthesizing 7 relevant WHO best buys on diet and physical activity. *Stage 2:* a search was conducted of 3 academic databases (PubMed, Scopus, and Web of Science) to identify relevant studies for adolescents (10-19y) in urban SSA. *Stage 3:* relevant data were extracted/synthesized to generate evidence-informed context, mechanisms, and outcome configurations (n=63), which contributed to the generation of 10 PTs. *Stages 4 and 5:* PTs were tested/refined using evidence from relevant SSA studies (n=27) and consultations with stakeholders in Ghana/Kenya.

RESULTS
Physical activity and healthy diet interventions are likely to be effective when they operate through 3 interconnected systems: an institutional framework (e.g. schools), environmental enablers and social support networks. Success requires established supportive scheduling [PT1], reinforced by trained and engaged teachers who can effectively implement nutrition and/or physical education [PT2, PT3]. These institutional elements must be supported by adequate environmental enablers, such as accessible physical activity facilities [PT5] and availability of affordable nutritious food options [PT6], with consideration for socioeconomic barriers that might limit access [PT7]. The intervention's impact could then be amplified through a comprehensive social support system where peer influence [PT8], parental engagement [PT9], and community involvement create reinforcing behavioural norms [PT4], while cultural relevance [PT10] ensures sustained participation.

CONCLUSIONS
Multi-component interventions could work by creating a system where institutional support, environmental access, economic access and social reinforcement work in synergy to normalise and facilitate healthy dietary and physical activity behaviors of adolescents.

RISK FACTORS OF CARDIOMETABOLIC HEALTH AND METABOLIC SYNDROME AMONG NON-PREGNANT WOMEN IN LEBANON

Nicolai Petry[1]; Omar Obeid[2]; Valeria Galetti[1]; Maya Kouzeiha[3]; Randa Hamade[4]; Amirhossein Yarparvar[5]; Lima Working Group[6]

[1]GroundWork, GroundWork, Fläsch, Switzerland; [2]Nutrition and Food Sciences, American University of Beirut, Beirut, Lebanon; [3]Nutrition, Mercy USA, Beirut, Lebanon; [4]Public Health, Ministry of Public Health, Beirut, Lebanon; [5]Nutrition, UNICEF, Beirut, Lebanon; [6]Nutrition, Nutrition working group, Beirut, Lebanon

BACKGROUND AND OBJECTIVES

Globally, non-communicable diseases are the leading cause of mortality among women, responsible for two-thirds of all deaths, half of which are due to cardiovascular diseases. We explored the prevalence and risk factors of metabolic syndrome in non-pregnant women aged 15–49 years of age in Lebanon.

METHODS

The prevalence and co-existence of diabetes or prediabetes, hypertension, obesity, visceral obesity, low HDL cholesterol, high total cholesterol, elevated triglycerides and inflammation and the association with nutrition and socioeconomic indicators were measured in women 15-49 years of age using data from a nationally representative cross-sectional stratified survey.

RESULTS

Diabetes and prediabetes were found in 3.4% and 8.3% of women, respectively. Hypertension was found in 6.6% of women, and 43.1% had inflammation, 21.9% had elevated triglycerides, 47.5% had low HDL cholesterol, and 4.7% had elevated total cholesterol. Obesity (body-mass-index >30) and visceral obesity affected 25.0% and 50.8% of women, respectively. All cardiometabolic risk factors were found to be highly and positively associated, and 72.2% of women aged 15-49 and 88.4% aged 40-49 had at least one cardiometabolic disorder. Metabolic syndrome affected 24.8% and 44.4%, respectively. Aside from higher age, low education was associated with a higher prevalence of most cardiometabolic risk factors. Only a few associations were detected between cardiometabolic risk factors and nutrition-related indicators.

CONCLUSIONS

The high prevalence of cardiometabolic risk factors and their co-existence in Lebanese women is concerning. Our data indicates that controlling obesity and inflammation is key to reducing the prevalence and minimizing the risk of cardiovascular diseases.

NEEDS SURVEY FOR PARTICIPANTS OF COOKING CLASS FOR CANCER PREVENTION

RITSUKO KATO[1]; Chitose Haruka[2]; Hayashi Kengo[3]; Shimizu Ryogo[4]
[1]Human Nutrition, Tokyo Kasei Gakuin University, Chiyoda Sambanchō Campus, Tokyo, Japan; [2]Nutrition Management Office, National Cancer Center Hospital, Chuo City, Japan; [3]Nutrition Management Office, NHO Shibukawa Medical Center, Shibukawa, Japan; [4]Nutrition Management Office, NHO Tochigi Medical Center, Utsunomiya, Japan

BACKGROUND AND OBJECTIVES

Cancer has been the leading cause of death among Japanese since 1981. National Cancer Center Hospital East has been hosting “Cooking Class for Cancer Prevention” three times a year since July 2009 for healthy individuals, providing information on desirable diets and dietary habits incorporating cooking practice. However, the effectiveness of these classes in cancer prevention depends on whether participants are able to apply what they have learned in the class to their daily lives. Therefore, it is necessary to equip them with self-management skills for cancer prevention, while providing practical information based on their culinary skills and lifestyle habits.

METHODS

In order to enhance the quality of the “Cooking Class for Cancer Prevention,” we performed a qualitative analysis through focus group interviews together with a quantitative analysis through tabulation of questionnaires to investigate the needs of participants.

RESULTS

articipants of the “Cooking Class for Cancer Prevention” were recruited by the National Cancer Center Hospital East. Each class included a lecture and cooking demonstrations by a registered dietitian, as well as hands-on cooking practice. Afterwards, self-administered questionnaires were collected. Group interviews were conducted with participants who responded to the questionnaire and gave their consent.Of the 66 participants (with a mean age of 62.9 years), 97% were women. The most common lifestyle change participants wanted to incorporate into their lives were related to diet, with the largest number of participants (79%) wanting to reduce salt intake. In contrast, only 29% were willing to undergo medical screenings. Group interviews were conducted with 13 participants who completed the questionnaire and gave their consent. Among the knowledge gained in the cooking class, the participants listed dietary habits and the use of ingredients and seasonings which are effective in preventing cancer, as what they want to practice in their real lives. Difficulties in implementation included accommodating family members of different ages and genders, reducing salt intake and changing habits, and indicated their needs for a way to develop meals.

CONCLUSIONS

Most participants were at the contemplation and preparation stages of the Transtheoretical Model, developing a program that incorporates behavior therapy to enhance self-efficacy, while providing information according to their needs, was considered effective in helping them acquire self-management skills.

PROTECTIVE EFFECTS OF CHRYSIN ALONE AND IN COMBINATION WITH SULFASALAZINE ON DINITROBENZENE SULFONIC ACID-INDUCED COLITIS IN MICE

Wen-Tzu Wu[1]; Kai-Li Liu[2]; Chun-Hung Yang[3]
[1]Food Nutrition and Health Biotechnology, Asia University, Taichung, Taiwan; [2]Department of Nutrition, Chung Shan Medical University, Taichung, Taiwan; [3]Post-Baccalaureate Veterinary Medicine, Asia University, Taichung, Taiwan

BACKGROUND AND OBJECTIVES
Ulcerative colitis is characterized by frequent relapsing inflammation in the colon. Chrysin, a nature flavonoid compound, is known for its anti-inflammatory properties. This study aimed to evaluate the effects of chrysin alone and in combination with sulfasalazine (SU) on colonic damage and inflammation in mice.

METHODS
Male C57BL/6JNarl mice were divided into five groups: control (CON), dinitrobenzene sulfonic acid (DNBS), DNBS + chrysin (DCH), DNBS + SU (DSU), and DNBS + chrysin + SU (DCS). Chrysin and SU were administered via oral gavage for 46 days. All animals were subjected to two episodes of DNBS instillations on day 22 and day 44, while the mice in CON group were given 50% ethanol instead.

RESULTS
The RESULTS revealed a significant colonic damage and inflammation in DNBS group, as evidenced by colon shortening with higher histological score, and decreased the expressions of E-cadherin (E-cad) and zonula occludens-1 (ZO-1). DSU and DCS groups exhibited significant improvement in DNBS-induced colon shortening, with DSU enhancing E-cad expression and decreased colonic tumor necrosis factor α (TNFα) and interlukin-1β levels. Additionally, DCH and DCS groups significantly increased the expressions of E-cad and ZO-1, with reducing the percent involvement of histopathology injury severity and TNFα level. Chrysin supplementation also increased short-chain fatty acid levels in the cecal contents.

CONCLUSIONS
These findings indicated that chrysin combination with SU may provide a beneficial strategy for protecting against the progression of DNBS-induced inflammation and mucosal damage in ulcerative colitis.

EFFECTS OF THE ADDITION OF SPRATS TO THE DIET OF RATS ON BODY WEIGHT GAIN, WEIGHTS OF SELECTED ORGANS AND LIVER ENZYME ACTIVITY

Ewa Piatkowska[1]; Aneta Kopec[2]; Urszula Pomietło,[2]; Kinga Dziadek,[1]; Ivo Doskocil[3]
[1]Department of Human Nutrition and Dietetics; Faculty of Food Technology, University of Agriculture in Krakow, Kraków, Poland; [2]Departament of Human Nutirion and Dietetics, Faculty of Food Technology, University of Agriculture in Krakow, Kraków, Poland; [3]2Department of Microbiology, Nutrition and Dietetics, Faculty of Agrobiology, Food and Natural R, Czech, Prague, Czechia

BACKGROUND AND OBJECTIVES
A balanced diet is the key to good health and well-being. Eating fish, especially oily fish such as salmon, mackerel or sprat, is good for your health because it is a source of valuable omega-3 fatty acids. These fats help lower total cholesterol, support heart function and improve brain function and help to reduce inflammatory parameters. Fish is also rich in protein, vitamins A and D, and minerals such as iodine and selenium, which support immunity and skin health. Regular consumption of fish can help reduce the risk of many chronic diseases. The objective of the present study was to verify the hypothesis about the impact of sprats added to the experimental diets of Wistar rats with induced oxidative stress on body weight gain, weights of selected organs and liver enzyme levels.

METHODS
Male, Wistar strain rats (5-week-old) with average body mass between 87-140 g were used. Animals were acclimated for 10 days on standard lab chow before assigned to experimental groups. Injection of streptozotocin in animals was in 8th day of acclimatization period. During the experiment period all animals were housed in plastic cages under controlled temperature (25°C) and light (12:12 light: dark cycle) conditions. Animals were divided into four groups. Group I – rats were fed AIN-93G diet, group II - rats were fed AIN-93G diet and oxidative stress was induced by intraperitoneal injection of streptozotocin (65 mg/kg/b.m), group III – rats were fed AIN-93G diet modified with addition of sprats, group IV - rats were fed AIN-93G diet modified with addition of sprats and oxidative stress was induced by intraperitoneal injection of streptozotocin (65 mg/kg/b.m). After 10 weeks, of experimental period fasted rats the rats will be euthanized. Blood samples were rapidly collected, transferred to centrifuge tubes and the serum was separated by low-speed centrifugation. The level of ALT and AST were determined in the serum. Livers, kidneys, heart were removed, washed in a cold solution of 0.9 % sodium chloride dried and weighed.

RESULTS
No significant changes in rodents body weight, weight of livers, hearts and kidneys were observed. Between the groups fed the AIN-93G diet and the AIN-93G diet with added fish, changes in liver enzyme levels were observed.

CONCLUSIONS
Further research is needed to deepen our understanding of this issue and to fill gaps in existing research.

THE EFFECT OF SPRATS ON LIPID METABOLISM IN EXPERIMENTAL RATS

Aneta Kopec[1]; Urszula Pomietło[1]; Ewa Piatkowska[2]; Kinga Dziadek[1]; Ivo Doskočil[3]
[1]Departament of Human Nutirion and Dietetics, Faculty of Food Technology, University of Agriculture in Krakow, Kraków, Poland; [2]Department of Human Nutrition and Dietetics; Faculty of Food Technology, University of Agriculture in Krakow, Kraków, Poland; [3]Department of Microbiology, Nutrition and Dietetics, Faculty of Agrobiology, Food and Natural Re, Czech University f Life Science Prague, Pragu, Czechia

BACKGROUND AND OBJECTIVES
Sprats (*Sprattus sprattus*) belong to the *Clupeidae* family and are a rich source of essential nutrients and minerals such as calcium, magnesium, iodine, selenium and zinc. It is also well known that thermal treatment can affect the nutritional composition and its functional effects. The objective of this study was to evaluate the effect of baked sprats added to the experimental diet on lipid metabolism in experimental rats with induced oxidative stress.

METHODS
Animals were acclimated to standard laboratory chow for 10 days before being assigned to experimental groups. Animals were injected with streptozotocin on day 8 of the acclimatisation period. The rats were divided into four groups. Group I - rats were fed with AIN-93G diet (negative control group), Group II - rats were fed with AIN-93G diet and oxidative stress was induced by intraperitoneal injection of streptozotocin (65 mg/kg/b.m.). Group III - rats were fed AIN-93G diet modified with addition of sprats, Group IV - rats were fed AIN-93G diet modified with addition of sprats and oxidative stress was induced by intraperitoneal injection of streptozotocin (65 mg/kg/b.m.). After 10 weeks of the experimental period, the rats were fasted, euthanised and blood samples were taken to obtain serum. Livers were dissected, weighed and frozen. In the serum, total cholesterol, HDL cholesterol, LDL cholesterol and triglicerides were measured using commercially available assays. Crude lipid content was measured in the liver using the Soxleth method.

RESULTS
Total and LDL cholesterol levels were significantly lower in sprat-fed rats in groups III and IV compared to experimental rats in groups I and II. Conversely, serum HDL cholesterol levels were significantly increased in rats from groups III and IV compared to groups I and II. The concentration of triglycerides significantly increased in the serum of rats of groups III and IV as compared to groups I and II. A similar trend was observed in the concentration of crude lipids in the liver.

CONCLUSIONS
Based on the RESULTS obtained, it can be suggested that sprats added to the diets of animals with/or without oxidative stress can modulate lipid metabolism, although further studies are required.

A COMPREHENSIVE ANALYSIS OF DIETARY INTAKE OF INDIVIDUAL CAROTENOIDS AND ODDS OF OVERWEIGHT/OBESITY – FINDINGS FROM THE PERSIAN COHORT STUDY

Farhad Vahid[1]; Saeid Doaei[2]; Torsten Bohn[1]
[1]Department of Precision Health, Luxembourg Institute of Health, Strassen, Luxembourg; [2]Department of Community Nutrition, Shahid Beheshti University of Medical Sciences, Tehran, Iran, Islamic Republic of

BACKGROUND AND OBJECTIVES
Major factors affecting human health and contributing significantly to the worldwide burden of disease are overweight and obesity, constituting growing public health concerns (1, 2). Dietary carotenoids have been shown in some, though partly conflicting, studies to have independent positive impacts on a range of health-related outcomes (3, 4). The present study aimed to thoroughly examine the association between individual dietary carotenoids and the odds of overweight or obesity. We postulated that a decreased risk of overweight or obesity is related to a higher dietary intake of carotenoids.

METHODS
Dietary intakes of 4202 participants (general adult population, men/women) of the PERSIAN cohort study were investigated by a 237-item validated FFQ, and carotenoid intake was determined by means of USDA food databases (3, 4). Several models of logistic regression were applied to assess the association between obesity/overweight (BMI≥25 kg/m2) and dietary intake of individual carotenoids after adjusting for confounders.

RESULTS
Calorie-adjusted total carotenoid intake (OR=0.392, CI95%: 0.274-0.560, P<0.01) and specific individual carotenoids, including β-carotene, lutein/zeaxanthin, phytoene, phytofluene, and violaxanthin were associated with obesity after adjusting for age and sex (all P<0.01), while lycopene was not. The associations remained statistically significant even after adjusting for marital status, education, job, and physical activity.

CONCLUSIONS
In summary, intake of several individual carotenoids showed promising associations with reduced overweight and obesity, with a notable exception of lycopene. Further research in additional populations is needed to confirm these findings and explore potential mechanisms of action.

SODIUM INTAKE AS A RISK FACTOR FOR OSTEOPOROSIS: A SYSTEMATIC REVIEW AND NARRATIVE SYNTHESIS OF OBSERVATIONAL STUDIES OF ADULTS

Mina Nicole Händel[1]; Isabel Cardoso,[1]; Camilla Paludan,[1]; Joanna Michałowska,[1]; Sofus Christian Larsen,[1]; Berit Lilienthal Heitmann,[2]; Bo Abrahamsen,[3]
[1]Unit for Dietary Studies, Parker Institute, Frederiksberg Hospital, Copenhagen, Denmark; [2]Department of Public Health, University of Copenhagen, Copenhagen, Denmark, The Research Unit for General Practice and Section of General Practice, Copenhagen, Denmark; [3]OPEN, Department of Clinical Research, University of Southern Denmark, Odense, Denmark

BACKGROUND AND OBJECTIVES
Understanding the possible role of sodium intake on the aetiology of osteoporosis can be relevant when developing and implementing prevention strategies for osteoporosis and its associated fractures. The objective is to examine the association between sodium intake/excretion and bone health by summarizing evidence of observational studies.

METHODS
: A literature search was performed in 5 electronic databases from inception to August 2023. The inclusion criteria were non-institutionalised adults with measured sodium intake or excretion. Outcomes were any bone indices. A narrative synthesis was undertaken. The certainty of the evidence was evaluated using GRADE and risk of bias was assessed using the quality criteria checklist for primary research of the Academy of Nutrition and Dietetics. PROSPERO registration: CRD42017065360.

RESULTS
34 unique studies met our inclusion criteria (n>160,000): 30 cross-sectional studies and 4 cohort studies. The study populations consisted of either only women or men and women combined, aged 18 to 89 years. 9 cross-sectional studies and 1 cohort study showed no association, and the remaining studies indicated that both low or high sodium intake/excretion was associated with decreased bone mineral density, higher risk of fractures or higher risk of osteoporosis. The certainty in the evidence is very low due to serious risk of bias, risk of inconsistency and risk of publication bias.

CONCLUSIONS
This narrative synthesis confirms how challenging it is to study the association between sodium and bone health. Most of the studies available are cross-sectional, which gives uncertain direction of causality, even though they included large study populations. The methodological limitations in the primary studies - such as lack of adjustment for relevant confounders, misclassification of exposure, missing data, selective reporting bias, and heterogeneous and inconsistent outcome reporting across studies - prohibits meta-analysis. Randomised controlled trials or prospective cohort studies using standardised set of outcomes are needed to establish dietary guidelines.

SOY INTAKE, SERUM URIC ACID LEVELS, AND HYPERURICEMIA IN CHINA: A PROSPECTIVE COHORT STUDY

Mengru Dong[1]; Jiguo Zhang[1]
[1]Nutrition Monitoring Department, National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China

BACKGROUND AND OBJECTIVES
The connection between soy intake and serum uric acid remains controversial. Association with hyperuricemia (HUA) is inconsistent, and data is limited. We assessed the longitudinal association between soy intake and serum uric acids level and risk of hyperuricemia among Chinese adults.

METHODS
We analyzed data of 7124 participants aged 18 years and above with at least two wave of completed data and without HUA at baseline from the China Health and Nutrition Survey (CHNS) with 10 years of follow-up. Hyperuricemia was defined as a fasting serum uric acid level > 420μmol/L. Intakes of soy were assessed via three consecutive days of 24-hour dietary recall method. On the basis of soy intake, participants were divided into 4 groups: non-consumers, T1 (lowest), T2 (medium), T3 (highest). Generalized estimated equation (GEE) models were used to analyze the association of soy intake with serum uric acid levels and hyperuricemia.

RESULTS
Overall, 9% (n=614) cases of hyperuricemia were documented during 16,859 person-years of follow-up. The soy intake was 19·4g/d, 12·1g/d, and 10·5g/d in 2009, 2015, and 2018, respectively. In the multivariate analysis, participants with highest (T3) soy intake was associated with a decrease in serum uric acid (regression coefficient [β]-3·53[-6·23--0·83]), compared to non-consumers. Participants in the highest (T3) soy intake groups showed a decrease in the risk of hyperuricemia (relative risk [RR] 0·76 [0·61-0·94]) compared to the non-consumers group.

CONCLUSIONS
Soy intake is negatively associated with serum uric acid levels and serves as a protective factor against hyperuricemia. Increasing soy intake is an important dietary strategy for hyperuricemia prevention.

CONFLICTS OF INTERESTS

MONUCO: MONITORING NUTRITIONAL CONSEQUENCES OF OBESITY TREATMENT ON WOMEN'S HEALTH AND TRANSGENERATIONAL EFFECTS FOR HEALTHIER FUTURE GENERATIONS – A MULTI-CENTRE PROSPECTIVE COHORT STUDY

Rebecca Schipper,[1]; Laura Heusschen,; Lara Schepers,[1]; Femke Fleur Verstraete,[1]; Eric Hazebroek,[2]; Ellen Kampman[1]; Agnes Berendsen[1]
[1]Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands; [2]Bariatric surgery, Rijnstate/Vitaly, Elst, Netherlands

BACKGROUND AND OBJECTIVES
In the Netherlands, over 12.000 patients receive obesity treatment annually (e.g., metabolic surgery or pharmacological treatment), of which the majority (80%) is female. Although obesity treatment is effective in reducing long-term bodyweight, it also negatively impacts nutritional status (vitamins, minerals, but also proteins), which may result in e.g. loss of muscle mass and bone mineral density, particularly in menopausal women. Furthermore, impaired nutritional status during subsequent pregnancy may potentially be detrimental for foetal growth and child development of the estimated 50% of women who become pregnant after obesity treatment. The transgenerational effects of obesity and obesity treatment induced maternal nutrient deficiencies on foetal growth, child development and the cardiometabolic disease and obesity risk of their offspring remain unclear.

METHODS
To monitor women's health, we will employ an organ systems approach by incorporating measurements of all eleven organ systems. Smart monitoring will be used to less-invasively monitor health from their home setting allowing allocating timely and targeted interventions towards the needs and living situation of the participants. To study the transgenerational consequences of obesity treatment on foetal growth and child health, pregnant women with a history of obesity treatment and their children will be monitored as well. Information on dietary intake will be collected using a mobile app and detailed information on nutrient status and nutrient stores will be analysed.

RESULTS
A multi-centre prospective observational study has been established with the aim to recruit 1150 women aged 18-55 years of age, living with obesity and receiving obesity treatment in the form of metabolic surgery or pharmacological treatment within multiple obesity centres. Additionally, pregnant women with a history of obesity treatment will also be recruited via obstetricians/gynaecologists and midwifery practices.

CONCLUSIONS
Previous studies have not looked into the longer-term health consequences of obesity treatment, specifically in women, mostly because it is burdensome and expensive to broadly monitor health in a health care setting and also because pharmacological treatment is relatively new. However, it is urgent to gather evidence and insights on the nutritional, metabolic and physiological consequences of obesity treatment in order to provide timely and targeted interventions to maintain and improve health of women with a history of obesity treatment and to contribute to healthier future generations.

CONFLICTS OF INTERESTS

BACKGROUND AND OBJECTIVES

Dietary habits significantly impact colorectal cancer (CRC) risk, influencing both the gut microbiota and its metabolic signature. Despite extensive research, the complex interactions between diet, gut microbiota, and metabolites in CRC risk remain unclear. In this direction, we recently demonstrated the direct link between diet-modulated gut bacterial communities and increased CRC risk in animal models (De Filippo et al., 2024). Here, we present new, unpublished data on Fecal Microbiota Transplantation (FMT) from human cohorts treated with three different dietary interventions to germ-free rats, in which the CRC risk was chemically induced. Our goal is to evaluate whether FMT can modulate CRC risk when transferred to a germ-free rat model and identify the key bacterial communities involved.

METHODS

We assessed the impact of three diets associated with CRC risk: a meat-based diet (MBD), a meat-based diet with alpha-tocopherol supplementation (MBDT), and a pesco-vegetarian diet (PVD). A controlled, randomized, parallel-group, 12-week intervention was conducted with 113 participants aged 18-50 years. We evaluated differences in fecal water genotoxicity, bile acids, fecal microbiota, and metabolomic profiles. To link bacterial communities to CRC risk, we performed Fecal Microbiota Transplantation (FMT) in male germ-free (GF) rats (n=10/group), randomly assigned to the three dietary groups. Fecal samples were collected three weeks after FMT, followed by CRC induction using 20 mg/kg of Azoxymethane. All rats were fed a standard pellet diet, with fecal samples collected two weeks after AOM injection and at sacrifice (14 weeks after AOM).

RESULTS

Dietary supplementation-MBD in human cohorts significantly increased CRC risk, however, it produced mild effects on overall bacterial communities, although distinctive changes in metabolic profiles were evident. The FMT caused risk transmission from humans to GF-rats, and this was accompanied by a more evident overall microbiota shift and related metabolic variations. Furthermore, persistent bacterial variants emerged, i.e., able to reside with the host even at the end of the experimental timeline.

CONCLUSIONS

The different dietary treatment produced specific taxonomic and metabolic changes and affects the CRC risk in the human cohort. Moreover, the increased risk observed in the human cohort fed with MBD was connected to specific changes in metabolic profiles and can be transferred through FMT into GF rats.

UNRAVELING THE ROLE OF FOODS ON INFLAMMATORY MEDIATORS: A SYSTEMATIC REVIEW OF HUMAN DIETARY INTERVENTION TRIALS

Veronica D'Antonio[1]; Chiara Bravo-Trippetta[1]; Marina Ramal-Sanchez[1]; Elena Corvaglia[1]; Donato Angelino[1]; Mauro Serafini[1]
[1]Department of Bioscience and Technology for Food, Agriculture and Environment, University of Teramo, Teramo, Italy

BACKGROUND AND OBJECTIVES

Unhealthy lifestyle-related factors have driven the onset and progression of chronic metabolic diseases (1), characterized by chronic low grade systemic inflammation (2). In particular, diet can modulate the inflammatory status, enhancing or mitigating its severity on the basis of its composition (3,4). To unravel the associations between specific food and inflammation, it is crucial to assess the impact on cytokine production, key mediators of inflammation, through data from well-designed and long-term trials. Therefore, this systematic review aimed to explore the available evidence from chronic dietary interventions focusing on the effects of foods/food categories on circulating cytokines, in humans.

METHODS

A PubMed database research, by specific keywords, was carried out on September 2024. Inclusion criteria foresaw chronic studies, measuring cytokine levels in human participants of intervention studies evaluating the effects of food consumption. Articles not in English, not focused on foods (i.e. supplements) or involving enteral or parenteral nutrition were excluded. After screening, studies were divided based on the food or beverage provided.

RESULTS

The search strategy pointed out 2,262 items, of which 70 studies met the inclusion criteria. Among these, fruits and vegetables reduced cytokines levels in 6 studies on 7, as cereals (7/9) and dairy products (4/5). Among beverages, fruit juices displayed anti-inflammatory effect in 13 studies on 19. Studies focusing on vegetable and animal fats and fish were effective in 4 studies on 7 and 4 on 6, respectively. However, seeds (2/5), brewed beverages (2/5), and nuts (0/2) displayed limited or inconsistent findings. As regards single cytokines, a total of 25 markers were investigated, with IL-6 and TNF-α being the most frequently analyzed (60 and 47 studies, respectively). On the whole, studies exhibited significant heterogeneity in study design, type of cytokines analyzed, participant characteristics and health status, as well as intervention durations, making it difficult to make firm CONCLUSIONS.

CONCLUSIONS

The present systematic revision of literature suggested a potential of certain foods and food groups, to modulate inflammation through their effects on cytokines. However, the limited number of studies and the significant variability in study designs and populations, suggest the need for more comprehensive and methodological research to confirm the relationship between foods and modulation of inflammation. BACKGROUND AND OBJECTIVES

The consumption of certain foods of animal origin, specially red meat and processed meat, is associated with a risk of colorectal cancer (CRC), a major cause of death in affluent countries. Epidemiological and experimental evidence supports the hypothesis that haem iron present in these foods promotes CRC.
Therefore, we studied possible associations between the intake of food containing haem iron (red and processed meat vs white meat −poultry and fish−) and CRC risk.

METHODS

This observational case-control study includes 229 patients diagnosed with CRC and 229 age- and sex-matched controls from a population-based bowel cancer screening program. Dietary intake was assessed using a validated food frequency questionnaire (Telleria-Aramburu et al., 2021). Ethical approval was obtained from the Clinical Research Ethics Committee of the Basque Country. Logistic conditional regression was used to calculate odds ratios (ORs) and 95% confidence intervals (CI) for CRC risk. The models were adjusted for known risk factors: sex, age, smoking status, antiplatelet and/or anticoagulant use, body mass index, intake of dietary fibre, calcium, folate, vitamin D, and ethanol, physical activity level, deprivation index (Orueta et al., 2013), and Predictive Risk Modelling (School of Public Health, Johns Hopkins University, 2012; Verisk Analytics, 2012). The significance level was corrected using a Bonferroni correction, assuming alpha was equal to 0.01.

RESULTS

Moderate intake of processed meat was associated with CRC risk (tertile 2 vs 1, OR=3.20, 95% CI 1.37−7.49, $p<0.01$). Although this association was not observed with a high intake ($p>0.05$), a high intake (3th tertile) of both, red and processed meat, was associated with increased CRC risk, even though with a lower significance (tertile 3 vs 1, OR 2.09, 95% CI 1.04−4.21, $p<0.05$). The RESULTS on processed meats were confirmed in the separate analysis for men, and distal colorectal cancer. However, consumption of white meat (poultry and fish) was not associated with CRC risk ($p>0.05$).

CONCLUSIONS

Moderate intake of processed meat was associated with significant increased risk of CRC. Our RESULTS highlight the difficulty of isolating the independent effects of food group intake, given the probable confounding influence of other dietary and lifestyle factors.

A RANDOMIZED CLINICAL TRIAL ON GUT MODULATION: PROBIOTICS AND PREBIOTICS FOR IMPROVED WEIGHT AND QUALITY OF LIFE IN WOMEN WITH FIBROMYALGIA

Nazli Nur Aslan Çin[1]; Murat Açik[2]
[1]Nutrition and Dietetics, Karadeniz Teknik Üniversitesi, Trabzon, Türkiye; [2]Nutrition and Dietetics, Fırat University, Elâzığ, Türkiye

BACKGROUND AND OBJECTIVES
Increased body weight causes further worsening of clinical symptoms in fibromyalgia syndrome, which is associated with pain and poor quality of life. The aim of this study was to investigate the effect of supplementation with probiotics and prebiotics on anthropometric measurements, energy and nutrient intake, and quality of life in overweight and obese patients with fibromyalgia syndrome (FMS).

METHODS
We extracted data from a clinical trial with 39 obese or overweight patients with FMS. The participants were randomly assigned to receive probiotics, prebiotics, or placebos for 8 weeks. Energy and some nutrient intake, anthropometric measurements, and SF-36 quality of life consisting of 8 sub-dimensions were measured during the pre-, mid-, and post-intervention phases. A repeated measure ANOVA was used to analyse the variables.

RESULTS
It was observed that the general characteristics of the groups were similar to each other. No significant difference in either BMI or other anthropometric data was seen among the groups. Although prebiotics showed an increasing trend in energy intake, no statistically significant RESULTS were found among the groups. No statistically significant difference was found in group-time interaction in the nutrient intake of the groups. Pain, a sub-dimension of SF-36 quality of life, improved with probiotics compared to placebo (p valuetime×groups<0.05). However, other subcomponents of SF-36 indicated no significant intervention-time interactions.

CONCLUSIONS
Overall, probiotic supplementation for 8 weeks among FMS patients resulted in improvement of pain, whereas pro- and pre-biotic administration had no significant effect on food intake and anthropometric data.

EIGHT-WEEKS OF BETAINE SUPPLEMENTATION IN PREMENOPAUSAL WOMEN WITH INCREASED BODY WEIGHT: A RANDOMIZED, DOUBLE-BLIND PLACEBO-CONTROLLED TRIAL

Agata Chmurzynska[1]; Emilia Zawieja[1]; Monika Mlodzik-Czyzewska[1]; Anna Makuch[1]
[1]Department of Human Nutrition and Dietetics, University of Life Sciences, Poznań, Poland

BACKGROUND AND OBJECTIVES
Betaine, a methyl derivative of the amino acid glycine, can be found naturally in food, but is also used in dietary supplements. Because betaine has been suggested to be effective in improving body composition, the aim of the present study was to determine the effects of eight-weeks of supplementation of 3 g/day betaine on body composition and lipid metabolism markers in women with increased body weight.

METHODS
The study was a randomized, double-blind, parallel-group, placebo-controlled trial (NCT06344377). Premenopausal women aged 18–45 years with body mass index (BMI) ≥ 25 kg/m2 and with waist circumference ≥ 80 cm were enrolled in 2024. Height was measured with a stadiometer, while a Bod Pod (Cosmed, Italy) was used to determine body mass and composition. Waist and hip circumferences were measured using nonelastic tape. Blood glucose concentrations and lipid profile were measured using an automatic biochemical analyzer (Konelab 20i) in an enzymatic assay.

RESULTS
Twenty-four women finished the study. After supplementation, no group differences were noted in body mass, body composition, or waist or hip circumference. There were also no differences in total cholesterol, LDL cholesterol, glucose, or triglyceride concentrations. The only difference was found in HDL cholesterol concentrations, which had significantly improved in the betaine-supplemented group ($p < 0.05$).

CONCLUSIONS
Short-term supplementation with betaine seems not to have had a significant effect on body mass or composition, but may improve blood lipid profiles in women with increased body weight.

Impact of Spirulina-enriched yogurt-like dessert on blood pressure in overweight individuals with high cardiometabolic risk: RESULTS from in vitro studies and a randomized, placebo-controlled clinical trial

Emilia Papakonstantinou[1]; Foteini Lympaki[1]; Aggeliki Savvidou[2]; Eleni Dalaka[2]; Marianna Giannoglou[3]; George Katsaros[3]; Georgios Theodorou[2]
[1]Food Science and Human Nutrition, Agricultural University of Athens, Athina, Greece; [2]Animal Science, Agricultural University of Athens, Athina, Greece; [3]Institute of Technology of Agricultural Products, Hellenic Agricultural Organization "DEMETER", Athens, Greece

BACKGROUND AND OBJECTIVES
To evaluate the effects of spirulina biomass and its incorporation into yogurt on angiotensin-converting enzyme (ACE) inhibitory activity and hypertension management.

METHODS
Two studies were conducted in parallel: an in vitro assessment of ACE inhibitory properties and a clinical trial targeting high cardiometabolic risk individuals. The in vitro study analyzed the ACE inhibitory activity of a peptide fraction (0-3 kDa) derived from spirulina platensis biomass (SB) and a yogurt dessert fortified with spirulina biomass (YSB). The clinical trial involved a randomized, placebo-controlled format with 64 overweight/obese participants consuming two portions of spirulina-enriched yogurt (4g/day) or placebo for 8-weeks and 4-weeks follow-up, while maintaining a Westernized-type diet, assessing peripheral and central systolic and diastolic blood pressure (BP) along with the augmentation index.

RESULTS
In vitro RESULTS showed that SB fractions significantly increased ACE inhibitory activity ($p<0.05$), contrasting with the YSB fractions that did not exhibit a similar effect, suggesting that spirulina's bioactive components might be less effective when processed into yogurt. Clinically, both groups maintained stable blood pressure throughout the study, with no significant interaction effects observed between the intervention and time.

CONCLUSIONS
The addition of SB to yogurt appeared to diminish its ACE inhibitory capacity *in vitro*, and spirulina supplementation in this form did not significantly improve hypertension markers *in vivo*. These findings underscore the complexity of food matrix effects on functional food efficacy and the need for further research into the integration of spirulina into everyday foods for high cardiometabolic risk individuals. ASSOCIATION OF DIETARY SODIUM AND POTASSIUM INTAKE, SODIUM TO POTASSIUM RATIO AND HYPERTENSION AMONG ADULTS IN [XXX] AND [XXX]: THE PICCAH STUDY

Tanisha Aflague[1]; Grazyna Badowski[1]; Rachael Leon Guerrero[1]
[1]College of Natural and Applied Sciences, University of Guam, Mangilao, Guam

BACKGROUND AND OBJECTIVES
The Western Pacific region has the highest non-communicable disease mortality. Increasing reliance on imported, high sodium processed foods throughout the Pacific Islands may exacerbate this problem. Excess sodium and inadequate potassium intake are linked to hypertension and risk for cardiovascular disease yet has not been evaluated in Micronesia. This study aims to examine the association of sodium and potassium intake and sodium-to-potassium (Na:K) ratio with hypertension (HTN) among adults in [XXX] and [XXX], located in Micronesia.

METHODS
The Pacific Islands Cohort on Cardiometabolic Health (PICCAH) Study, including 489 adults in [XXX] and [XXX] with both blood pressure and diet measures and demographics. Sodium and potassium intakes were estimated from the Marianas Food Frequency Questionnaire, in [XXX], and from the 24-Hour Recall then processed through the Pacific Tracker version 3.0 in [XXX]. Blood pressure was categorized as non-HTN (normal or elevated), Stage 1 HTN, and Stage 2 HTN using the American College of Cardiology and the American Heart Association guidelines. Multivariable logistic regression was used to examine associations between sodium and potassium intake and Na:K ratio with HTN. Odds ratios were adjusted for sex, age, ethnicity, BMI and location.

RESULTS
Majority of adults were CHamoru (45.3%) or Micronesian (36.7%) and had high BMI as 58.8% were obese. Differences by study location were significant for ethnicity, blood pressure category, potassium and sodium intake, and Na:K ratio. Specifically, higher rates of stage 2 HTN in [XXX], higher sodium intake in [XXX], and lower potassium intake in [XXX]. Only potassium intake was associated with stage 1 HTN. The adjusted odds ratios were 0.41 (95% CI, 0.21-0.78), and 0.69 (95% CI, 0.39, 1.22) comparing 2.0-2.9 and ≥3 g/d respectively, with ≤1.9 g/d potassium intake.

CONCLUSIONS
High sodium intake is associated with Stage 1 HTN among adults in [XXX] and [XXX]. Tropical produce in the Micronesia are great sources of potassium and readily available in [XXX] and [XXX], and intake of these food sources may be beneficial for HTN and obesity prevention; in addition to shifting the food system.

PLANT-BASED DIETARY PATTERNS MITIGATE THE ASSOCIATION BETWEEN INDOOR AIR POLLUTION AND DEPRESSION AMONG OLDER ADULTS IN CHINA

Junhua Zhu[1]; Yanhua Liu[1]; Bo Yacong[2]; Lyu Quanjun[1]
[1]Department of Nutrition, The first affiliated hospital of zhengzhou university, Zhengzhou, China; [2]School of Public Health, Zhengzhou university, Zhengzhou, China

BACKGROUND AND OBJECTIVES
Indoor air pollution has been identified as a contributing factor to the onset of depression, while adherence to plant-based diets is associated with reduced depressive symptoms. We aimed to explore the potential interaction of plant-based diets with depressive symptoms among older people.

METHODS
We utilized cross-sectional data from the 2018 Chinese Longitudinal Healthy Longevity Survey (CLHLS), encompassing 11,371 participants aged 65 years and older. Plant-based diet indices (PDI, hPDI, uPDI) were calculated using dietary data from a simplified food frequency questionnaire (FFQ). Indoor air pollution exposure was assessed via cooking fuels, humidity, and mold presence. Depression was measured using the CES-D-10. Associations were evaluated using multivariable logistic regression, stratified by indoor air pollution, key covariates, and food groups.

RESULTS
Participants exposed to severe indoor air pollution had 64% higher odds of depression (OR = 1.64, 95% CI: 1.41–1.92) compared to those with mild exposure. Higher adherence to the PDI and hPDI was associated with lower odds of depression (ORPDI = 0.81, 95% CI: 0.74–0.88; ORhPDI = 0.73, 95% CI: 0.68–0.79), especially in mild pollution environments. Conversely, the uPDI was linked to increased odds (ORuPDI = 1.86, 95% CI: 1.64–2.10). A significant interaction between PDI, hPDI and indoor air pollution was observed (*P*-interaction = 0.005, 0.004), highlighting the protective role of healthy plant-based diets.

CONCLUSIONS
Plant-based dietary patterns may attenuate the impacts of indoor air pollution on depression among older Chinese adults. Adherence to plant-based dietary patterns may be useful to prevent depression caused by indoor air pollution.

EFFECTS OF LALMIN IMMUNE PRO SUPPLEMENTATION ON ADIPOSE TISSUE INFLAMMATORY MARKERS AND PROTEOMIC PATHWAYS IN OLDER ADULTS WITH NON-LEAN BMI

Jack Pritchard[1]; Lauren Struszczak,[1]; Esra Bozbas[1]; Celeste Lugtmeijer[1]; Cealan Henry[1]; Joanna, L. Bowtell[1]; Mary, F. O'leary[1]
[1]Public Health and Sports Sciences, University of Exeter St Luke's Campus, Exeter, United Kingdom

BACKGROUND AND OBJECTIVES
Chronic low-grade adipose inflammation in older adults with higher body mass index can contribute to metabolic and immune dysfunction. This open-label pilot study aimed to evaluate the impact of 28-day supplementation with Lalmin Immune Pro (containing β-1,3/1,6 glucan, zinc, selenium, and vitamin D2) on inflammatory markers and proteomic pathways in subcutaneous adipose tissue and serum.

METHODS
Fifteen participants (36.5 ± 6.1 kg/m²; 66.40 ± 4.6 yr) consumed six Lalmin Immune Pro gummies daily for 28 days. Each daily serving contained 250 mg of yeast-derived β-1,3/1,6 glucan, 13.7 mg of zinc, 65.0 mcg of selenium, and 500 IU of vitamin D2. Blood and subcutaneous adipose tissue samples were collected pre-supplementation (Day 0), and post-supplementation (Day 28). Adipokine concentrations in adipose tissue supernatants, and serum inflammatory markers were measured via multiplex immunoassays. Tandem-mass-tagged proteomic analysis was performed on adipose tissue samples (Reactome differential pathway analysis via CAMERA algorithm).

RESULTS
Significant reductions in adipose tissue secretion of leptin ($p = 0.001$), MCP-1 ($p = 0.003$), MIP-3α ($p = 0.009$), IL-8 ($p = 0.004$), and IL-6 ($p = 0.020$) were observed post-supplementation. Serum inflammatory markers showed no significant changes ($p > 0.05$). Proteomic analysis of adipose tissue identified 5387 proteins, with significant alterations in 107 pathways. This included a Lalmin Immune Pro-induced downregulation of adaptive (FDR = 0.025, LogFC = -0.02) and innate immune system pathways (FDR = 9.28E-07 LogFC = -0.06). Lalmin Immune Pro supplementation also resulted in the upregulation of several pathways associated with mitochondrial function, including cristae formation (FDR = 6.25E-05, LogFC = 0.304), mitochondrial protein import (FDR = 1.00E-05, LogFC = 0.273), and aerobic respiration (FDR = 1.40E-05, LogFC = 0.210)

CONCLUSIONS
Lalmin Immune Pro supplementation significantly reduced inflammation-related adipokine secretion from subcutaneous adipose tissue. Analysis revealed modulation of immune and metabolic pathways, suggesting potential benefits for inflammation and metabolic health in older adults with elevated BMI.

ASSOCIATION BETWEEN DIETARY PATTERNS AND QUALITY OF LIFE IN ADULTS LIVING WITH TYPE-2 DIABETES MELLITUS

Grace Wumbee[1]; Frank Hayford[1]; Thomas Ndanu,[2]; Samuel Sackar,[1]; Eunice Nortey,[1]
[1]Department of Dietetics, University of Ghana, Accra, Ghana; [2]Department of Dentistry, Basic Sciences of School of Medicine and Dentistry-UG, Accra, Ghana

BACKGROUND AND OBJECTIVES
A key aspect of diabetes mellitus management is dietary modifications (Papamichou et. al, 2019) and good management of the condition can positively impact quality of life (Enang et al., 2021). The main study objectives were to determine the dietary patterns and quality of life scores in individuals living with type-2 diabetes, and an association between the two variables, if any.

METHODS
A cross-sectional study design was employed. Two-hundred outpatients with type-2 diabetes were recruited. A pretested questionnaire was used to collect socio-demographic, clinical, dietary patterns (using a Food Frequency Questionnaire), and quality of life (using the World Health Organization Quality of Life (WHOQOL) - BREF) data of participants. Data was analyzed using SPSS Version 22. Quality of life data was analyzed according to WHOQOL-BREF protocol. Principal Component Analysis (PCA) was used for dietary pattern analysis. Kruskal-Wallis' and correlation tests were used to analyze the relationship between variables ($p \leq 0.05$).

RESULTS
Quality of life was moderate overall, as well as in the social, physical and environmental domains, but participants had high psychological quality of life. Age, participants' socioeconomic status and duration of diabetes were the sociodemographic and clinical factors found to be inversely related with overall quality of life. Three dietary patterns were identified, and in descending order of consumption, these were the High energy, Vegetables and Fruits, and Animal Products patterns. Components of the high energy pattern included many high carbohydrate, local foods, as well as sweets, artificial spices and processed and cured meats/fish. Green leafy and other vegetables as well as fruits were the main components of the vegetable and fruits pattern. Main components of the animal products pattern included poultry, red meat, fish and alcohol. Only the vegetables and fruits pattern was positively associated with the psychological, environmental and overall quality of life.

CONCLUSIONS
The vegetables and fruit pattern was positively associated with the psychological and environmental quality of life domains and overall quality of life. Thus, in line with other studies, RESULTS from this study reinforces the recommendation that dietary strategies for diabetic patients should align with general healthy eating guides, predominantly the consumption of more fruits and vegetables.

LABORATORY ASSESSMENT FOR INDUSTRIALLY PRODUCED TRANS FATTY ACIDS (ITFA) TESTING CAPACITY IN ETHIOPIA

AZEB LELISA TOLESSA[1]; Wosenyeleh Ayele[2]; Kidist Demeke[2]; Awot Gebrehiwot[3]; Henock Mulugeta[2]; Meseret Kebede[4]; Hadgu Weldu[5]; Liz Drummond[6]; Heran Borta[7]; Negash Gizaw[8]
[1]Nutrition, Resolve to Save Lives , Addis Ababa, Ethiopia; [2]Laboratory, Ethiopian Food and Drug Authority/ የኢትዮጵያ ምግብና መድኃኒት ባለስልጣን, Addis Ababa, Ethiopia; [3]Laboratory Quality Assurance, Ethiopian Food and Drug Authority/ የኢትዮጵያ ምግብና መድኃኒት ባለስልጣን, Addis Ababa, Ethiopia; [4]Laboratory, Ethiopia Public Health Institute, Addis Ababa, Ethiopia; [5]Laboratory, Ethiopian Conformity Assessment Enterprise, አዲስ አበባ, Ethiopia; [6]Cardiovascular Health, Resolve to Save Lives US, New York, United States of America; [7]Director General, Ethiopian Food and Drug Authority/ የኢትዮጵያ ምግብና መድኃኒት ባለስልጣን, Addis Ababa, Ethiopia; [8]Deputy Director General, Ethiopian Food and Drug Authority/ የኢትዮጵያ ምግብና መድኃኒት ባለስልጣን, Addis Ababa, Ethiopia

BACKGROUND AND OBJECTIVES

Non-communicable diseases (NCDs) account for seven in ten deaths worldwide. In Ethiopia, NCDs are responsible for 48% of all deaths. An unhealthy diet, includes excess consumption of industrially produced trans fatty acids (iTFA), is a key risk factor for NCDs. In 2018, the World Health Organization (WHO) issued a global call to "eliminate iTFA by 2023". Ethiopia is considering adopting a best practice policy to eliminate iTFA from the food system. However, implementing effective control measures has been a key challenge due to the lack of laboratory capacity to analyze and detect industrially produced iTFAs. The objective of this study was to assess the capacity and capability of laboratories to analyze the iTFA content in food samples.

METHODS

The study involved both off-site and on-site assessments, including physical observations of the identified laboratories using a predetermined data collection tool, consultative discussions, and stakeholder consultations. A purposive sampling technique was employed to select sample laboratories from both the government and private sectors. The study aimed to assess the availability of equipment and consumables, the laboratories' accreditation status, the availability and capacity of personnel, the scope of tests, procurement processes, quality assurance practices, sample management, facility and environmental conditions, and safety precautions.

RESULTS

The study found that 67% of the laboratories had key equipment, such as GC-FID/GC-MS, for testing iTFA. Forty-four percent had well-equipped facilities with sufficient space and proper zoning. All laboratories had qualified staff, and 56% had established quality management systems. However, only 33% were accredited with ISO/IEC 17025:2017 by the Ethiopian Accreditation Service (EAS) with chemical and microbiological parameters, and none were specifically accredited for iTFA testing. Additionally, only three laboratories regularly operated GC equipment. Forty-four percent of the assessed laboratories met the minimum requirements for conducting iTFA analysis.

CONCLUSIONS

To support the enforcement of the iTFA elimination policy in the country, the four identified qualified laboratories could be made functional for iTFA detection in food matrices with minimal capacity-building support. This would include the provision of necessary consumables, assistance with obtaining ISO/IEC 17025:2017 accreditation for iTFA analysis, fostering interlaboratory collaboration, and establishing a robust monitoring system.

INTAKES OF NUTRIENTS RELATED TO NON-COMMUNICABLE DISEASES IS ASSOCIATED WITH HIGHER CONSUMPTION OF ULTRA-PROCESSED FOOD AMONG ADULTS IN DAKAR, SENEGAL

Saliou Diombo KEBE[1]; Abdou Badiane[1]; Papa Mamadou Dit Doudou SYLLA[2, 1]; Idohou-Dossou Nicole[1]; Adama Diouf[1]

[1]Laboratoire de Recherche en Nutrition et Alimentation Humaine, Faculté Sciences et Techniques, Université Cheikh Anta-Diop (UCAD), Dakar, Senegal; [2]Laboratoire des Sciences Biologiques, Agronomiques, Alimentaires et de Modélisation des Systèmes, Université Gaston Berger, Saint-Louis, Senegal

BACKGROUND AND OBJECTIVES

The Nutritional transition in Senegal, characterized by a shift in dietary patterns, is accompanied by a rising prevalence of non-communicable diseases (NCDs) such as obesity, diabetes and cardiovascular disease. According to the World Health Organization (WHO), NCDs are responsible for 74% of deaths worldwide and there is increasing evidence linking ultra-processed foods (UPF) – rich in fats, sugars, and salt but poor in essential nutrients – to the growing burden of these diseases. Although UPF consumption has been studied globally, its specific impact on nutrient intake within Senegalese context remains unexplored. Therefore, this study aimed to evaluate the contribution of UPF to dietary intakes of critical nutrients related to NCDs among adults living in urban Dakar.

METHODS

This cross-sectional study analyzed data from 301 urban adults in Dakar aged 18 to 69 years, targeted through a stratified two-stage cluster sample design. Dietary intakes of participants were assessed using a multi-stage 24-hour dietary recall and all the foods reported were categorized according to the NOVA classification. The nutrient composition of foods, including total fat, free sugars, sodium, potassium, protein and dietary fiber, was determined using nutritional labelling or nutritional composition tables. Multiple regression models adjusted for demographic factors were used to examine associations between terciles of UPF consumption and nutrient intakes and compliance to WHO dietary recommendations.

RESULTS

On average, unprocessed or minimally processed foods provided 56.9% of total energy intake (TEI), followed by processed culinary ingredients with 19.9% while UPF contributed to 17.4%. UPF contributed to 43% of free sugars, 26.9% of total fat, 24.4% of sodium, 24% of potassium, 18.9% of protein, 5.4% of dietary fiber and 5.2% of saturated fat intakes. For individuals, higher UPF consumption was associated with significantly higher intakes of total fat (β=26.9; $p<0.001$), free sugars (β=17.6; $p<0.001$), potassium (β=1.3; $p<0.001$) and protein (β=14.8; $p<0.01$). Greater consumption of UPF was positively associated with excessive intake of total fat (aOR=2.56; p=0.002) but a negative association was found with inadequate intakes of potassium (aOR=0.01; $p<0.001$) and protein (aOR=0.43; p=0.009).

CONCLUSIONS

Ultra-processed foods are not the main source of energy intake in Senegalese adults, but their consumption is a key factor in determining the nutritional quality of the diet. Indeed, these findings highlight the dual effect of UPF: exacerbating unhealthy nutrient intakes while slightly improving some beneficial nutrients such as potassium and protein intakes.

DIETARY RISK FACTORS FOR PARKINSON DISEASE

Sina-Isabel Warz[1]; Ottar Kjell Nygård[2, 3]; Charalampos Tzoulis[4, 5, 1]; Jutta Dierkes[1]
[1]Department of Clinical Medicine, University of Bergen, Bergen, Norway; [2]Department of Heart Disease, Haukeland universitetsjukehus, Haukelandsveien, Bergen, Norway, Bergen, Norway; [3]Department of Clinical Science, University of Bergen, Bergen, Norway, Bergen, Norway; [4]Department of Neurology, Neuro-SysMed Center, Haukeland universitetssjukehus, Haukelandsveien, Bergen, Norway, Bergen, Norway; [5]K.G Jebsen Center for Translational Research in Parkinson's Disease, University of Bergen, Bergen, Norway, Bergen, Norway

BACKGROUND AND OBJECTIVES

Parkinson's disease (PD) is a disabling neurodegenerative disease affecting 1-5% of the older population (1). It is believed that environmental factors are the leading causes of PD, potentially via inducing cellular stress, mitochondrial dysfunction, and neuroinflammation, although the exact pathways remain unknown (2,3). Increasing evidence supports that boosting cellular levels of the coenzyme nicotinamide adenine dinucleotide (NAD) confers neuroprotective effects in both healthy aging and neurodegeneration states (4). The vitamin niacin is a dietary precursor of NAD. This suggests a potential role of niacin in the development of neurodegeneration; however, this has not been investigated.

METHODS

A prospective observational cohort study (n=4,000) will investigate the association between niacin intake and the risk for Parkinson's Disease. Parkinson cases will be identified by the unique prescription of levodopa, monoamine oxidase B inhibitors, and/or dopamine agonists obtained from the Norwegian prescription registry. Dietary data from a food frequency questionnaire will be analyzed following a nutrient-based approach and a food-based approach. Cox proportional hazards regression models with appropriate covariates will be used to investigate the association of niacin and tryptophan intake, intake of foods rich in niacin, and risk of PD using the date of first prescription of relevant medication as proxy diagnosis of PD.

RESULTS

We hypothesize that niacin and foods rich in niacin will be associated with a lower risk for Parkinson's disease. The RESULTS are expected to be ready in Spring 2025.

CONCLUSIONS

This is a novel approach to investigate the association between dietary factors and incident Parkinson disease. We expect new knowledge on the risk factors for this neurodegenerative disease, which may then, in the longer term, also allow better prevention and treatment.

BACKGROUND AND OBJECTIVES
High sodium intake is a major risk factor for non-communicable diseases (NCDs) like cardiovascular diseases, causing millions of deaths annually worldwide. Sodium intakes in many countries are above the WHO recommendation of <2 g/day. Processed foods and condiments, which are major contributors to sodium intake, are increasingly consumed in low/middle-income countries. This study assessed sodium intake, high-salt food contributions, and the link between sodium and NCDs in non-pregnant women and men 15-59 years old in Burkina Faso.

METHODS
In 2023, we conducted a cross-sectional survey using stratified sampling covering all accessible areas in Burkina Faso. We used urinary biomarkers (sodium, creatinine) to assess total sodium intake and a combination of three dietary intake approaches (24-hour recall targeted to salt-rich foods, food frequency questionnaire for out-of-house composite dishes, and the household food purchase/adult-male-equivalent method for small commodity foods) to assess the relative contribution of different foods to total sodium intake. We measured visceral obesity, hypertension and urinary albumin to estimate the prevalence of kidney damage. Urinary potassium was measured to assess the potential positive effect on hypertension. We collected spot urine samples and additionally, a 24h urine sample from a sub-sample to validate spot urine sodium excretion in an African population.

RESULTS
Among 412 non-pregnant women and 316 men, mean sodium intake was high (women: 3.3 g/d; men: 2.8 g/d), with 69% of women and 62% of men exceeding the WHO recommendation. Household salt was the primary source of sodium contributing around 70% of total intake, with bouillon (10%) and snacks and out-of-house dishes (~10% each in men, and ~5% each in women) as secondary sources. Approximately 90% of participants showed a low daily potassium intake. The prevalence of hypertension was around 21% in men and 18% in women, with visceral obesity being more common in women (45% vs. 13%). We found no relationship between sodium intake and hypertension but participants with visceral obesity were more likely to be hypertensive, and participants with hypertension were more likely to suffer from kidney damage.

CONCLUSIONS
Strategies to reduce sodium and increase potassium intake, along with addressing visceral obesity are essential to prevent both cardiovascular diseases and kidney damage in Burkina Faso.

PLANT-BASED DIETARY PATTERN AND CARDIOVASCULAR RISK FACTORS: RESULT FROM CESCAS STUDY

Gladys Morales[1]; Natalia Elorriaga[2]; Solange Parra-Soto[3]; Jacqueline Araneda[3]; Vilma Irazola[2]; Fernando Lanas[4]
[1]Deparment of Public Health, University of La Frontera, Temuco, Chile; [2]Institute for Clinical Effectiveness and Health Policy (IECS), South American Center of Excellence for Cardiovascular Health (CESCAS/SACECH)., Buenos Aires, Argentina; [3]Departament Nutrition and Public Health, Biobio University Campus Fernando May, Chillán, Chile; [4]Deparment of Internal Medicine, University of La Frontera, Temuco, Chile

BACKGROUND AND OBJECTIVES
Despite the well-documented benefits of healthy plant-based diet (PBD) to reduce cardiovascular risk factors(CVRF), evidence is still scarce in Latin America (1). Therefore, this study explored the association between adherence toPBD patterns and CVRF in three Latin American countries.

METHODS
A cross-sectional design was conducted using baseline data of the CESCAS study (2), a population-based prospective cohort study conducted in four cities of Argentina, Chile and Uruguay. Dietary intake was assessed using a validated food-frequency questionnaire (FFQ), from which three PBD indices were calculated: an overall PBD (3), a healthful PBD (4), and an unhealthful PBD (4). The CVRF assessed included hypertension (SBP≥140mmHg or DBP≥90mmHg or receiving antihypertensive treatment), obesity (BMI≥30kg/m²) and central obesity; high LDL-cholesterol (≥100mg/dL); and diabetes (fast lycemia≥126 mg/dL o use of hypoglycemic agents). Logistic regression models were developed, adjusting for sociodemographic characteristics, total energy intake, and lifestyle factors. All analyses were conducted using STATA MP 17.

RESULTS
The study included 5167 participants (59.7% female;mean age 55.3 ±10.8 years). Higher adherence to theoverall PBD pattern was associated with a lower prevalence of obesity (OR 0.91; 95%CI 0.86-0.96), high LDL-cholesterol(OR 0.91; 95%CI 0.86-0.97), hypertension (OR 0.93; 95%CI 0.88-0.98), and central obesity (OR 0.91; 95%CI 0.86-0.96).Significant associations with high LDL-cholesterol were observed for the healthful PBD pattern (OR 0.93; 95%CI 0.88-0.99). Conversely, higher adherence to the unhealthful PBD pattern was associated with a lower prevalence of diabetes(OR 0.87; 95%CI 0.81-0.94).

CONCLUSIONS
These findings highlight the potential benefits of emphasizing healthy plant-based foods to reduce cardiovascular risk factors in Latin America. Promoting widespread adoption of healthy provegetarian diets should beconsiderated in future public health policies.

EXPOSURE TO FOOD MARKETING AND SUPPORT FOR REGULATORY MEASURES IN GHANA: INSIGHTS FROM A NATIONWIDE SURVEY

Gideon Amevinya[1]; Akua Tandoh[2]; Annabel Yeboah-Nkrumah[2]; Silver Nanema[2]; Ibrahim Baki[2]; Pearl Aovare[3]; Mary Mpereh[4]; Percy Agyekum[5]; Sebastian Sandaare[6]; Emma Ofori Agyemang[7]; Amos Laar[2]
[1]UMR MoISA , Research and Development Institute IRD Montpellier, Montpellier, France; [2]School of Public Health, University of Ghana, Accra, Ghana; [3]Department of Public & Occupational Health, Amsterdam Public Health Research Institute, Amsterdam UMC, University of Amsterdam, Amsterdam Netherlands; [4]Gender, Population and Social Policy, National Development Planning Commission, Accra, Ghana; [5]Food Evaluation and Registration Department, Food and Drugs Authority, Accra, Ghana; [6]., Coalition of Actors for Public Health Advocacy, Accra, Ghana; [7]Policy, Planning, Monitoring and Evaluation, Ministry of Health, Accra, Ghana

BACKGROUND AND OBJECTIVES
Food marketing significantly influences dietary behaviors, particularly among children and adolescents. Unhealthy food marketing has been linked to poor dietary habits. Regulatory measures to address food marketing are essential for creating healthier food environments. We explore public exposure to food marketing activities and assessed support for food marketing regulations in Ghana.

METHODS
A cross-sectional survey was conducted across three selected regions of Ghana—Greater Accra, Ashanti, and Northern—each representing one of the country's three ecological zones. Participants, consisting of residents aged 18 and above were randomly selected, and a structured survey questionnaire was administered by trained interviewers. Data were collected from 2,468 participants to assess: (1) the frequency and types of exposure to food marketing activities, including TV advertisements, online and social media; and (2) public perceptions and levels of support for regulatory measures to restrict unhealthy food marketing. Descriptive analysis was conducted to summarize the findings from the data.

RESULTS
Our findings show that online platforms (56%) were the most commonly accessed media, followed by television (50%) and billboards (23%). Respondents reported frequent exposure to unhealthy food marketing, with television (44%) being the most prominent channel, followed by online platforms (37%) and billboards (32%). Over half of the participants reported never seeing advertisements for fruits (62%) or vegetables (60%) in the seven days prior to data collection. Marketing tactics like emphasizing taste and enjoyment (56%) and using celebrities or influencers (53%) were particularly effective. Despite high exposure to unhealthy food marketing, 85% of respondents supported regulations, with 80% favoring a ban on unhealthy food billboards near schools and 77% supporting restrictions during children’s TV viewing hours.

CONCLUSIONS
The study highlights widespread exposure to food marketing in Ghana and substantial public support for regulatory interventions to restrict unhealthy food advertisements. These findings underscore the urgent need for policymakers to prioritize regulatory measures as part of broader strategies to promote healthier diets and mitigate the rising burden of diet-related diseases.

URBAN AND PERI-URBAN FOOD ENVIRONMENTS: A SYSTEMATIC SCOPING REVIEW OF EIGHT COUNTRIES

Amy Margolies[1]; Esther Choo[2]; Dorcas Amunga[3]
[1]Nutrition, Diets, and Health, International Food Policy Research Institute, Washington, United States of America; [2]Food systems and nutrition, Independent Consultant, Seattle, United States of America; [3]Nutrition and food systems, International Potato Centre, Nairobi, Kenya

BACKGROUND AND OBJECTIVES
Urban and peri urban (UPU) food environments (FE) are inundated with unhealthy, ultra-processed foods, contributing to a rise in overweight, obesity, and non-communicable diseases in almost all LMICs. Therefore, understanding the dynamics of urban FEs is critical to tailor interventions to curb the growing double burden of malnutrition (DBM). We conducted a systematic scoping review to assess the evidence on UPU FE in eight LMICs representing Asia (Philippines, Sri Lanka, Bangladesh), Africa (Kenya, Ghana, Ethiopia, Rwanda) and Latin America (Peru), including a review of evaluations of FE interventions.

METHODS
A systematic search of peer-reviewed journal articles was conducted in Scopus and Web of Science targeting the five most populated urban areas across eight focal countries. We synthesize the evidence over the past 20 years (January 2001–April 2023) and highlight gaps and areas for further investigation.

RESULTS
We screened 1,609 abstracts and extracted data from 251 studies. The evidence on urban food environments is growing. The average number of urban FE-related papers published annually increased from 2 articles (2001-2008) to 7 articles (2009-2016) and 25 articles a year between 2016-2022. The most studied urban FE dimensions were vendor and product properties and food availability. Most studies of vendor and product properties examined food safety challenges (71%). The availability of ultra processed foods in and around schools was studied across several countries. A wide range of indicators were used to capture vendor and product properties, marketing and regulation, desirability, and affordability. Measures to capture availability, prices, accessibility, stability, and convenience coalesced around a few common indicators. Seven urban FE interventions were evaluated with three identifying effective food safety interventions. Training vendors on food safety increased food handling practice and urban gardening reduced household food insecurity.

CONCLUSIONS
While the literature on UPU food environments is growing, there is ample room to build consensus around tools and metrics. We identify and recommend the use of common FE indicators relevant to urban areas and areas for future research. Working towards standardization or the common use of FE indicators could facilitate comparisons across settings. The evidence on FE interventions is still incipient – with the exception of food safety training – and begs the question of how to best develop innovative approaches to combating the growing urban DBM in LMICs.

ASSESSMENT OF PHYSICAL ACTIVITY LEVEL AND KNOWLEDGE OF HEALTHY EATING PATTERN IN INDIVIDUALS LIVING WITH OVERWEIGHT AND OBESITY

Maria Nikolova[1]
[1]Department of Epidemiolgy and Hygiene, Faculty of Medicine, Medical University of Sofia, Sofia, Bulgaria

BACKGROUND AND OBJECTIVES
The main behavioral risk factors for overweight and obesity are: unhealthy diet, alcohol consumption, nicotine abuse and low physical activity. The aim of the study is to assess the the level of physical activity and knowledge of a healthy eating pattern in individuals living with overweight and obesity from 19 to 60 years.

METHODS
Level of physical activity, diet, eating habits, knowledge of healthy eating were studied in not representative for the city of Sofia sample of 264 adults with different degrees of BMI, through a structured interview, International Physical Activity Questionnaire (IPAQ) and questionnaires on the health status, knowledge of a healthy eating pattern and lifestyle. Anthropometric indicators and indices measure nutritional status, and bioelectrical impedance analysis determine body composition and distribution (Tanita BC 420 MA).

RESULTS
Significantly healthier eating pattern (with breakfast [91.7% vs. 78.6%, ($p<0.05$)], three-time meal pattern [(36.1% vs. 18.8%, respectively, ($p<0.05$)], choosing more fresh fruits and vegetables [94,4% vs. 80,2%, ($p<0.05$)]) was observed in participants with normal weight compared to those with overweight and obesity. Overweight and obese individuals had a higher relative proportion of low level of physical activity compared to those of normal body weight [81.3% vs.76.4%, ($p=0.392$)].

CONCLUSIONS
Individuals with a normal BMI follow a significantly healthier diet, have better knowledge about healthy eating and body weight control approaches compared to individuals living with overweight and obesity, but no statistically significant difference was found in terms of their levels of physical activity.

VIRGIN FLAXSEED OIL, TOCOPHEROLS AND PHYTOSTEROLS PREVENTED THE NAFLD DEVELOPMENT AND FREE CHOLESTEROL ACCUMULATION IN RATS FED HIGH FAT DIETS

Juliana Sain[1]; Ignacio Scanarotti,[1]; Camila Roura[1]; Carolina Gerstner[1]; Luciana Vera Candioti[1]; Claudio A. Bernal[1]
[1]Food Science and Nutrition, Universidad Nacional del Litoral, Santa Fe, Argentina

BACKGROUND AND OBJECTIVES

Non-alcoholic fatty liver disease (NAFLD) is characterized by excessive liver triacylglyceride (TAG) accumulation in the absence of alcohol consumption and can progress to non-alcoholic steatohepatitis (NASH), involving inflammation, oxidative stress, and fibrosis. Free cholesterol (CHO) accumulation may contribute to the development of these conditions, and diet composition plays a critical role in either promoting or preventing this progression. Flaxseed (F) oil, rich in α-linolenic acid (ALA), and deodorizer distillates (DD) from sunflower oil, which contain tocopherols (TP) and phytosterols (PS), may help mitigate hepatic steatosis, inflammation, and NASH. This study aimed to investigate the potential of functional lipids (FL) present in DD to prevent NAFLD development in rats fed high-fat diets containing different linoleic acid (LA)/ALA ratios.

METHODS

Male Wistar rats (100 g BW) were divided into 7 groups and fed experimental diets with different fat levels (7% or 30% w/w), fat sources (soy -S-, corn -C-, or F), and DD supplementation: S7, S30, C30, F30, S30DD, C30DD, and F30DD, for 60 d. We assessed: BW gain, tissue lipid levels, fatty acid (FA) uptake and β-oxidation in the liver, gene expression related to FA transport and β-oxidation, liver cholesterol (CHO) homeostasis, glucose levels, hepatic VLDL-TAG secretion rate, liver histology, and TBARS levels.

RESULTS

S30 vs S7 showed increased BW gain, adipose tissue accumulation, glucose intolerance, and elevated TAG and free CHO levels in the liver, with ballooned hepatocytes, likely due to excessive FA influx, which is not balanced by and increase in β-oxidation. C30 group exhibited greater liver inflammation vs S30. F30 and F30DD attenuated BW gain, reduced adipose tissue, improved glucose levels, and showed normal histological features, lower hepatic TAG accumulation, linked to enhanced β-oxidation, increased CPT-1a activity, and upregulated β-oxidation-related gene expression. Both total and free CHO levels were reduced in the F30, reflecting increased CHO excretion and metabolism. DD supplementation improved β-oxidation, reduced hepatic CHO, slightly increased VLDL-TAG secretion, and decreased liver TBARS levels.

CONCLUSIONS

Virgin flaxseed oil, with or without TP and PS, effectively prevented TAG and free CHO accumulation in the liver. DD supplementation contributed to improved oxidative status. These findings suggest that FL from plant sources, such as a mixture of flaxseed oil, TP, and PS, could be promising dietary treatments for preventing NAFLD.

NOVA DIET QUALITY SCORES AND INCIDENCE OF HYPERTENSION IN THE NUTRINET-BRASIL COHORT STUDY

Fernanda Silva[1, 2]; Santos, Francine Dos[3, 2]; Euridice Martinez Steele[2]; Maria Laura Da Costa Louzada,[2]; Renata Bertazzi Levy[2]; Carlos Augusto Monteiro[2, 4]
[1]Preventive Medicine, Faculdade de Medicina da Universidade de São Paulo (FMUSP), São Paulo, Brazil; [2]Center for Epidemiological Research in Nutrition and Health (NUPENS/USP), School of Public Health of University of São Paulo, São Paulo, Brazil; [3]Nutrition, Universidade Federal de Ciências da Saúde de Porto Alegre, Porto Alegre, Brazil; [4]Nutrition, School of Public Health of University of São Paulo, São Paulo, Brazil

BACKGROUND AND OBJECTIVES
Hypertension is the leading cause of premature death worldwide (1). Unhealthy diets, such as those rich in ultra-processed foods (UPFs), are a major risk factor, while diets rich in unprocessed or minimally processed foods, especially whole plant-based foods (WPFs), have been linked to a reduced risk of hypertension (2-4). This study aims to assess the prospective association between the WPFs and UPFs Nova scores and the incidence of hypertension.

METHODS
NutriNet-Brasil is a web-based cohort study launched on January 26, 2020, with over 100,000 participants (5). The present study included 16,202 participants aged 18 or older, residing in Brazil, who were free of hypertension at baseline, had their blood pressure measured at least twice (both prior to and during follow-up), and completed at least three of five previously validated Nova 24-hour dietary recall screeners (6) at baseline. The Nova-WPF and Nova-UPF scores are calculated by summing the positive responses for the intake, on the previous day, of 33 varieties of unprocessed or minimally processed foods and 23 varieties of UPFs, respectively, and averaging across all completed screeners (from 3 to 5) (6). Incident cases of hypertension included individuals who reported a medical diagnosis of hypertension during follow-up. Baseline variables used for adjustments included age (as timescale), sex, education, ethnicity, living status, income source, smoking, alcohol consumption, physical activity, sleep duration, and family history of hypertension, diabetes, hypercholesterolemia, cardiovascular disease, and cancer. Cox proportional hazard models were used to estimate the hazard ratios (HR) and 95% confidence intervals (95% CI).

RESULTS
Over 22.8 months, 1,081 incident cases were identified. Individuals in the highest Nova-WPF quintile had a 42% lower risk of hypertension (HR, 0.58; 95% CI, 0.48-0.71) compared to those in the lowest quintile. Individuals in the highest quintile of Nova-UPF had a 92% greater risk of hypertension (HR, 1.92; 95% CI, 1.58-2.34). A linear trend in the association was observed for both dietary scores ($p<0.001$). In addition, the associations persisted after adjusting for the alternative score.

CONCLUSIONS
The Nova-WPF and the Nova-UPF dietary quality scores were associated with lower and higher risks of hypertension, respectively. Our RESULTS support the use of these scores in diet quality monitoring systems and facilitate the communication with policymakers.

BENEFITS OF A NUTRITIONAL INTERVENTION IN PATIENTS WITH HEAD AND NECK CANCER

Andrea Silva[1]
[1]Facultad Ciencias Quimicas y Biologicas, Mariano Gálvez University of Guatemala, Ciudad de Guatemala, Guatemala

BACKGROUND AND OBJECTIVES

Identify the benefits of nutritional intervention for patients with head and neck cancer.

METHODS

The search for articles published in the different databases showed a total of 260 articles in a period of time from February to September 2023, which are distributed as follows: BVS 94 articles, PubMed 25 articles, Scielo 11 articles, Embase 39 articles and Cochrane 91 articles.
The following combinations were used for the search strategy: Head and neck cancer and nutritional support ("Head AND neck neoplasms AND nutritional support"), Head and neck neoplasms AND payhway of feeding OR diet OR nutritional support ("Head and neck neoplasms AND payhway of feeding OR diet OR nutritional support"), Head and neck cancer and nutritional assessment or clinical deterioration and enteral nutrition ("Head an neck neoplasms AND nutrition assessment OR clinical deterioration AND enteral nutrition"), Nutrition assessmente AND head an neck neoplasms AND diet ("Nutrition assessmente AND head an neck neoplasms AND diet"), Head and neck cancer and nutritional assessment and diet ("Headn neck neoplasms AND nutrition assessment AND diet"), Head and neck cancer and enteral nutrition ("Head and neck neoplasms AND enteral nutririon")

RESULTS

According to the RESULTS obtained, an improvement is observed in the nutritional status of patients with respect to early nutritional intervention, since there are different signs and symptoms secondary to antineoplastic treatment, which can affect food consumption and tolerance. In addition, it is extremely important to be able to identify them in order to make a decision regarding nutritional intervention.
Nutrition in patients with head and neck cancer should be of utmost importance. It is mentioned that a diet containing foods rich in antioxidants can be of great help, since these can reduce the toxicity of oncology therapies.
Regarding the feeding routes used in patients with head and neck cancer, the main ones are nasogastric tube and percutaneous endoscopic gastrostomy, both of which can be of greater benefit in weight gain and improving the quality of life of patients. However, maintaining an NGT requires greater care at home compared to a PEG.

CONCLUSIONS

Early nutritional treatment can help prevent nutritional deterioration in patients and, at the end of oncological treatment, continue nutritional support until an adequate improvement in the patient's nutritional status is observed.

[1]Postgraduate Program in Applied Sciences to Woman's Health, Federal University of Rio Grande do Norte, Natal, Brazil; [2]Departament of Nutrition, Federal University of Rio Grande do Norte, Natal, Brazil; [3]Post gradute Program in Nutrition, Federal University of Rio Grande do Norte, Natal, Brazil; [4]Postgraduate Program in Applied Sciences to Woman's Health,, Federal University of Rio Grande do Norte, Natal, Brazil; [5]Medical Residency Program in Gynecology and Obstetrics, Federal University of Rio Grande do Norte, Natal, Brazil; [6]Department of Nutrition, Federal University of Rio Grande do Norte, Natal, Brazil; [7]Januário Cicco Maternity School, Federal University of Rio Grande do Norte, Natal, Brazil; [8]Departament of Nutrition, Federal University of Rio Grande do Norte, Parnamirim, Brazil

BACKGROUND AND OBJECTIVES

Although the literature presents the negative health consequences of consuming ultra-processed foods (UPF) in relation to adiposity and the development of chronic non-communicable diseases, there is still a scarcity of studies evaluating the impact of this consumption during the gestational period, especially on obstetric and perinatal outcomes in women with high-risk pregnancies. Therefore, the aim of this study was to assess the impactof UPF consumption on weight outcomes in women with Gestational Diabetes Mellitus (GDM).

METHODS

This was an observational, prospective cohort study of 140 women diagnosed with GDM and treated at a reference maternity hospital in northeastern Brazil. The study lasted an average of 25 weeks with three collections: T1: between the 1st and 2nd trimester, T2: in the 3rd gestational trimester and T3: in the immediate postpartum period. Data collection included sociodemographic characteristics, clinical and obstetric data, anthropometric data and food consumption. Food consumption was obtained by 24-hour recall and food categorized according to the Nova classification. Weight outcomes were assessed by gestational weight gain (GWG) at T1 and T2 and final GWG (T3). Women were grouped according to tertiles of UPF consumption in grams. The RESULTS of the multiple linear regression models were analyzed to as certain the association between UPF consumption in grams and weight outcomes, with adjustments for confounding variables.

RESULTS

Energy consumption was 1960.72 (±460.74) calories, with a UPF contribution of 17.95% (95% CI = 16.24 - 19.66), with an intake corresponding to 131.43 (IQR = 90.50 - 200.11) grams per day. Most of the women started pregnancy obese (57.10%). GPG at T1 and T2 represented a rapid cumulative gain in 57.10% and 47.60% of the pregnant women, respectively. The final GWG (T3) was 6.86 (±6.78) kg, with the majority of women having a high GWG (50.70%). The multiple linear regression models showed a positive relationship between a greater share of UPF in grams and cumulative and final GWG ($\beta = 0.014$; $p= 0.002$ and $\beta = 0.015$; $p = -0.023$, at T1 and T3, respectively).

CONCLUSIONS

RESULTS suggest that UPF consumption should be discouraged during high-risk pregnancy.

BACKGROUND AND OBJECTIVES

The changing food environment, characterized by increased availability, accessibility and affordability of energy dense, nutrient poor foods, is a key driver of rising rates of obesity and diet- related non-communicable diseases (NCDs). While a growing body of evidence supports various food environment policies to address these issues globally, public support is crucial for their effective development and implementation. The study aimed to examine public support for a range of policies aimed to address unhealthy food environments in Ghana.

METHODS

The study was a nation-wide cross-sectional study involving about 2468 aged 18 years and above. A multistage stratified sampling approach was used to select study participants. Data was collected through face-face interviews using tablets and analyzed descriptively.

RESULTS

The study revealed strong public support for various policies (front-of-package labeling, marketing restrictions, public food procurement regulations, and fiscal policies), with 60% or more of respondents expressing approval. Subsidies on healthy foods (98%) and front-of-package labeling policies received the highest support. Additionally, 90% favored government-funded TV campaigns highlighting the risks of unhealthy foods. Policies restricting the sale of unhealthy foods in public institutions (80%) and near schools (82.5%) or hospitals (86%) were widely supported. Fiscal measures, such as taxing unhealthy foods, had 74.1% approval, rising to 84.3% if revenues were used to subsidize healthy foods. Marketing restrictions, though slightly less popular, still had considerable backing, with support ranging from 67.1% to 77.1% for measures like banning celebrity endorsements, limiting fast-food outlets near schools, and restricting ads during children's viewing hours.

CONCLUSIONS

This study underscores substantial public support for government-led policy initiatives aimed at improving unhealthy food environments and encouraging healthier dietary choices. Policymakers can capitalize on this support to design, implement, and enforce robust policies that tackle the underlying causes of poor dietary patterns.

GENDER DIFFERENCES IN THE RISK OF ALZHEIMER'S DISEASE AND VASCULAR DEMENTIA AMONG ASIAN INDIVIDUALS WITH TYPE 2 DIABETES MELLITUS: A MINI SYSTEMATIC REVIEW

Samarakoon Mudiyanselage Dinithi Ravindrika Samarakoon[1]; Disara Hansalee Jayaweera[2]; Imasha Jayaweera,; Supeshala Kothalawala[3]; Samarakoon Mudiyanselage Dinithi Ravindrika Samarakoon[1]
[1]Program Convenor - Nursing, Edith Cowan University, Sri Lanka, Colombo, Sri Lanka; [2]Bachelor of Biomedical Science, Edith Cowan University, Sri Lanka, Colombo, Sri Lanka; [3]Program Convenor - Biomedical sciences, Edith Cowan University, Sri Lanka, Colombo, Sri Lanka

BACKGROUND AND OBJECTIVES
Type 2 diabetes mellitus (T2DM) is associated with an increased risk of dementia, including Alzheimer's disease (AD) and vascular dementia (VD) (Seo et al., 2024). While studies have highlighted gender differences in dementia risk among individuals with T2DM (Arenaza-Urquijo et al., 2024)., the extent and underlying causes of these disparities remain unclear.

METHODS
A comprehensive search was conducted between 2014 and 2024 across Scopus, PubMed, Google Scholar, and ScienceDirect, following PRISMA guidelines, resulting in the selection of nine peer-reviewed studies from Korea, India, and Japan that focused on T2DM and dementia, specifically gender differences in AD and VD. Studies were chosen based on gender-specific analysis of cognitive decline and dementia, considering age and early-onset diabetes, while excluding non-English publications, studies without gender analysis, non-Asian populations, and animal research. Key search terms included "T2DM," "AD," "VD," "gender differences," and "Asian populations."

RESULTS
Several studies highlight a gender disparity in dementia and cognitive impairment risk among individuals with T2DM, particularly in Asian populations. A 2024 Korean study found women diagnosed with T2DM before age 50 had a significantly higher risk of AD and VD compared to men, with AD risk 5.6 times higher and VD risk 6.5 times higher. In contrast, men showed a 3.3-fold increase in AD and a 5.5-fold increase in VD risk. Similarly, a 2021 Indian study found female T2DM patients had a higher incidence of mild cognitive impairment (MCI) and a 2.34-fold increased risk of VD. Research from Korea (2019) and Karnataka, India (2019) also showed higher dementia rates in women, particularly for AD, and a higher prevalence of cognitive dysfunction in older women. A 2019 Japanese study confirmed these findings, showing higher dementia incidence in women with T2DM. These studies collectively emphasize the heightened risk of dementia and cognitive decline in Asian women with T2DM.

CONCLUSIONS
This review highlights significant gender differences in AD and VD risk among Asians with T2DM, with women, especially those with early-onset diabetes or older age, at higher risk. The findings stress the need for targeted interventions for early diagnosis and prevention. Further research is required to understand the mechanisms behind this disparity and develop strategies to reduce dementia risk in women.

ANALYSIS ON THE STATUS OF EATING OUT AND THE INFLUENCING FACTORS OF OVERWEIGHT AND OBESITY AMONG SCHOOL CHILDREN AGED 6 TO 17 IN BEIJING

Yimei Sha[1]; Xiaoqi Wei[2]; Liyu Huang[1]; Bo Yu[1]; Jiali Duan[1]
[1]Institute for Nutrition and Food Hygiene, Beijing Center for Disease Prevention and Control, Beijing, China;
[2]National Institute for Nutrition and Health, Chinese Center for Disease Control and Prevention, Beijing, China

BACKGROUND AND OBJECTIVES
To investigate the status quo of eating out and the influencing factors of overweight and obesity among school children aged 6 to 17 years in Beijing.

METHODS
Based on the data of school children aged 6-17 years in Beijing during the Nutrition and Health Monitoring of children and nursing mothers in China from 2016 to 2017, the current situation of eating out and the influencing factors of overweight and obesity were analyzed.

RESULTS
In Beijing, the proportion of school children aged 6 to 17 years old eating out for breakfast, lunch and dinner was 42.2%, 80.5% and 32.5%, respectively, with the highest proportion eating out for lunch.The proportion of eating out for breakfast, lunch and dinner was related to parents' employment status, parents' education level, meeting the recommended daily physical activity and snacks. In terms of eating out places, Takeaways and Chinese restaurants are the most common places to eat out. The overweight/obesity rate of school children aged 6 to 17 years old in Beijing was 7.7%, and boys (11.1%) were higher than girls (4.3%). The RESULTS of multivariate logistic regression analysis showed that boys were the influencing factor of overweight/obesity in school children (OR=2.64, P<0.05).

CONCLUSIONS
We will actively promote the construction of healthy canteens and restaurants, promote nutritious meals throughout society, and cultivate healthy lifestyles for school-age children and their parents to ensure their healthy growth.

RELATIONSHIP BETWEEN DIETARY INTAKE, TRIGLYCERIDE-GLUCOSE INDEX AND TRIGLYCERIDE TO HDL CHOLESTEROL RATIO AS PREDICTORS OF CARDIOVASCULAR DISEASE

Mariana Andrea Janjetic[1, 2, 3]; Noelia Dressl,[4]; Sol Chiozza,[4]; Paula Mantero,[1]; Germán Flekenstein,[1]; Monica L Castro-Acosta[5]; Marcela Zubillaga,[1, 2]; Cinthia Goldman,[1, 2]
[1]Universidad de Buenos Aires, Facultad de Farmacia y Bioquímica, Cátedra de Física, CABA, Buenos Aires, Argentina; [2]Consejo Nacional de Investigaciones Científicas y Técnicas (CONICET), CABA, Buenos Aires, Argentina; [3]Universidad de Buenos Aires, Facultad de Medicina, Escuela de Nutrición, Centro de Investigaciones sobre Problemáticas Alimentarias y Nutricionales (CISPAN), CABA, Buenos Aires, Argentina; [4]Universidad de Buenos Aires, Facultad de Medicina, Escuela de Nutrición, CABA, Argentina; [5]Nutrition Sciences Academic Unit, Autonomous University of Sinaloa, Sinaloa, Mexico

BACKGROUND AND OBJECTIVES
The Triglyceride-Glucose Index (TyG) and the Triglyceride to High-Density Lipoprotein Cholesterol ratio (TG/HDL-C) have been identified as potential biomarkers for insulin resistance and were associated with cardiovascular disease. However, their relationship with dietary intake remains unexplored. We aimed to evaluate the relationship between added sugar, total sugar, and fat intake with the TyG index and the TG/HDL-C ratio

METHODS
We conducted a cross-sectional study including adult volunteers, both teaching and non-teaching staff from a national university. Participants completed a sociodemographic questionnaire, and measurements of weight, height, and waist circumference were taken. Biochemical assessments were performed, and the TyG index, TG/HDL-C ratio and Atherosclerotic Cardiovascular Disease (ASCVD) lifetime risk were calculated. Dietary intake was assessed through four 24 hours dietary recalls. Statistical analysis was performed using the SPSS software.

RESULTS
A total of 80 volunteers (40.4±10.5y), 76.3% (95%CI;65.8-84.2%) female, were included. Prevalence of overweight was 51.3% (95%CI;40.5-61.9%). The mean daily intake of total sugar, added sugar, and fat was 79.7 g/day, 48.0 g/day, and 82.1 g/day, respectively; 41.3% of participants exceeded the WHO recommendation for added sugar consumption. 38.8% had hypercholesterolemia, 12.5% had hypertriglyceridemia and 30.0% had fasting glucose greater than 100 mg/dL. The average TyG index and TG/HDL-C ratio were 8.32±0.44 and 1.64±0.40, respectively; the average ASCVD risk was 27.5%. Neither the TyG index nor the TG/HDL-C ratio were associated with added sugar intake (p=0.08, p=0.078), total sugar intake (p=0.38, p=0.32), fat intake (p=0.32, p=0.48) or ASCVD risk (p=0.06, p=0.28), even after adjusting for confounding variables.

CONCLUSIONS
Added sugar, total sugar and fat intake were not associated with the TyG index, the TG/HDL-C ratio or the ASCVD lifetime risk in the studied population. Further dietary assessments in larger cohorts are needed to confirm these findings.

THE EFFECT OF BLUEBERRY SUPPLEMENTATION ON INTRA-ARTICULAR INFLAMMATION AND POST-OPERATIVE RECOVERY IN PATIENTS UNDERGOING TOTAL KNEE REPLACEMENT FOR OSTEOARTHRITIS

Lauren Struszczak[1]; Waterson Ben[2]; Eyres Keith[2]; Garner Amy[2]; Morcrette Helen[1]; Bowtell Joanna[1]; O'leary Mary[1]
[1]Public Health and Sports Sciences, University of Exeter, Exeter, United Kingdom; [2]Orthopaedics, Royal Devon and Exeter Hospital, Exeter, United Kingdom

BACKGROUND AND OBJECTIVES

Osteoarthritis (OA) is a painful, chronic condition affecting 40% of those >70 years [1]. There remain no treatment strategies to prevent disease progression [2]. Inflammation is an important aetiological factor in the development of OA [3]. Previously, blueberry supplementation reduced arthritic pain [4] potentially via anti-inflammatory action. This study assessed the effect of blueberry supplementation on a) the inflammatory pathophysiology of OA and b) pre- and post-surgical pain and joint function in patients undergoing total knee replacement (TKR) surgery for OA.

METHODS

Patients undergoing TKR for OA were randomised to consume 40g (~429 mg anthocyanins) per day of freeze-dried blueberry (n=15, 69 ± 9 years, 33.8 ± 5.4 kg.m2) or placebo powder (n=16, 71 ± 8 years, 32.5 ± 5.6 kg.m2) 6-weeks pre- and post-TKR. Serial WOMAC (Western Ontario and McMaster Universities Arthritis Index) assessments were conducted three times pre- and post-TKR. Synovial fluid (SF) and synovium was collected from patients during their TKR. Cytokine and chemokine concentrations (CCL2, insulin, gp130, MMP1, CCL20, galectin-1, IL15, chemerin, IL6) in SF were measured using multiplex technology. CD206 was measured via ELISA in synovium lysates. Between group differences were tested using MANOVA, repeated measures ANCOVA and independent t-test.

RESULTS

A Principal Component Analysis (PCA) reduced the dimensionality of SF outcome measures (CCL2, CCL20 insulin, gp130, MMP1, CCL20, galectin-1, leptin IL15, chemerin, IL6, IL18), capturing key variations. A MANOVA using the first two principal components (PC1: 25.2%, PC2:13.3% variance) showed a significant ($F(2,28)=3.936$, $p=0.031$) difference in cytokine milieux between blueberry and placebo groups. Blueberry-supplemented SF contained less gp130 than those of placebo controls (blueberry 48.2 ± 16.2 ng/mL, placebo 59.2 ± 8.6 ng/mL; $p = 0.03$). There were no significant differences in CD206, (blueberry 230 ± 85 ng/mL, placebo 146 ± 123 ng/mL $p=0.06$). There was no significant interaction effect between supplementation group and WOMAC scores pre- or post-TKR ($F(2,52)=1.503$, $p=0.232$, $\eta p2 =0.055$ and $F(2, 50)=0.259$, $p=0.760$, $\eta p2=0.10$ respectively).

CONCLUSIONS

Longer-term blueberry supplementation could ameliorate OA pathology. Reduction in gp130 may be representative of improved tissue repair and reduced OA disease severity [5]. Dietary supplementation with blueberry may represent a useful tool for OA treatment.

VALIDITY OF FASTING PLASMA GLUCOSE IN REFERENCE TO HBA1C FOR THE DETECTION OF DIABETES IN AN OVERWEIGHT AND OBESE POPULATION IN SRI LANKA

Upul Senarath[1]; Prasad Katulanda,[2]; Nishan Kalupahana,[3]; Kunarathinam Partheepan,[4]; Gaya Katulanda,[5]
[1]Department of Community Medicine, University of Colombo, Colombo, Sri Lanka; [2]Department of Clinical Medicine, University of Colombo, Colombo, Sri Lanka; [3]Department pf Physiology, University of Peradeniya, Peradeniya, Sri Lanka; [4]SAIFRN Sri Lanka, SAIFRN, Colombo, Sri Lanka; [5]Chemical Pathology, National Hospital of Sri Lanka, Colombo, Sri Lanka

BACKGROUND AND OBJECTIVES
Validity of fasting plasma glucose (FPG) measurements for the detection of diabetes was evaluated in reference to HbA1c among a 35-64-year-old, overweight and obese population.

METHODS
Data were collected from 1200 adults aged 35-64 years having a BMI of 25 kg/m2
Sensitivity, specificity and ROC analyses were performed on 1121 persons for FPG (the index test) and HbA1c (the reference standard). HbA1c ≥6.5% was considered as having diabetes

RESULTS

Approximately 64% were female, 73% employed, 31% BMI ≥30 kg/m2, and 70% living in urban settings. Mean age (SD) was 47.8 (±7.5) years.
Prevalence of diabetes was 25.7% according to HbA1c ≥ 6.5%, and 44% of them were undiagnosed. A significant correlation was found between FPG values and HbA1c (r=0.863; p<0.001). At FPG cutoff point of 126mg/dl, the sensitivity was 60% (95%CI: 53.6, 65.5), and the specificity 99.8% (95%CI: 99.4, 100.1), with high agreement (kappa=0.69; p<0.001). The positive and negative predictive values were 98.7% (96.9, 100.5) and 89.3% (87.4, 91.3), respectively. At FPG 100mg/dl, the sensitivity increased to 82.0% (77.2, 86.7) and specificity reduced to 88.5% (86.2, 90.7), with a marginal change in kappa (0.66; p<0.001). ROC analysis found an area of 0.91 (p<0.001) under the curve at this optimum cutoff point.

CONCLUSIONS
A lower threshold of FPG (≥100 mg/dl) may achieve a maximum yield of diabetes during the screening of overweight or obese persons in the age group 35-64 years.

COUNTRY-SPECIFIC DIFFERENCES IN THE ASSOCIATION BETWEEN DIETARY INTAKE AND OBESITY IN TWO HIGH-INCOME COUNTRIES: THE PROSPECTIVE URBAN AND RURAL EPIDEMIOLOGY (PURE) STUDY

Christina Lundberg[1, 2]; Martin Lindgren[2, 3]; Joseph Philip[4]; Victoria Miller,[5, 6]; Annika Rosengren,[2, 3]
[1]Faculty of Education, Department of Food and Nutrition and Sport Science, Gothenburg, Sweden; [2]Department of Molecular and Clinical Medicine, Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden; [3]Department of Medicine Geriatrics and Emergency Medicine, Sahlgrenska University Hospital, Östra Hospital, Region Västra Götaland, Gothenburg, Sweden; [4]Population Health Research Institute, McMaster University and Hamilton Health Sciences, ,, Hamilton, ON, Canada; [5]Population Health Research Institute, McMaster University, Hamilton, ON, Canada; [6]Department of Medicine, McMaster University, Hamilton, ON, Canada

BACKGROUND AND OBJECTIVES
A healthy diet is associated with a reduced risk of obesity in adults (1). Canada and Sweden are two high-income countries with many similarities, yet the prevalence of obesity is significantly higher in Canada. This study aimed to investigate country-specific differences in associations between dietary intake and obesity.

METHODS
We included 6,008 men and women aged 34 to 60 years with normal weight (body mass index [BMI]: 18.5-<25 kg/m2 or obesity (BMI>30 kg/m2) from the Prospective Urban Rural Cohort Epidemiology (PURE) study (2), with participants from Canada (n=4124, 45% women) and Sweden (n=3,172, 46% women). The Alternative Healthy Eating Index (AHEI)-2010 score (3) was calculated from country-specific food frequency questionnaires. The AHEI score is based on 11 components: vegetables, fruit, whole grains, nuts and legumes, long chain omega–3 fats, and polyunsaturated fatty acids, sugar-sweetened drinks and fruit juice, alcohol, red and processed meat, *trans*-fats, and sodium. Each component scored from 0 to 10, with a maximum total score of 110, where higher scores indicate healthier diets. Logistic regression models with 95% confidence intervals (CIs), adjusted for sex and age, were used to estimate ORs of obesity (BMI≥30) in both countries across AHEI score quintiles (Q). Contrast matrices were used to compare ORs between countries.

RESULTS
The prevalence of obesity was higher in Canada (42.1%) than in Sweden (27.3%) (OR 1.98, CI 1.76-2.24). Still, having a healthy diet was more common in Canadian, compared with Swedish participants, with a mean AHEI score of 60.1 (standard deviation [SD]=13.4) and 56.3 (SD=11.2), respectively. Odds of obesity decreased linearly with higher AHEI scores in both countries. A significant interaction between country and AHEI score was observed. Compared with Swedish participants (Q1 as a reference), Canadian participants had increased odds of obesity across Q1 to Q3, with ORs: Q1=2.40 (CI=1.83-3.14), Q2=1.95 (CI=1.50-2.53, and Q3=1.64 (CI=1.26-2.13). For Q4 and Q5, Canadians had similar or lower odds compared with Swedish participants in Q1 (ORs: Q4=0.90 (CI=0.69-1.17 and Q5=0.40 (CI=0.31-0.53)).

CONCLUSIONS
Despite an overall healthier diet, Canadians had a higher prevalence of obesity compared to Swedish participants. Canadians also had higher odds of obesity compared with Swedish participants across AHEI scores. These data suggest that differences in diet quality between countries do not explain country-level differences in obesity prevalence or risk.

EFFECTS OF HEPATIC WDR6 SIRNA ADMINISTRATION ON THE PATHOGENESIS OF NON-ALCOHOLIC STEATOHEPATITIS/METABOLIC DYSFUNCTION-ASSOCIATED STEATOHEPATITIS (NASH/MASH) IN MICE

Tatsunobu Nakagawa[1]; Yuki Yoshii[1]; Jinyun Wang[1]; Issa Furihata[1]; Toshimitsu Komatsu[2]; Isao Shimokawa[2]; Akihito Ishigami[3]; Yoshitaka Kondo[3]; Takuya Chiba[1]
[1]Biomedical Gerontology Laboratory, School of Human Sciences, Waseda University Tokorozawa Campus, Tokorozawa, Japan; [2]Department of Pathology, School of medicine, Nagasaki University, Nagasaki, Japan; [3]Molecular Regulation of Aging, Tokyo Metropolitan Institute for Geriatrics and Gerontology (TMIG), Tokyo, Japan

BACKGROUND AND OBJECTIVES
WD repeat protein 6 (WDR6) is known to be expressed at a low level in the brains of long-lived rats. Previous studies have shown that WDR6 is involved in the insulin/insulin-like growth factor-1 (IGF-1) signaling pathway. Hence, WDR6 may be implicated in the regulation of feeding behavior and lifespan. Additionally, WDR6 positively regulates intracellar signaling pathways associated with lipid accumulation. Therefore, the liver-specific inhibition of WDR6 function would be expected to suppress lipid accumulation in the liver and inhibit the progression of non-alcoholic steatohepatitis / metabolic dysfunction-associated steatohepatitis (NASH/MASH).

METHODS
C57BL/6J mice were fed a choline-deficient, methionine-reduced, high-fat diet (CDAHFD) to induce NASH/MASH, and *Wdr6* siRNA was injected into the liver via a tail vein to determine the effects of *Wdr6* inhibition on the progression of NASH/MASH. Liver tissue samples were stained with hematoxylin/eosin or Sirius Red or subjected to F4/80 immunostaining. Lipids were extracted from the liver, and the triglyceride (TG) and total cholesterol (TC) levels were quantified. The plasma concentrations of TG and TC and the activity of alanine aminotransferase (ALT) were measured by colorimetric assays. Additionally, quantitative PCR was performed to measure gene expression levels in the liver.

RESULTS
Liver mass was significantly lower in the *Wdr6* siRNA-treated group (SI) than in the negative control group (NC). The SI group showed significantly lower expression of genes involved in various pathologic features of NASH/MASH, including hepatocellular injury, lipid accumulation, inflammation,proinflammatory cytokines,anti-inflammatory cytokines, fibrosis, and adipogenesis regulation and lower hepatic TG and TC levels *vs*. the NC group. In contrast, the SI group exhibited significantly higher expression of genes involved in fatty acid β-oxidation, anti-inflammatory regulation,and cholesterol efflux to bile *vs*.the NC group.

CONCLUSIONS
These RESULTS suggest that *Wdr6* siRNA administration promotes fatty acid β-oxidation via PPARα and suppresses lipid synthesis through PPARγ1. Furthermore, *Wdr6* siRNA may attenuate the progression of liver inflammation and fibrosis through cholesterol efflux to bile. Therefore, WDR6 may be an important therapeutic target for NASH/MASH.

CONFLICTS OF INTERESTS

THE EFFECTS OF 6 MONTHS DIETARY COUNSELING ON DIET QUALITY AND CARDIOVASCULAR RISK PROFILE IN PATIENTS WITH CARDIOVASCULAR DISEASE: A RANDOMIZED CONTROLLED TRIAL

Iris van Damme[1]; Eva Van Veldhuisen[1]; Renate Winkels[1]; Marianne Geleijnse[1]
[1]Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands

BACKGROUND AND OBJECTIVES
Despites the known benefits of a healthy diet for cardiovascular disease (CVD) risk factors, dietary counseling is not yet widely implemented in health care for patients with CVD. The aim of the current trial was to investigate how dietary counseling by a dietitian, focused on improving diet quality, influenced the cardiovascular risk profile of patients with established CVD.

METHODS
In this 6-month trial, 124 patients with CVD (68.1 ± 9.5 years, 72% men) were randomly assigned to counseling by a dietitian (n=63) or usual care (n=61). Differences in cardiovascular risk profile between groups were assessed with a 10-year composite cardiovascular risk prediction score that incorporated changes in blood pressure and low-density lipoprotein cholesterol (LDL-C). Changes in self-reported diet quality were assessed as secondary outcomes by use of the Dutch Healthy Eating Index-2015 (DHD15-index) that ranges from 0-160 with higher scores indicating higher diet quality. Also, changes in LDL-C, systolic blood pressure, body weight, and high-sensitivity C-reactive protein [hs-CRP]) were investigated as secondary outcomes. Analysis of covariance was used to compare 6-month values between groups, with analyses being adjusted for baseline values and factors that were used to stratify randomization.

RESULTS
Patients in the intervention group met on average 6 times (IQR 4-7) with the dietitian. Baseline estimated 10-year CVD risk was 24.3 ± 15.6 % in the usual care group and 23.3 ± 15.3 % in the intervention group. At six months, the absolute difference in 10 year CVD risk between groups was 1.9 % (95%CI: -2.8%; 6.5%), which was not statistically significant. The DHD15-index at baseline was 102 ± 22 in the usual care group and 104 ± 16 in the intervention group. At 6 months, the index was 5.7 points higher in the dietary counseling group compared to the usual care group (95%CI: 1.3; 10.1). However, no differences in LDL-C (-1.5 mmol/l, 95%CI: -7.1; 4.1), blood pressure (0.0 mmHg, 95%CI: -0.2; 0.2), body weight (-0.7 kg, 95%CI: -2.9; 1.5) or hs-CRP (0.71 mg/dl, 95%CI: -1.20; 2.62) between groups were found.

CONCLUSIONS
In this trial, dietary counseling for patients with CVD slightly improved self-reported adherence to a healthy diet in patients with established CVD. The counseling did not result in substantial differences in cardiometabolic risk profile after 6 months.

BACKGROUND AND OBJECTIVES

45% of the seven districts of the Autonomous Province of Vojvodina (APV) population are forced to use non-purified disinfected or undisinfected drinking water (NPDW), where arsenic represents one of the hazards. The objective is to assess the human health risk caused by arsenic concentration in drinking water in municipalities without appropriate treatment.

METHODS

The analyses are based on the RESULTS from 2023 for 11.919 NPDW samples originating from seven authorized and accredited public health institutions. Drinking water safety was assessed according to national laws. Total cancer risk (TCR) was characterized using the United States Environment Protection Agency methodology, considering ingestion and dermal absorption for adults and children up to 5, and with acceptability at E-4 to E-6.

RESULTS

Regarding arsenic concentration, 69% of NPDW samples were not in compliance in all seven districts of APV, with an average concentration of 0.08 mg/l and a maximum of 0.94 mg/l. TCR concerning ingestion and dermal absorption, with the dominance of ingestion (99%) for maximum arsenic concentration was not acceptable in six of seven districts (from 3,65E-02 to 7,80E-03) for adults. As for children up to 5, TCR was not acceptable in all seven districts regardless of average or maximum arsenic concentration (from 6,36E-02 to 8,23E-03 for average and from 1,88E-01 to 6,53E-03 for maximum concentration).

CONCLUSIONS

The NPDW in APV due to arsenic concentration poses significant human health risks, especially for children under 5. It underscores the urgent need for local governments to provide safe drinking water to every citizen of APV.

DIETARY CHOLEST-4-EN-3-ONE ALLEVIATES OBESITY-RELATED METABOLIC DISORDERS IN OBESE DIABETIC MICE

Mina Higuchi[1]; Bungo Shirouchi[1]
[1]Division of Human Health Science, Graduate School of Regional Design and Creation, University of Nagasaki, Nishi-Sonogi-gun, Nagasaki, Japan

BACKGROUND AND OBJECTIVES
Cholest-4-en-3-one (4-cholestenone, 4-STN) is a steroid that has an oxo group at the carbon-3 (3-oxo) position and a double bond at the carbon-4 position. Previous studies have shown that dietary 4-STN exerts anti-obesity and lipid-lowering effects in mice. However, its underlying mechanisms are not fully understood. In the present study, we evaluated whether 4-STN supplementation would protect obese diabetic *db/db* mice from obesity-related metabolic disorders.

METHODS
Five-week-old male C57BL/6J and *db/db* mice were housed individually in plastic cages in a temperature-controlled room. The experimental diets were prepared according to the AIN-76 formula with several modifications. *db/db* mice were assigned to two groups (n = 6/group) that were fed one of the following diets: a control diet containing 7% soybean oil and 0.1% cholesterol (CON group) or control diet supplemented with 0.25% 4-STN at the expense of sucrose (4-STN group). C57BL/6J mice (n = 6), which are the progenitors of *db/db* mice, were fed a control diet (NOR group). After 3 weeks of feeding experimental diets, respiratory gas analysis was conducted. After 4 weeks of feeding, the mice were sacrificed by exsanguination from the heart, and then obtained samples were analyzed.

RESULTS
There was no significant difference in food intake, final body weight, total oxygen consumption, energy expenditure, or carbohydrate oxidation. On the other hand, dietary 4-STN markedly alleviated hyperlipidemia, hepatic cholesterol accumulation, and hyperinsulinemia in *db/db* mice. However, the effect of dietary 4-STN was not sufficient to improve hepatic triglyceride accumulation or obesity in *db/db* mice. Further analysis demonstrated that dietary 4-STN significantly increased the content of free fatty acids and neutral steroids in the feces of *db/db* mice, indicating that the alleviation of hyperlipidemia by 4-STN was due to increased lipid excretion. In addition, dietary 4-STN significantly reduced the levels of desmosterol, a cholesterol precursor, in the plasma but not in the liver, suggesting that normalization of cholesterol metabolism by 4-STN is partly attributable to the suppression of cholesterol synthesis in extrahepatic tissues.

CONCLUSIONS
These RESULTS indicate that dietary 4-STN ameliorates obesity-related metabolic disorders such as hyperlipidemia, hepatic cholesterol accumulation, and hyperinsulinemia, in *db/db* mice.

EXPLORING THE ASSOCIATION BETWEEN DIETARY PATTERNS AND DIABETES AMONG THE POPULATION THROUGH THE NUTRITION AND HEALTH SURVEY IN TAIWAN (NAHSIT)

Yi Chin Liu[1]; Sin Tian Du[1]; Long Sheng Chen[1]
[1]Surveillance, Research and Health Education, Health Promotion Administration, Ministry of Health and Welfare, Taipei, Taiwan

BACKGROUND AND OBJECTIVES
Studies show that about 8.3% of adults worldwide have diabetes, making it a major cause of death among those under 60. Diabetes is linked to modifiable health behaviors, including obesity, physical activity, lifestyle, and diet. Specific foods like green vegetables, fresh fruits, and dairy are associated with a lower risk of diabetes, while frequent red meat consumption increases the risk. This study aims to use data from the Nutrition and Health Survey in Taiwan (NAHSIT) to identify dietary patterns and their association with diabetes.

METHODS
Using data from the 2017–2020 NAHSIT, we included 3,593 participants aged 19 and older who completed the Food Frequency Questionnaire (FFQ) and diabetes-related survey. Foods were grouped into 21 categories, and Principal Component Analysis (PCA) identified three dietary patterns: the Meat-Vegetable dietary pattern, the Healthy dietary pattern, and the High-Seafood-Low-Soymilk dietary pattern. Multivariable logistic regression was used to examine associations between these patterns and the risks of diabetes and prediabetes, adjusting for sociodemographic factors, with dietary pattern scores categorized into three groups (T1, T2, T3) from lowest to highest.

RESULTS
After adjustment, the Meat-Vegetable dietary pattern was linked to higher risks of diabetes and prediabetes (Diabetes: T2 vs. T1 OR=1.51, T3 vs. T1 OR=2.00; Prediabetes: T2 vs. T1 OR=1.60, T3 vs. T1 OR=2.12). The Healthy dietary pattern showed a protective effect against both conditions (Diabetes: T2 vs. T1 OR=0.70, T3 vs. T1 OR=0.74; Prediabetes: T2 vs. T1 OR=0.96, T3 vs. T1 OR=0.85). The High-Seafood-Low-Soymilk pattern was protective against prediabetes (T2 vs. T1 OR=0.86, T3 vs. T1 OR=0.95).

CONCLUSIONS
This study, using data from the Taiwanese population, found that the Meat-Vegetable dietary pattern—rich in poultry, processed meats, fried foods, and vegetables—was linked to higher risks of diabetes and prediabetes. In contrast, the Healthy dietary pattern, characterized by higher intake of fruits and nuts, showed significant protective effects. Further research is needed to determine the impact of the High-Seafood-Low-Soymilk dietary pattern on diabetes.

N-3 PUFA MITIGATES DIABETES-RELATED COGNITIVE DYSFUNCTION BY REGULATING CEREBRAL MITOCHONDRIAL FUNCTION

Yu Liu[1]; Xiaojun Ma[1]; Jingjing Xu[1]; Xixiang Wang[1]; Liu Lu[1]; Xiuwen Ren[1]; Xinjing Guo[1]; Linhong Yuan[1]
[1]School of Public Health, Capital Medical University, Beijing, China

BACKGROUND AND OBJECTIVES
Cognitive dysfunction is a common complication of Type 2 Diabetes Mellitus (T2DM). Dietary n-3 polyunsaturated fatty acids (n-3 PUFA) have been shown to enhance cognitive function and to reduce dementia incidence. Investigators explored the effects of n-3 PUFA on central insulin signaling pathways and mitochondrial function under diabetic states.

METHODS
We utilized multiple mouse models of diabetes and cognitive impairment to investigate the impact of impaired glucose metabolism on central insulin signaling pathways and mitochondrial function. Additionally, to address the machines of n-3 PUFA improve diabetes related cognitive dysfunction, we treated db/db mice with n-3 PUFA fortified diets to explore the effects of n-3 PUFA on insulin signaling pathways, mitochondrial function and cognitive function.

RESULTS
db/db mice exhibited pronounced insulin resistance and mitochondrial dysfunction in the brain cortex. Brain mitochondrial energy metabolism abnormality and glutamate-glutamine circulation disorder constitute the pathological basis for diabetes-related cognitive dysfunction. Dietary n-3 PUFA intervention alleviated insulin resistance, neuronal loss, mitochondrial structural abnormalities, energy metabolism disorders, glutamate-glutamine cycling disorders and cognitive dysfunction of db/db mice.

CONCLUSIONS
n-3 PUFA facilitated the recovery of cognitive function in db/db mice by regulating cortical mitochondrial energy metabolism and enhancing the glutamate-glutamine cycle.

TRANSFORMING FOOD ENVIRONMENTS: MANDATORY FOOD REGULATIONS TO SAFEGUARD CHILDREN'S HEALTH AND RIGHTS

Carmen Tse[1]; Andrea Galante[2]
[1]Global Health and Nutrition Team, World Vision International, Vaughan, Canada; [2]Global Center, World Vision International , Rome, Italy

BACKGROUND AND OBJECTIVES
The global rise in ultra-processed food (UPF) consumption is fuelling a health crisis among children, evidenced by escalating obesity, diet-related illnesses, and malnutrition. The food industry's aggressive marketing exacerbates the issue by targeting children with unhealthy options. This brief advocates for mandatory food regulations to protect children's rights, reshape food environments, and combat hunger and malnutrition.

METHODS
A literature review of global research and case studies that evaluate evidence-based policies for transforming food environments was conducted. The compilation of resources was analysed and synthesised into a policy brief.

RESULTS
Mandatory food regulations show transformative impact:
- Chile's Comprehensive Food Law: Reduced calorie, sugar, and sodium intake while limiting unhealthy advertising and fostering healthier food choices.
- Sugar Taxes in Mexico and the UK: Decreased sugary drink consumption, with Mexico reporting a 7.6% decline and the UK halving sugar intake in beverages. In Mexico, revenues supported public health, including school water fountains.
- Front-of-Pack Warning Labels: Empowered consumers to make healthier choices and reduced consumption of high-sugar, high-fat products.
- Marketing Restrictions: Protected children by banning ads, cartoon characters, and toys that promote unhealthy products.
The private sector plays a significant role in public policy-making via Industry lobbying and engagement, which impede the establishment and enforcement of mandatory food regulations.

CONCLUSIONS
Comprehensive food regulations are effective in reducing the appeal and consumption of UPF. Public policymaking needs to be protected from competing interests of the private sector when they infringe on children's rights to healthy diets and food environments. Governments must establish and enforce comprehensive food regulations, including marketing restrictions and industry accountability for ethical marketing, fiscal policies, and food labelling to ensure healthier food environments and safeguard children's health globally.

UNLIKE WATER-SOLUBLE CHOLINE, DIETARY PHOSPHATIDYLCHOLINE, A FAT-SOLUBLE CHOLINE, DOES NOT INCREASE PLASMA TRIMETHYLAMINE-N-OXIDE (TMAO) LEVELS IN RATS

Bungo Shirouchi[1, 2]; Ayano Fukuda[1]; Taiki Akasaka[3]
[1]Department of Nutrition Science, Faculty of Nursing and Nutrition, University of Nagasaki, Nishi-Sonogi-gun, Nagasaki, Japan; [2]Division of Human Health Science, Graduate School of Regional Design and Creation, University of Nagasaki, Nishi-Sonogi-gun, Nagasaki, Japan; [3]Center for Advanced Technical and Educational Supports, Kyushu University, Fukuoka, Japan

BACKGROUND AND OBJECTIVES
Choline, betaine, and L-carnitine are transformed into trimethylamine (TMA) by gut microbiota, absorbed into the liver, and oxidized into trimethylamine-*N*-oxide (TMAO) by flavin-containing monooxygenases. Elevated TMAO levels may negatively affect human health. As phosphatidylcholine (PC) is the main source of dietary choline, its intake or PC-rich foods may be harmful to human health; however, quantitative comparative information among dietary choline compounds (fat-soluble choline such as PC and water-soluble choline such as glycerophosphocholine [GPC] and choline chloride [CC]) regarding in vivo generation of TMAO is lacking. In this study, we compared the effects of PC, GPC, and CC on plasma TMAO levels and investigated their effects on gut microbiota at the genus level in rats.

METHODS
Male Sprague-Dawley rats were fed semisynthetic diets that contained 7% soybean oil (control group), 5.5% soybean oil + 2% soybean PC (PC group), 7% soybean oil + 0.6636% GPC (GPC group), or 7% soybean oil + 0.3602% CC (CC group) for 4 weeks. PC, GPC, and CC diets contained equimolar amounts of choline. All experimental diets contained equimolar amounts of fatty acids. After 4 weeks of feeding, the rats were sacrificed, and then obtained samples were analyzed.

RESULTS
There was no difference in food intake, liver weight, weights of mesenteric and abdominal WATs, or soleus muscle weight among the 4 groups. The GPC and CC groups had significantly lower Hepatic phospholipid (PL) contents than the control group. Plasma TMAO levels were significantly higher in the GPC and CC groups than in the control and PC groups. PL-derived choline is absorbed more efficiently in the small intestine than free forms of choline, suggesting that it is difficult to convert PC-derived choline into TMA in the large intestine, and that it does not increase plasma TMAO levels. At the genus level, plasma TMAO levels were significantly correlated with relative abundances of several gut microbes. Among those, the relative abundances of *Anaerotruncus* and *Coprobacter* may have large effects on changes in plasma TMAO levels of rats.

CONCLUSIONS
Our RESULTS clearly indicate that dietary PC, unlike GPC and CC, does not increase plasma TMAO levels in rats. Our data will be valuable as baseline data for the quantitative comparison of dietary choline compounds regarding in vivo TMAO production.

CONFLICTS OF INTERESTS
The authors have no conflict of interest.

ALLEVIATION EFFECT OF MAFLD BY DIETARY PHOSPHATIDYLINOSITOL: COMPARISON WITH DIETARY MYO-INOSITOL

Shiori Iwasaki[1]; Bungo Shirouchi[1]
[1]Division of Human Health Science, Graduate School of Regional Design and Creation, University of Nagasaki, Nishi-Sonogi-gun, Nagasaki, Japan

BACKGROUND AND OBJECTIVES
Growing evidence indicated that dietary phospholipids (PLs) have beneficial effects on health compared with dietary triglyceride (TG). Our previous studies showed that dietary phosphatidylinositol (PI), one of the minor PL molecular classes, alleviates metabolic dysfunction-associated fatty liver disease (MAFLD) in obese rats. However, it is well known that *myo*-inositol (INO), a constituent base of PI, also has the same effect. Therefore, it remains unclear whether ingestion of PI or INO is more effective. In the present study, we compared the effects of dietary PI and INO on the development of MAFLD in obese and diabetic *db/db* mice.

METHODS
Male *db/db* mice were fed semisynthetic diets that contained 7% soybean oil (TG group), 1% PI-containing diet (PI group), or INO-containing diet which is equal molar INO with PI diet (INO group) for 4 weeks. Also, all experimental diets contained equimolar amounts of fatty acids. After 4 weeks of feeding, the mice were sacrificed and then obtained samples were analyzed.

RESULTS
There was no significant difference in food intake among the 3 groups. The mice of TG group exhibited severe MAFLD. On the other hand, dietary PI and INO significantly alleviated MAFLD. Further analysis demonstrated that dietary PI and INO significantly decreased the activities of fatty acid synthase in the liver of mice, leading to the alleviation of MAFLD. In addition, fecal contents of TG and free fatty acids were significantly higher in the PI group than those in the TG and INO groups. On the other hand, plasma TG concentrations were significantly higher in the INO group than in the TG and PI groups.

CONCLUSIONS
Our RESULTS indicate that the mechanism by which dietary PI alleviates MAFLD (hepatic TG-lowering action) is partially different from that of dietary INO, and further suggest that dietary PI is more effective than dietary INO in terms of exerting an anti-obesity effect in *db/db* mice.

HEALTH IMPACTS OF ANIMAL- AND PLANT-BASED PROTEIN CONSUMPTION IN BELGIUM

Claire Dénos[1, 2, 3]; Stefanie Vandevijvere[3]
[1]STEN, Universiteit Gent - Campus Coupure, Gent, Belgium; [2]SONYA, Usquare.brussels (VUB - ULB), Ixelles, Belgium; [3]Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium

BACKGROUND AND OBJECTIVES
Growing concerns about the environmental and public health impacts of food consumption underscore the importance of evaluating these effects at the national level to inform proactive policies to improve population diets. Previous research has analyzed the environmental impact of protein consumption patterns in Belgium, showing that people who consume a 40/60 ratio of animal/plant-based protein have on average 29% lower diet-related greenhouse gas emissions compared to the average Belgian ratio of around 60/40 (Dénos et al. 2024). Building upon this work, this current study investigates the health impact of Belgian diets, with a specific focus on the ratio between animal and plant protein intake. This research is part of the SUSFOODBEL project, which seeks to identify priority policies to facilitate the transition towards more sustainable diets in Belgium.

METHODS
The Belgian diet was summarised, based on data from the most recent Belgian National Food Consumption Survey (2014-2015). A comparative risk assessment was performed to evaluate the major health outcomes (type 2 diabetes, ischemic heart disease and colorectal cancer) associated with protein consumption. The general framework of the Global Burden of Disease was followed. Population attributable fractions and the attributable burden were calculated for the year 2014 for selected health outcomes. Burden estimates were derived from the Belgian Burden of Disease study.

RESULTS
Preliminary findings suggest that shifts in protein consumption patterns towards more plant-based protein consumption may improve health outcomes such as type 2 diabetes, ischemic heart disease and colorectal cancer. This research will provide quantitative values on the burden attributed to animal and plant protein consumption in Belgium.

CONCLUSIONS
Reducing the environmental and health impacts of animal protein consumption in Belgium requires targeted policies. Promoting plant-based protein as part of a dietary shift could effectively foster both environmental sustainability and public health.

HEALTH LITERACY ASSESSMENT OF CAREGIVERS IN HOME ENTERAL NUTRITION

Rubia Thieme[1]; Giuliane Wrobel,[1]; Thais Rolim,[2]; Maria Eliana Schieferdecker,[1]
[1]Nutrition Department, Universidade Federal do Paraná - Jardim Botânico, Curitiba, Brazil; [2]Department of Public Health, Setor de Ciências da Saúde - UFPR - Rua Padre Camargo - Alto da Glória, Curitiba, Curitiba, Brazil

BACKGROUND AND OBJECTIVES

Health literacy (HL) refers to the ability to seek, understand, evaluate, and use health information and services to make informed decisions. High levels of HL are associated with disease prevention and health promotion. On home enteral nutrition (HEN), HL is essential for properly managing nutritional therapy and patient safety. This study aimed to assess the HL level among caregivers of patients on HEN.

METHODS

This observational, cross-sectional, and descriptive study included caregivers of individuals in HEN, with data collected through home visits between June and September 2024. Sociodemographic and caregiving data were obtained through interviews. HL was assessed using the Eight-Item Health Literacy Assessment Tool (HLAT-8), adapted for the Brazilian population, comprising eight Likert scale questions (0-5) addressing comprehension, information seeking, interactivity, and critical health knowledge. Scores ranged from 0 to 37, with higher scores indicating better HL (Abel et al., 2015). A score of ≥19 (≥50%) was considered satisfactory HL, while scores ≤18 were classified as unsatisfactory HL (Paes et al., 2022). Data were organized and analyzed using descriptive statistics in Excel for Windows®. The study was approved by the Ethics Committee of the Federal University of Paraná (77509924.4.0000.0102).

RESULTS

A total of 34 caregivers were included, 88.2% (n=30) were women, predominantly white (78.1%; n=25), married (50%; n=17), with incomplete middle school education (50%; n=17), and most had a family bond with the HEN patient (97.1%; n=33). HL assessment revealed a mean score of 28 ± 3.23, with all participants achieving satisfactory HL levels. Among the HLAT-8 attributes, understanding health information had the highest score (8.09 ± 2.01), followed by critical health knowledge (7.21 ± 1.49), information seeking (6.56 ± 0.99), and interactivity (6.15 ± 1.48).

CONCLUSIONS

Caregivers demonstrated satisfactory HL levels, with the highest performance in understanding health information. These findings highlight the importance of educational initiatives to enhance HL, particularly in home care.

EVALUATION OF IMPROVED CASSAVA (MANIHOT ESCULENTA CRANTZ) VARIETIES AND ASSOCIATED PRODUCTS FOR PROXIMATE, CYANOGENIC POTENTIAL AND GLYCEMIC INDICES

Gregory Nwaoliwe[1]; Emmanuel Alamu[1]; Rasaki Sanusi[2]; Busie Maziya-Dixon,[3]
[1]Food and Nutrition Science laboratory, IITA Nigeria, International Institutefor Tropical Agriculture Iita, Ibadan, Nigeria, Federal Republic of; [2]Human Nutrition andDietetics, University of Ibadan, Nigeria, Ibadan, Nigeria, Niger, Republic of; [3]Food and Nutrition, Sierra Leone Research Institute, Ibadan, Nigeria, Sierra Leone

BACKGROUND AND OBJECTIVES
The consumption of high-carbohydrate foods has been linked to an increased risk of diabetes mellitus, obesity, cardiovascular diseases, and certain cancers. Research suggests that low-glycemic index (GI) diets are more effective in managing blood glucose levels compared to high-GI foods, which contribute to insulin resistance. This study investigated the proximate, cyanide, and glycemic indices of roots and *eba* (*gari* dough) made from improved cassava cultivars.

METHODS
Twenty cassava cultivars were obtained from the IITA research farms and analyzed for proximate and carbohydrate compositions and cyanogenic potential using standard procedures. Afterward, four cassava varieties were selected using the agglomerate hierarchical cluster analysis. The selected varieties were processed into gari and reconstituted in hot water into *eba,* and the glycemic indices (GIs) of the four *eba* samples were determined in apparently 23 healthy volunteers.

RESULTS
The starch content of the selected varieties was 69.1% for IITA TMEB7419, 71.6% for TMSIBA980505, 72.7% for TMSIBA981089A, and 74.5% for TMSIBA980002. The ratios of starch to sugar were significantly ($p > 0.05$) comparable for all the samples. The GIs obtained for the four *eba* samples were 88.1% for TMSIBA980002; 87.2% for TMS980505; 84.4% for TMEB7419, and 89.1% for TMS IBA961089A.

CONCLUSIONS
This finding proves that the four varieties of *eba* selected for this work are high in glycemic index, implying that a high intake of such foods could benefit individuals involved in sports or energy-intense activities but could pose health risks especially for those with hypertension, obesity, or diabetes mellitus. Slowing absorption and mitigating blood sugar spikes by combining these foods with high-fiber vegetable soups is recommended for individuals with underlying conditions.

MG2+ SUPPLEMENTATION PREVENTS HYPERTENSION, ELEVATED LIPID PEROXIDATION, AND INCREASED OSMOTIC FRAGILITY OF ERYTHROCYTES IN PREGNANT DAHL SALT-SENSITIVE (SS) RATS FED A HIGH-SODIUM DIET

Lusliany Rondon[1]; Margrego Piña[1]; Deliana Rojas[1]; Reinaldo Marín[1]
[1]Centro de Biofísica y Bioquímica, Instituto Venezolano de Investigaciones Científicas (IVIC), Parroquia Macarao, Venezuela

BACKGROUND AND OBJECTIVES
Previous studies have shown that Sprague-Dawley pregnant rats consuming 1.8% NaCl solution during the final week of gestation develop hypertension, increased lipid peroxidation, and enhanced osmotic fragility of erythrocytes compared to those drinking tap water [1]. This salt-loaded pregnant rat model has been proposed as an animal model for preeclampsia [2]. Magnesium sulfate, commonly used to treat preeclampsia with severe features, mitigates the adverse effects of high Na+ intake in these pregnant rats [2]. In this study, we investigated the effect of 3% Mg2+ dietary supplementation (as magnesium gluconate) on Dahl salt-sensitive (SS) pregnant rats, with and without 3% Na+ (as NaCl 8%) in their diet.

METHODS
Blood pressure was measured using the indirect tail-cuff method. Lipid peroxidation was assessed through thiobarbituric acid reactive substances (TBARS) in blood plasma. Erythrocyte osmotic fragility was determined using a previously described method [3].

RESULTS
RESULTS demonstrated that 3% Mg2+ supplementation in the diet of Dahl SS pregnant rats prevented the increase in blood pressure, lipid peroxidation, and erythrocyte osmotic fragility associated with high sodium intake.

CONCLUSIONS
These findings are particularly relevant as Dahl SS rats exhibit a potentially defective Mg metabolism, which has been implicated as a contributing factor to hypertension [4].

MG2+ SUPPLEMENTATION PREVENTS HYPERTENSION AND HIGH NITRITES AND NITRATES IN KIDNEY HOMOGENATES IN DAHL SS RATS FED A HIGH SODIUM DIET

Gabriela Alejandra González-Infante[1]; Lusliany Rondon[1]
[1]Centro de Biofísica y Bioquímica, Instituto Venezolano de Investigaciones Científicas (IVIC), Parroquia Macarao, Venezuela

BACKGROUND AND OBJECTIVES
Mg2+ deficiency has been related to inducing the Renin-Angiotensin-Aldosterone System (RAAS) in humans and rats (1-3). We have previously shown that magnesemia in Dahl salt-sensitive (SS) rats is ameliorated when treated with Losartan and a defective Mg2+ metabolism in this strain, may be a contributing factor to hypertension (4). In this study, we investigated the effect of 3% Mg2+ dietary supplementation on male Dahl-SS-rats fed a high or normal Na+ diet and treated with or without Losartan.

METHODS
Rats from our inbred colony and from 6-week-old were randomly divided into 8 groups and during the following 6 weeks were treated as follows: 8%NaCl, 8%NaCl-Losartan, 3%Mg2+-8%Na+Cl-, and 3%Mg-8%Na+Cl--Losartan and 4 respective controls. Blood pressure was measured using the indirect tail-cuff method. NO production assessed by its degradation products: nitrites and nitrates, were measured by Griess Reaction in plasma and kidney. Lipid peroxidation was assessed through Malondialdehyde (MDA) Essay in plasma and kidney. Kidney function was measured using creatinine clearance.

RESULTS
Our RESULTS show that Mg2+ supplementation increased plasma nitrites and nitrates and when adding a high Na+-diet this feature remained unchanged, while in kidney were normalized. Mg2+ supplementation did not prevent lipid peroxidation in kidney, while kidney function was unaffected.

CONCLUSIONS
These findings show that Mg2+ supplementation in Dahl-SS-rats fed a high Na+ diet prevents hypertension and high nitrites and nitrates in kidney homogenates. The mechanisms are not well understood, but hormone secretion related to RAAS may be implicated since lipid peroxidation was not prevented in kidney.

DIETARY PATTERNS, NCD DIET QUALITY SCORES AND THE RISK OF DIABETES: A MULTI-COUNTRY STUDY

Evangelista Malindisa,[1, 2]; Sana Ahmed[3]; George Praygod[4]; Suzanne Filteau[5]
[1]Mwanza Research Centre, National Institute of Medical Research, Mwanza, Tanzania, United Republic of; [2]Physiology, Catholic University Of Health And Allied Sciences, Mwanza, Tanzania, United Republic of; [3]Food and Nutrition and Food Technology, University of Delhi, New Delhi, India; [4]Muhimbili Medical Research Centre, National Institute for Medical Research, Dar, Tanzania, United Republic of; [5]Department of Population Health, London School of Hygiene and Tropical Medicine,, London, United Kingdom

BACKGROUND AND OBJECTIVES
Non-communicable diseases (NCDs) such as diabetes, are major global health challenges. Dietary habits play a critical role in NCD risk, with the World Health Organization advocating for nutrient-rich, minimally processed diets. The Diet Quality Questionnaire (DQQ) quantifies diet adequacy and NCD risk using NCD-Protect and NCD-Risk scores. However, their relationships with data-driven dietary patterns remain underexplored. This study evaluated the associations between PCA-derived dietary patterns and NCD-Protect and NCD-Risk scores, and assessed their associations with diabetes indicators

METHODS
Data from 1,859 participants in the SAMPA study across cohorts in India, Zambia, Tanzania, and the Philippines were analyzed. Dietary patterns were derived using principal component analysis (PCA), and NCD scores were computed from food frequency questionnaire (FFQ) data. Adjusted linear regressions evaluated associations with diabetes indicators, while agreements were assessed using kappa statistics

RESULTS
Diverse dietary patterns across cohorts were extracted which seemed healthy, unhealthy or suboptimal. Some degree of correlations was observed between the PCA and diet quality scores. However, there were variable associations between dietary metrics and diabetes indicators. Among Tanzanian adults, suboptimal patterns were associated with increased OGTT glucose, while unhealthy patterns and NCD scores showed no associations. Among Filipino adults, high NCD-Risk scores were associated with increased glucose levels, with no significant HbA1c associations. Other cohorts demonstrated limited or inconsistent associations

CONCLUSIONS
These findings highlight cohort-specific dietary influences on diabetes risk and emphasize the need for diverse dietary metrics. Limitations include the cross-sectional design underscoring the need for longitudinal research to validate these tools

EPO6_169

USING A CONCEPT MAPPING TOOL TO STUDY THE CORPORATE POLITICAL ACTIVITY OF COMMERCIAL ACTORS IN PUBLIC HEALTH

Sofia da Costa[1, 2]; Mélissa Mialon[3, 4]; Pedro Graça[2, 1]; Maria João Gregório[2, 5, 1]
[1]EPIUnit - ITR, Institute of Public Health of the University of Porto, Porto, Portugal; [2]Faculty of Nutrition and Food Sciences, University of Porto, Porto, Portugal; [3]Inserm Chaire, Inserm, Paris, France; [4]Trinity Business School, Trinity College Dublin, Dublin, Ireland; [5]National Healthy Eating Promotion Program, Directorate-General of Health, Lisbon, Portugal

BACKGROUND AND OBJECTIVES

Non-communicable diseases (NCDs) caused 43 million deaths in 2021 [1], many of which are linked to the influence of commercial actors across various sectors, including tobacco, alcohol, ultra-processed foods, sugary beverages, and fossil fuels [2;3]. Despite the existence of effective public health policies, these industries often hinder their implementation through 'Corporate Political Activity' (CPA). CPA refers to the strategies employed by commercial entities to shape public policy in ways that serve their interests, often at the expense of public health objectives [4].

While CPA strategies used by commercial actors in sectors such as food, alcohol, tobacco, and fossil fuels are well-documented in the scientific literature [4;5], there is limited evidence on which specific CPA strategies are most likely to influence public health policies. These strategies are known for their multi-faceted and systematic nature, reflecting the disproportionate power of corporations in policy spaces and the conflicts of interest that may undermine democratic processes [4]. This study aims to address this gap by using a concept map tool to identify and prioritise the CPA strategies with the most significant impact on public policies in Portugal.

METHODS

A Concept Map Analysis (CMA)-based tool is being developed to help identify and prioritise CPA strategies with the most significant impact on public health policies. The participatory and structured nature of CMA, chosen due to the complexity of the issue [6], aims to foster consensus among public health actors in Portugal, who will be engaged to identify and categorise CPA strategies. The CMA process will begin with brainstorming sessions to familiarise participants with CPA activities, which will then be organised into clusters based on their perceived impact on public health policies. Multivariate statistical techniques, such as multidimensional scaling (MDS) and hierarchical cluster analysis, will be used to assess the relationships between strategies and identify those most likely to influence policy outcomes [7].

RESULTS

The CMA tool is set to be implemented in Portugal in 2025. Concept mapping will identify CPA strategies with the highest likelihood of shaping public policy in Portugal.

CONCLUSIONS

The tool will offer a systematic approach for policymakers and public health advocates to assess CPA activities and their impact on health policy. It will support transparent and democratic policymaking processes while addressing a critical gap in the literature.

THE EFFECTS OF FERMENTED OAT-BASED PRODUCT ON CARDIOVASCULAR DISEASE RISK FACTORS AND PSYCHOLOGICAL DISTRESS: FINDINGS FROM A RANDOMISED CONTROLLED CROSSOVER STUDY

Vilma Liikonen[1]; Kati Väkeväinen[1]; Carlos Gómez-Gallego[1]; Marjukka Kolehmainen[1]
[1]Institute of Public Health and Clinical Nutrition, University of Eastern Finland, Kuopio, Finland

BACKGROUND AND OBJECTIVES
A healthy diet including nutrient-dense and fibre-rich foods, such as oats, has a positive impact on both cardiovascular and mental health (Pallazola et al. 2019; Firth et al. 2020). Moreover, fermenting plant-based foods may bring additional health benefits through various mechanisms (Wastyk et al. 2021). This study investigated the association between the fermentation of oat-based food consumption, psychological distress, and cardiovascular disease (CVD) risk factors.

METHODS
Fifty-six participants with mild metabolic deterioration (55 ± 8.4 years; BMI 30.4 ± 3.0) completed a 12-week crossover intervention study, during which they ate fermented and non-fermented oat-based products as part of their habitual diet for three weeks each. Metabolic risk factors of CVD (glucose, total cholesterol, LDL-cholesterol, HDL-cholesterol, triglycerides, systolic blood pressure, and waist circumference) were measured before and after the study periods. Psychological distress was assessed with the General Health Questionnaire-12 (GHQ-12). Changes in CVD risk factors and GHQ-12 scores were assessed during the study period, in which participants consumed the fermented product.

RESULTS
HDL-cholesterol levels and waist circumference significantly changed ($p < 0.05$) during the consumption of the fermented product, while no significant changes were observed in GHQ-12 scores.

CONCLUSIONS
Consuming fermented oat-based foods may provide an additional positive effect on cholesterol metabolism but does not appear to influence psychological distress.

LACTOBACILLUS FERMENTUM SUPPLEMENTATION DELAYS AND REDUCES HIGH BLOOD PRESSURE AND NORMALIZE NA+/K+ AND NA+ ATPASE ACTIVITY IN SALT DEPENDENT HYPERTENSION

Rubén Biomón[1]; Víctor Salazar[1]; Elisabetta Lucci[2]; Carolina Pestana[2]; Lusliany Rondon[1]
[1]Centro de Biofísica y Bioquímica, Instituto Venezolano de Investigaciones Científicas (IVIC), Parroquia Macarao, Venezuela; [2]Departamento de Tecnología de Procesos Biológicos y Bioquímicos, Universidad Simón Bolívar, Caracas, Miranda, Venezuela, Caracas, Venezuela

BACKGROUND AND OBJECTIVES
Essential arterial hypertension (EHT) comprises 95% of diagnosed cases of hypertension worldwide. Pharmacological therapy is associated with many side effects. Alternative methods such as probiotic bacteria supplementation have been sought. We evaluated the effect of continuous administration of *Lactobacillus fermentum* CVCM 1469, a strain with probiotic potential evaluated *in vitro*, on the development of EHT in the Dahl salt-sensitive (SS) rat model.

METHODS
Six-week-old male Dahl-SS-rats were randomly divided into four groups and during the following 6 weeks they were treated as follow: Dahl-SS-standard-diet, Dahl-SS-8%NaCl, Dahl-SS-8%NaCl-Losartan and Dahl-SS-8%NaCl-Lactobacillus. Losartan was administered by drinking water in a dosage of 10mg/kg/day and *L. fermentum* CVCM 1469 in diet at a dose of 2x107 CFU.
Biological, Clinical-Biochemical, Physiological, parameters and Immunohistochemical analyses were evaluated.

RESULTS
Biological parameters: Intake, urine and fecal excretion were not modified by Lactobacillus supplementation in Dahl-SS-8%NaCl-rats. However, water intake was normalized in this group.
Clinical-Biochemical parameters: Bodyweight was not corrected by *Lactobacillus* supplementation in Dahl-SS-8%NaCl-rats. While hypercalciuria and hyperkaliuria were observed. Increased fractional excretion of Magnesium was reported, however, plasma magnesium remained unchanged.
Physiological parameters: blood pressure values were significantly lower ($p<0.001$) in the Dahl-SS-8%NaCl-Lactobacillus group when compared to the Dahl-SS-8%NaCl and normalization of Na+/K+ and Na+ ATPase activity was observed.
Immunohistochemical analyses showed a reduction in the amounts of pro-inflammatory cytokines in the kidney.

CONCLUSIONS
Daily administration of 2x107 CFU of *L. fermentum* to Dahl-SS-8%NaCl-rats delayed the onset of EHT accompanied by normalization of Na+/K+ and Na+ ATPase activity by, among other mechanisms, modulating renal inflammation.

TOTUM-070, a polyphenol-rich combination of plant extracts, reduces LDL cholesterol in individuals with moderate hypercholesterolemia: RESULTS from the randomized, double-blind, placebo-controlled HEART-2 trial

Pascal Sirvent[1]; Vivien Chavanelle[1]; Yolanda F. Otero[1]; Arnaud Michaux[1]; Véronique Sapone[1]; Murielle Cazaubiel[1]; Sébastien L. Peltier[1]; Jean-Marie Bard[2]
[1]Valbiotis R&D, Valbiotis, Périgny, France; [2]UFR Pharmacie, Nantes Université, Nantes, France

BACKGROUND AND OBJECTIVES

TOTUM-070 (T070) is a polyphenol-rich substance composed of 5 plant extracts: olive leaves, artichoke leaves, chrysanthellum, goji berries and black pepper. Preliminary *ex vivo* study in humans have shown that the bioactive compounds in this formulation improve lipid metabolism in liver cells. This clinical study aimed to assess the efficacy of TOTUM-070 in reducing plasma LDL-cholesterol (LDL-C) concentration in individuals with moderate hypercholesterolemia.

METHODS

This was a multicenter, randomized, double-blind, placebo-controlled trial. The study included male and female participants aged 18-70 years with moderate hypercholesterolemia (LDL-C between 130 and 190 mg/dL) who were not receiving cholesterol-lowering medication. Participants were randomly assigned to consume a 5-g daily dose of TOTUM-070 or a placebo for 3 months. The primary outcome was the change in fasting blood LDL-C concentration, measured by ultracentrifugation. Secondary outcomes included safety and changes in the lipid profile. Analyses were conducted in the Intention-to-treat (ITT) population. The HEART-2 study is registered at ClinicalTrials.gov (NCT06243484).

RESULTS

A total of 180 participants (mean age: 56.8 ± 9.2 years; BMI: 25.8 ± 3.8 kg.m2; 70.9% women, baseline LDL-C: 1.44 ± 0.19g/L) were included and randomized. TOTUM-070 was well tolerated, with no significant adverse events reported. Fasting blood LDL-C levels were significantly reduced in the TOTUM-070 group compared to the placebo group (Baseline: 1.44 ± 0.18 vs 1.44 ± 0.19 g/L; after 3 months: 1.33 ± 0.17 vs 1.42 ± 0.19 g/L, $p<0.01$). Additionally, compared to placebo, TOTUM-070 consumption resulted in significant reduction in total cholesterol ($p<0.001$), non-HDL-cholesterol ($p<0.001$), triglycerides ($p<0.01$), apolipoproteinB100/ apolipoprotein A1 ratio ($p<0.05$), and apolipoprotein C3 ($p<0.001$).

CONCLUSIONS

In conclusion, this study showed that daily intake of TOTUM-070 significantly lowers LDL-cholesterol and improves other lipid parameters in individuals with moderate hypercholesterolemia. TOTUM-070 may represent a promising non-pharmacological option for the management of early-stage hypercholesterolemia.

OXIDATIVE STRESS AND IMMUNOGLOBULINS IN GESTATIONAL DIABETES

Valdés-Ramos Roxana[1]; Beatriz Elina Martinez-Carrillo[1]; Ana Laura Guadarrama-López[1]; G Rillo Arturo[1]
[1]Nutrition Research Laboratory, Universidad Autónoma del Estado de México Facultad de Medicina, Toluca de Lerdo, Mexico

BACKGROUND AND OBJECTIVES
Gestational diabetes (GD) affects between 8 and 18% of pregnancies worldwide, it is related to obesity and insulin resistance and is associated with oxidative stress and changes in the immune system. With the objective to evaluate the differences in oxidative stress and immunoglobulins between pregnant women with or without GD.

METHODS
A prospective study with pregnant women with and without GD (n=22 per group). After obtaining informed consent, we obtained age and gestational age, dietary data (food frequency), anthropometry (weight and height), and a venous blood sample for laboratory analyses (glucose, Hb1Ac, IgA, IgG, IgM, total cholesterol, triglycerides, catalase, total antioxidant capacity, TBARs and superoxide dismutase). Data were analyzed with Student's t-test or Kruskal-Wallis.

RESULTS
Pregestational BMI and glucose were significantly higher in women with GD ($p<0.01$), as well as glucose and Hb1Ac at GD diagnosis ($p<0.001$). We found TBARS higher in healthy patients ($p<0.05$), SOD higher in GD ($p<0.05$), IgM higher in GD ($p<0.01$).

CONCLUSIONS
Oxidative stress was increased in healthy women, while antioxidants were found increased in GD, contrary to what we expected. With respect to immunoglobulins, not much information is available in the literature, the presence of increased IgM in patients with GD, may be indicating the presence of infection at the time of sampling. Glucose indicators were higher in women who developed GD even before they were pregnant. We observed no differences in lipid profile as well as in dietary intake. Further research is needed to improve treatment and outcomes in pregnant women who develop gestational diabetes.

THE IMPACT OF AN ANTI-INFLAMMATORY DIET ON SERUM ATHEROGENIC INDICES AND ANTHROPOMETRIC PARAMETERS IN BREAST CANCER PATIENTS RECEIVING AROMATASE INHIBITORS

Danijela Ristic-Medic[1, 2]; Aleksandra Arsic[1, 2]; Marija Paunovic[1, 2]; Milica Kojadinovic[1, 2]; Maja Milosevic[1, 3]; Aleksandar Celebic[4, 5]; Vesna Vucic[1, 2]
[1]Institute for medical research, University of Belgrade, Beograd, Serbia; [2]Center of Research Excellence in Nutrition and Metabolism, Group for Nutritional Biochemistry and Dietology,Institute for medical reserach, Belgrade, Serbia; [3]Group for Neuroendocrinology, Institute for Medical Research, Belgrade, Serbia; [4]Medical school, University of Montenegro, Podgorica, Montenegro; [5]Institute of Oncology, Clinical Center of Montenegro, Podgorica, Montenegro

BACKGROUND AND OBJECTIVES
Postmenopausal breast cancer (BC) patients undergoing aromatase inhibitor (AI) therapy often face lipid metabolism changes and altered body composition, increasing their risk of cardiovascular and metabolic complications. An anti-inflammatory diet (AID), rich in whole grains high in fibers, vegetables (e.g., leafy greens, tomatoes), polyphenol-rich fruits (berries), omega-3 sources (fatty fish, nuts, seeds, oils), and low-glycemic index foods, has shown potential for improving metabolic health. This study evaluated the effects of AID on atherogenic indices and anthropometric parameters in postmenopausal BC patients on AI therapy.

METHODS
A 16-week randomized controlled trial was conducted with 30 participants. The experimental group followed a personalized anti-inflammatory dietary protocol, while the control group maintained their usual diet. Lipid profiles, body composition parameters (BMI, waist-to-hip ratio, visceral fat area (VFA), and body fat percentage (BF%) assessed via bioimpedance), and atherogenic indices including the atherogenic index of plasma (AIP), atherogenic coefficient (AC), and Castelli Risk Index (CRI) I & II were measured at baseline and post-intervention. Based on an initial nutritional status assessment, a conservative caloric restriction (CR) of 500–1000 kcal/day was included in the personalized intervention when appropriate.

RESULTS
At baseline, 55% of the diet-intervention group were overweight or obese. This group demonstrated significant reductions in CRI I & II and AIP ($p \leq 0.05$). Anthropometric measures revealed significant decreases in BMI, waist circumference, VFA ($p \leq 0.05$), and BF% ($p \leq 0.01$), with no significant change in skeletal muscle mass. These improvements were significantly greater compared to the control group. Weight loss of 5% to 10% of initial body weight was achieved through CR tailored to the patients' age and initial BMI.

CONCLUSIONS
An anti-inflammatory diet may help manage lipid abnormalities and improve body composition in postmenopausal BC patients on AI therapy. Larger studies are needed to validate these promising pilot findings.
This study was supported by the Science Fund of the Republic of Serbia (Grant PRISMA No.5050, Project title: Anti-Inflammatory Dietary Intervention in breast cancer patients receiving aromatase inhibitors - AID) ClinicalTrials.govr: NCT06214598.

OPTIMIZING OMEGA-3 FATTY ACIDS, DIETARY FIBER, AND MICRONUTRIENT INTAKE IN BREAST CANCER PATIENTS ON AROMATASE INHIBITOR THERAPY BY AN ANTI-INFLAMMATORY DIET

Danijela Ristic-Medic[1, 2]; Biljana Pokimica[1, 2]; Vladica Zikic[3]; Snjezana Petrovic[1, 2]; Nebojsa Ivanovic[4, 5]; Vesna Vucic[1, 2]

[1]Institute for medical research, University of Belgrade, Beograd, Serbia; [2]Center of Research Excellence in Nutrition and Metabolism, Group for Nutritional Biochemistry and Dietology,Institute for medical reserach, Belgrade, Serbia; [3]Cognitive Neuroscience Department, Research and Development Institute "Life Activities Advancement Centre, Belgrade, Serbia; [4]Faculty of Medicine, University of Belgrade, Belgrade, Serbia; [5]Department of Surgical Oncology, University Hospital Medical Center (UHMC) "Bezanijska kosa", Belgrade, Serbia

BACKGROUND AND OBJECTIVES

Breast cancer patients on aromatase inhibitor (AI) therapy frequently encounter nutritional and metabolic challenges. A pro-inflammatory diet, linked to obesity, consists of refined carbs, saturated fats, and low fruit and vegetable intake. In contrast, the anti-inflammatory diet (AID) emphasizes omega-3 fatty acids, complex carbs, lean proteins, polyphenols, and fiber. This study aimed to assess changes in omega-3, fiber, and micronutrient intake in postmenopausal breast cancer (BC) patients undergoing AI therapy with an AID protocol.

METHODS

Thirty participants were enrolled in a 16-week intervention. The intervention group followed an AID, while the control group maintained their usual diet. Dietary intake was assessed using three 24-hour recalls and a food frequency questionnaire. The total antioxidant capacity (Total-ORAC) value was used to assess the antioxidant capacity of diets.

RESULTS

The AID group showed significantly higher intake of omega-3 fatty acids (including alpha-linolenic acid, EPA, and DHA) and dietary fiber ($p<0.05$). The diet also significantly increased the intake of several key vitamins and minerals. Vitamin D, which supports bone health and immune function, was primarily derived from fortified foods and oily fish, which are often limited during AI therapy. Vitamin E, an antioxidant, comes from nuts and seeds, while vitamin A was sourced from vegetables. The intake of vitamin C, essential for collagen synthesis and immune defense, was increased through citrus fruits and berries. Additionally, the intake of vitamins B6 and B12, critical for energy metabolism and neurological health, also showed significant improvements ($p<0.05$). Mineral intake also showed positive changes such as magnesium (from nuts, seeds, and leafy greens), and selenium (from fish and whole grains). Additionally, patients significantly reduced their sodium intake ($p < 0.05$), contributing to better dietary balance. The overall dietary total-ORAC increased, highlighting the enhanced nutritional quality achieved through the anti-inflammatory diet.

CONCLUSIONS

Together, these micronutrient improvements strengthened the diet's anti-inflammatory and immune-supportive properties. This dietary approach offers substantial benefits for BC patients undergoing AI therapy, helping mitigate treatment-related side effects and promoting overall health.

PLASMA TNF-A AND ADIPOCYTOKINES LEVELS IN APOE/LDLR-/- MICE FED FERMENTED FOOD PRODUCTS AS A VITAMIN K DIETARY SOURCES

Magdalena Franczyk-Żarów[1]; Hayat Hassen[1]; Izabela Czyżyńska-Cichoń[2]; Anna Gdula[2]; Renata Kostogrys[1]
[1]Department of Human Nutrition and Dietetics, University of Agriculture in Krakow, Kraków, Poland;
[2]Jagiellonian Center for Experimental Therapeutics (JCET), Jagiellonian University, Krakow, Poland

BACKGROUND AND OBJECTIVES
Vitamin K (VK) comprises a group of similarly structured, fat-soluble substances which exists in nature in the form of VK1 and VK2. Vitamins K has shown potential for the prevention and treatment of various diseases (cardiovascular, bone health, cancer). VK exert a range of activities that extend far beyond coagulation and include anti-inflammatory effects, it can reduce oxidative stress and inflammation. Main nutritional sources of VK1 are green, leafy vegetables, whereas sources of VK2 are fermented food, e.g. natto-fermented soybean, dairy (e.g. cheese), meat and eggs. The main objective of the research was to verify the hypothesis about the effectiveness of dietary vitamin VK2 as an anti-inflammatory agent, in the prevention of atherosclerosis in ApoE/LDLR-/- mice. Therefore the aim of the study was to analyze the level of inflammatory markers (e.g. TNF-alpha) and adipocytokines (adiponectin, resistin) in mice plasma.

METHODS
Two month-old mice were fed for the 8 weeks AIN-93G modified diets containing vitamin K-rich products: natto, cheese, sauerkraut and synthetic vitamin K2 MK-7 (100 µg/kg b.w./day). Blood was collected from the left ventricle of heart into tubes and centrifuged at 14,000×g for 4 minutes to isolate plasma. Measurements of inflammatory marker (TNF-α) and adipocytokins (adiponectin and resistin) were done by immunoenzymatic method by ELISA test using commercially available kits (Bio-Techne, R&D Systems, Inc. Minneapolis, MN, USA).

RESULTS
Plasma TNF-α level was significantly increased ($p<0.05$) in mice fed cheese (4.72 pg/ml) compared to other experimental groups (e.g. control 2.30 pg/ml). Whereas, concentration of adiponectin was significantly decreased ($p<0.05$) in cheese group (9.54 µg/ml) compared to control (16.40 µg/ml). Adiponectin level was also significantly decreased ($p<0.05$) in mice fed natto (12.76 µg/ml) in comparison to control. However, no significant changes in the concentrations of resistin were observed after feeding mice experimental diets. Additionally, body weight of mice was unchanged.

CONCLUSIONS
In conclusion, high concentrations of TNF-α inhibit the secretion of adiponectin from adipocytes (probably by reducing adiponectin gene expression) in plasma of mice fed diet with cheese. It is known that high levels of TNF-α were shown in cardiovascular diseases. Whereas, adiponectin has anti-atherogenic and anti-inflammatory effects.

Facultad de Veterinaria., Universidad de Zaragoza, Zaragoza, Spain

BACKGROUND AND OBJECTIVES

Chronic low-grade inflammation (CLGI), characterized by increased serum inflammatory markers such as C-reactive protein (CRP), IL-6 and TNFα, has been associated with the development of several non-communicable diseases. Mediterranean diet (MD), renowned for its anti-inflammatory properties, is regarded as a strategy for managing CLGI. Dietary fiber -an essential component of MD– has been suggested to reduce serum inflammatory markers, while simple sugars and saturated fatty acids have been linked to higher concentrations. This study aimed to evaluate the effect of an intervention based on nutritionally enhanced bakery products, with higher fiber content and other nutritional improvements, compared to conventional products, on CLGI in children with overweight and obesity.

METHODS

Randomized controlled crossover study, with two 8-week intervention periods separated by a 5-week washout. Participants, 6-12 years old children with overweight or obesity, followed an MD-based intervention and were randomly assigned to consume conventional bakery products (control) or enhanced products (intervention): one type of bread and two bakery items with a 39-49% increase in dietary fiber, and reductions in saturated fat (43-73%) and sugar (39-200%). Blood samples were collected at baseline and post-intervention to assess changes in inflammatory markers concentrations in both groups. To assess the combined effect of all inflammatory markers, an index was calculated by subtracting the sum of z-scores of the anti-inflammatory markers (IL-10,IL-4 and ghrelin) from the sum of z-scores of the proinflammatory markers (CRP, white blood cell count, leptin, IFNγ, TNFα, IL-1β, IL-6).

RESULTS

20 participants (age 11.2±1.6 years) met the inclusion criteria, having values for all inflammatory markers in the four measurements and having excluded those with acute inflammatory processes (leukocytosis or CRP > 10 mg/L). After adjusting for covariates (baseline inflammatory status, age, sex and zBMI), a significant interaction between the intervention and sequence was observed ($F=4.6$, $p=0.049$). The inflammation index decreased by −0.506 in the intervention group compared to the control group from baseline to the end of the study. No significant differences were observed in any of the inflammatory markers when analyzed individually.

CONCLUSIONS

Nutritionally improved bakery products intake, compared to conventional ones, may have an effect on CLGI in children with overweight/obesity.

SOURCE-SPECIFIC DIETARY NITRATE AND NITRITE INTAKE AND INCIDENCE OF COLORECTAL CANCER IN THE DANISH DIET, CANCER, AND HEALTH COHORT

Dorit Wielandt Erichsen[1]; Nicola P Bondonno,[1, 2]; Pratik Pohkarel[1, 3]; Kirsten Frederiksen,[4]; Catherine Bondonno,[2, 5]; Liezhou Zhong[6, 2]; Jörg Schullehner[7, 8]; Anja Olsen,[1]; Anne Tjønneland[1, 9]; Cecilie Kyrø[1]

[1]Diet, Cancer and Health, Danish Cancer Institute, Copenhagen, Denmark; [2]Nutrition and Health Innovation Research Institute, Edith Cowan University, Perth, Australia; [3]Nutrition and Health Innovation Research Institute, School of Medical and Health Sciences, Edith Cowan University, Perth, Australia; [4]Statistics and Data Analysis, Danish Cancer Institute, Copenhagen, Denmark; [5]Medical School, The University of Western Australia, Perth, Australia; [6]The University of Western Australia, Institute of Agriculture, Perth, Australia; [7]Department of Public Health, Aarhus University, Aarhus, Denmark; [8]Department of Groundwater and Quaternary Geology Mapping, Geological Survey of Denmark and Greenland, Copenhagen, Denmark; [9]Department of Public Health, University of Copenhagen, Copenhagen, Denmark

BACKGROUND AND OBJECTIVES

Nitrate and nitrite, found in a variety of foods and drinking water, may be associated with colorectal cancer (CRC) via the formation of carcinogenic N-nitroso compounds (NOCs). The aim of this study was to examine source-specific associations and identify subpopulations at higher risk.

METHODS

Data was obtained from the Danish Diet, Cancer, and Health cohort, including over 54,610 participants with no history of cancer at baseline. Participants reported their usual diet in an FFQ, and nitrate/nitrite intakes were calculated using comprehensive food composition databases and data from national monitoring programmes on drinking water quality. During 27 years of follow-up, 2245 cases of CRC (of which 1508 colon and 737 rectal) were identified through national health registries. Cox proportional hazards models, adjusted for sociodemographic, diet and lifestyle factors, were used to estimate associations between source-specific nitrate/nitrite intakes and incidence of CRC as sub-types. Analyses were stratified by sex and factors hypothesized to promote (smoking and high consumption of red meat) and inhibit (high consumption of vitamin C, vitamin E, folate, and polyphenols) the formation of NOCs.

RESULTS

No associations were observed between intakes of nitrate/nitrite from dietary sources and incidence of CRC [HR [95% CI)]: plant sources: 0.97 (0.84, 1.12), naturally-occuring animal sources: 0.97 (0.84, 1.12), additive-permitted meat sources: 1.05 (0.90, 1.21), or drinking water: 1.07 (0.91, 1.24). We observed no clear pattern in the HRs when stratifying by factors hypothesized to influence the formation of NOCs. While no associations were found for tap water-sourced nitrate intake, a significantly higher rate of colon cancer was observed among participants supplied by wells with a nitrate concentration ≥ 9.25 mg/L [1.52 (1.11, 2.07)]. The association was similar across all models of adjustment. In the stratified analysis, evidence of the association was observed among former or current smokers [1.77 (1.24, 2.44)], and in participants with a low intake of folates [1.67 (1.03, 2.70)], and flavonoids [1.85 (1.16, 2.95)], and a high intake of red meat [1.58 (0.97, 2.57)].

CONCLUSIONS

Nitrate/nitrite intake from animal sources and plant sources were not associated with incidence of CRC in the cohort. A nitrate concentration in tap water ≥9.25 mg/L was associated with a higher incidence of colon cancer among subpopulations hypothesized to be at increased risk of NOCs formation.

BACKGROUND AND OBJECTIVES
The Mediterranean diet (MD) is associated with cardiovascular and cognitive health benefits. However, it is challenging for Western populations to replicate the recommended blend and quantity of fruits and vegetables. Polyphenols a key bioactive found in MD with antioxidant and anti-inflammatory properties, may also influence extracellular vesicle (EV) dynamics. DailyColors™, a polyphenol-rich formulation inspired by the MD, incorporates extracts from 16 fruits, vegetables, and herbs. This study aimed to evaluate the cognitive and physiological effects of 60 days of supplementation with DailyColors™ in overweight older adults.

METHODS
A total of 150 UK adults aged 50 years and older with a BMI ≥ 25 were recruited for a randomised, double-blind, placebo-controlled study conducted to evaluate cognitive and physical fitness via the PROTECT-UK online platform. Participants were randomly assigned to receive either a medium dose (750 mg, ~300 mg polyphenols), a high dose (2000 mg, ~750 mg polyphenols) of DailyColors™, or a placebo for 60 days. Additionally, a subset of 45 participants (n=15 per group) underwent further assessments, including blood pressure monitoring, phenolic metabolite analysis, evaluation of circulating EVs, and tandem-mass-tagged serum proteomics in blood.

RESULTS
Sixty days of DailyColors™ supplementation improved cognitive function, with significant improvements in attentional reaction time and accuracy in the intervention groups. Enhanced physical fitness was observed in the Timed Stand Test in the high-dose group and in the Chair Stand Test across all groups. Proteomic analysis showed that both medium and high doses of DailyColors™ decreased protein expression in pathways associated with inflammation and immunity, vesicle-mediated transport. Expression of proteins known to inhibit high-density lipoprotein (HDL) assembly was also diminished. No such effects were observed in the placebo group. No significant effects were observed on the size and concentration of total EVs or specific EV populations (CD31+, CD41+, CD45+, or CD31+CD45-).

CONCLUSIONS
DailyColors™ supplementation may improve cognitive function, physical fitness, and overall health in older, overweight individuals, possibly replicating the anti-inflammatory benefits of the MD. These RESULTS should be further explored via larger-scale studies.

FLAVORS OF HEALTH: COMMUNITY-BASED NUTRITION EDUCATION FOR CHRONIC DISEASE PREVENTION

Elizabeth Gollub[1]; Jean Pierre Enriquez,[2]
[1]School of Nutrition and Food Sciences, Louisiana State University AgCenter, Baton Rouge, United States of America; [2]School of Nutrition and Food Sciences, Louisiana State University, Baton Rouge, United States of America

BACKGROUND AND OBJECTIVES
Throughout the world, high rates of chronic disease can be attributed in part to poor diet and physical inactivity, both of which can be mitigated through behavior change.Flavors of Health (FoH) is a dynamic, community nutrition and health education program within the State of Louisiana. FoH utilizes evidence-based information and practices to empower both youth and adults to make healthy food and fitness choices, to help prevent or manage chronic disease and improve quality of life.

METHODS
FoH consists of a group of nutrition extension agents and specialists across the state who develop and conduct presentations and community workshops on a variety of food, nutrition, and lifestyle topics. Agents engage with their communities through a variety of methods, to build consumer's knowledge and skills in areas of label reading/food selection, food preparation and cooking, creating healthy home food environments, exercise/physical activity, healthy habit development strategies, weight management, and diet-disease issues and trends. FoH has also developed multi-session educational initiatives to help prevent or manage diabetes, hypertension, overweight/obesity, and chronic diseases in general. FoH typically evaluates these initiatives among small samples of adult participants, through a pre/post intensive survey design, analyzed using Wilcoxon signed-rank test; and a 3-month follow-up survey to assess on-going behaviors/use of information. Participant comments after each learning event are also collected.

RESULTS
FoH teaches and motivates participants to make healthier choices: "*I learned to create healthy, lifestyle goals that are specific, do-able and sustainable*"; "*…this workshop has inspired me to cook more!*" Program survey participants (n=26 to 49) reported ($p<0.05$): increased consumption of fruits, vegetables, whole grains; reduced consumption of saturated fats and sodium; increased frequency of label reading to make healthier food choices; increased time being physically active; decreased time spent sitting; increased confidence in various [healthy] food-related activities. Most respondents (up to 98%) maintained their behavior changes through follow-up.

CONCLUSIONS
The FoH program affects healthy eating and physical activity behaviors among adult participants and appears to support maintenance of these behaviors. The FoH approach to community nutrition education supports chronic disease risk reduction.

CONFLICTS OF INTERESTS
The authors have no conflict of interest.

"A TASTE OF HERBS AND SPICES": A COMMUNITY-BASED FOOD AND NUTRITION EDUCATION INITIATIVE TO ADD FLAVOR, REDUCE SODIUM, AND IMPROVE HEALTH

Elizabeth Gollub[1]; Shakera Williams[2]
[1]School of Nutrition and Food Sciences, Louisiana State University AgCenter, Baton Rouge, United States of America; [2]Nutrition and Community Health, Lsu Agcenter-Extension Services, Minden, United States of America

BACKGROUND AND OBJECTIVES

High sodium intake is among dietary risk factors that largely impact chronic disease (CD) and early death, while *taste* is a primary driver of food choice and eating behavior. Diet strategies to improve public health include a focus on knowledge, confidence and skills associated with adoption of lower salt food preparation. “A Taste of Herbs and Spices” (Taste) is a Louisiana-based nutrition education initiative, promoting an array of herbs and spices, in lieu of salt, to develop flavorful, culturally appropriate dishes/meals. The objective of Taste is to encourage lower sodium cooking and meal preparation, ultimately, to improve diet quality and health.

METHODS

Taste highlights a different herb/spice each month. A one-page, two-sided colorful newsletter-style template has been developed to provide a consistent format for information describing the herb/spice, its nutritional benefits, how to use it, and how to grow it. Importantly, a recipe and an herb/spice sample, sufficient to prepare the recipe, is also included. This document also provides links to AgCenter nutrition education/CD prevention curricula available to community members. And each document contains a QR code linking to a [voluntary], 4-item program evaluation survey. All information is reviewed by field specialists. The document is printed; the seasoning sample is attached. Each month LSU AgCenter nutrition agents distribute the informational handout to libraries, community centers, and/or other local organizations, for community access. Some agents also conduct food/recipe demonstrations at these sites.

RESULTS

The Taste program just began its third year. Materials have been picked up by approximately 2,000 people each month, across 23 of Louisiana’s parishes. The year 1 survey focused on familiarity of this and other AgCenter nutrition education/CD prevention programs. Of those responding (n=106), 90% did not know about the nutrition educational opportunities, and 96% reported that they plan to find out more about them. The year 2 survey focused on behavior change. Of those reporting (n=85), 74% tried a new herb/spice because of this program, and 100% will/will possibly use the herb/spice in place of salt, in food preparation.

CONCLUSIONS

A Taste of Herbs and Spices successfully fosters flavorful, lower sodium cooking to improve diet quality.Taste materials help publicize more substantial nutrition education/CD prevention programs. Directly and indirectly, Taste supports better health within the community.

DEFICIENCY IN WDR6 REGULATES LIPID METABOLISM AND SUPPRESSES FAT ACCUMULATION IN OB/OB MICE

Jinyun Wang[1]; Issa Furihata[1]; Tatsunobu Nakagawa[1]; Akihito Ishigami[2]; Yoshitaka Kondo[2]; Toshimitsu Komatsu[3]; Isao Shimokawa[3]; Takuya Chiba[1]
[1]Biomedical Gerontology Laboratory,School of Human Sciences, Waseda University Tokorozawa Campus, Tokorozawa, Japan; [2]Molecular Regulation of Aging, Tokyo Metropolitan Institute for Geriatrics and Gerontology, Tokyo, Japan; [3]Department of Pathology, School of Medicine, Nagasaki University, Nagasaki City, Japan

BACKGROUND AND OBJECTIVES

WD repeat protein 6 (WDR6) is characterized by a WD repeat sequence with motifs of approximately 40–60 amino acids repeated four or more times. Previous studies showed that the knockdown of WDR6 reduced lipid accumulation in 3T3-L1 cells; however, its role in systemic fat accumulation remains poorly understood. This study explored the effects of systemic WDR6 deficiency on obesity-related phenotypes in Lep*ob/ob* mice, providing new insights into the molecular mechanisms underlying obesity.

METHODS

Wdr6+/+Lep*ob/ob* and Wdr6−/−Lep*ob/ob* mouse groups were generated by crossing Lep*ob/+* mice with Wdr6+/− mice, both on a C57BL/6J genetic background. Mice were maintained under ad libitum feeding and drinking conditions until 16 weeks of age. Bodyweight, food intake, water consumption, and fat volume were measured. Plasma, liver, and adipose tissue samples were collected from each group for the analysis of lipid metabolism-related gene and protein expression using qPCR and western blotting(WB).

RESULTS

The body weights of Wdr6−/−Lep*ob/ob* mice were significantly lower than those of Wdr6+/+Lep*ob/ob* mice. Computed tomography (CT) imaging demonstrated a substantial reduction in subcutaneous and visceral fat volumes in the Wdr6−/−Lep*ob/ob* group compared with the Wdr6+/+Lep*ob/ob* group. Additionally, plasma aspartate aminotransferase (AST) levels were significantly lower, and adiponectin levels were significantly higher in the Wdr6-/-Lep*ob/ob* group. mRNA expression analysis by qPCR showed an upregulation of genes associated with β-oxidation in Wdr6−/−Lep*ob/ob* mice. Furthermore, protein analysis revealed increased p-AMPK levels and suppressed ACC levels. These RESULTS suggest that WDR6 deficiency activates the AMPK-ACC pathway, promoting lipid metabolism and reducing fat accumulation.

CONCLUSIONS

This study demonstrated that WDR6 inhibition in Lep*ob/ob* mice activated the AMPK-ACC pathway and promoted β-oxidation, leading to reduced body weight. These findings suggest that WDR6 is a novel regulator of lipid metabolism and may be a potential therapeutic target for metabolic disorders.

GREEN-ALGAE EXTRACT AS A NOVEL FUNCTIONAL FOOD COMBATING OBESITY BY IMPROVING LIPID PROFILE AND PEROXISOME PROLIFERATOR-ACTIVATED RECEPTOR-GAMMA COACTIVATOR 1-ALPHA LEVELS

Fahrul Nurkolis[1]; Nurpudji Astuti Taslim[2]; Hardinsyah Ridwan[3]
[1]Master of Basic Medical Science, Faculty of Medicine Airlangga University, Surabaya, Indonesia; [2]Clinical Nutrition, Hasanuddin University, Makassar, Indonesia; [3]Applied Nutrition, IPB University, Bogor, Indonesia

BACKGROUND AND OBJECTIVES
Obesity is associated with cardiovascular disease, metabolic disorders, and accelerated aging. Both obesity and aging manifest in decreased peroxisome proliferator-activated receptor-γ coactivator α (PGC-1α) levels. *Caulerpa racemosa* (sea grapes), a green alga abundant in shallow temperate and tropical seas around the world, is harvested intensively as a source of macro and micronutrients, and is important in the Southeast Asian traditional diet. Integrating compound profiling via metabolomics, followed by in silico, in vitro tests and a clinical trial, this study aims to improve our understanding of the pharmacological activity of *C. racemosa* ethanol extract (CRE) demonstrated in our previous preclinical trial (In Vivo study).

METHODS
Six major CRE constituents identified by metabolomic profiling were evaluated using an in silico approach against human pancreatic lipase, a-glucosidase, and a-amylase to predict prospective anti-obesity candidates. A 4-week randomized, double blind, placebo-controlled clinical trial was conducted to evaluate the effect of CRE on the lipid profile and PGC-1α levels in obese men. Participants were randomly assigned CRE (*n*=35) or placebo (*n*=35) at a dose 1.68 g/70kg BW/day. The trial received ethical approval from Prof. Dr. R. D. Kandou General Hospital with No. 142/EC/KEPK-KANDOU/VIII/2021 and was registered with ClinicalTrials.gov NCT05037591.

RESULTS
In vitro, CRE showed 45.66±0.55% antioxidant activity by DPPH assay. The lipase inhibitory activity of CRE reached 90.30±0.40%, 1.75% lower than orlistat. The a-amylase inhibitory activity of CRE was 84.07±5.28%, while its inhibitory activity against a-glucosidase was 81.67±1.54%, both lower than acarbose. The CRE group showed a significant ($p<0.05$) decrease in blood glucose, total cholesterol, low-density lipoprotein (LDL), triglycerides (TG), waist circumference, BMI, and WHR ($p <0.05$), while PGC-1α and high-density lipoprotein (HDL) increased significantly ($p =0.0001$) compared with the placebo group.

CONCLUSIONS
Our study revealed that green algae *C. racemosa* extract or CRE is a potent anti-obesity agent or functional food that produces no significant adverse effects.

UNLOCKING THE THERAPEUTIC POTENTIAL OF EDIBLE BIRD NEST: IN SILICO, IN VITRO, AND IN VIVO EVIDENCE AGAINST METABOLIC SYNDROME ON OBESE RATS

Fahrul Nurkolis[1]; Rony Abdi Syahputra[2]; Hardinsyah Ridwan[3]
[1]Master of Basic Medical Science, Faculty of Medicine Airlangga University, Surabaya, Indonesia; [2]Pharmacology, Universitas Sumatera Utara, Medan, Indonesia; [3]Applied Nutrition, IPB University, Bogor, Indonesia

BACKGROUND AND OBJECTIVES
This study aims to reveal the existence of an edible bird nest (EBN) as a functional food candidate that may be a new alternative in fighting metabolic syndrome.

METHODS
The study included three approaches: in silico molecular docking simulation, in vitro, and in vivo in rats fed on cholesterol- and fat-enriched diets (CFED) as obesity model. Four terpenoids of Bakuchiol, Curculigosaponin A, Dehydrolindestrenolide, and 1-methyl-3-(1-methyl-ethyl)-benzene in EBN have been identified through LCMS/MS-QTOF. Forty male Rats (*Rattus norvegicus*) rats weighing 204.03 ± 3.68 g were used in the in vivo investigation. The rats came from the Animal Model Farm in Yogyakarta, Indonesia, and were acclimated for 10 days in a controlled environment (27 °C, 50–60% relative humidity, balanced light–dark cycle), with access to regular animal feed and water from PT Citra Ina Feedmill.

RESULTS
In molecular docking simulations, Bakuchiol and Dehydrolindestrenolide are considered very potent because they have higher inhibitory power on the four receptors (iNOS, ROS1 kinase, FTO, and lipase) than standard drugs. In vitro tests also provide insight into the antioxidant, antidiabetic, and antiobesity activities of EBN, which is quite feasible due to the smaller EC50 value of EBN compared to standard drugs. Interestingly, in vivo studies also showed significant improvements ($p<0.05$) in the lipid profile, blood glucose, enzymatic levels, and inflammatory biomarkers in rats given high-dose dietary supplementation of EBN. More interestingly, high-dose dietary supplementation of EBN upregulates PGC-1α and downregulates HMG-CoA reductase. In addition, CFED rats supplemented with both doses of EBN had significant improvements in inflammatory biomarkers, including peroxisome proliferator-activated receptor-γ coactivator 1-α Levels PGC-1α, TNF-α), IL-10, and superoxide dismutase (SOD) serum levels.

CONCLUSIONS
Comprehensively, it has been revealed that EBN can be novel functional foods for combating metabolic syndrome.

DELITES™ SUPPLEMENTATION MITIGATES METABOLIC SYNDROME AND MODULATION GUT MICROBIOME IN MALE SPRAGUE DAWLEY RATS FED ON CHOLESTEROL- AND FAT-ENRICHED DIET: A RANDOMIZED PRECLINICAL TRIAL STUDY

Juan Leonardo[1]; Fahrul Nurkolis[2]; Rony Abdi Syahputra[3]; Nurpudji Astuti Taslim[4]; Hardinsyah Ridwan[5]
[1]Herbal Medicine, PT. Citra Deli Kreasitama, Jakarta, Indonesia; [2]Master of Basic Medical Science, Faculty of Medicine Airlangga University, Surabaya, Indonesia; [3]Pharmacology, Universitas Sumatera Utara, Medan, Indonesia; [4]Clinical Nutrition, Hasanuddin University, Makassar, Indonesia; [5]Applied Nutrition, IPB University, Bogor, Indonesia

BACKGROUND AND OBJECTIVES
Metabolic syndrome (MetS) is a global health concern, characterized by a combination of dyslipidemia, insulin resistance, obesity, and hypertension, significantly increasing the risk of type 2 diabetes mellitus (T2DM) and cardiovascular diseases. Gut microbiota plays a pivotal role in MetS pathophysiology, with dysbiosis exacerbating metabolic impairments. Delites™, a supplement inspired by Traditional Chinese Medicine, has shown potential in modulating gut microbiota and mitigating MetS.

METHODS
A randomized preclinical trial was conducted on 32 rats divided into four groups: control-normal, CFED, CFED+low-dose Delites™ (54 mg/kg), and CFED+high-dose Delites™ (108 mg/kg). Parameters including lipid profiles, enzymatic activity, molecular biomarkers, and gut microbiota composition were analyzed.

RESULTS
Delites™ significantly improved lipid profiles, reduced inflammation (TNF-α), enhanced anti-inflammatory markers (IL-10), and increased energy metabolism regulator PGC-1α. Gut microbiota modulation showed increased beneficial genera (*Bifidobacterium*, *Lactobacillus*) and reduced pathogenic *Proteus*, improving microbial diversity.

CONCLUSIONS
Delites™ supplementation effectively mitigates MetS through metabolic and microbiota modulation. These findings highlight its potential for precision medicine approaches to combat metabolic disorders. Further research is needed to explore its long-term effects and translational relevance in humans.

THE EFFICACY OF NOVEL SEAWEED SULFATED POLYSACCHARIDES IN ALLEVIATING CARDIOMETABOLIC SYNDROME VIA PRMT1/DDAH/ADMA AND GUT MICROBIOTA MODULATION IN OBESITY MODELS

Rudy Kurniawan[1]; Fahrul Nurkolis[2]; Hardinsyah Ridwan[3]; A.yasmin Syauki[4]; Agussalim Bukhari[5]; Andi Makbul Aman[6]; Nurpudji Astuti Taslim[5]
[1]Graduate School of Medicine, Hasanuddin University, Makassar, Indonesia; [2]Master of Basic Medical Science, Faculty of Medicine Airlangga University, Surabaya, Indonesia; [3]Applied Nutrition, IPB University, Bogor, Indonesia; [4]Department of Nutrition, Hasanuddin University, Makassar, Indonesia; [5]Clinical Nutrition, Hasanuddin University, Makassar, Indonesia; [6]Internal Medicine, Hasanuddin University, Makassar, Indonesia

BACKGROUND AND OBJECTIVES
Our investigation intended to analyze the effects of sulfated polysaccharides from *Caulerpa racemosa* (SPCr) in attenuating obesity-induced cardiometabolic syndrome via regulating the protein PRMT1-DDAH-ADMA with the mTOR-SIRT1-AMPK pathways and gut microbiota modulation.

METHODS
A total of forty rats were randomly divided into four treatment groups: Group A received a standard diet; Group B was provided with a diet enriched in cholesterol and fat (CFED); and Groups C and D were given the CFED along with ad libitum water, and daily oral supplementation of 65 or 130mg/kg of body weight (BW) of SPCr, respectively. This study approved by the Ethics Committee with a registration number of 039/EC/KEPK-KANDOU/IV/2023, and received approval from the ethics board of the International Register of Preclinical Trial Animal Studies Protocols (preclinicaltrials.eu) under the registration number PCTE0000370.

RESULTS
Group D showed the lowest low-density lipoprotein, triglyceride, total cholesterol, and blood glucose levels, and the highest HDL level compared to the other groups in this study. These RESULTS in the group fed high-dose SPCr demonstrated a significant effect compared to the group fed low-dose SPCr ($p < 0.0001$), as well as in total cholesterol and blood glucose ($p < 0.05$). Supplementation with SPCr was also observed to have an upregulation effect on peroxisome proliferator-activated receptor gamma coactivator (PGC)-1alpha, interleukin 10, Sirtuin 1, DDAH-II, superoxide dismutase (SOD) cardio, and AMPK, which was also followed by a downregulation of PRMT-1, TNF-α, 3-hydroxy-3-methylglutaryl coenzyme A reductase inhibitor, and mTOR. Interestingly, gut microbiota modulation was also observed; feeding the rats with a cholesterol-enriched diet shifted the gut microbiota composition toward the Firmicutes level, lowered the Bacteroidetes level, and increased the Firmicutes level.

CONCLUSIONS
A dose of 130 mg/kg BW of SPCr is the recommended dose, and investigation still needs to be continued in clinical trials with humans to see its efficacy at an advanced level.

PROBIOTIC LACTOBACILLUS SP. AS A VIABLE STRATEGY FOR MODULATION OF NON-COMORBID OBESITY: A METHODICAL META-ANALYSIS AND GRADE ASSESSMENT OF RANDOMIZED CONTROLLED TRIALS

Fahrul Nurkolis[1]; Rony Abdi Syahputra[2]; Arifa Mustika[3]; Nurpudji Astuti Taslim[4]; Hardinsyah Ridwan[5]
[1]Master of Basic Medical Science, Faculty of Medicine Airlangga University, Surabaya, Indonesia; [2]Pharmacology, Universitas Sumatera Utara, Medan, Indonesia; [3]Department of Anatomy, Histology, and Pharmacology, Faculty of Medicine Airlangga University, Surabaya, Indonesia; [4]Clinical Nutrition, Hasanuddin University, Makassar, Indonesia; [5]Applied Nutrition, IPB University, Bogor, Indonesia

BACKGROUND AND OBJECTIVES
The World Health Organization (WHO) reports that over 650 million people are affected by obesity. A prominent contemporary approach to treating obesity involves altering the gut microbiota. Substantial evidence indicates that Lactobacillus sp. may beneficially impact body weight and fat accumulation. The aim of this study is to evaluate the efficacy and safety of probiotic supplementation with *Lactobacillus sp.* in individuals who are overweight or obese.

METHODS
The Preferred Reporting Items for Systematic Review and Meta-analysis, commonly known as PRISMA, were adhered to in this research. Searches were conducted in the following medical databases up to November 28, 2024: PubMed, Wiley, ScienceDirect, and Cochrane. Revised Tool for Risk of Bias in Randomized Trials (RoB 2.0) was used to evaluate the potential for bias, and Review Manager 5.4 was employed for the meta-analysis.

RESULTS
A total of 1,058 participants was included across 12 studies. Eight studies presented a low risk of bias, and four presented a medium risk of bias. Significant reductions were observed in body mass index (BMI; MD:-0.40 kg/m2; 95%CI: -0.48 to -0.32, $p<0.00001$), weight (MD:-1.16 kg; 95%CI: -1.79 to -0.53, $p=0.0003$), waist circumference (MD:-1.41 cm; 95%CI: -1.75 to -1.08, $p<0.00001$), and hip circumference (MD:-0.85 cm; 95%CI: -1.09 to -0.61, $p<0.00001$).

CONCLUSIONS
Supplementation *with Lactobacillus sp.* probiotics to address gut dysbiosis demonstrates potential in inducing reductions in body mass index, body weight, adipose tissue content, waist and hip circumferences, visceral and subcutaneous adiposity, and leptin levels, while concurrently elevating adiponectin concentrations, with an observed absence of discernible adverse effects.

EMPLOYING MULTI-OMICS, PHARMACOINFORMATICS, AND IN VITRO APPROACHES TO DISCOVER THERAPEUTIC BIOMOLECULES IN OYSTER MUSHROOM

Fahrul Nurkolis[1]; Rony Abdi Syahputra[2]; Juan Leonardo[3]; Nurpudji Astuti Taslim[4]; Hardinsyah Ridwan[5]
[1]Master of Basic Medical Science, Faculty of Medicine Airlangga University, Surabaya, Indonesia; [2]Pharmacology, Universitas Sumatera Utara, Medan, Indonesia; [3]Herbal Medicine, PT. Citra Deli Kreasitama, Jakarta, Indonesia; [4]Clinical Nutrition, Hasanuddin University, Makassar, Indonesia; [5]Applied Nutrition, IPB University, Bogor, Indonesia

BACKGROUND AND OBJECTIVES
Oyster mushroom (*Pleurotus ostreatus*) is recognized as a functional food due to its bioactive compounds with therapeutic potential, particularly in managing metabolic disorders. This study aims to explore the bioactive profile of oyster mushroom flour (OMF) using a multi-omics approach to evaluate its antioxidant, antiobesity, and antidiabetic properties.

METHODS
A comprehensive multi-omics approach was employed, integrating metabolomics and proteomics profiling using LC-HRMS and Orbitrap mass spectrometry. In vitro assays assessed antioxidant capacity through ABTS and superoxide dismutase (SOD) activity, antiobesity potential via lipase inhibition and 3T3-L1 adipocyte assays, and antidiabetic effects via α-glucosidase, α-amylase, and dipeptidyl peptidase-4 (DPP-4) inhibition tests. *In silico* pharmacoinformatics analysis further mapped molecular interactions and pathways.

RESULTS
Metabolomic profiling identified 376 unique compounds and 13 peptides, including antioxidants and enzyme inhibitors, contributing to antiobesity and antidiabetic effects. In vitro assays demonstrated that OMF exhibited significant radical scavenging activity with ABTS inhibition (EC_{50}: 119.80 mg/mL) and SOD activity (EC_{50}: 101.75 mg/mL). The lipase inhibition assay revealed an IC_{50} value of 104.10 mg/mL, indicating a potential antiobesity effect. Additionally, OMF showed significant α-glucosidase inhibition (EC_{50}: 101.90 mg/mL), α-amylase inhibition (EC_{50}: 96.18 mg/mL), and DPP-4 inhibition (EC_{50}: 130.59 mg/mL), with statistical significance ($p < 0.05$). *In silico* pharmacoinformatics analysis mapped bioactive compounds to metabolic pathways, revealing enrichment in oxidative stress response and glucose metabolism pathways. Notably, the KEGG pathway analysis identified significant involvement in "Metabolic pathways" (Fold Enrichment: 500, FDR < 0.05) and "Biosynthesis of secondary metabolites" (Fold Enrichment: 500, FDR: 3.83e-68). Network pharmacology studies indicated interactions of bioactive compounds with key molecular targets such as PPAR-γ, GLUT4, and AMPK, which are crucial in regulating glucose uptake and lipid metabolism. These RESULTS confirm the potential of OMF in metabolic disorder management.

CONCLUSIONS
These findings validate *P. ostreatus* as a natural resource for managing metabolic disorders and developing evidence-based functional foods. The study bridges the gap between compound discovery and therapeutic application, paving the way for broader utilization in nutraceuticals and precision nutrition strategies.

INFLAMMATORY POTENTIAL OF THE DIET IN KIDNEY TRANSPLANT RECIPIENTS: ASSOCIATION WITH SARCOPENIA AND ITS COMPONENTS

Mariana Costa[1]; Jenneffer Tibaes[2]; Livia Mendonça[1]; Mariana Portugal[3]; Karine Pontes[4]; Ana Paula Menna Barreto[5]; Larissa Bianchi[6]; Maria Inês Barreto Silva[2, 3]; Marcia Klein[3]
[1]Postgraduate Program in Medical Sciences, Rio de Janeiro State University, Rio de Janeiro, Rio de Janeiro, Brazil; [2]Division of Human Nutrition, Department of Agricultural, Food and Nutritional Science, University of Alberta, Alberta, Canada; [3]Department of Applied Nutrition, Rio de Janeiro State University, Rio de Janeiro, Rio de Janeiro, Brazil; [4]Postgraduate Program in Clinical and Experimental Pathophysiology, Rio de Janeiro State University, Rio de Janeiro, Rio de Janeiro, Brazil; [5]Nutrition Institute, Federal University of Rio de Janeiro - Macaé, Rio de Janeiro, Brazil; [6]Postgraduate Program in Food, Nutrition and Health, Rio de Janeiro State University, Rio de Janeiro, Rio de Janeiro, Brazil

BACKGROUND AND OBJECTIVES
Sarcopenia, a progressive and generalized disorder of the skeletal muscle associated with adverse outcomes, is highly prevalent in kidney transplant recipients (KTR). The etiology of sarcopenia is multifactorial, and inflammation is one of its underlying mechanisms. Recently, evidence has emerged that dietary intake is capable of modulating systemic inflammation. The dietary inflammatory index (DII) is a widely used tool to assesses the inflammatory potential of the diet. Previous studies have shown a negative association between the DII and sarcopenia in the general population; however, to our knowledge, no study has investigated this association in KTR. The present study aimed to evaluate the association between DII and sarcopenia and its components (muscle mass, muscle strength, muscle quality, and physical performance) in KTR.

METHODS
This cross-sectional study included 170 adult KTR (59% men) aged 50 (42-57) years. Appendicular lean soft tissue (ALST) was evaluated using dual-energy X-ray absorptiometry, muscle strength by handgrip strength (HGS), muscle quality by muscle quality index (MQI), and physical performance by gait speed (GS). Sarcopenia was defined according to the European Working Group on Sarcopenia in Older People 2 (EWGSOP2) and sarcopenic obesity according to the European Society for Clinical Nutrition and Metabolism (ESPEN) and the European Association for the Study of Obesity (EASO). Energy adjusted DII (E-DII) was estimated based on 3 24-h recalls as proposed by Shivappa et al. (2014) and stratified as anti-inflammatory (E-DII<0) and pro-inflammatory (E-DII>0).

RESULTS
The E-DII ranged from -2.89 to 4.78. KTR with E-DII>0 (n=94), compared to those with E-DII<0 (n=76), exhibited lower values of GS (1.02 ± 0.18 vs. 1.09 ± 0.21; p=0.03). E-DII was negatively correlated with MQI (r = -0.23; p = 0.006) even after adjustment for confounders (r = -0.28; p = 0.001) and tended to be negatively correlated with HGS (r = -0.16; p = 0.06) and GS (r = -0.16; p = 0.05). In the adjusted regression analysis, higher E-DII values were associated with higher odds of poor MQI (1.37 (1.02-1.84); p = 0.04) and presented a tendency toward higher odds of low HGS (1.30 (0.97-1.75); p = 0.08). Indices of ALST (ALST/height, /weight, and /BMI) and the diagnosis of sarcopenia and sarcopenic obesity were not associated with the E-DII.

CONCLUSIONS
The present study suggests that in KTR a pro-inflammatory diet is associated with poor muscle quality and worse physical performance.

ADDRESSING DYSLIPIDEMIA IN MADHYA PRADESH, INDIA: A CALL FOR TARGETED LIPID-LOWERING INTERVENTIONS

Abhijit Pakhare[1]; Ankur Joshi[1]; Joshi Rajnish[2]; Ashwin Kotnis[3]; Arun Kokane[1]
[1]Community and Family Medicine, All India Institute of Medical Sciences Bhopal, Bhopal, India; [2]General Medicine, All India Institute of Medical Sciences Bhopal, Bhopal, India; [3]Biochemistry, All India Institute of Medical Sciences Bhopal, Bhopal, India

BACKGROUND AND OBJECTIVES

The rising burden of atherosclerotic cardiovascular disease (ASCVD) in India is driven by risk factors such as hypertension, diabetes, obesity, and tobacco use, with dyslipidemia contributing significantly to this risk. However, population-based data on lipid profiles stratified by ASCVD risk are limited, particularly in low epidemiological transition states like Madhya Pradesh. This study aimed to quantify the burden of dyslipidemia and assess the need for lipid-lowering therapy as a strategy for primary and secondary prevention of ASCVD in Madhya Pradesh.

METHODS

We conducted a secondary analysis of a cross-sectional, population-based STEPS survey in Madhya Pradesh, India, covering 4,552 adults. Lipid parameters (total cholesterol, LDL-C, HDL-C, triglycerides) were assessed using point-of-care testing. ASCVD risk was categorized following the Lipid Association of India 2020 guidelines, and treatable dyslipidemia was defined using updated therapeutic thresholds.

RESULTS

Among 4,552 participants, we found that 32.73% of study population is at a low ASCVD-risk, and 36.42% and 30.84% are at moderate and high/ very high risk for CVD. The proportion of individuals in each of these risk-categories who need lipid-lowering therapy in these low, moderate and high risk categories is 1.5%, 8.7% and 38.1% respectively for LDL-C treatable dyslipidemia, and 1.1%, 5.2%, and 25.1% respectively for Non-HDL-C treatable dyslipidemia. Thus, a total of 19.3% of adults in the state of Madhya Pradesh need statin therapy.

CONCLUSIONS

This study highlights the considerable burden of dyslipidemia and the associated need for lipid-lowering therapy in the population of Madhya Pradesh, especially in individuals with moderate to high ASCVD risk. With nearly one-fifth of the population requiring statin therapy, there is an urgent need to enhance screening and treatment efforts to manage dyslipidemia effectively. The findings emphasize the importance of a risk-based approach to cardiovascular disease prevention, particularly in populations with elevated risk factors such as hypertension, obesity, and diabetes. Implemention of guideline-directed interventions, including statin use and lifestyle modifications, are needed for the mitigation of the progression of cardiovascular diseases in this population.

NON-CANCER EFFECT OF NITRATE AND NITRITE ON HUMAN HEALTH FROM DRINKING WATER IN THE AUTONOMOUS PROVINCE OF VOJVODINA

Sanja Bijelovic[1]; Emil Zivadinovic[2]; Natasa Dragic[3]; Stanka Bobic[2]
[1]Department of Hygiene and Human Ecology, University of Novi Sad, Faculty of Medicine, Public Health Institute, Novi Sad, Serbia, Novi Sad, Serbia; [2]Department of Hygiene and Human Ecology, Public Health Institute of Vojvodina, Novi Sad, Serbia, Novi Sad, Serbia; [3]Department for Hygiene and Human Ecology, University of Novi Sad, Faculty of Medicine, Public Health Institute, Novi Sad, Serbia, Novi Sad, Serbia

BACKGROUND AND OBJECTIVES
In 2023, 45% of the Autonomous Province of Vojvodina (APV) population, especially in municipalities without appropriate drinking water treatment, used non-purified but disinfected drinking water (NPDW), which was safe in about 18% of samples. Among elevated concentrations of organic matter, ammonia, iron, and manganese and inadequate sensory characteristics, the recognized hazards were nitrate and nitrite. This work aims to assess the non-cancer effect of nitrate and nitrite on the APV population's human health

METHODS
The analyses are based on the RESULTS for 11.919 NPDW samples from the APV originating from seven authorized and accredited public health institutions. Drinking water safety was assessed according to national laws, in which the proposed level for nitrate is 50 mg/l and nitrite 0.03 mg/l. The non-cancer risk was characterized by the chronic hazard index (HHI) using the United States Environment Protection Agency methodology, separately for adults and children, ingestion and dermal absorption, and average and maximum nitrate and nitrite concentrations.

RESULTS
The average and maximum nitrate concentrations in NPDW were 5.23 mg/l and 139 mg/l, respectively. Regarding nitrite, the average concentration was 0.04 mg/l, while the maximum was 1.01 mg/l. The highest nitrate and nitrite concentrations in NPDW were found in the south and south-west of APV. After one year of ingestion and dermal absorption, HHI for average nitrate concentration among adults and children under five is acceptable (8.46E-02; 4.36E-01, respectively), while the maximum nitrate concentration with HHI 2.25E+00 for adults and 1.16E+01 for children under five represent a nonacceptable hazard. Although are the average and maximum nitrite concentrations in NPDW above the proposed values, HHI for nitrite does not represent a human health hazard (<1) nor for adults (5.97E-04 for average and 1.63E-02 for maximum concentration), nor children under five (3.08E-03 for average and 8.38E-02 for maximum concentration).

CONCLUSIONS
The concentration of nitrate and nitrite in NPDW in APV poses critical health concerns, so action is urgently needed to provide safe drinking water to every citizen of APV. The local governments responsible for water supply must be encouraged to take immediate and effective action to address this pressing issue.

EFFECTS OF SEMAGLUTIDE 2.4 MG ON HEALTHCARE COSTS IN PATIENTS WITH OBESITY AND HEART FAILURE

Melissa Akerib[1]; Wojciech Michalak[2]; Zhenxiang Zhao[2]; Nana Boame[3]; Danielle Sienko[4]; Mads Faurby[2]; Sara Alvarez[2]
[1]Medical Affairs, Novo Nordisk, Puteaux, France; [2]Novo Nordisk, Novo Nordisk, Plainsboro Township, United States of America; [3]Genesis Research Group, Genesis Research Group, Hoboken, United States of America; [4]Genesis, Genesis Research Group, Hoboken, United States of America

BACKGROUND AND OBJECTIVES
Obesity is increasingly recognized as a significant public health challenge and economic burden in the United States. Multiple studies have established obesity as a major risk factor for the development of heart failure (HF). Similarly, HF also imposes a significant economic burden on healthcare systems. Semaglutide 2.4 mg, which has shown improvements in HF-related symptoms, physical limitations, along with noticeable weight loss in the STEP-HFpEF phase 3 clinical trial, may reduce healthcare costs in the real world. This study assessed the change in medical costs in the year pre vs. post initiation of treatment with semaglutide 2.4 mg among patients with overweight or obesity (Ov/Ob) and HF.

METHODS
Patients with Ov/Ob and HF initiating semaglutide 2.4 mg after June 15th 2021 with ≥12 months of continuous insurance enrollment before (baseline period) and after (follow-up period) the index date (first semaglutide 2.4 mg fill date) were identified from a large nationally representative claims database. Absolute and relative changes in inpatient, outpatient, emergency room (ER), and total medical costs were assessed in the follow-up period vs. baseline period using a paired t-test.

RESULTS
A total of 806 eligible patients with Ov/Ob and HF treated with semaglutide 2.4 mg were identified; more than half were female (59.7%) with a mean age of 54 years and BMI of 36.9 kg/m2 . The mean total costs per patient per year (PPPY) were $29,654 in the baseline period, compared to $22,152 in the follow-up period, resulting in a reduction in total medical costs by $7,502 (25.3%; p=0.003). Mean inpatient, outpatient, and ER costs PPPY were $13,481, $13,975, and $2,197 in the baseline period compared to $9,110, $11,341, and $1,701 in the follow-up period, resulting in a reduction in costs by $4,372 (32.4%; p=0.04), $2,634 (18.84%; p=0.005), and $496 (22.58%; p=0.003), respectively.

CONCLUSIONS
Semaglutide 2.4 mg was associated with a significant decrease in annual medical costs among patients with Ov/Ob and HF.

NON COMMUNICABLE DISEASE PROFILE OF A RURAL COMMUNITY IN KWAZULU-NATAL IN SOUTH AFRICA

Jandri Barnard[1]
[1]Dietetics and Nutrition, University of KwaZulu-Natal - Pietermaritzburg Campus, Pietermaritzburg, South Africa

BACKGROUND AND OBJECTIVES
According to Indigo Wellness report released by the World Health Organization (WHO) South Africa has the unhealthiest people in the world out of the status of 151 countries. The score was brought down by the following criteria of the population: inactivity (0), hypertension (0.2), obesity (0.2) and diabetes risk (0.2) together with low life expectancy (0). This reflects the unhealthy reality as set out by the WHO that 28.3% of adults are obese, with an increased risk of non-communicable diseases like hypertension and diabetes. The increased consumption of highly refined and processed foods together with the decreased consumption of nutrient- and fibre-dense fruits, vegetables, legumes and grains in communities attribute to increased risk of non-communicable diseases.

METHODS
Participants were conveniently sampled with door-to-door visits from trained fieldworkers within the Umzinyathi District – one of the rural areas of the KwaZulu-Natal province. Non-communicable diseaases diagnosis, like diabetes Mellitus, hypertension and cholesterol dia was self-reported after known medical diagnosis of participant. Dietary intake was taken by 24-hour recall administered by fieldworkers.

RESULTS
The study sample (N=150) were predominantly female (83%) with 125 females completing the 24 hour food recall questionnaire compared to 25 male adults. Self-reported non-communicable diseases included a profile of 29.3% (n = 24) already diagnosed with Diabetes Mellitus (DM) of the total sample. 66.7% of the self-reported adults have been diagnosed with DM type 1 and 33.3% with DM type 2 while being on treatment. With 50% (n=48) diagnosed with hypertension on treatment and 21% (n=17) with high cholesterol levels.

CONCLUSIONS
